"The count was difficult enough to please; he was sufficiently impressed with the beauties of the original. He went over every part of the translation with me, observed on every passage in which justice was not done to the thought or the force of the expression lost, and made many useful criticisms. During this occupation we had occasion to see one another often, and became very intimate; and, as he had read much, had seen a great deal of the world, was acquainted with all the most distinguished persons who at that time adorned either the royal court or the republic of letters in France, had a great knowledge of French and Italian literature, and possessed very good taste, his conversation was extremely interesting and not a little instructive. I had such frequent opportunities of seeing him at this time, and afterwards at a much more important period of his life, that I think his character was well known to me. I doubt whether it has been so well known to the world, and I am convinced that great injustice has been done him. This, indeed, is not surprising, when one considers that, from the first moment of his entering upon the career of an author, he had been altogether indifferent how numerous or how powerful might be the enemies he should provoke. His vanity was certainly excessive; but I have no doubt that, in his public conduct as well as in his writings, he was desirous of doing good, that his ambition was of the noblest kind, and that he proposed to himself the noblest ends. He was, however, like many of his countrymen, who were active in the calamitous Revolution which afterwards took place, not sufficiently scrupulous about the means by which those ends were to be accomplished. He indeed to some degree professed this; and more than once I have heard him say that there were occasions upon which 'la petite morale était ennemie de la grande.' It is not surprising that with such maxims as these in his mouth, unguarded in his expressions, and careless of his reputation, he should have afforded room for the circulation of many stories to his disadvantage. Violent, impetuous, conscious of the superiority of his talents, and the declared enemy and denouncer of every species of tyranny and oppression, he could not fail to shock the prejudices, to oppose the interests, to excite the jealousy, and to wound the pride of many descriptions of persons. A mode of refuting his works, open to the basest and vilest of mankind, was to represent him as a monster of vice and profligacy. A scandal once set on foot is strengthened and propagated by many, who have no malice against the object of it. They delight to talk of what is extraordinary; and what more extraordinary than a person so admirable for his talents and so contemptible for his conduct, professing in his writings principles so excellent and in all the offices of public and private life putting in practice those which are so detestable? I indeed possessed demonstrative evidence of the falsehood of some of the anecdotes which by men of high character were related to his prejudice."—*Life of Sir S. Romilly*, vol. i. p. 58.

This luminous judgment, the best that is extant on the character of Mirabeau, deserved to be quoted at length; it must be noted that it was written by a man of acknowledged purity of life, who admired Mirabeau in early life, not when he was a statesman, but when he was only a struggling literary man. This close association with Romilly, and his friends Baynes, Trail, and Wilson, does credit to Mirabeau, and must have helped that moral revolution against his passions which was passing within him. He was a warm friend, and first made Romilly acquainted with Lord Lansdowne, and tried to get him a seat in parliament. Lord Lansdowne was himself an extraordinary man, and the first of the new Whigs might well feel sympathy with the statesman of the French Revolution. The *Considérations sur l'ordre de Cincinnatus* which Romilly translated was the only important work Mirabeau wrote in the year 1785, and it is a good specimen of his method. He had read a pamphlet published in America attacking the proposed order, which was to form a bond of association between the officers who had fought in the American War of Independence against England; the arguments struck him as true and valuable, so he rearranged them in his own fashion, and rewrote them in his own oratorical style. He soon found such work not sufficiently remunerative to keep his "petite horde" in comfort, and then turned his thoughts to employment from the French foreign office either in writing or in diplomacy. He first sent Madame de Nehra to Paris to make his peace with the authorities, in which she was completely successful, and then returned himself, hoping to get employment through an old literary collaborateur of his, Durival, who was at this time director of the finances of the department of foreign affairs. One of the functions of this official was to subsidize political pamphleteers, and Mirabeau had hoped to be so employed, but he ruined his chances by a series of financial works. On his return to Paris he had become acquainted with Clavières, a Genevese exile, who was minister of finance during the Revolution, and who now introduced him to a banker named Panchaud. From them he heard plenty of abuse of stock-jobbing, and seizing their ideas he began to regard stock-jobbing, or agiotage, as the source of all evil, and to attack in his usual vehement style the Banque de St Charles and the Compagnie des Eaux. This was at least disinterested on his part, for, while his supporters were poor, the bankers he attacked were rich, and would gladly have bought his silence; but Mirabeau, though ever ready to take money for what he wrote, never sold his opinions, or wrote what he did not really believe. The very eloquence of his style rests upon the enthusiastic conviction that he himself was right, and those who differed from him were stupidly and wilfully wrong. This last pamphlet brought him into a controversy with Beaumarchais, who certainly did not get the best of it, but it lost him any chance of literary employment from Government. However, his ability was too great to be neglected by a great minister such as M. de Vergennes undoubtedly was, and after a preliminary tour in the early spring of 1786 he was despatched in June 1786 on a secret mission to the court of Prussia, from which he returned in January 1787, and of which he gave a full account in his *Histoire Secrète de la Cour de Berlin*.

The months he spent at Berlin were important ones in the history of Prussia, for in them Frederick the Great died. The letters just mentioned show clearly what Mirabeau did and what he saw, and equally clearly how unfit he was to be a diplomatist; for, with all his knowledge of men and his influence over them, he thought (and showed he thought) too much of himself ever to be able to surprise their secret thoughts and intentions. He certainly failed to conciliate the new king Frederick William; and thus ended Mirabeau's one attempt at diplomacy. During his journey he had made the acquaintance of a Major Mauvillon, whom he found possessed of a great number of facts and statistics with regard to Prussia; these he made use of in a great work on Prussia published in 1788, as Romilly says, to show that he could write more than a fugitive pamphlet. But, though his *Monarchie Prussienne* gave him a general reputation for historical learning, he had in this same year lost a chance of political employment. He had offered himself as a candidate for the office of secretary to the Assembly of Notables which the king had just convened, and to bring his name before the public published another financial work, the *Denonciation de l'Agiotage*, dedicated to the king and notables, which abounded in such violent diatribes that he not only lost his election, but was obliged to retire to Tongres; and he further injured his prospects by publishing the reports he had sent in during his secret mission at Berlin. But 1789 was at hand; the states-general was summoned; Mirabeau's period of probation was over, and he was at last to have that opportunity of showing his great qualities both as statesman and orator on a worthy arena.

On hearing of the king's determination to summon the states-general, Mirabeau started for Provence, and offered to assist at the preliminary conference of the noblesse of his district. They rejected him; he appealed to the *tiers état*, and was returned both for Aix and for Marseilles. He elected to sit for the former city, and was present at the opening of the states-general on May 4, 1789. From this time the record of Mirabeau's life forms the best history of the first two years of the Constituent Assembly, for at every important crisis his voice is to be heard, though his advice was not always followed. It is impossible here to detail minutely the history of these two eventful years; it will be rather advisable to try and analyse the manner in which Mirabeau regarded passing events, and then show how his policy justifies our analysis.

Mirabeau possessed at the same time great logical acuteness and most passionate enthusiasm; he was therefore both a statesman and an orator, and the interest of the last two years of his life lies mainly in the gradual but decided victory of the statesmanlike and practical over the impulsive and oratorical qualities. From the beginning Mirabeau recognized that government exists in order that the bulk of the population may pursue their daily work in peace and quiet, and that for a Government to be successful it must be strong. In this practical view of the need of a strong executive lies one of Mirabeau's greatest titles to the name of statesman. At the same time he thoroughly comprehended that for a Government to be strong it must be in harmony with the wishes of the majority of the people, and that the political system of Louis XIV. was now falling for lack of this. He had carefully studied the English constitution in England under the guidance of such men as Lord Lansdowne, Sir Gilbert Elliot, and Romilly, and appreciated it with the wise approval of its powers of expansion which characterized the new Whigs, and not with the blind admiration of Burke. He understood the key-notes of the practical success of the English constitution to be the irresponsibility of the king, the solidarity of the ministers, and the selection of the executive from among the majority of the representatives of the country; and he hoped to establish in France a system similar in principle, but without any slavish imitation of the details of the English constitution.

In the first stage of the history of the states-general Mirabeau's part was very great. He was soon recognized as a leader, to the chagrin of Mounier, because he always knew his own mind, and was prompt at emergencies. To him is to be attributed the successful consolidation of the National Assembly, its continuance in spite of De Brezé and the carpenters, and the address to the king for the withdrawal of the troops assembled by De Broglie. When the taking of the Bastille had assured the success of the Revolution, he was the one man who warned the Assembly of the futility of passing fine-sounding decrees and the necessity for acting. He declared that the famous night of August 4 was but an orgy, giving the people an immense theoretical liberty while not assisting them to practical freedom, and overthrowing the old régime before a new one could be constituted. Still more did he show his foresight when he attacked the dilatory behaviour of the Assembly, which led to the catastrophes of the 5th and 6th October. He implored the Assembly to strike while the iron was hot, and at once solve in a practical manner the difficult problems presented by the abolition of feudalism. But the Assembly consisted of men inexperienced in practical politics, who dreamed of drawing up an ideal constitution preluded by a declaration of rights in imitation of the Americans; and for two months the Assembly discussed in what words the declaration should be expressed, while the country was in a state of anarchy, declaring old laws and customs abolished and having no new ones to obey or follow, disowning the old administrative system and having no new one yet instituted, while Paris was starving and turbulent, and the queen and her friends planning a counter-revolution. The result of these two months' theorizing was the march of the women to Versailles, and the transfer of the king to Paris. Mirabeau now saw clearly that his eloquence would not enable him to guide the Assembly by himself, and that he must therefore try to get some support. He wished to establish a strong ministry, which should be responsible like an English ministry, but to an assembly chosen to represent the people of France better than the English House of Commons then represented England. He first thought of becoming a minister at a very early date, if we may believe a story contained in the *Mémoires* of the Duchesse d'Abrantes, to the effect that in May 1789 the queen tried to bribe him, but that he refused to be bribed to silence, and expressed his wish to be a minister. The indignation with which the queen repelled the idea may have been the cause of his thinking of the Duc d'Orleans as a possible constitutional king, because his title would of necessity be parliamentary. But the weakness of Orleans was too palpable, and in a famous remark Mirabeau expressed his utter contempt for him. He also attempted to form an alliance with Lafayette, but the general was as vain and as obstinate as Mirabeau himself, and had his own theories about a new French constitution. Mirabeau tried for a time, too, to act with Necker, and obtained the sanction of the Assembly to Necker's financial scheme, not because it was good, but because, as he said, "no other plan was before them, and something must be done."

Hitherto weight has been laid on the practical side of Mirabeau's political genius; his ideas with regard to the Revolution after the 5th and 6th October must now be examined, and this can be done at length, thanks to the publication of Mirabeau's correspondence with La Marck, a study of which is indispensable for any correct knowledge of the history of the Revolution between 1789 and 1791.

The Comte de la Marck was a Flemish lord of the house of Aremberg, who had been proprietary colonel of a regiment in the service of France; he was a close friend of the queen, and had been elected a member of the states-general. His acquaintance with Mirabeau, commenced in 1788, ripened during the following year into a friendship, which La Marck hoped to turn to the advantage of the court. After the events of the 5th and 6th of October he consulted Mirabeau as to what measures the king ought to take, and Mirabeau, delighted at the opportunity, drew up an admirable state-paper, which was presented to the king by Monsieur, afterwards Louis XVIII. The whole of this *Mémoire* should be read to get an adequate idea of Mirabeau's genius for politics; here it must be merely summarized.

The main position is that the king is not free in Paris; he must therefore leave Paris and appeal to France. "Paris n'en veut que l'argent; les provinces demandent des lois." But where must the king go? "Se retirer à Metz ou sur toute autre frontière serait déclarer la guerre à la nation et abdiquer le trône. Un roi qui est la seule sauvegarde de son peuple ne fuit point devant son peuple; il le prend pour juge de sa conduite et de ses principes." He must then go towards the interior of France to a provincial capital, best of all to Rouen, and there he must appeal to the people and summon a great convention. It would be ruin to appeal to the noblesse, as the queen advised: "un corps de noblesse n'est point une armée, qui puisse combattre." When this great convention met, the king must show himself ready to recognize that great changes have taken place, that feudalism and absolutism have for ever disappeared, and that a new relation between king and people has arisen, which must be loyally observed on both sides for the future. "Il est certain, d'ailleurs, qu'il faut une grande révolution pour sauver le royaume, que la nation a des droits, qu'elle est en chemin de les recouvrer tous, et qu'il faut non seulement les rétablir, mais les consolider." To establish this new constitutional position between king and people would not be difficult, because "l'indivisibilité du monarque et du peuple est dans le cœur de tous les Français; il faut qu'elle existe dans l'action et le pouvoir."

Such was Mirabeau's programme, which he never diverged from, but which was far too statesmanlike to be understood by the poor king, and far too positive as to the altered condition of the monarchy to be palatable to the queen. Mirabeau followed up his *Mémoire* by a scheme of a great ministry to contain all men of mark,—Necker as prime minister, "to render him as powerless as he is incapable, and yet preserve his popularity for the king," the archbishop of Bordeaux, the Duc de Liancourt, the Duc de la Rochefoucauld, La Marck, Talleyrand bishop of Autun at the finances, Mirabeau without portfolio, Target mayor of Paris, Lafayette generalissimo to reform the army, Ségur (foreign affairs), Mounier, and Chapelier. This scheme got noised abroad, and was ruined by a decree of the Assembly of November 7, 1789, that no member of the Assembly could become a minister; this decree destroyed any chance of that necessary harmony between the ministry and the majority of the representatives of the nation existing in England, and so at once overthrew Mirabeau's present hopes and any chance of the permanence of the constitution then being devised. The queen utterly refused to take Mirabeau's counsel, and La Marck left Paris. However, in April 1790 he was suddenly recalled by the Comte de Mercy-Argenteau, the Austrian ambassador at Paris, and the queen's most trusted political adviser, and from this time to Mirabeau's death he became the medium of almost daily communications between the latter and the queen. Mirabeau at first attempted again to make an alliance with Lafayette by a letter in which he says, "Les Barnave, les Duport, les Lameth ne vous fatiguent plus de leur active inaction; on singe longtemps l'adresse, non pas la force." But it was useless to appeal to Lafayette; he was not a strong man himself, and did not appreciate "la force" in others. From the month of May 1790 to his death in April 1791 Mirabeau remained in close and suspected but not actually proved connexion with the court, and drew up many admirable state-papers for it. In return the court paid his debts; but it ought never to be said that he was bribed, for the gold of the court never made him swerve from his political principles—never, for instance, made him a royalist. He regarded himself as a minister, though an unavowed one, and believed himself worthy of his hire. Undoubtedly his character would have been more admirable if he had acted without court assistance, but it must be remembered that his services deserved some reward, and that by remaining at Paris as a politician he had been unable to realize his paternal inheritance. Before his influence on foreign policy is discussed, his behaviour on several important points must be noticed. On the great question of the veto he took a practical view, and seeing that the royal power was already sufficiently weakened, declared for the king's absolute veto, and against the compromise of the suspensive veto. He knew from his English experiences that such a veto would be hardly ever used unless the king felt the people were on his side, in which case it would be a useful check on the representatives of the people, and also that if it was used unjustifiably the power of the purse possessed by the representatives and the very constitutional organization of the people would, as in England in 1688, bring about a bloodless revolution, and a change in the person entrusted with the royal dignity. He saw also that much of the inefficiency of the Assembly arose from the inexperience of the members, and their incurable verbosity; so, to establish some system of rules, he got his friend Romilly to draw up a detailed account of the rules and customs of the English House of Commons, which he translated into French, but which the Assembly, puffed up by a belief in its own merits, refused to use. On the great subject of peace and war he supported the king's authority, and with some success. What was the good of an executive which had no power? Let it be responsible to the representatives of the nation by all means; but if the representatives absorbed all executive power by perpetual interference, there would be six hundred kings of France instead of one, which would hardly be a change for the better. Again Mirabeau almost alone of the Assembly understood the position of the army under a limited monarchy. Contrary to the theorists, he held that the soldier ceased to be a citizen when he became a soldier; he must submit to be deprived of his liberty to think and act, and must recognize that a soldier's first duty is obedience. With such sentiments, it is no wonder that he approved of Bouillé's vigorous conduct at Nancy, which was the more to his credit as Bouillé was the one hope of the court influences opposed to him. Lastly, in matters of finance he showed his wisdom: he attacked Necker's "caisse d'escompte," which was to have the whole control of the taxes, as absorbing the Assembly's power of the purse; and he heartily approved of the system of assignats, but with the important reservation that they should not be issued to the extent of more than one-half the value of the lands to be sold. This restriction was not observed, and it was solely the enormous over-issue of assignats that caused their great depreciation in value.

Of Mirabeau's attitude with regard to foreign affairs it is necessary to speak in more detail. He held it to be just that the French people should conduct their Revolution as they would, and that no foreign nation had any right to interfere with them, so long as they kept themselves strictly to their own affairs. But he knew also that neighbouring nations looked with unquiet eyes on the progress of affairs in France, that they feared the influence of the Revolution on their own peoples, and that foreign monarchs were being prayed by the French emigrés to interfere on behalf of the French monarchy. To prevent this interference, or rather to give no pretext for it, was his guiding thought as

to foreign policy. He had been elected a member of the comité diplomatique of the Assembly in July 1790, and became its reporter at once, and in this capacity he was able to prevent the Assembly from doing much harm in regard to foreign affairs. He had long known Montmorin, the foreign secretary, and, as matters became more strained from the complications with the princes and counts of the empire, he entered into daily communication with the minister, advised him on every point, and, while dictating his policy, defended it in the Assembly. Thus in this particular instance of the foreign office, for the few months before Mirabeau's death, a harmony was established between the minister and the Assembly through Mirabeau, which checked for a time the threatened approach of foreign intervention, and maintained the honour of France abroad. Mirabeau's exertions in this respect are not his smallest title to the name of statesman; and how great a work he did is best proved by the confusion which ensued in this department of affairs upon his death.

For indeed in the beginning of 1791 his death was very near; and he knew it to be so. The wild excesses of his youth and their terrible punishment had weakened his strong constitution, and his parliamentary labours completed the work. So surely did he feel its approach that some time before the end he sent all his papers over to his old English friend and schoolfellow Sir Gilbert Elliot, who kept them under seal until claimed by Mirabeau's executors. In March his illness was evidently gaining on him, to his great grief, because he knew how much depended on his life, and felt that he alone could yet save France from the distrust of her monarch and the present reforms, and from the foreign interference, which would assuredly bring about catastrophes unparalleled in the history of the world. On his life hung the future course of the Revolution. Every care that science could afford was given by his friend and physician, the famous chemist Cabanis, to whose brochure on his last illness and death the reader may refer. The people, whose faith in him revived in spite of all suspicions, when they heard that he was on his death-bed, kept the street in which he lay quiet; but medical care, the loving solicitude of friends, and the respect of all the people could not save his life. His vanity appears in its most gigantic proportions in his last utterances during his illness; but many of them have something grand in their sound, as his last reported expression, when he looked upon the sun—"If he is not God, he is at least His cousin-german." When he could speak no more he wrote with a feeble hand the one word "dormir," and on April 2, 1791, he died.

With Mirabeau died, it has been said, the last hope of the monarchy; but, with Marie Antoinette supreme at court, can it be said that there could ever have been any real hope for the monarchy? Had she been but less like her imperious mother, Louis would have made a constitutional monarch, but her will was as strong as Mirabeau's own, and the Bourbon monarchy had to meet its fate. The subsequent events of the Revolution justified Mirabeau's prognostications in his first mémoire of October 15, 1789. The royal family fled towards the German frontier, and from that moment there sunk deep into the hearts of the people not only of Paris, but of the provinces, a conviction that the king and queen were traitors to France, which led inevitably to their execution. The noblesse and the foreign aid on which the queen relied proved but a source of weakness. The noblesse, Mirabeau had said, was no army which could fight; and truly the army of the emigrés could do nothing against revolutionary France in arms. The intervention of foreign aid only sealed the king's fate, and forwarded the progress of the Revolution, not in a course of natural development, but to the terrible resource of the Reign of Terror. With regard to the Assembly too, and its constitution, Mirabeau had shown his foresight. The constitution of 1791, excellent as it was on paper, and well adapted to an ideal state, did not deal adequately with the great problems of the time in France, and by its ridiculous weakening of the executive was unsuited to a modern state. Surely if events ever proved a man's political sagacity, the history of the French Revolution proved Mirabeau's.

A few words must be added on Mirabeau's manner of work and his character.

No man ever so thoroughly used other men's work, and yet made it all seem his own. "Je prends mon bien où je le trouve" is as true of him as of Molière. His first literary work, except the bombastic but eloquent *Essai sur le Despotisme*, was a translation of Watson's *Philip II.*, accomplished in Holland with the help of Durival; his *Considérations sur l'ordre de Cincinnatus* was based on an American pamphlet, and the notes to it were contributed by Target; while his financial writings were all suggested by the Genevese exile Clavières. During the Revolution he received yet more help; men were proud to labour for him, and did not murmur because he absorbed all the credit and fame. Dumont, Clavières, Duroveray, Pellenc, Lamourette, and Reybaz were but a few of the most distinguished of his collaborators. Dumont was a Genevese exile, and an old friend of Romilly's, who willingly prepared for him those famous addresses which Mirabeau used to make the Assembly pass by sudden bursts of eloquent declamation; Clavières and Duroveray helped him in finance, and not only worked out his figures, but even wrote his financial discourses. Pellenc was his secretary, and wrote the speeches on the goods of the clergy and the right of making peace, and even the Abbé Lamourette wrote the speeches on the civil constitution of the clergy. Reybaz, whose personality has only been revealed within these last ten years, not only wrote for him his famous speeches on the assignats, the organization of the national guard, &c., which Mirabeau read word for word at the tribune, but even the posthumous speech on succession to estates of intestates, which Talleyrand read in the Assembly as the last work of his dead friend. Yet neither the gold of the court nor another man's conviction would make Mirabeau say what he did not himself believe, or do what he did not himself think right. He took other men's labour as his due, and impressed their words, of which he had suggested the underlying ideas, with the stamp of his own individuality; his collaborators themselves did not complain,—they were but too glad to be of help in the great work of controlling and forwarding the French Revolution through its greatest thinker and orator. True is that remark of Goethe's to Eckermann, after reading Dumont's *Souvenirs*: "At last the wonderful Mirabeau becomes natural to us, while at the same time the hero loses nothing of his greatness. Some French journalists think differently. . . . . The French look upon Mirabeau as their Hercules, and they are perfectly right. But they forget that even the Colossus consists of individual parts, and that the Hercules of antiquity is a collective being—a gigantic personification of deeds done by himself and by others."

There was something gigantic about all Mirabeau's thoughts and deeds. The excesses of his youth were beyond all bounds, and severely were they punished; his vanity was immense, but never spoilt his judgment; his talents were enormous, but could yet make use of those of others. As a statesman his wisdom is indubitable, but by no means universally recognized in his own country. Lovers of the *ancien régime* abuse its most formidable and logical opponent; believers in the Constituent Assembly cannot be expected to care for the most redoubtable adversary of their favourite theorists, while admirers of the republic of every description agree in calling him from his connexion with the court the traitor Mirabeau. As an orator more justice has been done him: his eloquence has been likened to that of both Bossuet and Vergniaud, but it had neither the polish of the old 17th-century bishop nor the flashes of genius of the young Girondin. It was rather parliamentary oratory in which he excelled, and his true compeers are rather Burke and Fox than any French speakers. Personally he had that which is the truest mark of nobility of mind, a power of attracting love, and winning faithful friends. "I always loved him," writes Sir Gilbert Elliot to his brother Hugh; and Romilly, who was not given to lavish praise, says, "I have no doubt that in his public conduct, as in his writings, he was desirous of doing good, that his ambition was of the noblest kind, and that he proposed to himself the noblest ends." What more favourable judgment could be passed on an ambitious man! What finer epitaph could a statesman desire!

The best edition of Mirabeau's works is that published by Blanchard in 1822, in 10 vols., of which two contain his *Œuvres Oratoires*; from this collection, however, many of his less important works, and the *Monarchie Prussienne*, in 4 vols., 1788, are omitted. For his life consult *Mirabeau: Mémoires sur sa vie littéraire et privée*, 4 vols., 1824, and, what is of most importance, *Mémoires biographiques, littéraires, et politiques de Mirabeau écrits par lui-même, par son père, son oncle, et son fils adoptif*, which was issued by M. Lucas de Montigny in 8 vols., Paris, 1834. See also Dumont, *Souvenirs sur Mirabeau*, 1832; Duval, *Souvenirs sur Mirabeau*, 1832; Victor Hugo, *Étude sur Mirabeau*, 1834; *Mirabeau's Jugendleben*, Breslau, 1832; Schneidewin, *Mirabeau und seine Zeit*, Leipsic, 1831; *Mirabeau, a Life History*, London, 1848. The publication of the *Correspondance entre Mirabeau et le Comte de la Marck*, by Ad. Bacourt, 2 vols., 1851, marks an epoch in our exact knowledge of Mirabeau and his career. The most useful modern books are Louis de Loménie, *Les Mirabeau*, 1878, which, however, chiefly treats of his father and uncle; Ph. Plan, *Un Collaborateur de Mirabeau*, 1874, treating of Reybaz, and throwing infinite light on Mirabeau's mode of work; and, lastly, H. Reynald, *Mirabeau et la Constituante*, 1873. On his eloquence and the share his collaborators had in his speeches, see Aulard, *L'Assemblée Constituante*, 1882. For his death see the curious brochure of his physician Cabanis, *Journal de la maladie et de la mort de Mirabeau*, Paris, 1791. (H. M. S.)

MIRABEAU, VICTOR RIQUETI, MARQUIS DE (1715–1789), himself a distinguished author and political economist, but more famous as the father of the great Mirabeau, was born at Pertuis near the old chateau de Mirabeau on October 4, 1715. He was brought up very sternly by his father, and in 1729 joined the army. He took keenly to campaigning, but never rose above the rank of captain, owing to his being unable to get leave at court to buy a regiment. In 1737 he came into the family property on his father's death, and spent some pleasant years till 1743 in literary companionship with his dear friends Vauvenargues and Lefranc de Pompignan, which might have continued had he not suddenly determined to marry—not for money, but for landed estates. The lady whose property he fancied was Marie Geneviève, daughter of a M. de Vassan, a brigadier in the army, and widow of the Marquis de Saulvebœuf, whom he married without previously seeing her on April 21, 1743. While in garrison at Bordeaux, Mirabeau had made the acquaintance of Montesquieu, which may have made him turn his thoughts to political speculations; anyhow it was while at leisure after retiring from the army that he wrote his first work, his *Testament Politique* (1747), which demanded for the prosperity of France a return of the French noblesse to their old position in the Middle Ages. This work, written under the influence of the feudal ideas impressed upon him by his father, was followed in 1750 by a book on the *Utilité des États Provenciaux*, full of really wise considerations for local self-government, which was published anonymously, and had the honour of being attributed to Montesquieu himself. In 1756 Mirabeau made his first appearance as a political economist by the publication of his *Ami des Hommes ou traité de la population.* This work has been often attributed to the influence, and in part even to the pen, of Quesnay, the founder of the economical school of the physiocrats, but was really written before the marquis had made the acquaintance of the physician of Madame de Pompadour. In 1760 he published his *Théorie de l'Impôt,* in which he attacked with all the vehemence of his son the farmers-general of the taxes, who got him imprisoned for eight days at Vincennes, and then exiled to his country estate at Bignon. At Bignon the school of the physiocrats was really established, and the marquis surrounded himself with devotees, and eventually in 1765 bought the *Journal de l'agriculture, du commerce, et des finances,* which became the organ of the school. He was distinctly recognized as a leader of political thinkers by Prince Leopold of Tuscany, afterwards emperor, and by Gustavus III. of Sweden, who in 1772 sent him the grand cross of the order of Vasa. But the period of his happy literary life was over; and his name was to be mixed up in a long scandalous lawsuit. Naturally his marriage had not been happy; he had separated from his wife by mutual consent in 1762, and had, he believed, secured her safely in the provinces by a lettre de cachet, when in 1772 she suddenly appeared in Paris, and soon after commenced proceedings for a separation. The poor marquis did not know what to do; his sons were a great trouble to him, and it was one of his own daughters who had encouraged his wife to take this step. Yet he was determined to keep the case quiet if possible for the sake of Madame de Pailly, a Swiss lady whom he had loved since 1756. But his wife would not let him rest; her plea was rejected in 1777, but she renewed her suit, and, though the great Mirabeau had pleaded his father's case, was successful in 1781, when a decree of separation was pronounced. This trial had quite broken the health of the marquis, as well as his fortune; he sold his estate at Bignon, and hired a house at Argenteuil, where he lived quietly till his death on July 11, 1789.

For the whole family of Mirabeau, the one book to refer to is Louis de Loménie's *Les Mirabeau*, 2 vols., 1878, and it is greatly to be regretted that the talented author did not live to treat the lives of the great Mirabeau and his brother. See also Lucas de Montigny's *Mémoires de Mirabeau,* and, for the marquis's economical views, De la Vergne's *Économistes français du 18me siècle.*

MIRAGE. See LIGHT, vol. xiv. p. 600.

MIRAMON, MIGUEL, a Mexican soldier of French extraction, was born in the city of Mexico, September 29, 1832, and shot along with the emperor Maximilian at Queretaro, June 19, 1867. While still a student he helped to defend the military academy at Chapultepec against the forces of the United States; and, entering the army in 1852, he rapidly came to the front during the civil wars that disturbed the country. It was largely due to Miramon's support of the ecclesiastical party against Alvarez and Comonfort that Zuloaga was raised to the presidency; and in 1859 he was called to succeed him in that office. Decisively beaten, however, by the Liberals, he fled the country in 1860, and spent some time in Europe earnestly advocating foreign intervention in Mexican affairs; and when he returned it was as a partisan of Maximilian. His ability as a soldier was best shown by his double defence of Puebla in 1856.

MIRANDA, FRANCESCO (1754–1816), was born at Santa Fé in New Granada in 1754. He entered the army, and served against the English in the American War of Independence. The success of that war inspired him with a hope of being the Washington of his own country, and a belief that the independence of Spanish America would increase its material prosperity. With these views he began to scheme a revolution, but his schemes were discovered and he had only just time to escape to the United States. Thence he went to England, where he was introduced to Pitt, but chiefly lived with the leading members of the opposition—Fox, Sheridan, and Romilly. Finding no help in his revolutionary schemes, he travelled over the greater part of Europe, notably through Austria and Turkey, till he arrived at the court of Russia, where he was warmly received, but from which he was dismissed, though with rich presents, at the demand of the Spanish ambassador, backed up by the envoy of France. The news of the dispute between England and Spain about Nootka Sound in 1790 recalled him to England, where he saw a good deal of Pitt, who had determined to make use of him to "insurge" the Spanish colonies, but the peaceful arrangement of the dispute again destroyed his hopes. In April 1792 he went to Paris, with introductions to Pétion and the leading Girondists, hoping that men who were working so hard for their own freedom might help his countrymen in South America. France had too much to do in fighting for its own freedom to help others; but Miranda's friends sent him to the front with the rank of general of brigade. He distinguished himself under Dumouriez, was intrusted in February 1793 with the conduct of the siege of Maestricht, and commanded the left wing of the French army at the disastrous battle of Neerwinden. Although he had given notice of Dumouriez's projected treachery, he was put on his trial for treason on May 12. He was unanimously acquitted, but was soon again thrown into prison, and not released till after the 9th Thermidor. He again mingled in politics, and was sentenced to be deported after the struggle of Vendémiaire. Yet he escaped, and continued in Paris till the *coup d'état* of Fructidor caused him finally to take refuge in England. He now found Pitt and Dundas once more ready to listen to him, and the latter sent a special minute to Colonel Picton, the governor of Trinidad, to assist General Miranda's schemes in every possible way; but, as neither of them would or could give him substantial help, he went to the United States, where President Adams gave him fair words but nothing more. Once more he returned to England,

where Addington might have done something for him but for the signature of the peace of Amiens in 1802. At the peace, though in no way amnestied, he returned to Paris, but was promptly expelled by the First Consul, who was then eager to be on good terms with the court of Spain. Disappointed in further efforts to get assistance from England and the United States, he decided to make an attempt on his own responsibility and at his own expense. Aided by two American citizens, Colonel Smith and Mr Ogden, he equipped a small ship, the "Leander," in 1806, and with the help of the English admiral Sir A. Cochrane made a landing near Carácas, and proclaimed the Colombian republic. He had some success, and would have had more had not a false report of peace between France and England caused the English admiral to withdraw his support. At last in 1810 came his opportunity; the events in Spain which brought about the Peninsular War had divided the authorities in Spanish America, some of whom declared for Joseph Bonaparte, others for Ferdinand VII., while others again held to Charles IV. At this moment Miranda again landed, and had no difficulty in getting a large party together who declared a republic both in Venezuela and New Granada or Colombia. But Miranda's desire that all the South American colonies should rise, and a federal republic be formed, awoke the selfishness and pride of individual provincial administrations, and thus weakened the cause, which further was believed to be hateful to heaven owing to a great earthquake on March 26, 1812. The count of Monte Verde, the Bourbon governor, had little difficulty in defeating the dispirited forces of Miranda, and on July 26 the general capitulated on condition that he should be deported to the United States. The condition was not observed; Miranda was moved from dungeon to dungeon, and died in 1816 at Cadiz.

There are allusions to Miranda's early life in nearly all memoirs of the time, but they are not generally very accurate. For his trial see Buchez et Roux, *Histoire Parlementaire*, xxvii. 26–70. For his later life see Biggs, *History of Miranda's Attempt in South America*, London, 1809; and Veggasi, *Revolucion de la Columbia*.

MIRANDOLA. See Pico.

MIRKHOND (1433–1498). Mohammed bin Kháwandsháh bin Mahmúd, commonly called Mírkhwánd or Mírkháwand, more familiar to Europeans under the name of Mirkhond, was born in 1433, the son of a very pious and learned man who, although belonging to an old Bokhara family of Sayyids or direct descendants of the Prophet, lived and died in Balkh. From his early youth he applied himself to historical studies and literature in general. In Herát, where he spent the greater part of his life, he gained the favour of that famous patron of letters, Mír 'Alíshír (born 1440), who served his old school-fellow the reigning sultan Husain (who as the last of the Tímúrides in Persia ascended the throne of Herát in 1468), first as keeper of the seal, afterwards as governor of Jurján. At the request of this distinguished statesman and writer[1] Mirkhond began about 1474, in the quiet convent of Khilásíyah, which his patron had founded in Herát as a house of retreat for literary men of merit, his great work on universal history, the largest ever written in Persian, and to the present day an inexhaustible mine of information both to Eastern and Western scholars. It is named *Rauzat-ussafá fi sírat-ulanbiá walmulúk walkhulafá* or *Garden of Purity on the Biography of Prophets, Kings, and Caliphs*. That the author has made no attempt at a critical examination of historical traditions can scarcely be called a peculiar fault of his, since almost all Oriental writers are equally deficient in sound criticism; more censurable is his flowery and often bombastic style, but in spite of this drawback, and although, in our own age, the discovery of older works on Asiatic history has diminished to some extent the value of Mirkhond's *Rauzat*, it still maintains its high position as one of the most marvellous achievements in literature from the pen of one man, and often elucidates, by valuable text-corrections, various readings, and important additions, those sources which have lately come to light. It comprises seven large volumes and a geographical appendix; but internal evidence proves beyond doubt that the seventh volume, the history of the sultan Husain (1438–1505), together with a short account of some later events down to 1523, cannot have been written by Mirkhond himself, who died in 1498. He may have compiled the preface, but the main portion of this volume is probably the work of his grandson, the equally renowned historian Khwándamír (1475–1534), to whom also a part of the appendix must be ascribed.

The following is a summary of the contents of the other six volumes. Vol. i.: Preface on the usefulness of historical studies, history of the creation, the patriarchs, prophets, and rulers of Israel down to Christ, and the Persian kings from the mythical times of the Péshdádians to the Arab conquest and the death of the last Sásánian Yazdajird III. in 30 A.H. (651 A.D.). Vol. ii.: Mohammed, Abúbekr, 'Omar, 'Othmán, and 'Alí. Vol. iii.: The twelve imáms and the Omayyad and 'Abbásid caliphs down to 656 A.H. (1258 A.D.). Vol. iv.: The minor dynasties contemporary with and subsequent to the 'Abbásids, down to 778 A.H. (1376 A.D.), the date of the overthrow of the Kurds by Tímúr. Vol. v.: The Moghuls down to Tímúr's time. Vol. vi.: Tímúr and his successors down to Sultan Husain's accession in 873 A.H. (1468 A.D.). The best accounts of Mirkhond's life are De Sacy's "Notice sur Mirkhond" in his *Mémoires sur diverses antiquités de la Perse*, Paris, 1793; Jourdain's "Notice de l'histoire universelle de Mirkhond" in the *Notices et Extraits*, vol. ix., Paris, 1812 (together with a translation of the preface, the history of the Ismailians, the conclusion of the sixth volume, and a portion of the appendix); Elliot, *History of India*, vol. iv. p. 127 *sq.*; Morley, *Descriptive Catalogue*, London, 1854, p. 30 *sq.*; Rieu, *Cat. of Persian MSS. of the Brit. Mus.*, vol. i., London, 1879, p. 87 *sq.* Mirkhond's patron, Mír 'Alíshír, to whom the Rauzat is dedicated, died three years after him (1501).

Besides the lithographed editions of the whole work in folio, Bombay, 1853, and Teheran, 1852–56, and a Turkish version, Constantinople, 1842, the following portions of Mirkhond's history have been published by European Orientalists: *Early Kings of Persia*, by D. Shea, London, 1832 (Oriental Translation Fund); *L'Histoire de la dynastie des Sassanides*, by S. de Sacy (in the above-mentioned *Mémoires*); *Histoire des Sassanides* (*texte Persan*), by Jaubert, Paris, 1843; *Historia priorum regum Persarum*, Pers. and Lat., by Jenish, Vienna, 1782; *Mirchondi historia Taheridarum*, Pers. and Lat., by Mitscherlik, Göttingen, 1814, 2d ed., Berlin, 1819; *Historia Samanidarum*, Pers. and Lat., by Wilken, Göttingen, 1808; *Histoire des Samanides*, translated by Defrémery, Paris, 1845; *Historia Ghaznevidarum*, Pers. and Lat., by Wilken, Berlin, 1832; *Geschichte der Sultane aus dem Geschlechte Bujeh*, Pers. and German, by Wilken, Berlin, 1835; followed by Erdmann's *Erläuterung und Ergänzung*, Kazan, 1836; *Historia Seldschuckidarum*, ed. Vullers, Giessen, 1837, and a German translation by the same; *Histoire des Sultans du Kharezm*, in Persian, by Defrémery, Paris, 1842; *History of the Atabeks of Syria and Persia*, in Persian, by W. Morley, London, 1848; *Historia Ghuridarum*, Pers. and Lat., by Mitscherlik, Frankfort, 1818; *Histoire des Sultans Ghurides*, translated into French by Defrémery, Paris, 1844; *Vie de Djenghiz-Khan*, in Persian, by Jaubert, Paris, 1841 (see also extracts from the same 5th volume in French translation by Langlès in vol. vi. of *Notices et Extraits*, Paris, 1799, p. 192 *sq.*, and by Hammer in *Sur les origines Russes*, St Petersburg, 1825, p. 52 *sq.*); "Tímúr's Expedition against Tuktamish Khán," Persian and French, by Charmoy, in *Mémoires de l'Acad. Impér. de St Pétersbourg*, 1836, pp. 270–321 and 441–471. (H. E.)

MIROPOLIE, a town of Russia, situated in the government of Kursk, district of Suja, 83 miles south-west of Kursk and 25 miles from the Sumy railway station. It is supposed to have been founded in the 17th century, when it was fortified against the raids of Tartars. The fertility of the soil led to the settlement of large villages close by the fort, and the 10,800 inhabitants of this town are still engaged mostly in agriculture. There is also an extensive manufacture of boots.

MIRROR. It is only since the early part of the 16th century that mirrors have become articles of household furniture and decoration. Previous to that time—from the 12th to the end of the 15th century—pocket mirrors or small hand mirrors carried at the girdle were indispensable adjuncts to ladies' toilets. The pocket mirrors consisted of small circular plaques of polished metal fixed in a shallow circular box, covered with a lid. Mirror cases were chiefly made of ivory, carved with relief representations of love

[1] Mír 'Alíshír not only excelled as poet both in Chaghatái, in which his epopees gained him the foremost rank among the classic writers in that language, and in Persian, but composed an excellent tadhkirah or biography of contemporary Persian poets.

or domestic scenes, hunting, and games, and sometimes illustrations of popular poetry or romance. Gold and silver, enamels, ebony, and other costly materials were likewise used for mirror cases, on which were lavished the highest decorative efforts of art workmanship and costly jewelling. The mirrors worn at the girdle had no cover, but were furnished with a short handle. In 625 Pope Boniface IV. sent Queen Ethelberga of Northumbria a present of a silver mirror; and there is ample evidence that in early Anglo-Saxon times mirrors were well known in England. It is a remarkable fact that on many of the sculptured stones of Scotland, belonging probably to the 7th, 8th, or 9th century, representations of mirrors, mirror cases, and combs occur.

The method of backing glass with thin sheets of metal for mirrors was well known in the Middle Ages at a time when steel and silver mirrors were almost exclusively employed. Vincent de Beauvais, writing about 1250, says that the mirror of glass and lead is the best of all "quia vitrum propter transparentiam melius recipit radios." It is known that small convex mirrors were commonly made in southern Germany before the beginning of the 16th century, and these continued to be in demand under the name of bull's-eyes (*Ochsen-Augen*) till comparatively modern times. They were made by blowing small globes of glass into which while still hot was passed through the pipe a mixture of tin, antimony, and resin or tar. When the globe was entirely coated with the metallic compound and cooled it was cut into convex lenses, which of course formed small but well-defined images. It appears that attention was drawn to this method of making mirrors in Venice as early as 1317, in which year a "Magister de Alemania," who knew how to work glass for mirrors, broke an agreement he had made to instruct three Venetians, leaving in their hands a large quantity of mixed alum and soot for which they could find no use.

It was, however, in Venice that the making of glass mirrors on a commercial scale was first developed; and that enterprising republic enjoyed a rich and much-prized monopoly of the manufacture for about a century and a half. In 1507 two inhabitants of Murano, representing that they possessed the secret of making perfect mirrors of glass, a knowledge hitherto confined to one German glass-house, obtained an exclusive privilege of manufacturing mirrors for a period of twenty years. In 1564 the mirror-makers of Venice, who enjoyed peculiar privileges, formed themselves into a corporation. The products of the Murano glass-houses quickly supplanted the mirrors of polished metal, and a large and lucrative trade in Venetian glass mirrors sprang up. They were made from blown cylinders of glass which were slit, flattened on a stone, carefully polished, the edges frequently bevelled, and the backs "silvered" by an amalgam. The glass was remarkably pure and uniform, the "silvering" bright, and the sheets sometimes of considerable dimensions. In the inventory of his effects made on the death of the great French minister Colbert is enumerated a Venetian mirror 46 by 26 inches, in a silver frame, valued at 8016 livres, while a picture by Raphael is put down at 3000 livres.

The manufacture of glass mirrors, with the aid of Italian workmen, was practised in England by Sir Robert Mansel early in the 17th century, and about 1670 the duke of Buckingham was concerned in a glass-work at Lambeth where flint glass was made for looking-glasses. These old English mirrors, with bevelled edges in the Venetian fashion, are still well known.

The Venetians guarded with the utmost jealousy the secrets of their varied manufactures, and gave most exceptional privileges to those engaged in such industries. By their statutes any glassmaker carrying his art into a foreign state was ordered to return on the pain of imprisonment of his nearest relatives, and should he disobey the command emissaries were delegated to slay the contumacious subject. In face of such a statute Colbert attempted in 1664, through the French ambassador in Venice, to get Venetian artists transported to France to develop the two great industries of mirror-making and point-lace working. The ambassador, the bishop of Béziers, pointed out that to attempt to send the required artists was to court the risk of being thrown into the Adriatic, and he further showed that Venice was selling to France mirrors to the value of 100,000 crowns and lace to three or four times that value. Notwithstanding these circumstances, however, twenty Venetian glass-mirror makers were sent to France in 1665, and the manufacture was begun under the fostering care of Colbert in the Faubourg St Antoine, Paris. But previous to this the art of blowing glass for mirrors had been actually practised at Tour-la-Ville, near Cherbourg, by Richard Lucas, Sieur de Nehou, in 1653; and by the subsequent combination of skill of both establishments French mirrors soon excelled in quality those of Venice. The art received a new impulse in France on the introduction of the making of plate glass, which was discovered in 1691. The St Gobain Glass Company attribute the discovery to Louis Lucas of Nehou, and over the door of the chapel of St Gobain they have placed an inscription in memory of "Louis Lucas qui inventa in 1691 le methode de couler les glaces et installa la manufacture en 1695 dans le château de Saint Gobain."

Manufacture.—The term "silvering," as applied to the formation of a metallic coating on glass for giving it the properties of a mirror, was till quite recently a misnomer, seeing that till about 1840 no silver was used in the process. Now, however, a large proportion of mirrors are made by depositing on the glass a coating of pure silver, and the old amalgamation process is comparatively little used.

The process of amalgamation consists in applying a thin amalgam of tin and mercury to the surface of glass, which is done on a perfectly flat and horizontal slab of stone bedded in a heavy, iron-bound wooden frame, with a gutter running round the outer edge. On the surface of this table, which must be perfectly smooth and level, is spread a sheet of thin tin-foil, somewhat larger than the glass to be operated on, and after all folds and creases have been completely removed, by means of stroking and beating with a covered wooden rubber, the process of "quickening" the foil is commenced. A small quantity of mercury is rubbed lightly and quickly over the whole surface, and the scum of dust, impure tin, and mercury is taken off. Mercury is then poured upon the quickened foil, until there is a body of it sufficient to float the glass to be silvered (about $\frac{1}{4}$ inch deep), and, the edge at one of the sides having been cleared of the scum peculiar to mercury, the glass (scrupulously cleaned simultaneously with the above operations) is slid from that side over the surface of the mercury. Weights are placed over the surface until the greater part of the amalgamated mercury is pressed out, the table is then tilted diagonally, by means of dumb-screws, and all superfluous mercury finds its way to the gutter. The glass is left twenty-four hours under weights; it is then turned over silvered side up, and removed to a drainer with inclining shelves, where by slow degrees, as it dries and hardens, it is brought to a vertical position, which in the case of large sheets may not be arrived at in less than a month. This process yields excellent results, producing a brilliant silver-white metallic lustre which is only subject to alteration by exposure to high temperatures, or by contact with damp surfaces; but the mercurial vapours to which the workmen are exposed give rise to the most distressing and fatal affections.

In 1835 Baron Liebig observed that, on heating aldehyde with an ammoniacal solution of nitrate of silver, in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation is due the modern process of silvering glass. In practice the process was introduced about 1840; and it is now carried on, with several modifications, in two distinct ways, called the hot and the cold process respectively. In the former method there is employed a horizontal double-bottomed metallic table, which is heated with steam to from 35° to 40° C. The glass to be silvered is cleaned thoroughly with wet whiting, then washed with distilled water, and prepared for the silver with a sensitizing solution of tin, which is well rinsed off immediately before its removal to the silvering table. The table being raised to the proper temperature, the glass is laid, and the silvering solution at

once poured over it, before the heat of the table has time to dry any part of the surface of the glass. The solution used is prepared as follows:—in half a litre of distilled water 100 grammes of nitrate of silver are dissolved; to this there is added of liquid ammonia (sp. gr. 0·880) 62 grammes; the mixture is filtered, and made up to 8 litres with distilled water, and 7·5 grammes of tartaric acid dissolved in 30 grammes of water are mixed with the solution. About 2·5 litres are poured over the glass for each superficial metre to be silvered. The metal immediately begins to deposit on the glass, which is maintained at about 40° C. (104° F.), and in little more than half an hour a continuous coating of silver is formed. The silvered surface is then cleaned by very cautiously wiping with a very soft chamois rubber, and treated a second time with a solution like the first, but containing a double quantity of tartaric acid. This solution is applied in two portions, and thereafter the glass is once more carefully cleared of all unattached silver and refuse and removed to a side room for backing up.

In silvering by the cold process advantage is taken of the power of inverted sugar to reduce the nitrate of silver. This process has been adopted for the silvering of mirrors for astronomical telescopes, notably for Leverrier's great telescope in the Paris Observatory. For ordinary mirror silvering the following is the process recommended by H. E. Benrath. Two solutions are prepared, the first of which contains the silver salt, and the second the sugar preparation. For the silver solution 800 grammes of nitrate of silver and 1200 grammes of nitrate of ammonium are dissolved in 10 litres of water, and 1·3 kilos of pure caustic soda in 10 litres of water, and of each of these solutions 1 litre is added to 8 litres of water, which is allowed to rest till the sediment forms and then decanted. The second solution—inverted sugar—is prepared by dissolving 150 grammes of loaf sugar with 15 grammes of vinegar in 0·5 litre of water, and boiling the solution for half an hour. After cooling it is made up with water to 4200 cubic centimetres. The silvering is done on horizontal tables in a well-lighted and moderately heated apartment, and the glass is cleaned with scrupulous care. For each square centimetre of glass operated on 15 cubic centimetres of the silver solution above described are measured out, and from 7 to 10 per cent. of the solution of inverted sugar is added, both being quickly stirred together and poured rapidly and evenly over the glass. The reduction immediately begins, and the solution exhibits tints passing through rose, violet, and black, till in about seven minutes it again becomes transparent and the deposit of metal is complete. This first deposit is extremely thin, and allows the transmission of bluish rays. The exhausted solution with floating and unattached dust-like granules of silver is carefully wiped off, the silvered surface washed with distilled water and again treated with the mixed solutions to the extent of half the quantity used in the first application. The finished surface is wiped and washed in the most thorough manner,—for the least trace of caustic soda left would destroy the mirror. The further processes are the same in both methods of silvering.

The deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the tin-mercury amalgam, and moreover real silvered glass has a slightly yellowish tinge. These defects have been overcome by a process introduced by M. Lenoir, which consists of brushing over the silvered surface with a dilute solution of cyanide of mercury, which instantaneously forming a kind of amalgam renders the deposit at once much whiter and more firmly adherent than before. To protect the thin metallic film from mechanical injury and the chemical action of gases and vapours, it is coated with shellac or copal varnish, over which when dry are applied two coatings of red-lead paint.

Platinum Mirrors.—A cheap process of preparing mirror glass is to some extent prosecuted in France, whereby a thin but very adherent deposit of platinum is formed on the glass. A solution of chloride of platinum with a proportion of litharge and borate of lead dissolved in essential oil of spike is applied with a brush to well-cleaned glass, which is then placed on edge in a muffle furnace, and the platinum is thus burned in, forming an exceedingly thin but brilliant metallic backing having a somewhat grey lustre. It is used only for the lids of cheap boxes, toys, ornamental letters, &c.

Magic Mirrors.—Hand mirrors of metal are still in common use in Oriental countries, and especially in Japan and China they continue to be the prevalent form of looking-glass. In the former country indeed bronze mirrors are articles of the greatest importance in the generally meagre furnishing of houses, and besides possess a religious significance. They have been known and used from the most remote period, mention of them being found in Chinese literature of the 9th century. The (reputed) first made Japanese mirror, preserved at Isé, is an object of the highest veneration in Japan, and an ancient mirror, connected with which is a tradition to the effect that is was given by the sun-goddess at the foundation of the empire, is a principal article of the Japanese regalia. The mirrors of Japan vary in form and size, but in general they consist of thin disks, from 3 to 12 inches in diameter, of speculum metal with handles cast in one piece. The polished face of the mirror is slightly convex in form, so that a reflected image is seen proportionately reduced in size; the back of the disk is occupied with characteristic Japanese ornamentation and inscriptions in bold relief, and its rim is also raised to the back. Much attention has been attracted to these mirrors by a singular physical peculiarity which in a few cases they are found to possess. These are known as magic mirrors from the fact that when a strong beam of light is reflected from their smooth and polished surface, and thrown on a white screen, an image of the raised ornaments and characters on the back of the mirror is formed with more or less distinctness in the disk of light on the screen. This peculiarity has at no time been specially observed by the Japanese, but in China it attracted attention as early as the 11th century, and mirrors possessed of this property sell among the Chinese at ten or even twenty times the price sought for the ordinary non-sensitive examples. The true explanation of the magic mirror was first suggested by the French physicist Person, who observed that the reflecting surface of the mirrors was not uniformly convex, the portions opposite relief surfaces being plane. Therefore, as he says, "the rays reflected from the convex portion diverge and give but a feebly illuminated image, while, on the contrary, the rays reflected from the plane portions of the mirror preserve their parallelism, and appear on the screen as an image by reason of their contrast with the feebler illumination of the rest of the disk." That such differences of plane in the mirror surface arise is an accidental circumstance due to the manner in which it is prepared, a process explained by Professors Ayrton and Perry, by whom ample details of the history, process of manufacture, and composition of Oriental mirrors have been published. A preliminary operation in polishing the surface consists of scoring the cast disk in every direction with a sharp tool. The thicker portions with relief ornament offer more resistance to the pressure of the tool than the thin flat portions, which tend to yield and form at first a concave surface, but this by the reaction of its elasticity rises afterwards and forms a slightly convex surface while the more rigid thick portions are comparatively little affected. This irregularity of surface is inconspicuous in ordinary light, and does not visibly distort images; but when the mirror reflects a bright light on a screen the unequal radiation renders the minute differences of surface obvious. The ingenious theory of Person has been established by experiments communicated by M. Govi to the academy of Turin in 1864-65, and more recently by investigations of MM. Bertin and Dubosq. See *Annales de Chimie et de Physique* (5th ser., vol. xx.). (J. PA.)

Ancient Mirrors.

The mirror of classical antiquity (*κάτοπτρον*, speculum) was a thin disk of bronze slightly convex on one side and polished, usually provided with a handle, sometimes mounted on a stand in the form of a female figure (see COSTUME, vol. vi. p. 453, fig. 1), sometimes fixed inside a circular bronze case. The common size is that of an ordinary hand mirror. Examples large enough to take in the whole figure appear to have been rare. Mirrors of glass are mentioned, and though none of them have been found their existence need not be questioned altogether, since the process of silvering occasionally employed on bronze mirrors suggests that an analogous process may have been applied to glass. But the very large number of mirrors still existing from antiquity shows that bronze was the regular material employed. The alloy known as speculum, producing a very hard metal with great reflecting power, is comparatively seldom met with. Silver mirrors are mentioned, but none have as yet been found.

The principal feature of ancient mirrors, especially those of Etruria, is the design incised on the back (see ETRURIA, vol. viii. p. 643). While twelve incised specimens are all that are as yet known from Greece, the number found in Etruria must be nearly a thousand. As a rule the subjects incised are taken from Greek mythology and legend, the names of the persons represented being frequently added in Etruscan letters and orthography. In most cases the style of drawing, the types of the figures, and the manner of composing the groups are true to the characteristics of Greek art. Some may have been imported from Greece; but the greater number appear to have been more or less faithfully imitated from such designs as occurred on the almost innumerable printed Greek vases which the Etruscans obtained from Greece. Even where distinctly Etruscan figures are introduced, such as the heroes Ælius and Cælius Vibenna on a mirror in the British Museum, Greek models are followed. The characteristics of Greek art here referred to date from a little before 400 B.C., and last for some time after. In this period would fall the majority of the Etruscan mirrors, and to this period also belong the Greek incised mirrors, among which may be mentioned for their beauty one representing Leucas and Corinthus, inscribed with their names (engraved, *Monuments Grecs*, 1873, pl. 3, published by the Association pour l'encouragement des Études Grecques), and another in the British Museum (*Gazette Arch.*, ii. pl. 27), on the back of which is a figure of Eros which has been silvered over. With this last-mentioned mirror was found the bronze case used to contain it,

on the back of which is a group of Aphrodite and Eros in repoussée. It was found in Crete. But most of the Greek mirrors and mirror-cases having artistic designs are from Corinth. One bears the name of the artist, Ἀπολλᾶς ἐποίει (engraved, *Arch. Zeitung*, 1862, pl. 166, fig. 1).

Archaic art (about 500 B.C.) is represented by a mirror in the British Museum from Sunium in Attica. The mirror itself is quite plain, but the stand is composed of a draped female figure, above whose head float two cupids. From Etruria there is a comparatively small number with archaic incised designs. It may be concluded that the luxury of mirrors enriched with incised designs was not freely indulged before 400 B.C. in Etruria and never to any extent in Greece. A special centre of incised mirrors was the Latian town of Præneste (Palestrina), and it is of interest in regard to some of the mirrors found there that they have inscriptions in early Latin. Artistically they have a purely Greek character. Plain mirrors are found wherever Greek and Roman civilization spread, and it may be seen from a specimen found in Cornwall, now in the British Museum, that the Celtic population of England had adopted the form and substance of the mirror from their conquerors. This specimen is enriched with a Celtic pattern incised. The shape of the handle testifies to native originality. Mirrors were used in Greece, perhaps rarely, for divination, as appears, for example, from Pausanias (vii. 21, 5), the method being to let the mirror down into a well by means of a string till it reached close to the surface of the water. When it was pulled up after a little it was expected to show the face of the sick person on whose behalf the ceremony was performed. This was at Patras.

The principal publications on ancient mirrors are Gerhard, *Etruskische Spiegel*, Berlin, 1843-67, 4 vols., containing 430 plates; for the Greek mirrors, Mylonas, Ἑλληνικὰ κάτοπτρα, Athens, 1876, and Dumont, *Bullet. de Corresp. Hellén.*, 1877, p. 108; see also Friederichs, *Kleinere Kunst und Industrie im Alterthum*, Düsseldorf, 1871, p. 18 *sq.*; and Marquardt and Mommsen, *Handbuch der römischen Alterthümer*, vii. pt. 2, p. 670. (A. S. M.)

MÍRZÁPUR, a district in the North-Western Provinces of India, lying between 23° 51′ 30″ and 25° 31′ N. lat., and between 82° 9′ 15″ and 83° 0′ 36″ E. long., is bounded on the N. by Jaunpur and Benares, on the E. by Shahábád and Lohárdagá, on the S. by Sargújá state, and on the W. by Allahábád and Rewah state, and has an area of 5217 square miles. It is crossed from east to west by the Vindhya and Káimur ranges. A central jungly plateau connects these, and separates the valley of the Ganges from that of the Son.

The population in 1872 was 1,015,203 (males, 520,496; females, 494,707), of whom 949,644 were Hindus, 64,809 Mohammedans, and 750 Christians. The non-Asiatic population numbered 623. Only three towns had a population exceeding 5000:—Mírzápur, 67,274; Chanár, 10,154; and Ahraura, 9091. Out of a Government-assessed area of 3048 square miles, 1313 are cultivated, 497 cultivable waste, and 1238 uncultivable. The part of Mírzápur which lies north of the Vindhyás is very highly cultivated and thickly peopled, but the rest of the district consists largely of ravines and forests, with a very sparse population. Local manufactures comprise carpets of a superior description, brass ware, and shellac. The East Indian Railway traverses the district, along the right bank of the Ganges, for a distance of 32 miles. The climate is slightly warmer and damper than that of districts farther north and east. The mean annual rainfall is 42·7 inches.

MÍRZÁPUR, chief town and administrative headquarters of the above district, is situated on the south bank of the Ganges, 56 miles below Allahábád (25° 9′ 43″ N. lat., 82° 38′ 10″ E. long.). The population in 1872 was 67,274, of whom 55,917 were Hindus and 11,053 Mohammedans. Up to quite recent years Mírzápur was the largest mart in upper India for grain and cotton; but of late its commercial importance has rapidly decreased, owing to the establishment of through railway communication with Bombay *via* Jabalpur, and the rise of Cawnpore to the position of a mercantile centre. The river front, lined with stone *gháts* or flights of stairs, and exhibiting numerous mosques, Hindu temples, and dwelling-houses of the wealthier merchants, with highly decorated façades and richly carved balconies and door-frames, is handsome; but the interior of the town is mainly composed of mud huts. The manufacture of shellac gives employment to about four thousand persons; brass ware and carpets are also made. The imports consist of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt, and cotton; the same articles, with manufactured lac-dye, shellac, and *ghí*, are exported.

MISDEMEANOUR. "The word misdemeanour," says Russell (*On Crimes*, vol. i. chap. iv.), "is applied to all those crimes and offences for which the law has not provided a particular name." Stephen, in his *Digest of the Criminal Law*, adopts the following mode of distinguishing between misdemeanour and other crimes. "Every crime is either treason, felony, or misdemeanour. Every crime which amounts to treason or felony is so denominated in the definitions of crimes hereinafter contained. All crimes not so denominated are misdemeanours." It is customary to speak of misdemeanour as implying a less degree of crime than felony (see FELONY). "Misdemeanours," observes Russell in the passage already cited, "have been sometimes termed *misprisions*; indeed the word misprision, in its larger sense, is used to signify every considerable misdemeanour which has not a certain name given to it in the law, and it is said that a misprision is contained in every felony whatsoever, so that the offender may be prosecuted for misprision at the option of the crown." Misprision, in a more restricted sense (or negative misprision), is the concealment of an offence. Positive misprisions are contempts or misdemeanours of a public character, *e.g.*, mal-administration of high officials, contempt of the sovereign or magistrates, &c. The rule as to punishment, when no express provision has been made by law, is that "every person convicted of a misdemeanour is liable to fine and imprisonment without hard labour (both or either), and to be put under recognizances to keep the peace and be of good behaviour at the discretion of the court" (Stephen's *Digest*, art. 22). By 28 & 29 Vict. c. 67 prisoners convicted of misdemeanour and sentenced to hard labour shall be divided into two divisions, one of which shall be called the first division, and when a person convicted of misdemeanour is sentenced to imprisonment without hard labour the court may order him to be treated as a first-class misdemeanant, who shall not be deemed a "criminal prisoner" within the meaning of that Act. The Prison Act, 1877 (§§ 40, 41), requires prisoners convicted of sedition or seditious libel, or attached for contempt of court, to be treated as misdemeanants of the first class.

In New York and some other States of the American Union the legislature has defined felony as any crime which is or may be punishable with death or imprisonment in a State prison, all other crimes being misdemeanours.

MISHNAH. The *Mishnah*, in the most familiar application of the name, is the great collection of legal decisions by the ancient rabbis which forms in each Talmud the text on which the *Gemara* rests, and so is the fundamental document of the oral law of the Jews. The question What is Mishnah? was asked, however, as early as the latter part of the 1st or the early part of the 2d century, though in a somewhat different sense and for a somewhat different purpose.[1] It will be answered in the course of this article in all its bearings.

1. *Name.*—Rabbinic tradition has fixed the pointing *Mishnah* (מִשְׁנָה) by giving its *status constructus* as *Mishnath*. Although the word *Mishnah* is not found in the Bible, it is no doubt a classical Hebrew term, signifying something closely akin to *Mishneh* (which term occurs more than once there), as may be seen on comparing *Mikvah* with *Mikveh*, *Miknah* with *Mikneh*, *Ma'alah* with *Ma'aleh*, and *Mar'ah* with *Mar'eh*, each two of which are, however they may vary in practical application, unquestionably synonymous terms. The practical significations of *Mishnah* are seven in number:—(1) repetition, *i.e.*, tradition:[2] as such it is the equivalent of the

[1] See T. B., *Kiddushin*, 49*a*.

[2] The root *Shanoh* (שָׁנֹה), from which *Mishnah* is immediately derived, is not merely, as is often thought, to *learn*, to *teach*, but to *repeat*; and it is in reality this last meaning which underlies the two former.

δευτερώσεις of Epiphanius,[1] the *traditiones et δευτερώσεις* of Jerome,[2] the δευτέρωσις of Justinian,[3] and the שניה לתורה ("the second to the law") of the *Arukh*[4]; (2) recitation from memory, in contradistinction to reading from a book;[5] (3) study: as such it is the equivalent of *Midrash* in the former part of its third signification; (4) instruction: as such it is the equivalent of *Midrash* in the latter part of its third signification;[6] (5) system, style, view, line of study and instruction: as such it is identical with the Talmudical *Shittah*;[7] (6) a paragraph of the *Mishnah*: it is invariably employed in this sense in the Babylonian Talmud, and is identical with the word *Halakhah*, used for the same purpose, in the Palestinian Talmud; and (7) the collection of the decisions of the whole "oral law," *i.e.*, the *Mishnah* in the concrete sense. The word *Mishnah* has three different plurals:—(1) the traditional *Mishnayoth* for signification (7), formed on the analogy of *Miḳvaoth* (not, as some think, on that of *Miḳraoth* or *Midrashoth*); (2) the correct, though questioned, *Mishniyyoth* for signification (6), formed on the analogy of *Parshiyyoth* from *Parashah* (or *Parshah*), not to speak of that of *Ma'asiyyoth* from *Ma'aseh*; (3), the somewhat inelegant, but correct, *Mishnoth*,[8] which also serves for signification (6). Significations (1), (2), (3), (4), and (5) have, however inconsistent it may appear when one takes into consideration their respective equivalents, no plural whatever. So much for the Hebrew *Mishnah*. The Aramaic *Mathnitho* will be spoken of later.

2. *Contents and Nature.*—The *Mishnah* consists chiefly of *Halakhah*;[9] there is, comparatively speaking, little *Agadah*[10] to be found in it. It is not, however, as many think, either a commentary on the Halakhic portions of the Pentateuch, or on the ordinances of the *Sopherim*, or on both together. It rather presupposes the knowledge of, and respect for, both the Mosaic and the Sopheric laws, and it only discusses, and finally decides on, the best mode and manner of executing these. The discussions and eventual decisions to be found in the *Mishnah* owe their existence principally to deep meditation on these two kinds of laws, notably on the former, by the rabbis of various ages, but chiefly by those who lived fifty years before and one hundred and fifty years after the rise of Christianity, the names of whom it faithfully gives, along with their respective discussions and decisions. There are but few cases to be found in the *Mishnah* which would critically come under the denomination of an *Halakhah le-Mosheh mis-Sinai, i.e.*, an explanation (of a law) as directly given by God to Moses, and in uninterrupted succession received from him by the rabbis. Several cases given under this name in the *Mishnah* are not *bona fide* cases;[11] for the test of such an *Halakhah* is that it must never have been contested by any one.[12]

3. *Method.*—A *Mishnah*, if genuine, never begins with a passage of the Pentateuch, and even comparatively seldom brings direct proof from or gives reference to it. When there is any exception to this rule it will be found, on close examination, either that such a paragraph belongs to a very early age (that of the *Sopherim*), or that it is to be found in another work of the "oral law," and is simply copied in the *Mishnah*, or, what is more likely, that, if independent, it belongs to a very late age, or, finally, that the proof or the reference thus given is only a later addition. One example of the true method of the *Mishnah* will, perhaps, better illustrate the foregoing statement than a sheet full of theorizing on the subject; and this one example will the more surely suffice because of its mixed (Mosaic and Sopheric) character. It is the very first paragraph of the whole *Mishnah*, and runs thus: "From what time (of the day) does (may, should) one read the *Shema'* ('the taking upon oneself the yoke of the heavenly kingdom') in the evening?" The *Mishnah* does not begin: One is in duty bound to read the *Shema'* in the evening, because it is written (Deut. vi. 7), "And when thou liest down." For, in the first place, the law to read the *Shema'* evening and morning is not unquestionably Mosaic, as the words, "And thou shalt talk of them, &c.," do not refer to this passage of the law particularly, but rather to the words of the Pentateuch in general;[13] and, secondly, it is needless to say that one is in duty bound to recite the *Shema'* twice a day, since every Jew readily acknowledges this duty and executes it, although it is not Mosaic. This duty of reading the *Shema'*, the grounds on which this duty rests, and how it is best fulfilled, are fully and ably discussed, developed, and finally settled in that part of the Talmud called *Gemara*,[14]—the business of which it is to discuss the words of the *Mishnah* and to show the sources of the tradition, and eventually the passage in the Pentateuch (if on such the case rest) from which the respective disputants had derived their views, &c.

4. *Purpose.*—Although it is a book containing Halakhic decisions, the *Mishnah* was never intended, as many think, to enable the reader thereof to decide from it immediately. This mistake is old[15] and widely spread,—but a mistake nevertheless. The purpose of the *Mishnah* was and is simply to exhibit the development of the "oral law" and the view taken of this development by the rabbis of various times. For this reason one finds side by side with the opinions of the majority those also of the minority, which latter are very carefully given. But why, since these opinions of the minority can have no decisional effect? The *Mishnah* itself (*'Eduyyoth*,[16] i. 5)

[1] *Hæres.*, xv. (κατὰ γραμματέων), *in fine.* Epiphanius was a native of Palestine, even if he was not, as some think, of Jewish parentage. As a Palestinian writer on Jewish and semi-Jewish matters he must have had a more than superficial knowledge of the Jewish traditions (the *Mishnah*, &c.). And indeed, to judge from the account he gives of the various Jewish traditions (although the text of this account is extremely corrupt in every way), he was pretty well informed. For he tells us that the Jews have four kinds of traditions:—such as are ascribed to Moses (by which he no doubt means the *Halakhah le-Mosheh mis-Sinai*); such as are ascribed to the sons of Asmonæus (by which he means the *Teḳanoth*, &c., of the *Beth Dino shel Ḥashmonai*; see T. B., *'Abodah Zarah*, 36*b*); such as are ascribed to R. 'Aḳibah (the great teacher and martyr); and such as are ascribed to R. Andan, &c. (Rabbi Yehudah Hannasi).

[2] *In Isaiam*, cap. viii. 11–15.

[3] *Nov.* cxlvi. (Περὶ Ἑβραίων) κεφ. ά, *in medio.*

[4] Article משנה (first definition).

[5] Contrast *Shanoh* (שָׁנֹה) with *Ḳaro* (קָרֹא).

[6] See article MIDRASH, p. 285.

[7] See Schiller-Szinessy, *Catalogue of Hebrew MSS. in the Cambridge University Library*, ii. p. 94.

[8] See MS. Add. 464 (University Library, Cambridge), leaf 283*b*.

[9] This word, derived from the root *Halokh* (הָלֹךְ), to go, is synonymous with *Minhag* (custom, practice) and *Mishpat* (rule), &c.

[10] For the meaning of this term and the Agadic parts which are to be found in the *Mishnah*, see MIDRASH.

[11] See R. Asher b. Yeḥiel (Harosh), *Hilekhoth Miḳvaoth* (coming close after this Rabbi's commentary on *Niddah*, in the printed editions of the Bab. Talmud), i. 1.

[12] There are, however, at least sixteen such *bona fide* cases to be found in the works of the "oral law."

[13] See T. B., *Berakhoth*, on Deut. xi. 19.

[14] *Gemara*, or *Gemoro*, signifies concretely discussion on and final settlement of the contents of the *Mishnah*, from *gemar* (גְּמַר), to study deeply, to come to a final result; which last signification is, to some extent, to be found also in the Hebrew root *gamor* (גָּמֹר). Compare T. B., *Bobo Metsi'o*, 33*a*, and Rashi, *in loco.*

[15] See T. B., *Sotah*, 22*a*.

[16] The word עדיות is variously pointed:—*'Aduyoth*, *'Ediyoth*, and, as in the text, *'Eduyyoth*, which last, if the name come from עדות, because of the testimony of the witnesses on which this *Massekheth* chiefly rests, would be the only correct one. But it ought to be remarked that the Babylonian teachers must have spelled it *'Idiyyoth* (best things), since its equivalent is given by them as *Beḥirto* (or *Beḥirotho*). See T. B., *Berakhoth*, 27*a* and elsewhere.

answers this question: it is that the teacher or the judge of later ages may be thus enabled, if he have good grounds for taking a view different from that of the majority as given hundreds of years before, to reverse the old decision, by forming, on the strength of the example before him, with others who agree with him (or without them, if only one vote was wanted to reverse the majority) a fresh majority. Thus the Jewish "oral law" can never become ossified like the laws of the Medes and Persians.

5. *Language.*—The *Mishnah* is, on the whole, written in almost pure Hebrew; and even the originally non-Hebrew words (Aramaic, Greek, Latin, &c.) are so skilfully Hebraized that they are a most creditable testimony to the linguistic powers both of many of the disputants mentioned in it, whose very words are in most cases given, and of the editor[1] or editors who revised them.

6. *Age and Authorship.*—R. Yehudah Hannasi (the Prince), the reputed author (in reality only the principal and best among the editors) of the *Mishnah*, was born before the year 140 of the Christian era. His name was in full Yehudah b. Shimeʿon b. Gamliel b. Shimeʿon b. Gamliel[2] b. Shimeʿon b. Hillel. On account of his holy living he was surnamed Rabbenu Hakkadosh, and on account of his great learning and authority he was called simply "Rabbi" ("My Teacher" *par excellence*). Rabbi and his time, however, are no *terminus a quo* for the composition of the *Mishnah*. For, not to speak of many isolated *Mishniyyoth* which can be brought home to R. Meir, to R. ʿAkibah, to Hillel,[3] to Yose b. Yoʿezer,[4] and to others, even to the earlier *Sopherim*,[5] we find that R. Yose b. Ḥalaphta of the 1st century already quotes the beginning and ending of a whole Mishnic treatise (*Kelim*[6]), and that in the same century (or very early in the 2d) another treatise consisting of early testimonies (*ʿEduyyoth*[7]) was put into order. Moreover, although the phrases *Mishnath R. Eliʿezer b. Yaʿakob*[8] and *Mishnath R. ʿAkibah*[9] do simply signify the systems, styles, and views of these two eminent teachers, there can be little doubt that they and others besides them, presided over colleges in which the whole Halakhic matter was systematically treated and regularly gone through. Nor are Rabbi and his time for the composition of the *Mishnah* a *terminus ad quem*, for the *Mishnah* was not brought to a close till a very long time afterwards. Not only did R. Ḥiyya Rabbah, R. Hoshaʿyah Rabbah, and Shimeʿon bar Kappara redact *Mishnayoth*,[10] but in the *Mishnah* before us notices are actually found which reach to the end of the 3d century, if not even later. The statement that Rabbi was the first to write down the *Mishnah* is untrue, because the thing is impossible. For the two Talmuds, of which that of Babylonia was not finished before the 6th century (if then), know, certainly, nothing of the writing down of the *Mishnah*. On the contrary, their language throughout presupposes the *Mishnah* in their time to have been what its name indicates, a repetition, *i.e.*, a thing acquired by continual recitation, because, like the other works of the "oral law" (*Torah shebbeʿal peh*), it was to be, and was, handed down orally.[11] As for the difficulty of keeping in memory such a stupendous and vast work as the *Mishnah*, it is sometimes forgotten in this controversy that memory was aided by a great variety of mnemotechnic means, such as numbers and names of teachers, and by the existence of other works of the "oral law," which, although they also were not written down, could be easily kept in memory because they rested on letters, words, and verses of the written Pentateuch. Anyhow, there is ample evidence, both negative and positive, that the *Mishnah* as we now have it was not committed to writing in the times of Rabbi or for long afterwards. But it certainly does not follow that no merit is due to Rabbi in connexion with the *Mishnah*. His merit in connexion with it is great in every way. For (1) Rabbi was himself a link in the chain of tradition, since he had "received" from his own father and so on up to his ancestor Hillel and even higher; (2) he gave in the *Mishnah* his own decisions, in most cases in accordance with those of the famous R. Meir, which are thus in a great part secured to us; (3) in giving his own decisions he preserved to us also a good many decisions of the teachers of the 2d century; (4) in collecting all these decisions he anxiously ascertained the genuine formulas of the older *Mishniyyoth*;[12] (5) he did not merely reproduce the formulas which he esteemed the best, but discussed them anew in his own college, which was composed of men of the highest eminence, as is well known; (6) although he gave on the whole the very language of the teachers who preceded him, he gauged it, guarding it against the barbarisms which are so plentiful in the other works of the "oral law"; and (7) he scattered the *Mishnah* broadcast (though only by word of mouth) over all Palestine and Babylonia by means of the disciples who flocked to him from all parts of those countries. If the *Mishnah*, as it now exists, is not entirely his, it certainly belongs to him in a great measure and in more than one sense.

7. *Value and Appreciation.*—Whatever can be said in favour of the *Agadah* applies with equal if not greater force to the *Mishnah*, as the latter is a canonical and therefore more reliable work of the "oral law." The *Mishnah* is one of the richest mines of archæology which the world possesses. But it waits yet for the master touch to break the spell which holds it bound. Great, however, as the value of the *Mishnah* is, its popularity has never been steady, but has been continually fluctuating, and that for various reasons. Even Rabbi in his time had to appeal for due attention to it. Whilst it was neglected in troublous times by the masses, who ran after the *Agadah*,[13] which, besides being consoling, needed no particular study, it was, in prosperous times, neglected by the rabbis themselves through the study of the Bible and the Talmud.[14] And much more was this

[1] The Hebrew spoken in the house of the principal editor of the *Mishnah* was so correct that rabbis actually learnt the meaning of uncommon words of the Bible from the handmaidens of this house. See T. B., *Rosh Hasshanah*, 26*b*. As for Rabbi himself, he was not merely a fine Hebrew scholar, but a fine Greek scholar also. He was also a purist; for in T. B., *Sotah*, 49*b*, he is reported to have exclaimed, "Why should any one speak in Palestine 'Sursi'? Let him speak either Hebrew or Greek!" In using the word "Sursi" for "Surith" (Syriac), he no doubt makes a punning allusion to the mixed (cut-up) character of the language, corrupted from Hebrew, Chaldee, Persian, Greek, and Latin.

[2] This was the teacher of St Paul.

[3] In addition to such well-known Agadic *Mishniyyoth* as those which are distinctly ascribed in *Aboth* to Hillel, see *Mishnah Kiddushin*, iv. 1; and contrast it with the language and style of the *Mishnah* in general, and that of *Massekhto Kiddushin* in particular.

[4] *Mishnah ʿEduyyoth*, viii. 4.

[5] See *Mishnah Maʿaser Sheni*, v. 7; *Sotah*, v. 1, 2; *Negaʿim*, xii. 5, 6, 7, &c.; though it cannot be said that these passages preserve the teaching of the *Sopherim* in their original purity.

[6] See *Mishnah Kelim*, *in fine*.

[7] See T. B., *Berakhoth*, 28*a*: "It is handed down orally (תנא) that *Eduyyoth* was on that day (when R. Elʿazar b. ʿAzaryah was installed as president) gone through," *i.e.*, redacted.

[10] See *Koheleth Rabbah* on ii. 8 *in medio*.

[11] See particularly T. B., *Bobo Metsiʿo*, 33*a* and *b*; and compare also Rashi, *in loco*.

[12] See T. Y., *Maʿaser Sheni*, v. 1; and compare the preceding note.

[13] See MIDRASH, p. 285, note 14.

[14] R. Yohanan said, This *Mishnah* (*Boraitho*), that no study can excel that of *Gemara*, was taught in the time of (and by) Rabbi himself. Then the people went after *Gemara* and neglected the study of the *Mishnah*. Whereupon he again bade them ever run more after *Mishnah* than after *Gemara*. T. B., *Bobo Metsiʿo*, 33*b*, and Rashi, *in loco*.

the case when the Talmud had developed from a mere studious activity to two concrete works of large size.

8. *The Ultimate Writing Down of the Mishnah.*—The troubles of the unhappy Jews had multiplied everywhere. The masses, as already stated, preferred, in consequence of these troubles, the *Agadah*. But the number of the learned also diminished through these troubles day by day; and the comparatively few that remained preferred more and more the Talmud (in Palestine the Palestinian and in Babylonia the Babylonian), which was a better field for the exercise of their ingenuity. The fate of the *Mishnah* would have been sealed had it not been ultimately written down. But the writing down of *Halakhah en masse* had been prohibited in early times. Two considerations, however, ultimately removed all scruples. (1) It was a time to do something for God, even if by such doings His law was apparently destroyed.[1] Let one (and a minor) law be disregarded, so that many (and higher) laws be preserved. The *Halakhoth* of the *Mishnah* were numerous and the students few; the power of tyranny increased and that of the memory decreased by reason of the persecution. (2) The language of the *Mishnah*, although pure, and indeed purer than the language of several books of the Bible, was so concise and terse that it could not be understood without a commentary; and, therefore, even after being written down, it would virtually retain its oral character.

9. *Recensions.*—The *Mishnah* has three principal recensions:—(1) the *Mishnah* as presented in the work standing by itself; (2) that on which the Palestinian Talmud rests; and (3) that of the Babylonian Talmud. The first-named and the last-named *Mishnayoth* have always been known as complete; the second, however, was supposed for several hundred years to be imperfect, lacking four *Peraḳim* in *Shabbath*, two entire *Massekhtoth* in the *Seder Neziḳin*, the whole of the *Seder Ḳodoshim*, and by far the greater part of the *Seder Tohoroth*.[2] But since 1869 this recension also has been known to have been always complete; and it is to be found in its entirety in a MS. purchased in that year for the University Library of Cambridge (Add. 470. 1). Besides these three there are many minor recensions, touching, however, only isolated readings. These last are to be attributed chiefly to copyists. The origin of the difference between the principal recensions is to be sought in the following two facts:—(1) Rabbi had himself gone twice through the *Mishnah* and had himself considerably altered the wording of the text;[3] and (2) his successors in early and late times had wilfully altered and corrected the original text.

10. *Divisions and Detailed Contents of the Mishnah.*—The *Mishnah* in all recensions is divided into six *Sedarim* (orders), each of which contains a number of *Massekhtoth*[4] (treatises), which stand in connexion with one another. These are subdivided into *Peraḳim* (chapters), and these again into *Halakhoth* or *Mishniyyoth* (paragraphs called *Mishnoth*).[5] The number of the *Sedarim* is six, that of the *Massekhtoth* sixty,[6] and that of the *Peraḳim* 523, or, with a fourth *Pereḳ* to *Bikkurim*, 524.[7] The following is a scheme of the whole *Mishnah*.[8]

I. Zera'im (on Agriculture, preceded by the Treatise on Thanksgivings[9]). (1) *Berakhoth* (blessings), in nine chapters; (2) *Peah* (Lev. xix. 9, &c.), in eight chapters; (3) *Demai* (fruit, grain, &c., doubtful if tithed), in seven chapters; (4) *Kil'ayim* (mixtures of plants, animals, and garments respectively), in nine chapters; (5) *Shebi'ith* (year of release), in ten chapters; (6) *Terumoth* (gifts to the priests), in eleven chapters; (7) *Ma'aser Sheni*[10] (Deut. xiv. 22–27), in five chapters; (8) *Ma'aser Rishon*, otherwise *Ma'aseroth* (Levitical tithes), in five chapters; (9) *Hallah* (Num. xv. 19–21), in four chapters; (10) *'Orlah* (Lev. xix. 23), in three chapters; and (11) *Bikkurim* (Deut. xxvi. 1–10), in three (commonly four) chapters.

II. Mo'ed (on Festival Times). (1) *Shabbath* (Sabbath), in twenty-four chapters; (2) *'Erubin* (mixtures, *i.e.*, ideal union of divided spaces), in ten chapters; (3) *Pesaḥ* (commonly *Pesaḥim*, *i.e.*, Passover), in ten chapters; (4) *Kippurim* (commonly *Yoma*, *i.e.*, "the day" [of atonement]), in eight chapters; (5) *Sheḳalim* (Exod. xxx. 12–15), in eight chapters; (6) *Sukkah* (Lev. xxiii. 34–43), in five chapters; (7) *Betsah* ("an egg," so called from the beginning of the treatise; also *Yom Tob*, *i.e.*, on work prohibited, or permitted, on festivals), in five chapters; (8) *Rosh Hasshanah* (on the various kinds of new year, as religious or civil, the king's accession and coronation, &c.), in four chapters; (9) *Ta'aniyyoth* (fast-days), in four chapters; (10) *Megillah* (reading of the book of Esther, other readings, &c.), in four chapters; (11) *Hagigah* (festival-offerings), in three chapters; (12) *Mashḳin* (so called from the beginning of the treatise, but commonly *Mo'ed Katan*, on work prohibited, or permitted, on the middle holidays of Passover and Tabernacles), in three chapters.

III. Nashim (Women). (1) *Nashim* (so called from the first distinctive word of the treatise, but commonly *Yebamoth*, on sisters-in-law, the levirate, &c.), in sixteen chapters; (2) *Kethuboth* (marriage-pacts, settlements, &c.), in thirteen chapters; (3) *Nedarim* (vows), in eleven chapters; (4) *Nazir* (Num. vi. 2–21), in nine chapters; (5) *Gittin* (bills of divorcement and other bills), in nine chapters; (6) *Kiddushin* (betrothal and marriage), in four chapters; (7) *Sota* (mostly *Sotah*, Num. v. 12–31), in nine chapters.

IV. Neziḳim, commonly *Neziḳin* (Damages, &c.; see Exod. xxi., xxii., &c.). (1) *Neziḳin* (commonly *Bobo Ḳammo*, the Former Gate, in ten chapters; *Bobo Metsi'o*, the Middle Gate, in ten chapters; and *Bobo Bathro*, the Last Gate, in ten chapters[11]), in thirty chapters; (2) *Synhedrin* (courts of justice, &c.), in eleven chapters; (3) *Makkoth* ("forty stripes save one," &c.), in three chapters; (4) *Shebu'oth* (oaths, &c.), in eight chapters; (5) *'Eduyyoth* (testimonies) or *'Idiyyoth* (chiefest or best things[12]), in eight chapters; (6) *'Abodah Zarah* (idolatry), in five chapters; (7) *Aboth* (see Midrash, p. 286), in five chapters; (8) *Horayoth* (judicial errors, teachings, and decisions), in three chapters.

V. Kodoshim (Holy Things). (1) *Zebaḥim*[13] (sacrifices), in fourteen chapters; (2) *Menaḥoth* (meat-offerings), in thirteen chapters; (3) *Sheḥitath Ḥullin* (slaying animals for common food; commonly *Ḥullin*, or common food), in twelve chapters; (4) *Bekhoroth* (the first-born of beast and man), in nine chapters; (5) *'Arakhim*, commonly *Erachin* (on valuations; see Lev. xxvii. 2–33), in nine chapters; (6) *Temurah* (Lev. ix. 10, 33), in seven chapters; (7) *Karethoth*, not *Kerithoth* (sins the punishment of which is excision), in six chapters; (8) *Me'ilah* (Num. v. 6, 7), in six chapters; (9) *Middoth* (description of the temple and its measurements; see Midrash, p. 286), in five chapters; (10) *Tamid* (perpetual or daily sacrifice), in six (commonly arranged in seven) chapters; (11) *Kinnim* (sacrifices of birds), in three chapters.

VI. Tohoroth (Purifications). (1) *Kelim* (impurities of vessels), in thirty chapters; (2) *Oholoth* (Num. xix. 14–16, &c.), in eighteen chapters; (3) *Nega'im* (plague of leprosy in man, house, and garment), in fourteen chapters; (4) *Parah* (Num. xix. 1–19), in twelve chapters; (5) *Tohoroth* (euphemism for impurities), in ten chapters; (6) *Miḳvaoth* (religious baths), in ten chapters; (7) *Niddah* (Lev. xv. 19–33), in ten chapters; (8) *Makhshirim* (liquids

[1] This is a somewhat inexact application of Ps. cxix. 126, but it has been more than once acted upon both in ancient and modern times by the Jews. Compare the explanation given in T. B., *Berakhoth*, 63*a*, and *Menaḥoth*, 99*a*.

[2] *Niddah* is the only *Massekheth* of this *Seder* of which three entire *Peraḳim* are to be found in the printed editions. Compare Schiller-Szinessy, *Occasional Notices*, &c., i. (Cambridge, 1878, 8vo) p. 8.

[3] See T. B., *Bobo Metsi'o*, 44*a*, and elsewhere.

[4] Whether the word *Massekheth* comes from *Masokh* (מָסַךְ, to pour into, to mix, &c.), or from *Nasokh* (נָסַךְ, to pour, to mix, to weave, &c.), it signifies in either case here a mould, a form, a frame. *Massekheth* has three several plurals:—(1) the common *Massekhtoth* (not *Massikhtoth*); (2) the less common *Massekhoth* (see MS. Add. 470. 1, belonging to the University Library of Cambridge, leaf 69*a* and elsewhere); and (3) *Massekhtiyyoth* (מסכתיות), see *Midrash Rabbah* on Canticles vi. 8, 9. The Aramaic *Massekhto* (not *Massikhto*) has in the plural *Massekhotho*, the use of which is, however, very uncommon.

[5] Compare above, p. 503.

[6] Compare *Midrash Rabbah* on Canticles vi. 8, 9.

[7] Others include, instead of a fourth *Pereḳ of Bikkurim*, the *Pereḳ Rabbi Meir*, *i.e.*, the treatise "On the Acquisition of the Law." The original *Mishnah*, however, had neither of these two *Peraḳim*.

[8] *In this scheme the Cambridge MS. of the Mishnah is taken as* the groundwork, while the variations in title, &c., are given from the common texts.

[9] Compare St Paul's words, Eph. v. 20, εὐχαριστοῦντες πάντοτε ὑπὲρ πάντων.

[10] On the apparent anomaly of *Ma'aser Sheni* preceding *Ma'aser Rishon*, see Schiller-Szinessy's *Catalogue of Hebrew MSS. in the Cambridge University Library*, vol. ii. p. 1, note 4.

[11] In the Cambridge MS. Add. 470. 1, *Massekhto Neziḳin* is given correctly as one, containing thirty chapters. Compare T. B., *Bobo Ḳammo*, leaf 102*a*, *'Abodah Zarah*, 7*a*, and *Midrash Shemuel*, v.

[12] See p. 503, note 16.

[13] Also known under *Sheḥitath Ḳodoshim*.

predisposing for the contraction of impurities, Lev. xi. 34), in six chapters; (9) *Zabim* (Lev. xv. 2–33), in five chapters; (10) *Tebul Yom* (Num. xix. 19), in four chapters; (11) *Yadayim* (purification of the hands), in four chapters; (12) *'Okotsin* (stalks, peel, &c., of fruit), in three chapters.

11. *Editions.*—The editions of the *Mishnah*, whether as a book by itself or as contained in the Babylonian Talmud, are too numerous to be mentioned here. The *editio princeps* of the *Mishnah*, as a separate book, appeared (with Maimonides's commentary) at Naples in 1492 (see MAIMONIDES), and that as contained in the Babylonian Talmud at Venice in 1520–23, both in folio. As part of the Palestinian Talmud the *Mishnah* came out also at Venice, in 1523–24, folio. This Talmud, however, being defective, its *Mishnah* naturally is incomplete too (see p. 505); and it is, moreover, "corrected" by the scribe of 1288–89 (see Schiller-Szinessy, *Occasional Notices*, &c., i. pp. 8, 11). The syndics of the University Press of Cambridge have therefore laid the learned public under considerable obligations by publishing for the first time the complete original *Mishnah* on which the Palestinian Talmud rests, from the unique MS. preserved in the University Library.[1]

12. *Translations.*—There exist translations of the *Mishnah* in Latin, German, and English. (1) There is a Latin translation by the brothers Abendana (R. Ya'akob and R. Yitshak). The former was *Haham* (*Hakham, i.e.*, chief rabbi) of the Sepharadim in England, and the latter was teacher of Hebrew and Rabbinic at Cambridge and Oxford successively. Both brothers, correspondents in 1660 of Buxtorf, were fine Hebrew and Latin scholars (see Schiller-Szinessy, "The Abendanas," in *Jewish World* of December 5, 1879). This translation is preserved in the Cambridge University Library MS. Mm. 1. 4–8.[2] (2) The Abendanas' version was before Surenhusius when he compiled, from old and new materials, his Latin translation, which appeared (with the text of the *Mishnah* and the translation also of the commentaries of Maimonides and "Bertinoro") at Amsterdam in 1698–1703, folio. The great indebtedness of Surenhusius to the Abendanas is a fact either unknown to or ignored by the bibliographers.[3] (3) A German translation by Rabe came out in German letters at Onolzbach in 1760–63, 4to. (4) The version last-named was in the possession of the anonymous author of the translation, printed in Rabbinic letters, in the Vienna edition of the *Mishnah* with the commentary *Kaph Nahath*, 1817–35, 8vo. This author (or editor) silently "used" the work of his predecessor. (5) Both these translations were surpassed in German diction, as well as in correctness of rendering, by that which came out in Hebrew square letters at Berlin in 1832–34, 4to, and which, no doubt, belongs to J. M. Jost the historian. (6) The English translation which came out at London in 1843, 8vo, by De Sola and Raphael, extends only over eighteen treatises.

13. *Commentaries.*—The commentaries on the *Mishnah* are almost as numerous as the editions, and cannot therefore be specially enumerated here. The principal and the oldest, however, are the following. (1) The two Talmuds themselves, of which, at present,[4] the Babylonian is the only (and that but comparatively) perfect one, or at all events the more extensive of the two. It ought, however, to be stated, first, that the Palestinian Talmud has *Gemara* on the whole order *Zera'im*, whilst the Babylonian has it on the first "treatise" only of that order (*Berakhoth*), and, secondly, that the *Gemarath Shekalim* in the Babylonian Talmud is only borrowed from the Palestinian Talmud. (2) The commentaries on *Zera'im*, *Tohoroth*, &c., by Rabbenu Hai Gaon, who was the last, most learned, and in every way noblest of the Geonim.[5] He flourished in the 10th and 11th centuries. Part of the commentaries (viz., that on *Tohoroth*) has appeared in the collection *Kobets Ma'ase Yede Geonim*, &c. (Berlin, 1856, 8vo). (3) The commentary on various treatises of the B. Talmud, and indirectly on the *Mishnah*, by Rabbenu Gershom Meor Haggolah (the "Light of the *Diaspora*,"[6] flourished in the 10th and 11th centuries). Fragments of this commentary are incorporated in the ordinary Talmud editions (*e.g.*, *Nedarim*, 22*b*, &c.), but the greater part lies as yet in manuscript in various libraries. (4) The commentary of Rabbenu Hananeel, who lived at Kairawan (in Africa) in the 10th and 11th centuries. His commentary on the Talmud, and thus indirectly on the *Mishnah*, is now being published in the Vilna edition of the Babylonian Talmud.[7] (5) The commentary of Rashi (*ob.* 1105) in all those parts of the B. Talmud on which that "prince of commentators" wrote. Here ought to be mentioned also the separate *editio princeps* of this commentary as far as the *Mishnah* is concerned, which appeared at Leghorn in 1653–54, 8vo. (6) The supplements and additions to the commentary of Rashi by his son-in-law Rabbenu Yehudah b. Nathan (*e.g.*, T. B., *Makkoth*, 19*b*, &c.), and by his grandsons Rabbenu Shemuel b. Meir (*vulgo* Rashbam; see *Pesahim*, 99*b*, and *Bobo Bathro*, 29*a*, &c.) and Rabbenu Shema'yah b. Simhah of Vitri,[8] who interpreted the *Massekheth Middoth* before Rashi, his grandfather (see Schiller-Szinessy, *Catalogue of the Hebrew MSS.* preserved in the University Library of Cambridge, ii. p. 89). (7) The commentary on the whole *Mishnah* by MAIMONIDES (*q.v.*). (8) The commentary by R. Abraham b. David of Posquières (*vulgo* Rabad) on *'Eduyyoth* (see editions of the B. Talmud), *Kinnim* (with two other commentaries by Rabbenu Zerahyah Hallevi and R. Asher b. Yehiel, Constantinople, 1751, folio), and on many other *Mishnaiyyoth* of the orders *Zera'im* and *Tohoroth* (in his "strictures" on Maimonides, *Mishnah Torah*, books *Zera'im* and *Tohorah*). (9) The commentary of R. Shimshon of Sens (who, like the foregoing, was a contemporary and opponent of Maimonides) on the orders of *Zera'im* (with supplements taken from the works of the somewhat older R. Yitshak b. Malkitsedek) and *Tohoroth*.[9] (10) The commentary by R. Meir of Rothenburg (the celebrated captive of Rudolph of Hapsburg); see under (13) below. (11) The commentary by R. Asher b. Yehiel (a disciple of the foregoing, who died at Toledo in 1327) on twenty-one treatises of the orders i. and vi. (12) The commentary on the whole *Mishnah*, by Rabbenu 'Obadyah di Bertinoro (flourished in the 15th and 16th centuries), the editions of which are very numerous. (13) The commentary on the whole *Mishnah*, by R. Yomtob Lipmann Heller (flourished in 16th and 17th centuries). This famous teacher, rabbi in some of the greatest congregations of the Jews (Prague, Vladimir, and Cracow), incorporated much of the commentary of R. Meir of Rothenburg; compare under (10).

Mathnitho.

14. *Works Subsidiary and Auxiliary to the Mishnah.*—These may be summed up under the word *Mathnitho*. *Mathnitho* is ostensibly the Aramaic equivalent of the Hebrew *Mishnah*; in reality, however, it signifies and comprises, not merely everything which is understood under that name, but also *Boraitho* (in full, *Mathnitho Boraitho*), *i.e.*, four other works of the oral law, and many literary notices of Mishnic and pre-Mishnic times besides, which are scattered throughout the Talmuds and other early Rabbinic works.

Tosephto.

The first of these is *Tosephto*. As its name indicates, *Tosephto* is "Addition," *i.e.*, to the canonical *Mishnah*. All *Mishnah* teachers from time immemorial, notably R. 'Akibah and R. Yehudah Hannasi, left out, when they taught *Mishnah*, a large mass of kindred and explanatory matter, which they only occasionally and supplementarily mentioned, *i.e.*, when absolutely wanted. The chief collection of this additional matter, not incorporated in the system of the canonical *Mishnah*, is called *Tosephth* in Hebrew and *Tosephto* (or *Tosiphta* as some less correctly write it) in Aramaic. The Aramaic singular and the Hebrew plural occur already in the Talmuds and *Midrashim*.[10] *Tosephto* shares with the *Mishnah*, which it enlarges and explains, the number of orders and treatises, but not that of chapters, of which it has only 452. The oldest collection of Tosephtic matter, even as the oldest collection of Mishnic matter, is due to R. 'Akibah. But, whilst

---

[1] See Mr W. H. Lowe's able edition of this grand work (*The Mishnah on which the Palestinian Talmud rests*, Cambridge, 1883, 8vo).

[2] According to Picciotto (*Sketches of Anglo-Jewish History*, London, 1875, 8vo, p. 55), R. Yitshak Abendana translated the *Mishnah* and its commentaries (Maimonides and "Bertinoro"?) also into Spanish.

[3] Surenhusius was also aided in his grand work by the books and notes of Guisius (in *Berakhoth*, *Peah*, *Demai*, *Kil'ayim*, *Shebi'ith*, *Terumoth*, and *Ma'aseroth*, i.–iii. 3), Schmid (in *Shabbath* and *'Erubin*), Houting (*Rosh Hasshanah*), Lund (*Ta'anith*), Otho (*Shekalim*), Wagenseil (*Sotah*), Cocceius (*Makkoth*), Fagius (*Aboth*), Arnoldi (*Tamid*), L'Empereur (*Middoth*), and Ulmann (*Zebahim* and *Karethoth*). But without the Abendanas Surenhusius could never have commenced, much less executed, the great task he had before him.

[4] For the probability that the missing parts of the Palestinian Talmud will one day come to light somewhere in the East, see Schiller-Szinessy in the *Academy*, February 23, 1878; *He-Chaluz*, xi.; and Steinschneider, *Handschriften-Verzeichnisse der königlichen Bibliothek zu Berlin*, ii., &c. (1878, 4to), p. 65, where a passage of Palestinian *Gemara* of *'Okotsin* is actually quoted.

[5] He was also a poet of no mean standing. See his *Musar Haskel* (or *Hassekhel*), *ed. princ.* Fano, 1505 (?), 4to.

[6] In the synod called together by Rabbenu Gershom, among several "ordinances" was also one that no Jew is allowed to marry more than one wife.

[7] His commentary on *Pesahim* appeared at Paris in 1868, and that on *Makkoth* at Leipsic in 1876, both in 8vo.

[8] These writers (together with Rabbenu Meir another son-in-law and Rabbenu Ya'akob another grandson of Rashi) are the first of the so-called Tosaphists, whose activity continued down to the early part of the 14th century.

[9] Whether the commentary on *Tamid* printed under his name, together with that of R. Asher b. Yehiel on the same treatise (Prague, 1725, 4to), is really his is still matter of dispute.

[10] See T. Y., *Shabbath*, viii. 1, &c.; T. B., *Synhedrin*, 86*a* and elsewhere; *Midrash Rabbah* on Ecclesiastes v. 8, &c. There can be little doubt that in some places the word תוספתא ought to be transliterated *Tosephotho* (*i.e.*, as plural).

the *Mishnah*, as a work, was first sifted by his disciple R. Meir, *Tosephto*, as a work, was first sifted by another disciple R. Nehemyah; and just as R. Meir's *Mishnah* was sifted again by *Rabbi* and others after him, and was not written down before the 6th century, so *Tosephto* was sifted again by R. Ḥiyya, R. Hosha'yah, and others, and was not written down in its entirety before the 6th century. It is no wonder, then, that it now contains matter of a considerably later age. *Tosephto* is not merely of great help for understanding the *Mishnah*, which is, in a certain sense, incomplete without it, but for the precise and exact knowledge of Jewish archæology and other sciences, and in its Agadic parts, of which there are many, for the Greek Scriptures also. Here ought also to be mentioned *Aboth de-Rabbi Nathan*, which is, no doubt, *Tosephto* to the *Mishnah* of *Aboth*. *Tosephto* used to be printed till within the last forty years [1] as an appendix to the *Riph*, *i.e.*, the *Hilekhoth Rab Alphes* (a compendium of the Talmud by R. Yitsḥak b. Ya'akob Al-Phesi, or Al-Phasi, *i.e.*, of Fez, *ob.* 1103), which appeared first with this appendix at Venice, 1521–22, folio. Here, however, it was not edited critically or printed with even ordinary care. But in the Vienna edition of the Babylonian Talmud (1860–72) it came out, for the first time, worthily after a MS. till then uncollated which is preserved in the Court Library. Dr Zuckermandel has since published it from the Erfurt and Vienna MSS., with collations.[2] A Latin translation of *Tosephto* (with the Hebrew text) is to be found, under the name of *Tosaphta*, in Blasius Ugolinus's *Thesaurus Antiquitatum Sacrarum* (xvii.–xx.). It comprises, however, only the orders *Zera'im*, *Mo'ed*, and *Ḳodoshim*, and came out at Venice in the years 1755–57, folio.

hilto. The second of these pieces of literature is *Mekhilto*. This word is the Aramaic equivalent of the Hebrew *Middah* (measure), and hence signifies mould, form, *i.e.*, of Scriptural exegesis, notably of part or parts of the Pentateuch. As such it might, of course, stand for any kind of commentary on any book of the Pentateuch, and have been composed by any one. And we find, indeed, that *Mekhilto* signified at one time a commentary on the books Exodus, Leviticus, Numbers, and Deuteronomy, either by R. Yishma'el or by R. 'Akibah,[3] at another time a commentary on Exodus, by R. Shime'on b. Yoḥai,[4] and at another time again a commentary on the last four books of Moses, by (Shime'on) Ben 'Azzai.[5] *Mekhilto* now, however, means a commentary on the greater part of Exodus, ascribed to R. Yishma'el (flourished in the 1st century); although, in reality, this teacher cannot have been the author of the book, seeing that his name is more than seventy times mentioned in it. The reason why the ancients called the book by his name is, no doubt, because the first words of the real work are *Amar Rabbi Yishma'el*. Like the other works of the "oral law," *Mekhilto* was not written down before the 6th century, a fact which accounts also, in part at least, for the loss of several portions of this commentary, which, at present, only extends from xii. 1 to xxv. 3, with several gaps between. That *Mekhilto* was once fuller than it is now we know, not only from a statement made by Maimonides and others, but from a MS. (Add. 394. 1, in the University Library of Cambridge, leaf 40*b*), where an extract is given by a Franco-German author of the 12th or 13th century. The Talmud knows the name *Mekhilto*, and actually quotes *Boraithoth* (non-canonical *Mishniyyoth*) which are to be found in our book; and yet the existing *Mekhilto* can scarcely have been known to the teachers of the Talmud. *Mekhilto* is by some called *Midrash* and by others *Mishnah*; both names are in a certain sense correct. It is *Midrash* in substance, inasmuch as it contains exegesis, and in form, inasmuch as it is subdivided into *Parshiyyoth* and follows the order of the Scriptural verses. But it is *Mishnah* in substance, inasmuch as it not only deals with the groundwork of the *Mishnah*, but consists of *Boraithoth* (non-canonical *Mishniyyoth*), and in form, inasmuch as it is, like the canonical *Mishnah*, divided into *Massekhtoth*. These latter are nine in number, and are called respectively (1) *Dephisha* (with 18 *Parshiyyoth* and 1 *Pethihto* or introduction), (2) *Beshallaḥ* (with 6 *Parshiyyoth* and 1 *Pethiḥto*), (3) *Deshiretha* (with 10 *Parshiyyoth*), (4) *Vayyassa'* (with 6 *Parshiyyoth*), (5) *'Amaleḳ* (with 2 *Parshiyyoth*), (6) *Yithro* (with 2 *Parshiyyoth*), (7) *Baḥodesh* (with 11 *Parshiyyoth*), (8) *Neziḳin* and *Kaspo* (with 20 *Parshiyyoth*), and (9) *Shabbetho* (with 2 *Parshiyyoth*—1 in the pericope *Ki thissa* and 1 in that of *Vayyaḳhel*). *Mekhilto* was published first at Constantinople in 1515, under the name of *Sepher Hammekhilto*, and in 1545 at Venice as *Midrash Hammekhilto*. In 1712 it appeared at Amsterdam with a commentary. In 1744 it appeared again at Venice with a Latin translation by Blasius Ugolinus (*Thes. Antiq. Sacr.*, xiv.). In 1801 it appeared at Leghorn with a different commentary. In 1844 it came out at Vilna with a new commentary. All these are in folio. The best and cheapest editions with commentaries are those by Weiss (1865) and Friedmann (1870), both printed at Vienna, and in 8vo.

The third of these pieces of literature is *Siphro*. Both Leviticus itself, because it is the most difficult of all Mosaic books, and the oldest Rabbinic commentary on it, because it is the most difficult of all commentaries on the Scriptures, have been from time immemorial known under the name of *Siphro* (*i.e.*, *the* Book).[6] This book and this commentary are also called *Torath Kohanim*, and the former is spoken of in the Talmud already as *Siphro debe Rab*.[7] This latter expression has led many great men (among others Maimonides)[8] to ascribe the authorship of this commentary to Rab (Abba Arikho, a nephew and disciple of R. Ḥiyya). But such a view is erroneous in the extreme, as the book is, so far as form and substance go, both older and later than Rab, paradoxical as this statement may appear. It is older in its origin and in its matter, for not merely do all the anonymous *Boraithoth* which are to be found in it belong to R. Yehudah b. Il'ai, a teacher of the 1st century, but one of the sons of Rabbi (of the 2d century) had actually taught another rabbi two-thirds of a third, *i.e.*, two-ninths, of this work.[9] It is later than Rab, for in it are found one "authority" and several "results" of much later date than that of this great Babylonian teacher.[10] The fact is, the word *Rab* in the phrase *Siphro debe Rab* is not a proper name at all, but simply stands for "teacher," and *debe Rab* thus signifies "of a school," a term used for any teacher and any school of any time. Although most of the *Boraithoth* which it contains are as old as the 1st century, this book as such cannot have been written down earlier than the 6th, in accordance with the treatment, in this respect, of all the other Halakhic works of the "oral law." *Siphro*, although it bears on the pericopes and verses of Leviticus, and is on account of this fact by many called a *Midrash*, is in reality *Mishnah*,[11]—a name borne out by the nature of its contents, which are mostly Mishnic, and sometimes represent actual canonical *Mishniyyoth*. *Siphro* exhibits a curious conglomeration of matter. It opens with the "Rules of the Interpretation of Scripture," ascribed to R. Yishma'el,—a *Boraitho* which, although important in itself, is not more important for this than for any other commentary on the Pentateuch. And this conglomerate nature shows itself even more strikingly in form; for *Siphro* contains as forms of division *Dibburim*, *Mekhilto*, *Parshiyyoth* (some of which mean pericopes, whilst others mean chapters), *Peraḳim*, and *Pisḳoth*. All this points, of course, to various divisions of the book made at various times. Whilst none of these divisions can be later than the 12th century,[12] the earliest is at least as old as the 2d, and belongs perhaps to the 1st.[13] *Siphro* is chiefly of importance for the understanding of the *Mishnah* of the orders *Ḳodoshim* and *Tohoroth* (which were, no doubt, the earliest *Mishniyyoth* put into "order"); but, whilst it is a sure help for the *Mishnah*, the *Mishnah* is no sure help for it: *Siphro* is a genuine specimen of the "oral law," inasmuch as it cannot be mastered without a teacher. Owing to the difficulty of understanding it, *Siphro* has not been often studied, and consequently not often printed. The *editio princeps* is of 1545; the second edition with the commentary *Ḳorban Aharon* is of 1609–11, both at Venice. The third edition with the just-named commentary is of 1702, and came out at Dessau. The fourth edition, with a Latin translation, is to be found in Blasius Ugolinus's *Thesaurus Antiquitatum Sacrarum*, &c., Venice, 1744 (vol. xiv.). All these are in folio. The fifth edition, with the commentary *'Azarath Ḳohanim* (vol. i.), appeared at Vilna, 1845, 4to. The sixth edition, with the commentary *'Asirith Haephah*, appeared at Lemberg, 1848, folio. The seventh edition, with the commentary *Hattorah Vehам-Mitsvah*, appeared at Bucharest, 1860, 4to. The eighth edition, with the commentary of R. Abraham b. David of Posquières, &c., appeared at Vienna, 1862; and the ninth edition, with the commentary by R. Shimshon of Sens, appeared at Warsaw, 1866, both in folio. Siphro.

The fourth of these pieces of literature is *Siphere*. *Siphere*, or *Siphere debe Rab*, which in earlier times certainly included the oldest Rabbinic commentaries on Exodus, Numbers, and Deuteronomy (and perhaps also that on Leviticus), means now the oldest Rabbinic commentary on the last two books of Moses only. Siphere.

[1] That on the order *Zera'im* came out at Vilna in 1799, 4to; but in its entirety it came only out between 1837, 1841, and 1871, folio.

[2] Issued at Pasewalk and Treves from 1877 to 1882, 8vo.

[3] See Maimonides's preface to the *Mishneh Torah*.

[4] See Naḥmanides's commentary on the Pentateuch (on Gen. xlix. 31).

[5] See *Yuḥasin Hasshalem* (ed. Filipowski, London and Edinburgh, 1857. 8vo), p. 30, col. 2.

[6] See T. B., *Berakhoth*, 18*b*, and Rashi, *in loco*. The *Siphro* said here to have been studied by Benaiah the son of Jehoiada may well have been our Leviticus, though of course it cannot have been the *Siphro* with which we are here concerned.

[7] *Ibid.*

[8] Preface to *Mishneh Torah*.

[9] See T. B., *Ḳiddushin*, 33*a*.

[10] See the pericope *Ḳedoshim*, vi.

[11] Its original founder (R. Yehudah b. Il'ai) identifies *Mishnah* and *Midrash*, T. B., *Ḳiddushin*, 49*a*.

[12] They were known to R. Abraham b. David (Rabad).

[13] T. B., *Ḳiddushin*, 33*a*.

Both books are divided into *Piskoth* (paragraphs), of which *Siphere* on Numbers has 161, whilst that on Deuteronomy has 357. The ancient division into *Boraithoth* cannot now be accurately traced. The work commences now at Numbers v. 1, and goes to the end of Deuteronomy. The passages anonymously given in *Siphere* are ascribed by the Babylonian Talmud[1] to R. Shime'on b. Yohai, the favourite disciple of R. 'Akibah, and the reputed author of the *Zohar*. But although he is no doubt the virtual author of *Siphere*, seeing that most *Boraithoth* which are to be found therein are his, he cannot be, technically speaking, its author. For, in the first place, he is not only repeatedly named in the book, but several times actually contradicted by others; and, secondly, there are several passages, anonymously given, in the book, which can only be the result of "Talmudic" study, and must be consequently posterior to the composition of the Talmud. The fact is that *Siphere*, like the other works of the "oral law," was not written down before the 6th century. It ought to be mentioned here that the rabbis of the 11th, 12th, and 13th centuries, and even somewhat later, speak also of another *Siphere* which they variously designate as *Siphere Panim Sheni*, *Siphere shel Panim Sheni*, *Siphere Bemidbar Sinai*, *Siphere Zutta*, and *Siphere* simply. To judge from the extracts which have come down to us, that work must not only have been of much later date, but also of far less value than the work in our hands. *Siphere* appeared for the first time in 1545, and with a Latin translation by Blasius Ugolinus, in his *Thesaurus*, &c. (vol. xv.), in 1744,—both at Venice, and in folio. The third edition appeared at Hamburg in 1789, and the fourth at Sulzbach in 1802, both in 4to. The fifth edition, with the commentary *Zera' Abraham*, appeared in two volumes, of which the first was printed at Dyhernfurt in 1811 and the second at Radawell in 1820, both in folio. The sixth and best edition is that of Friedmann (Vienna, 1864), and the seventh is that of Lemberg, 1866, both in 8vo.

Boraitho. There is also a fifth piece of Mishnic literature known specially by the name *Boraitho*. Besides the *Boraithoth* constituting *Tosephto*, *Mekhilto*, *Siphro*, and *Siphere*, there are hundreds of other *Boraithoth* to be found scattered about in both Talmuds. These are, however, mere fragments of the vast *Mishnayoth* (entire Mishnic works[2]) composed by Bar Kappara, Rabbi Hiyya, and hundreds of other teachers, which in course of time must have perished. There is, however, enough left of the *Mishnah*, canonical and non-canonical, to prove the correctness of the cabbalistic remark that *Mishnah* is the equivalent of *Neshamah* (soul). This is no mere trifling based on the fact that the two words (משנה, נשמה) accidentally consist of the same letters; it is rather an enunciation of an intrinsic truth: what the soul (*Neshamah*) is to the body, the *Mishnah* is to Mosaism. The soul gives life to the body, and the *Mishnah* gives life to the Pentateuch. For the letter killeth, but the spirit giveth life! (S. M. S.-S.)

MISKOLCZ, capital of the Cis-Tisian county of Borsod, Hungary (48° 6′ N. lat., 20° 49′ E. long.), is picturesquely situated in a valley watered by the Szinva, 90 miles northeast from Budapest, with which, as also with Debreczen and Kássa (Kaschau), it is directly connected by railway. Miskolcz is one of the most thriving provincial towns in the kingdom, and has many fine buildings, including Roman Catholic, Greek Catholic, Lutheran, and Calvinist churches and schools, a Minorite convent, synagogue, Hungarian theatre, hospital, royal and circuit courts of law, salt and tax offices, and the administrative bureaus for the county. There are manufactories of snuff, porcelain, boots and shoes, and prepared leather, and both steam and water mills. The trade is chiefly in grain, wheaten flour, wine, fruit, cattle, hides, honey, wax, and the agricultural products of the neighbourhood. The great fairs, held five times a year, are much resorted to by strangers from a distance. Not far from the town are stone quarries and iron mines. At the end of 1880 the (civil) population amounted to 24,343, of whom the majority were Magyars by nationality.

During the 16th and 17th centuries Miskolcz suffered much from the desolating hordes of Ottomans who then ravaged the country, as also from the troops of various Transylvanian princes and leaders, especially those of George Rákóczy and Emeric Tökölyi. In 1781, 1843, and 1847 it was devastated by fire, and on the 30th August 1878 a great portion of the town was laid in ruins by a terrific storm. (See HUNGARY, vol. xii. p. 374.)

MISREPRESENTATION. See FRAUD.

[1] *Synhedrin*, 86*a*.

[2] According to T. B., *Hagigah*, 14*a*, there existed at one time no less than six or seven hundred *Mishnah* orders.

MISSAL,[3] the book containing the liturgy, or office of the mass, of the Latin Church. This name (*e.g.*, Missale Gothicum, Francorum, Gallicanum Vetus) began to supersede the older word *Sacramentary* (Sacramentarium, Liber Sacramentorum) from about the middle of the 8th century. At that period the books so designated contained merely the fixed canon of the mass or consecration prayer (actionem, precem canonicam, canonem actionis), and the variable collects, secretæ or orationes super oblata, prefaces, and post-communions for each fast, vigil, festival, or feria, of the ecclesiastical year; for a due celebration of the Eucharist they required accordingly to be supplemented by other books, such as the *Antiphonarium*, afterwards called the *Graduale*, containing the proper antiphons (introits), responsories (graduals), tracts, sequences, offertories, communions, and other portions of the communion service designed to be sung by the schola or choir, and the *Lectionarium* (or *Epistolarium* and *Evangelistarium*) with the proper lessons. Afterwards missals began to be prepared containing more or less fully the antiphons and lessons as well as the prayers proper to the various days, and these were called *missalia plenaria*. All modern missals are of this last description. The *Missale Romanum ex decreto SS. Concilii Tridentini restitutum*, now in almost exclusive use throughout all the churches of the Latin obedience, owes its present form to the council of Trent, which among its other tasks undertook the preparation of a correct and uniform liturgy, and entrusted the work to a committee of its members. This committee had not completed its labours when the council rose, but the pope was instructed to receive its report when ready and to act upon it. The "reformed missal" accordingly was promulgated by Pius V. on July 14, 1570, and its universal use enjoined on all branches of the Catholic Church, the only exceptions allowed being in the case of churches having local and independent liturgies which had been kept in unbroken use for at least two centuries.[4] It has subsequently undergone slight revisions under Clement VIII. (1604) and Urban VIII. (1634); and various new masses, both obligatory and permissive, universal and local, have been added by the competent authority. Although the Roman is very much larger in bulk than any other liturgy, it need hardly be explained that the communion office to which it relates is not in itself inordinately long. By much the greater part of it is contained in the "ordinary" and "canon" of the mass, usually placed about the middle of the missal, and occupies, though in large type, only a few pages in any printed copy. The work owes its bulk and complexity to two circumstances. On the one hand, in the celebration of the sacrifice of the mass practically nothing is left to the impulse or discretion of the officiating priest; everything—what he is to say, the tone and gestures with which he is to say it, the cut and colour of the robe he is to wear—is carefully prescribed either in the general rubrics prefixed to the text, or in the running rubrics which accompany it.[5] On the other hand, the Roman, like all the Western liturgies, is distinguished

[3] *Missalis* (sc., *liber*), *Missale*, from *Missa*; see vol. viii. p. 652.

[4] The English missal consequently continued to be used by English Catholics until towards the end of the 17th century, when it was superseded by the Roman through Jesuit influence. The Gallican liturgy held its ground until much more recently, but has now succumbed under the Ultramontanism of the bishops.

[5] In all the older liturgies the comparative absence of rubrics is conspicuous and sometimes perplexing. It is very noticeable in the Roman *Sacramentaries*, but the want is to some extent supplied by the very detailed directions for a high pontifical mass in the various texts of the *Ordo Romanus* mentioned below. That there was no absolutely fixed set of rubrics in use in France during the 8th century is shown by the fact that each priest was required to write out an account of his own practice ("libellum ordinis") and present it for approbation to the bishop in Lent (see Baluze, *Cap. Reg. Franc.*, i. 824, quoted in Smith's *Dict. of Chr. Antiq.*, ii. 1521).

from those of the Eastern Church by its flexibility. Partly by conscious effort, no doubt, but partly also by happy accident, a well-marked distinctive character has been given in one or all of the above-mentioned respects to the office for each ecclesiastical season, for each fast or festival of the year, almost for each day of the week; and provision has also been made of a suitable communion service for many of the special and extraordinary occasions both of public and of private life. This richness of variety is seen not only in the collects but also in the lessons and antiphonal parts of the service, passages of Scripture in the selection and collocation of which an exquisite delicacy of religious and æsthetic instinct has been for the most part strikingly shown.

The different parts of the Roman communion office are not all of the same antiquity. Its essential and characteristic features are most easily caught, and their rationale best understood, by reference to the earliest *Sacramentaries* (particularly the Gregorian, which was avowedly the basis of the labours of the Tridentine committee), to the Gregorian *Antiphonary*, and to the oldest redaction of the *Ordo Romanus*.[1] The account of the mass (qualiter Missa Romana celebratur) as given by the *Sacramentarium Gregorianum* is to the effect that there is in the first place "the *Introit* according to the time, whether for a festival or for a common day; thereafter *Kyrie Eleison*. (In addition to this *Gloria in Excelsis Deo* is said if a bishop be [the celebrant], though only on Sundays and festivals; but a priest is by no means to say it, except only at Eastertide. When there is a litany (quando letania agitur) neither *Gloria in Excelsis* nor *Alleluia* is sung.) Afterwards the *Oratio* is said, whereupon follows the *Apostolus*, also the *Gradual* and *Alleluia*. Afterwards the *Gospel* is read. Then comes the *Offertorium*,[2] and the *Oratio super oblata* is said." Then follow the *Sursum Corda*, the *Preface*, *Canon*, Lord's Prayer and "embolism" (ἐμβόλισμα or insertion, *Libera nos, Domine*), given at full length precisely as they still occur in the Roman missal.

In every liturgy of all the five groups a passage similar to this occurs, beginning with *Sursum Corda*, followed by a *Preface* and the recitation of the *Sanctus* or Angelic Hymn. The "canon" or consecration prayer, which in all of them comes immediately after, invariably contains our Lord's words of institution, and (except in the Nestorian liturgy) concludes with the Lord's Prayer and "embolism." But within this framework there are certain differences of arrangement, furnishing marks by which the various groups of liturgies can be classified (see vol. xiv. p. 709 *sq.*). Thus it is distinctive of the liturgy of Jerusalem that the "great intercession" for the quick and the dead follows the words of institution and an Epiklesis (ἐπίκλησις τοῦ πνεύματος ἁγίου) or petition for the descent of the Holy Spirit upon the gifts; in the Alexandrian the "great intercession" has its place in the *Preface*; in the East Syrian it comes between the words of restitution and the Epiklesis; in the Ephesine it comes before the *Preface*; while in the Roman it is divided into two, the commemoration of the living being before, and that of the dead after, the words of institution. Other distinctive features of the Roman liturgy are (1) the position of the "Pax" after the consecration, and not as in all the other liturgies at a very early stage of the service, before the *Preface* even; and (2) the absence of the Epiklesis common to all the others.[3]

[1] For the genealogical relationships of the Roman with other liturgies, the reader is referred to the article LITURGY (vol. xiv. 706 *sq.*), where some account is also given of the three *Sacramentaries*. For the doctrines involved in the "sacrifice of the mass," see EUCHARIST, vol. viii. p. 650 *sq.*

[2] Some editions do not mention the Offertory here.

[3] This was one of the points discussed at the council of Florence, and Cardinal Bessarion for a time succeeded in persuading the Greeks to give up the Epiklesis.

The words of its "canonical prayer" are of unknown antiquity; they are found in the extant manuscripts of the *Sacramentarium Gelasianum*, and were already old and of forgotten authorship in the time of Gregory the Great, who, in a letter to John, bishop of Syracuse (*Registr. Epist.*, vii. 64), speaks of it as "the prayer composed by a 'scholastic'" (precem quam scholasticus composuerat). The same letter is interesting as containing Gregory's defence, on the ground of ancient use, of certain parts of the Roman ritual to which the bishop of Syracuse had taken exception as merely borrowed from Constantinople. Thus we learn that, while at Constantinople the *Kyrie Eleison* was said by all simultaneously, it was the Roman custom for the clergy to repeat the words first and for the people to respond, *Christe Eleison* being also repeated an equal number of times. Again, the Lord's Prayer was said immediately after the consecration aloud by all the people among the Greeks, but at Rome by the priest alone.

The somewhat meagre and imperfect liturgical details furnished by the *Sacramentarium Gregorianum* are supplemented in a very full and interesting manner by the successive texts of the *Ordo Romanus*, the first of which dates from about the year 730. The ritual they enjoin is that for a pontifical high mass in Rome itself; but the differences to be observed by a priest "quando in statione facit missas" are comparatively slight. Subjoined is a précis of *Ordo Romanus I.*

It is first of all explained that Rome has seven ecclesiastical regions, each with its proper deacons, subdeacons, and acolytes. Each region has its own day of the week for high ecclesiastical functions, which are celebrated by each in rotation. [This accounts for the Statio ad S. Mariam Majorem, ad S. Crucem in Jerusalem, ad S. Petrum, &c., prefixed to most of the masses in the *Gregorian Sacramentary*, and still retained in the "Proprium de Tempore" of the Roman missal.] The regulations for the assembling and marshalling of the procession by which the pontiff is met and then escorted to the appointed station are minutely given, as well as for the adjustment of his vestments "ut bene sedeant," when the sacristy has been reached. He does not leave the sacristy until the *Introit* has been begun by the choir in the church. Before the *Gloria* he takes his stand at the altar, and after the *Kyrie Eleison* has been sung (the number of times is left to his discretion) he begins the *Gloria in Excelsis*, which is taken up by the choir. During the singing he faces eastward; at its close he turns round for a moment to say "Pax vobis," and forthwith proceeds to the *Oratio*.[4] This finished, all seat themselves in order while the subdeacon ascends the ambo and reads [the *Epistle*]. After he has done, the cantor with his book (cantatorio) ascends and gives out the response (*Responsum*) with the *Alleluia* and *Tractus* in addition if the season calls for either. The deacon then silently kisses the feet of the pontiff and receives his blessing in the words "Dominus sit in corde tuo et in labiis tuis." Preceded by acolytes with lighted candles and subdeacons burning incense, he ascends the ambo, where he reads the *Gospel*. At the close, with the words "Pax tibi" and "Dominus vobiscum," the pontiff,[5] after another *Oratio*, descends to the "senatorium" accompanied by certain of the inferior clergy, and receives in order the oblations of the rulers (oblationes principum), the archdeacon who follows taking their "amulas" of wine and pouring them into a larger vessel; similar offerings are received from the other ranks and classes present, including the women. This concluded, the pontiff and archdeacon wash their hands, the offerings being meanwhile arranged by the subdeacons on the altar, and water, supplied by the leader of the choir (archiparaphonista), being mingled with the wine. During this ceremony the schola have been engaged in singing the *Offertorium*; when all is ready the pontiff signs to them to stop, and enters upon the *Preface*, the subdeacons giving the responses. At the Angelic Hymn (*Sanctus*) all kneel and continue kneeling, except the pontiff, who rises alone and begins the *Canon*. At the words "per quem hæc omnia" the archdeacon lifts the cup with the oblates, and at "Pax Domini sit semper vobiscum" he gives the peace to the clergy in their order, and to the laity. The pontiff then breaks off a particle from the consecrated bread and lays it upon the altar; the rest he places on the paten held by the deacon. It is then distributed while *Agnus Dei* is sung. The pontiff in communicating puts the particle into the cup, saying, "Fiat commixtio et consecratio corporis et sanguinis Domini nostri Jesu Christi accipientibus nobis in vitam æternam." Those present communicate in their order under this species also.

[4] Quam collectam dicunt, *Ord. Rom. II.*

[5] After singing "Credo in unum Deum," *Ord. Rom. II.*

As the pontiff descends into the senatorium to give the communion, the schola begins the communion *Antiphon*, and continues singing the *Psalm* until, all the people having communicated, they receive the sign to begin the *Gloria*, after which, the verse having been again repeated, they stop. The celebrant, then, facing eastward, offers the *Oratio ad Complendum*, which being finished the archdeacon says to the people, "Ite, missa est," they responding with "Deo gratias."

To complete our idea of the Roman communion office as it was prior to the end of the 8th century we must now turn to the Gregorian *Antiphonarius sive Gradualis Liber ordinatus per circulum anni*, which as its name implies contains those variable portions of the mass which were intended to be sung by the schola or choir. It gives for each day for which a proper mass is provided—(1) the *Antiphona* (Antiphona ad Introitum) and *Psalmus*; (2) the *Responsorium* and *Versus*, with its *Alleluia* and *Versus*; (3) the *Offertorium* and *Versus*; (4) the *Communio* and *Psalmus*. Some explanation of each of these terms is necessary. (1) The word *Antiphon* (ἀντίφωνον, Old English *Antefn*, English *Anthem*) in its ecclesiastical use has reference to the very ancient practice of relieving the voices of the singers by dividing the work between alternate choirs. In one of its most usual meanings it has the special signification of a sentence (usually scriptural) constantly sung by one choir between the verses of a psalm or hymn sung by another. According to the Roman liturgiologists it was Pope Celestine who enjoined that the Psalms of David should be sung (in rotation, one presumes) antiphonally before mass; in process of time the antiphon came to be sung at the beginning and end only, and the psalm itself was reduced to a single verse. In the days of Gregory the Great the introit appears to have been sung precisely as at present,—that is to say, after the antiphon (proper and *par excellence*), the *Psalmus* with its *Gloria*, then the antiphon again. (2) The *Responsorium*, like the Greek antiphon, derives its name from the responsive manner of singing. As introduced between the epistle and gospel it was probably at first a comparatively long passage, usually an entire psalm or canticle, originally given out by the cantor from the steps from which the epistle had been read (hence the later name *Graduale*), the response being taken up by the whole choir. (3) The *Offertorium* and *Communio* correspond to the "hymn from the book of Psalms" mentioned by early authorities (see, for example, Augustine, *Retr.*, ii. 11; *Ap. Const.*, viii. 13) as sung before the oblation and also while that which had been offered was being distributed to the people. A very intimate connexion between these four parts of the choral service can generally be observed; thus, taking the first Sunday in the ecclesiastical year, we find both in the *Antiphonary* and in the modern *Missal* that the antiphon is Ps. xxv. 1–3, the psalmus Ps. xxv. 4, the responsorium (graduale) and versus Ps. xxv. 3 and xxv. 4, the offertorium and versus Ps. xxv. 1–3 and Ps. xxv. 5. The communio is Ps. lxxxv. 12, one of the verses of the responsorium being Ps. lxxxv. 7. In the selection of the introits there are also traces of a certain rotation of the psalms in the Psalter having been observed.

The first pages of the modern Roman missal are occupied with the *Calendar* and a variety of explanations relating to the year and its parts, and the manner of determining the movable feasts. The general rubrics (*Rubricæ Generales Missalis*) follow, explaining what are the various kinds of mass which may be celebrated, prescribing the hours of celebration, the kind and colour of vestments to be used, and the ritual to be followed (ritus celebrandi missam), and giving directions as to what is to be done in case of various defects or imperfections which may arise. The *Præparatio ad Missam*, which comes next, is a short manual of devotion containing psalms, hymns, and prayers to be used as opportunity may occur before and after celebration. Next comes the proper of the season (*Proprium Missarum de Tempore*), occupying more than half of the entire volume. It contains the proper introit, collect (one or more), epistle, gradual (tract or sequence), gospel, offertory, secreta (one or more), communion, and post-communion for every Sunday of the year, and also for the festivals and ferias connected with the ecclesiastical seasons, as well as the offices peculiar to the ember days, Holy Week, Easter, and Whitsuntide. Between the office for Holy Saturday and that for Easter Sunday the ordinary of the mass (*Ordo Missæ*), with the solemn and proper prefaces for the year, and the canon of the mass are inserted. The proper of the season is followed by the proper of the saints (*Proprium Sanctorum*), containing what is special to each saint's day in the order of the calendar, and by the *Commune Sanctorum*, containing such offices as the common of one martyr and bishop, the common of one martyr not a bishop, the common of many martyrs in paschal time, the common of many martyrs out of paschal time, and the like. A variety of masses to be used at the feast of the dedication of a church, of masses for the dead, and of votive masses (as for the sick, for persons journeying, for bridegroom and bride) follow, and also certain benedictions. Most missals have an appendix also containing certain local masses of saints to be celebrated "ex indulto apostolico."

Masses fall into two great subdivisions:—(1) ordinary or regular (secundum ordinem officii), celebrated according to the regular rotation of fast and feast, vigil and feria, in the calendar; (2) extraordinary or occasional (extra ordinem officii), being either "votive" or "for the dead," and from the nature of the case having no definite time prescribed for them. Festival masses are either double, half-double, or simple, an ordinary Sunday mass being a half-double. The difference depends on the number of collects and secretæ; on a double only one of each is offered, on a half-double there are two or three, and on a simple there may be as many as five, or even seven, of each. Any mass may be either high (missa solennis) or low (missa privata). The distinction depends upon the number of officiating clergy, certain differences of practice as to what is pronounced aloud and what inaudibly, the use or absence of incense, certain gestures, and the like. Solitary masses are forbidden; there must be at least an acolyte to give the responses. The vestments prescribed for the priest are the amice, alb, cingulum or girdle, maniple, stole, and chasuble (planeta); see COSTUME, vol. vi. p. 462. There are certain distinctions of course for a bishop or abbot. The colour of the vestments and of the drapery of the altar varies according to the day, being either white, red, green, violet, or black. This last custom does not go much further back than Innocent III., who explains the symbolism intended.

Subjoined is an account of the manner of celebrating high mass according to the rite at present in force.

1. The priest who is to celebrate, having previously confessed (if necessary) and having finished matins and lauds, is to seek leisure for private prayer (fasting) and to use as he has opportunity the "prayers before mass" already referred to. How the robing in the sacristy is next to be gone about is minutely prescribed, and prayers are given to be used as each article is put on. The sacramental elements having previously been placed on the altar or on a credence table, the celebrant enters the church and takes his stand before the lowest step of the altar, having the deacon on his right and the subdeacon on his left. After invoking the Trinity (In nomine Patris, &c.) he repeats alternately with those who are with him the psalm "Judica me, Deus," which is preceded in the usual way by an antiphon (Introibo ad altare Dei), and followed also by the Gloria and Antiphon.[1] The versicle "Adjutorium nostrum," with its

[1] This antiphon is not to be confounded with the Antiphona ad Introitum further on. This use of the 43d Psalm goes as far back at least as the end of the 11th century, being mentioned by Micrologus (1080). It is omitted in masses for the dead and during Holy Week.

response "Qui fecit," is followed by the "Confiteor,"[1] said alternately by the priest and by the attendants, who in turn respond with the prayer for divine forgiveness, "Misereatur." The priest then gives the absolution ("Indulgentiam"), and after the versicles and responses beginning "Deus, tu conversus" he audibly says, "Oremus," and ascending to the altar silently offers two short prayers, one asking for forgiveness and liberty of access through Christ, and another indulgence for himself "through the merits of thy saints whose relics are here." Receiving the thurible from the deacon he incenses the altar, and is thereafter himself incensed by the deacon. He then reads the Introit, which is also sung by the choir; the "Kyrie Eleison" is then said, after which the words "Gloria in Excelsis"[2] are sung by the celebrant and the rest of the hymn completed by the choir.

2. Kissing the altar, and turning to the people with the formula "Dominus vobiscum," the celebrant proceeds with the collect or collects proper to the season or day, which are read secretly. The epistle for the day is then read by the subdeacon, and is followed by the gradual, tract, alleluia, or sequence, according to the time.[3] This finished, the deacon places the book of the gospels on the altar, and the celebrant blesses the incense. The deacon kneels before the altar and offers the prayer "Munda cor meum," afterwards takes the book from the altar, and kneeling before the celebrant asks his blessing, which he receives with the words "Dominus sit in corde tuo." Having kissed the hand of the priest, he goes accompanied by acolytes with incense and lighted candles to the pulpit, and with a "Dominus vobiscum" and minutely prescribed crossings and incensings gives out and reads the gospel for the day, at the close of which "Laus tibi, Christe" is said, and the book is brought to the celebrant and kissed with the words "Per evangelica dicta deleantur nostra delicta." The celebrant then standing at the middle of the altar sings the words "Credo in unum Deum," and the rest of the Nicene creed is sung by the choir.[4]

3. With "Dominus vobiscum" and "Oremus" the celebrant proceeds to read the Offertory, which is also sung by the choir. This finished he receives the paten with the host from the deacon, and after offering the host with the prayer beginning "Suscipe, Sancte Pater" places it upon the corporal. The deacon then ministers wine and the subdeacon water, and before the celebrant mixes the water with the wine he blesses it in the prayer "Deus qui humanæ." He then takes the chalice, and having offered it ("Offerimus tibi, Domine") places it upon the corporal and covers it with the pall. Slightly bowing over the altar, he then offers the prayer "In spiritu humilitatis," and, lifting up his eyes and stretching out his hands, proceeds with "Veni sanctificator." After blessing the incense ("Per intercessionem beati Michaelis archangeli") he takes the thurible from the deacon and incenses the bread and wine and altar, and is afterwards himself incensed as well as the others in their order. Next going to the epistle side of the altar he washes his fingers as he recites the verses of the 26th Psalm beginning "Lavabo." Returning and bowing before the middle of the altar, with joined hands he says, "Suscipe, sancta Trinitas," then turning himself towards the people he raises his voice a little and says, "Orate, fratres" ("that my sacrifice and yours may be acceptable to God the Father Almighty"), the response to which is "Suscipiat Dominus sacrificium de manibus tuis," &c. He then recites the secret prayer or prayers, and at the end says, with an audible voice, "Per omnia sæcula sæculorum" (℟. "Amen").

4. Again saluting with a "Dominus vobiscum," he lifts up his hands and goes on to the "Sursum Corda" and the rest of the Preface. A different intonation is given for each of the prefaces.[5] At the Sanctus the handbell is rung. If there is a choir the Sanctus is sung while the celebrant goes on with the Canon.[6] After the words of consecration of the wafer, which are said "secretly, distinctly, and attentively," the celebrant kneels and adores the host, rising elevates it, and replacing it on the corporal again adores it (the bell meanwhile being rung).[7] The same rite is observed when the chalice is consecrated. Immediately before the Lord's Prayer, at the words "per ipsum et cum ipso et in ipso," the sign of the cross is made three times over the chalice with the host, and towards the close of the "embolism" the fraction of the host takes place. After the words "Pax Domini sit semper vobiscum" the emission of the particle into the cup takes place with the words "Hæc commixtio et consecratio," &c. The celebrant then says the Agnus Dei three times.

5. While the choir sings the Agnus Dei and the Communion, the celebrant proceeds, still "secrete," with the remainder of the office, which though printed as part of the canon is more conveniently called the Communion and Post-communion. After the prayer for the peace and unity of the church ("Domine Jesu Christe, qui dixisti") he salutes the deacon with the kiss of peace, saying, "Pax tecum"; the subdeacon is saluted in like manner, and then conveys the "pax" to the rest of the clergy who may be assisting. The celebrant then communicates under both species with suitable prayers and actions, and afterwards administers the sacrament to the other communicants if there be any. Then while the wine is poured into the cup for the first ablution he says, "Quod ore sumpsimus"; having taken it he says, "Corpus tuum, Domine." After the second ablution he goes to the book and reads the Communion. Then turning to the people with "Dominus vobiscum" he reads the Post-communion (one or more); turning once more to the congregation he uses the old dismissal formula "Dominus vobiscum" (℟. Et cum spiritu tuo), and "Ite, missa est" [or "Benedicamus Domino," in those masses from which "Gloria in Excelsis" has been omitted] (℟. Deo Gratias). Bowing down before the altar he offers the prayer "Placeat tibi, sancta Trinitas," then turning round he makes the sign of the cross over the congregation with the words of the benediction ("Benedicat").[8] He then reads the passage from the gospel of John beginning with "In principio erat Verbum," or else the proper gospel of the day.[9] (J. S. BL.)

MISSIONS. The history of Christian missions may, for practical purposes, be best divided into three chief periods—(1) the primitive, (2) the mediæval, and (3) the modern. None of these periods can be neglected, for they have an intimate connexion with each other, and illustrate the activity respectively of individuals, of the church in her corporate capacity, and of societies.

1. *The Primitive Period.*

Christian missions had their origin in the example and the command of our Lord Himself (Matt. xxviii. 19); and the unparalleled boldness on the part of the Founder of Christianity, which dared to anticipate for the Christian faith a succession of efforts which should never cease to cause its propagation to be undertaken as "a distinct and direct work," has been justified by the voice of history.[10] Whereas other religions have spread from country to country as component parts of popular opinion, have travelled with migration or conquest, have passed in the train of things and by the usual channels of communication, the first foundations of the church had hardly been laid before individual missionary activity marked the life of each one of the circle of the apostles.

Of the actual details of their labours we have been permitted to know but little. Three only of the immediate followers of the Saviour have any conspicuous place in the apostolic records, and the most illustrious in the whole domain of missionary activity, St Paul, did not belong to the original twelve. His activity took the form of journeys and voyages, chiefly to large towns, where his message found a point of contact either with the Jewish synagogue or the aspirations of the Gentile world. The result of his labours and of those of his successors

[1] A form very similar to the present is given by Micrologus, and it is foreshadowed even in liturgical literature of the 8th century.

[2] During Lent and Advent, and in masses for the dead, this is omitted. In low masses it is of course said, not sung (if it is to be said). It may be added that this early position of the *Gloria in Excelsis* is one of the features distinguishing Roman from Ephesine use.

[3] The tract is peculiar to certain occasions, especially of a mournful nature, and is sung by a single voice. By a sequence is understood a more or less metrical composition, not in the words of Scripture, having a special bearing on the festival of the day. See, for example, the sequence, "Lauda Sion Salvatorem," on Corpus Christi day.

[4] On certain days the *Credo* is omitted.

[5] Now eleven; they were at one time much more numerous.

[6] The approved usage appears to be in that case that it is sung as far as "Hosanna in Excelsis" before the elevation, and "Benedictus qui venit" is reserved till afterwards. In France it was a very common custom, made general for a time at the request of Louis XII., to sing "O salutaris hostia" at the elevation.

[7] The history of the practice of elevating the host is somewhat obscure. It seems to have arisen out of the custom of holding up the oblations, as mentioned in the *Ordo Romanus* (see above). The elevation of the host, as at present practised, was first enjoined by Pope Honorius III. The use of the handbell at the elevation is still later, and was first made general by Gregory XI.

[8] The benediction is omitted in masses for the dead.

[9] The reading of the passage from John on days which had not a proper gospel was first enjoined by Pius V.

[10] Davison, *On Prophecy*, p. 278.

was that towards the middle of the 2d century the church had gradually extended its conquests through Asia Minor, Greece, Italy, southern Gaul, and northern Africa.[1] Ecclesiastical history can tell but little of the church's earliest teachers, and the infancy of many of the primitive congregations is wrapped in hopeless darkness. Whatever was effected was due to the evangelizing labours of individual bishops and clergy, who occupied themselves "in season and out of season," and toiled zealously and effectively in the spread of the church, though leaving no record of their devotion. Amongst the most distinguished representatives of this individual activity in the 4th and 5th centuries may be mentioned Ulfila, the "apostle of the Goths," about 325; Frumentius, a bishop of Abyssinia, about 327; Chrysostom, who founded at Constantinople in 404 A.D. an institution in which Goths might be trained to preach the gospel to their own people;[2] Valentinus, the "apostle of Noricum," about 440; and Honoratus, who from his monastic home in the islet of Lerins, about 410, sent forth numerous labourers to southern and western Gaul, to become the leading missionaries of their day among the masses of heathendom in the neighbourhood of Arles, Lyons, Troyes, Metz, and Nice.

2. *The Mediæval Period.*

With the 5th century the church found a very different element proposed to her missionary energies and zeal. Her outposts of civilization had scarcely been planted when she was confronted with numberless hordes which had long been gathering afar off in their native wilds, and which were now precipitated over the entire face of Europe. Having for some time ceased to plead for toleration, and learnt to be aggressive, she not only stood the shock of change but girded herself for the difficult work of calming the agitated elements of society, of teaching the nations a higher faith than a savage form of nature worship, of purifying and refining their recklessness, independence, and uncontrollable love of liberty, and fitting them to become members of an enlightened Christendom.

(*a*) *The Celtic Missionaries.*—The first pioneers who went forth to engage in this difficult enterprise came from the secluded Celtic churches of Ireland and the Scottish Highlands, which, though almost forgotten amidst the desolating contest which was breaking up the Roman world, were no sooner founded than they sent forth "armies of Scots" to pour back upon the Continent the gifts of civilization and the gospel. Of many who deserve mention in connexion with this period, the most prominent were—Columba, the founder of the famous monastery of Iona, and the evangelizer of the Albanian Scots and northern Picts; Aidan, the apostle of Northumbria; Columbanus, the apostle of the Burgundians of the Vosges; Callich or Gallus, the evangelizer of north-eastern Switzerland and Alemannia; Kilian, the apostle of Thuringia; and Trudpert, the martyr of the Black Forest. The zeal of these singular men at the head of ardent disciples seemed to take the world by storm. Travelling generally in companies, and carrying a simple outfit, these Celtic pioneers flung themselves on the Continent of Europe, and, not content with reproducing at Annegray or Luxeuil the willow or brushwood huts, the chapel and the round tower, which they had left behind in Derry or in the island of Hy, they braved the dangers of the northern seas, and penetrated as far as the Faroes and even far distant Iceland.[3]

(*b*) *The English Missionaries.*—Thus they laid the foundations, awing the heathen tribes by their indomitable spirit of self-sacrifice and the sternness of their rule of life. But, marvellous as it was, their work lacked the element of permanence; and it became clear that if Europe was to be carried through the dissolution of the old society, and missionary operations consolidated, a more practical system must be devised and carried out. The men for this work were now ready. Restored to the commonwealth of nations by the labours of the followers of Augustine of Canterbury and the Celtic missionaries from Iona, the sons of the newly evangelized English churches were ready to go forth to the help of their Teutonic brothers in the German forests. The energy which warriors were accustomed to put forth in their efforts to conquer was now "exhibited in the enterprise of conversion and teaching"[4] by Wilfrid on the coast of Friesland,[5] by Willibrord in the neighbourhood of Utrecht,[6] by the martyr-brothers Ewald or Hewald amongst the "old" or continental Saxons,[7] by Swidbert the apostle of the tribes between the Ems and the Yssel, by Adelbert, a prince of the royal house of Northumbria, in the regions north of Holland, by Wursing, a native of Friesland, and one of the disciples of Willibrord, in the same region, and last, not least, by the famous Winfrid or Boniface, the "apostle of Germany," who went forth first to assist Willibrord at Utrecht, then to labour in Thuringia and Upper Hessia, then, with the aid of his kinsmen Wunibald and Willibald, their sister Walpurga, and her thirty companions, to consolidate the work of earlier missionaries, and finally to die a martyr on the shore of the Zuyder Zee.

(*c*) *Scandinavian Missions.*—Devoted, however, as were the labours of Boniface and his disciples, the battle was not yet nearly won. All that he and they and the emperor Charlemagne after them achieved for the fierce untutored world of the 8th century seemed to have been done in vain when, in the 9th, "on the north and north-west the pagan Scandinavians were hanging about every coast, and pouring in at every inlet; when on the east the pagan Hungarians were swarming like locusts and devastating Europe from the Baltic to the Alps; when on the south and south-east the Saracens were pressing on and on with their victorious hosts. It seemed then as if every pore of life were choked, and Christendom must be stifled and smothered in the fatal embrace."[8] But it was even now that one of the most intrepid of missionary enterprises was undertaken, and the devoted Anskar went forth and proved himself a true apostle of Denmark and Sweden, sought out the Scandinavian viking in his native home and icy fiords, and, after persevering in the face of apparently insurmountable difficulties and hardships, handed on the torch of self-denying zeal to others, who "casting their bread on the waters" saw, after the lapse of many years, the close of the monotonous tale of burning churches and pillaged monasteries, and taught the fierce Northman to lay aside his old habits of piracy, and gradually learn respect for civilized institutions.

(*d*) *Slavonic Missions.*—Thus the "gospel of the kingdom" was successively proclaimed to the Roman, the Celtic, the Teutonic, and the Scandinavian world. A contest still more stubborn remained with the Slavonic tribes, with their triple and many-headed divinities, their powers of good and powers of evil, who could be approached only with fear and horror, and propitiated only with human sacrifices. Mission work commenced in Bulgaria during the latter part of the 9th century; thence it extended to Moravia, where two Greek missionaries—Cyril and Methodius—provided for the people a Slavonic Bible

and a Slavonic Liturgy; thence to Bohemia, and so onwards to the Scythian wilds and level steppes, where arose the Russian kingdom of Ruric the Northman, and where about the close of the 10th century the Eastern Church "silently and almost unconsciously bore into the world her mightiest offspring."[1] But, though the baptism of Vladimir and the flinging of the triple and many-headed idols into the waters of the Dnieper was a heavy blow to Slavonic idolatry, mission work was carried on with but partial success; and it taxed all the energies of Albrecht, bishop of Bremen, of Vicilin, bishop of Oldenburg, of Bishop Otto of Bamberg the apostle of the Pomeranians, of Adalbert the martyr-apostle of Prussia, to spread the word in that country, in Lithuania, and in the territory of the Wends. It was not till 1168 that the gigantic four-headed image of Swantevit was destroyed at Arçona, the capital of the island of Rügen, and this Mona of Slavonic superstition was included in the advancing circle of Christian civilization. As late as 1230 human sacrifices were still being offered up in Prussia and Lithuania, and, in spite of all the efforts of the Teutonic Knights to expel by force the last remains of heathenism from the face of Europe, idolatrous practices still lingered amongst the people, while in the districts inhabited by the Lapps, though successful missions had been inaugurated as early as 1335, Christianity cannot be said to have become the dominant religion till at least two centuries later.

(*e*) *Moslem Missions.*—The mention of the order of the Teutonic Knights reminds us how the crusading spirit had affected Christendom, and exchanged the patience of a Boniface or an Anskar for the fiery zeal of the warrior of the cross. Still it is refreshing to notice how even now there was found the famous Raymond Lully to protest against propagandism by the sword, to urge on pope after pope the necessity of missions amongst the Moslems, and to seal his testimony with his blood outside the gates of Bugiah in northern Africa (June 30, 1315). Out of the crusades, however, arose other efforts to bear the banner of the cross into the lands of the East, and to develop the work which Nestorian missionaries from Baghdad, Edessa, and Nisibis had already inaugurated along the Malabar coast, in the island of Ceylon, and in the neighbourhood of the Caspian Sea. In 1245 the Roman pontiff sent two embassies, one to charge the Mongol warriors to desist from their desolating inroads into Europe, the other to attempt to win them over to the Christian faith. The first, a party of four Dominicans, sought the commander-in-chief of the Mongol forces in Persia; the second, consisting of Franciscans, made their way into Tartary, and sought to convert the successor of Oktai-Khan. Their exertions were seconded in 1253 by the labours of another Franciscan whom Louis IX. of France sent forth from Cyprus,[2] while in 1274 the celebrated traveller Marco Polo, accompanied by two learned Dominicans, visited the court of Kublai-Khan, and at the commencement of the 14th century two Franciscans penetrated as far as Peking, and kept alive a flickering spark of Christianity in the Tartar kingdom, even translating the New Testament and the Psalter into the Tartar language, and training youths for a native ministry.[3]

(*f*) *Missions to India and the New World.*—These tentative missions in the East were now to be supplemented by others on a larger scale. In 1486 the Cape of Good Hope was rounded by Dias, and in 1508 the foundations of the Portuguese Indian empire were laid by Albuquerque. Columbus also in 1492 had landed on San Salvador, and the voyages of the Venetian Cabot along the coast of North America opened up a new world to missionary enterprise. These bold discoverers had secured the countenance of the pope on the condition that wherever they might plant a flag they should be also zealous in promoting the extension of the Christian faith. Thus a grand opportunity was given to the churches of Portugal and Spain. But the zeal of the Portuguese, even when not choked by the rising lust of wealth and territorial power, took too often a one-sided direction, repressing the Syrian Christians on the Malabar coast, and interfering with the Abyssinian Church,[4] while the fanatic temper of the Spaniard, maddened by his prolonged conflict with the infidel at home, betrayed him into methods of propagating his faith which we cannot contemplate without a shudder, consigning, in Mexico and Peru, multitudes who would not renounce their heathen errors to indiscriminate massacre or abject slavery.[5] Their only defender for many years was the famous Las Casas, who, having sojourned amongst them till 1516, has drawn a terrible picture of the oppression he strove in vain to prevent.[6] Some steps indeed were taken for disseminating Christian principles, and the pope in granting territory to the crowns of Spain and Portugal had specially urged this duty, and had been instrumental in inducing a band of missionaries, chiefly of the mendicant orders, to go forth to this new mission field.[7] But the results were scanty. Only five bishoprics had been established by 1520, and the number of genuine converts was small. In settling, however, his realm the conqueror of Mexico evinced no little solicitude for the spiritual welfare of his charge; and the labours of the devoted men whom he begged the emperor to send out were successful in banishing every vestige of the Aztec worship from the Spanish settlements.[8]

(*g*) *The Jesuit Missions.*—It was during the period at which we have now arrived that the great organization of the Jesuits came into existence, and one of the first of Loyola's associates, Francis Xavier, was also one of the greatest and most zealous missionaries of his or any other era. Encouraged by the joint co-operation of the pope and of John III. of Portugal, and strongly tinged like Loyola with ideas of chivalry and self-devotion, he disembarked at Goa on the 6th of May 1542, and before his death on the Isle of St John (Hiang-Shang), December 2, 1552, he had roused the European Christians of Goa to a new life, laboured with singular success amongst the Paravars, a fisher caste near Cape Comorin, gathered many converts in the kingdom of Travancore, visited the island of Malacca, made his way to and founded a mission in Japan, thence revisited Goa, and impelled by the quenchless desire to unfurl the banner of the cross in China, had set out thither to fall a victim to malignant fever at the early age of forty-six, within sight of that vast empire whose conversion had been the object of his holy ambition.

The immediate successor of Xavier, Antonio Criminalis, was regarded by the Jesuits as the first martyr of their society (1562). Mattheo Ricci, an Italian by birth, was also an indefatigable missionary in China for twenty-seven years, while the peculiar methods of unholy compromise with Brahmanism in India followed by Robert de' Nobili drew down the condemnatory briefs of pope after pope, and were fatal to the vitality of his own and other missions.

Other representatives of the same order worked with success in evangelizing the Spanish settlement of Paraguay in 1582, while their defeated foes the Huguenots sent forth under a French knight of Malta a body of devoted men to attempt the formation of a Christian colony at Rio Janeiro. By the close of the 16th century the unflagging zeal of the Jesuits led to a more complete development and organization of the missionary system of the Roman Church. To give unity and solidity to the work of missions, a committee of cardinals was appointed under the name of the "Congregatio de propaganda fide," and to it was entrusted the entire management of the mission, conducted under the superintendence of the pope. The scheme originated with Gregory XIII., but was not fully organized till forty years afterwards, when Gregory XV. gave it plenary authority by a bull dated June 2, 1622. Gregory's successor, Urban VIII., supplemented the establishment of the congregation by founding in connexion with it a great missionary college, where Europeans might be trained for foreign labours, and natives might be educated to undertake mission work wherever new colonies were settled. At this college is the missionary printing-press of the Roman Church, and its library contains an unrivalled collection of literary treasures bearing on the particular work. From its walls have gone forth numbers of devoted men, who have proved themselves able to promote in a singular degree the enlargement of the boundaries of the church by means of material as well as spiritual forces.

3. *The Modern Period.*

This last period of missionary activity is distinguished in a special degree by the exertions of societies for the development of mission work.

As contrasted with the colossal display of power on the part of the Church of Rome, it must be allowed that the churches which in the 16th century broke off from their allegiance to the Latin centre at first presented a great lack of anxiety for the extension of the gospel and the salvation of the heathen. The causes of this, however, are not far to seek. The isolation of the Teutonic churches from the vast system with which they had been bound up, the conflicts and troubles among themselves, the necessity of fixing their own principles and defining their own rights, concentrated their attention upon themselves and their own home work, to the neglect of work abroad.

Still the development of the maritime power of England, which the Portuguese and Spanish monarchies noted with fear and jealousy, was distinguished by a singular anxiety for the spread of the Christian faith. Edward VI. in his instructions to the navigators in Willoughby's fleet, Cabot in those for the direction of the intended voyage to Cathay, good old Hakluyt, who promoted many voyages of discovery in addition to writing their history, agree with Sir Humphrey Gilbert's chronicler that "the sowing of Christianity must be the chief intent of such as shall make any attempt at foreign discovery, or else whatever is builded upon other foundation shall never obtain happy success or continuance." When on the last day of the year 1600 Queen Elizabeth granted a charter to George, earl of Cumberland, and other "adventurers," to be a body-corporate by the name of "The Governor and Company of Merchants of London trading with the East Indies," the expressed recognition of higher duties than those of commerce may by some be deemed a mere matter of form, and, to use the words of Bacon, "what was first in God's providence was but second in man's appetite and intention." Yet a keen sense of missionary duty marks many of the chronicles of English mariners. Notably was this the case with the establishment of the first English colony in America, that of Virginia, by Sir Walter Raleigh. The philosopher Heriot, one of his colleagues, laboured for the conversion of the natives, amongst whom the first baptism is recorded to have taken place on August 13, 1587.[1] Raleigh himself presented as a parting gift to the Virginian Company the sum of £100 "for the propagation of the Christian religion" in that settlement.[2] When James I. granted letters patent for the occupation of Virginia it was directed that the "word and service of God be preached, planted, and used as well in the said colonies as also as much as might be among the savages bordering among them"; and the honoured names of Nicolas Ferrar, John Ferrar, Dr Donne, and Sir John Sandys, a pupil of Hooker, are all found on the council by which the home management of the colony was conducted.

In the year 1618 was published *The True Honour of Navigation and Navigators*, by John Wood, D.D., dedicated to Sir Thomas Smith, governor to the East India Company, and much about the same time appeared the well-known treatise of the famous Grotius, *De Veritate Religionis Christianæ*, written for the express use of settlers in distant lands. The wants, moreover, of the North American colonies did not escape the attention of Archbishop Laud during his official connexion with them as bishop of London, and he was developing a plan for promoting a local episcopate there when his troubles began and his scheme was interrupted. During the Protectorate, in 1649, an ordinance was passed for "the promoting and propagating of the gospel of Jesus Christ in New England" by the erection of a corporation, to be called by the name of the President and Society for the Propagation of the Gospel in New England, to receive and dispose of moneys for the purpose, and a general collection was ordered to be made in all the parishes of England and Wales; and Cromwell himself desired a scheme for setting up a council for the Protestant religion, which should rival the Roman Propaganda, and consist of seven councillors and four secretaries for different provinces.[3] On the restoration of the monarchy, through the influence of Richard Baxter with Lord Chancellor Hyde, the charter already granted by Cromwell was renewed, and its powers were enlarged. For now the corporation was styled "The Propagation of the Gospel in New England and the parts adjacent in America," and its object was defined to be "not only to seek the outward welfare and prosperity of those colonies, but more especially to endeavour the good and salvation of their immortal souls, and the publishing the most glorious gospel of Christ among them." On the list of the corporation the first name is the earl of Clarendon, while the Hon. Robert Boyle was appointed president. Amongst the most eminent of its missionaries was the celebrated John Eliot, who, encouraged by Boyle, and assisted by him with considerable sums of money, brought out the Bible in the Indian language in 1661–64, having revealed at the end of the Indian grammar which he had composed the secret of his success: "prayer and pains, through faith in Jesus Christ, will do anything." Boyle displayed in other ways his zeal for the cause of missions. He contributed to the expense of printing and publishing at Oxford the four Gospels and the Acts of the Apostles in the Malay language, and at his death left £5400 for the propagation of the gospel in heathen lands.

The needs of the colonial church soon excited the attention of others also, and great efforts were made by Bishop Beveridge, Archbishop Wake, Archbishop Sharpe, Bishop Gibson, and afterwards by the philosophic Bishop Berkeley, and Bishop Butler, the famous author of the *Analogy*, to

[1] Hakluyt, *Voyages*, iii. 345.

[3] Neale, *History of New England*, i. p. 260; Burnet, *History of his own Times*, i. p. 132.

develop the colonial church and provide for the wants of the Indian tribes. In 1696 Dr Bray, at the request of the governor and assembly of Maryland, was selected by the bishop of London as ecclesiastical commissary; and, having sold his effects, and raised money on credit, he sailed for Maryland in 1699, where he promoted, in various ways, the interests of the church. Returning to England in 1700–1, and supported by all the weight of Archbishop Tenison and Bishop Compton, he was graciously received by William III., and received letters patent under the great seal of England for creating a corporation by the name of the "Society for the Propagation of the Gospel in Foreign Parts" on the 16th of June 1701.

With the establishment of this corporation the era of the activity of societies for carrying out mission work may be said to commence, though the opening of the 18th century saw other movements set on foot for the same object. Thus in 1705 Frederick IV. of Denmark founded a mission on the Coromandel coast, and inaugurated the labours of Ziegenbalg, Schultze, and Schwartz, whose devotion and success told with such remarkable reflex influence on the church at home. Again in 1731 the Moravians illustrated in a signal degree the growing consciousness of obligation towards the heathen. Driven by persecution from Moravia, hunted into mountain-caves and forests, they had scarcely secured a place of refuge in Saxony before, "though a mere handful in numbers, yet with the spirit of men banded for daring and righteous deeds, they formed the heroic design, and vowed the execution of it before God, of bearing the gospel to the savage and perishing tribes of Greenland and the West Indies, of whose condition report had brought a mournful rumour to their ears." And so, literally with "neither bread nor scrip," they went forth on their pilgrimage, and, incredible as it sounds, within ten years they had established missions in the islands of the West Indies, in South America, Surinam, Greenland, among the North American tribes, in Lapland, Tartary, Algiers, Guinea, the Cape of Good Hope, and Ceylon.[1]

Such were the preparations for the more general movements during the last hundred years, and the manifestation of missionary zeal on a scale to which it would be difficult to find a parallel in Western Christianity.

The progress that has been made may be best judged of from consideration of the following details:—

(*a*) At the close of the last century there were only seven missionary societies in existence, properly so called. Of these three only, the Society for the Propagation of the Gospel in Foreign Parts, the Halle-Danish Society, and the Moravians, had been at work for the greater part of the century, whilst four, the Church Missionary Society, the Baptist Missionary Society, the London Missionary Society, and the Dutch Society at Rotterdam, began their work only in its tenth decade. To-day these seven have, in Europe and America alone, increased to upwards of seventy, and to these must be added, not only several independent societies in the colonies, but numerous missionary associations on a smaller scale, the offspring of English and American societies.

(*b*) The following chronological lists illustrate the growth of missionary societies in Britain and the United States:—

Great Britain and Ireland.

1691. Christian Faith Society for the West Indies.
1698. *Society for Promoting Christian Knowledge.*
1701. Society for the Propagation of the Gospel in Foreign Parts.
1732. Moravian (Episcopal) Missions of the United Brethren.
1792. Baptist Missionary Society.
1795. London Missionary Society.
1796. *Scottish Missionary Society.*
1799. Church Missionary Society.
1799. Religious Tract Society.
1804. British and Foreign Bible Society.
1808. London Society for Promoting Christianity among the Jews.
1813. *Wesleyan Missionary Society.*
1817. General Baptist Missionary Society.
1823. *Colonial and Continental Church Society.*
1829. Church of Scotland Mission Boards.
National Bible Society of Scotland.
1831. Trinitarian Bible Society.
1832. Wesleyan Ladies' Auxiliary for Female Education in Foreign Countries.
1834. Society for Promoting Female Education in the East.
1835. United Secession (now United Presbyterian) Foreign Missions.
1836. Colonial Missionary Society.
1840. Foreign Aid Society.
Coral Missionary Fund.
1840. Welsh Calvinistic Methodist Missionary Society.
1841. Colonial Bishoprics Fund.
1841. Edinburgh Medical Missionary Society.

(*c*) At the beginning of the present century the total sum contributed for Protestant missions can hardly be said to have amounted to £50,000; in 1882 the amount raised by British contributions alone to foreign missions amounted to upwards of £1,090,000,[2] thus divided:—

Church of England Missions	£460,935
Joint Societies of Churchmen and Nonconformists	153,320
Nonconformist Societies, English and Welsh	313,177
Scottish and Irish Societies	155,767
Roman Catholic Societies	10,910

(*d*) At the same date it is calculated that there were about 5000 heathen converts under instruction, not counting those belonging to the Roman Catholic missions. At the present day the converts from heathenism may be estimated certainly at no less than 1,800,000, a single year (1878) showing an increase of about 60,000.

(*e*) When the Society for the Propagation of the Gospel was founded in 1701, there were probably not twenty clergymen of the Church of England in foreign parts. The spiritual condition of the settlers in America and elsewhere was terrible in the extreme, and no effort was then made by the church to win over the heathen to Christ. But now the position which the church holds in the British colonies and dependencies and many parts of heathendom is recognized by all. In those regions where the society labours, and which before it commenced its work were spiritually the "waste places" of the earth, there are, including the American Church (*the first fruits of the society's efforts*), 138 bishops, more than 5000 clergy, and upwards of 2,000,000 members of the communion.

The above tables sufficiently indicate how varied are the missionary agencies now at work, covering the heathen

world with a network of mission outposts, which within the last century have won nearly two millions of converts to the Christian faith.

The continuity of missionary enthusiasm maintained through the primitive, the mediæval, and the modern periods of the church's history, operating at every critical epoch, and surviving after periods of stagnation and depression, is a very significant fact. It is true that other religions have been called missionary religions, and that one of them occupies the first place in the religious census of mankind.[1] But the missionary activity of Buddhism is a thing of the past, and no characteristic rite distinguishing it has found its way into a second continent; while, as for Mohammedanism, the character of its teaching is too exact a reflexion of the race, time, place, and climate in which it arose to admit of its becoming universal.[2] These and other religions of the far East may still maintain their hold over millions, but it must be admitted that their prospect of endurance in the presence of advancing Christianity is very small, and it is difficult to trace the slightest probability of their harmonizing with the intellectual, social, and moral progress of the modern world. With all its deficiencies, the Christian church has gained the "nations of the future," and whereas in the 3d century the proportion of Christians to the whole human race was only that of one in a hundred and fifty, this has now been exchanged for one in five,[3] and it is indisputable that the progress of the human race at this moment is entirely identified with the spread of the influence of the nations of Christendom.

Side by side with this continuity of missionary zeal, a noticeable feature is the immense influence of individual energy and the subduing force of personal character. Around individuals penetrated with Christian zeal and self-denial has centred not merely the life, but the very existence, of primitive, mediæval, and modern missions. What Ulfila was to the Gothic tribes, what Columba and his disciples were to the early Celtic missions, what Augustine or Aidan was to the British Isles, what Boniface was to the churches of Germany and Anskar to those of Denmark and Sweden, that, on the discovery of a new world of missionary enterprise, was Xavier to India, Hans Egede to Greenland, Eliot to the Red Indians, Martyn to the church of Cawnpore, Marsden to the Maoris, Carey and Marshman to Burmah, Heber, Wilson, Milman, and Duff to India, Gray, Livingstone, Mackenzie, Steere, Callaway to Africa, Broughton to Australia, Patteson to Melanesia, Mountain and Feild to Newfoundland, Crowther to the Niger Territory, Brett to Guiana. At the most critical epochs such men have ever been raised up, and the reflex influence of their lives and self-denial has told upon the church at home, while apart from their influence the entire history of important portions of the world's surface would have been altered.

If from the agents themselves we turn to the work that has been accomplished it will not be disputed that the success of missions has been marked amongst rude and aboriginal tribes. What was true in the early missions has been found true in these latter times. The rude and barbarous northern peoples seemed to fall like "full ripe fruit before the first breath of the gospel." The Goths and the Vandals who poured down upon the Roman empire were evangelized so silently and rapidly that only a fact here and there relating to their conversion has been preserved. Now this is exactly analogous to modern experience in the South Seas, America, and Africa. We must here content ourselves with a cursory survey of what missionary enterprise has accomplished in those regions and among the more civilized nations of Eastern Asia.

The South Seas.—That missions have done much in these regions in suppressing cannibalism, human sacrifices, and infanticide, humanizing the laws of war, and elevating the social condition of women, is a fact confirmed by the researches of Meinicke, Waitz, Gerland, Oberlander, and even of Darwin.[4]

In Australia work among the aborigines, wherever it has been zealously conducted, has been blessed with signal success. Amongst the Papuans the Moravian stations of Ebenezer in the district of Wimmera, and Ramahyuck in that of Gippsland, can point to their little villages of 125 native Christian inhabitants, their cleanly houses, and their well-ordered churches. In the district of South Adelaide, at Point Macleay, the Scottish Presbyterian Mission has been similarly successful, while in New Zealand the native population was converted almost within a single generation. In the islands north and north-west of Australia the Dutch missionaries have been especially successful in the Minahassa (see CELEBES), of whose 114,000 inhabitants more than 80,000 have been won over to the Christian faith, forming 195 communities with 125 schools; and in southern Borneo, the Rhenish Mission in the south and the Society for the Propagation of the Gospel in the north have been enabled to establish themselves firmly, while the former society has also done a great work among the Battaks in Sumatra. Amongst the dark-coloured races of Polynesia missionary work has made great advances through the labours of the London Missionary Society, the Wesleyans, and the American Board. Making Tahiti its basis of operations, the first-named society has carried on missionary operations in the islands of Australasia, Hervey, Samoa, Tokelau, and Ellice, while the American Board has witnessed equally favourable results in the Sandwich Islands, and in Micronesia (Caroline, Marshall, and Gilbert Islands) the agents of the Hawaiian Association are actively at work under the direction of American missionaries. In Melanesia the Society for the Propagation of the Gospel, the Wesleyans, the London Missionary Society, and the Presbyterians are all actively engaged. The Fiji group stands out as one of the most promising centres of Christian civilization, and the governor, Sir A. Gordon, was enabled to report in 1879 that, out of a population of about 120,000, 102,000 are now regular worshippers in the churches, which number 800, while over 42,000 children are in attendance in 1534 Christian day schools. The Loyalty Islands have been occupied partly by Roman Catholic missions and partly by the London Missionary Society, while in the New Hebrides the missionaries of the Free Church of Scotland and of the Presbyterian churches of Canada, New Zealand, and Australia, in spite of many obstacles, the unhealthiness of the climate, and the variety of the dialects spoken, have upwards of 3000 natives receiving Christian teaching, 800 communicants, and 100 native teachers. On the islands of Banks, Santa Cruz, and Solomon, the English Episcopal Church is achieving no little success, sending native youths for months at a time to Norfolk Island to receive instruction, whence they return again in order to spread the knowledge of truth at home. These islands will ever be famous in connexion with the martyr death of the noble Bishop Patteson.

The Uncivilized Peoples of America.—The quiet humble labours of the Moravians have accomplished much in Greenland and Labrador, whilst among the Indians of Canada and the people of Hudson's Bay the Society for the Propagation of the Gospel has not laboured in vain, nor the Church Missionary Society in the dioceses of Rupertsland, Red River, Saskatchewan, and Moosonee. At Columbia, on the coast of the Pacific, a practical missionary genius named William Duncan has succeeded in civilizing a body of Indians degraded by cannibalism, and at his Metlakahtla mission stands at the head of a community of some thousand persons, which has a larger church than is to be found between there and San Francisco. Testimony to the value of the results achieved was borne in 1876 by Lord Dufferin, then governor-general of Canada, who declared that he could hardly find words to express his astonishment at what he witnessed. Amongst the Indian tribes of the United States work is carried on by the Moravians, the American Board of Missions, the Presbyterians of the North and South, the Baptists, the Episcopal Methodists, and the American Missionary Society; and the result is that 27,000 Indians, divided amongst the 171 communities of different denominations (including the Roman Catholic) are in full membership with the church, and have 219 places of worship, besides 366 schools attended by about 12,222 Indian children. The Cherokees, the Choctaws, the Creeks, the Chickasaws, have their own churches, schools, and academies, and may compare favourably both intellectually and morally with their white neighbours in Missouri, Arkansas, and Texas.[5] Amongst the negroes in the United States more than 1000 places of worship have been built since the last war, while the American Missionary Association alone has erected 26 academies with about 6000 students, for the purpose of

[4] See Christlieb, *Foreign Missions*, p. 88. [5] *Ibid.*, pp. 98, 99.

preparing freed slaves to be teachers and missionaries. Amongst the Indians on the Essequibo and Berbice in British Guiana, the missions of the Society for the Propagation of the Gospel have been rapidly extended, and now upwards of half the Indian population are members of Christian churches. In the British West Indies, through the united labours of various missionary societies, out of 1,000,000 inhabitants upwards of 248,000 are returned as regular members of the churches, 85,000 as communicants, while 78,600 children receive instruction in 1123 day schools, of which number about 45,000 belong to Jamaica.

Passing to the southern promontory of South America, we find that the self-denying labours of Allen Gardiner are beginning to justify the devotion that prompted them. The London South American Missionary Society not only carries on its operations in the Falkland Islands, where youths from Tierra del Fuego receive instruction, but has founded stations in Tierra del Fuego itself, has roused the natives of Patagonia from their spiritual deadness, and has extended its labours even to the Indians in Brazil.

Africa.—Here there are three great regions of missionary activity,—on the west coast, in the south, and in some parts of the east.

The largest and most fruitful mission field in West Africa is that of Sierra Leone, where at least seven-eighths of the people are now Christians, though the first mission does not date further back than the present century;[1] and important results have also been obtained in Senegambia (on the Pongas), in Old Calabar, and in the republic of Liberia. On the Gold and Slave Coasts the labours of English Wesleyan missionaries and of the North German missionary societies have been crowned with no small success, while the Basel Society, which celebrated its jubilee in 1878, has extended its sphere of activity to Ashantee, translating the Scriptures into the native languages, and changing primeval marshes into bright-looking Christian villages. In the Yoruba lands the Church Missionary Society has 11 stations, 5994 Christians, and 1657 scholars, while on the Niger we are confronted with the interesting spectacle of negro preachers and teachers labouring under the coloured Bishop Crowther, carrying on a work which within the last few years was consecrated by the blood of martyrs.

South Africa has for some time been a centre of missionary activity. Here thirteen British and Continental associations have proved that all the South African races, Hottentots and Kaffres, Fingoes and Bechuanas, Basutos and Zulus, are capable of attaining a considerable degree of Christian civilization, and can not only be instructed in handicraft and agriculture, but trained as ministers and teachers. A single instance of this is afforded in British Kaffraria by the Lovedale Institute of the Free Church of Scotland, where youths from all the above-mentioned tribes are taught along with Europeans, and every Sunday sixty students proclaim the gospel in the neighbouring villages. In the cause of mission work here few ever laboured more zealously than the late Bishop Gray, whose diocese, when first constituted, included the whole colony of the Cape, but whose successor has now for his suffragans the bishops of Grahamstown, Maritzburg, St Helena, Bloemfontein, Zululand, St John's, and Pretoria.

East and East Central Africa, so long neglected, is now being rapidly occupied by missionary enterprise. Here the island of Madagascar has been in great part evangelized, while on the island of Mauritius the Anglican Mission has developed pre-eminent results. On the mainland, the coast of Zanzibar calls for special notice. Here the little island of the same name has long been the seat of the Universities Mission to Central Africa, and the heroic Bishop Steere has not only erected a cathedral on the site of the former slave-market, but translated the New Testament into Sawahili, a language which can be understood by the tribes around the lakes, and even in Uganda.

China.—"O mighty fortress! when shall these impenetrable brazen gates of thine be broken through?" was the mournful exclamation of Valignani, the successor of Xavier, as he gazed in sadness at the mountains of China. The words well express the incredible difficulties which this largest and most thickly peopled heathen land in the world, with its petrified constitution and culture of three thousand years, presents in the way of missionary effort. The country itself, the people, their speech, their manners, their religion, their policy, seemed to unite in opposing an insuperable barrier, but history has to record how efforts have been made by many bodies, and at many times, to break it down. An early Nestorian Church established itself in the empire, but was either uprooted, or died out in course of time. In the 16th century the Jesuits undertook the task, and in spite of the persecutions which they have undergone the missions of the Roman Church, with their numerous foreign clergy and their hosts of natives of different ecclesiastical degrees, have attained no small measure of success. Before the country was really opened to foreigners by the treaty of Tientsin, pioneers proceeded thither from America, and from the London Missionary Society. The labours of Dr Legge in translating and reducing to system the Chinese classics are well known. At the present day it is estimated that there are upwards of 29 societies at work in the country, with about 250 ordained missionaries and 63 female teachers, and the number is constantly increasing. These societies, of which the largest proportion belong to England, and the next largest to America, support, it is estimated, 20 theological schools, 30 higher boarding schools for boys with 611 scholars, 38 for girls with 777 scholars, 177 day schools for boys with 4000 to 5000 pupils in attendance, 82 for girls with 1307, while 16 missionary hospitals and 24 dispensaries are under the direction of medical missionaries, whose work in China has been recognized almost from the first as the source of the greatest blessing. The mission centres stud the east coast from Hong Kong and Canton to the frontiers of Manchuria in the north; thence they advance little by little every year into the interior, while as yet the western provinces are scarcely touched by missionary effort. The literary labours of the various societies have been carried on with the utmost perseverance; and on the foundations laid by a Morrison and a Milne later toilers have been enabled to raise a superstructure of translations of various portions of the Bible, as well as various Christian books and religious and general periodicals which constitute a means of vast importance towards gradually gaining over this land of culture. At Peking a Russian mission has been labouring for more than one hundred and fifty years. The Society for the Propagation of the Gospel and the Church Missionary Society have lately opened up new centres in this almost limitless country.[2]

Japan.—Of the missions in Japan it is as yet too early to forecast the future. The signing of the commercial treaties of 1854 and 1858 with America and England was followed in 1859 by efforts on the part of the American churches to extend a knowledge of Christianity, and in these Bishop Williams, an accomplished Japanese scholar, proved himself a valuable leader and guide. Soon afterwards other societies found their way into the country, and in March 1872 the first Japanese congregation, of 11 converts, was constituted in Yokohama. Within the last eight years these 11 have increased to 1200, while the American missions have been supplemented by those of the Church Missionary Society and the Society for the Propagation of the Gospel. Nearly every mission has what may be called a high school for girls, and these institutions are very popular. Thousands of copies also of the Gospels have been circulated in Japanese, and representatives of nearly all the missions are engaged in translating the entire New Testament, while a Russo-Greek mission has established itself in the north, and is advancing steadily, having already made about 3000 converts.[3] Thus, when it is considered that in the beginning of the 17th century the Japanese Government drove out the Portuguese and massacred the native Catholic converts, and prohibited all Christians under pain of death from ever setting foot in the country, and when it is borne in mind that many of these old laws against Christianity have not yet been repealed and that the old distrust of strangers is still plainly discernible among the governing classes, it is clear that, while there is much ground for hope, effectual results can only be the work of time.

India.—What is true of China and Japan applies with tenfold force to India. Here the results achieved resemble those which were attained in the conflict between Christianity and the religion of old pagan Rome, with its mass of time-honoured customs interwoven with the literature, institutions, and history of the empire. Against the influence of prestige and settled prejudice the wave of the gospel beat for centuries in vain. Slowly and gradually it was undermining the fabric, but no striking results were immediately visible. So also in India with the Hindu proper Christianity has hitherto made inappreciable progress, while among the rude aboriginal or non-Aryan tribes its success has been remarkable. Independently of Roman Catholic missions upwards of twenty-eight societies are earnestly engaged in the English mission field, and the following figures will give some idea of the progress that has been made during the last twenty or thirty years. In British India, including Burmah and Ceylon, it is estimated that in 1852 there were 22,400 communicants and 128,000 native Christians young and old; in 1862 these had increased to 49,681 communicants and 213,182 native Christians; in 1872 there had been a further increase to 78,494 communicants and 318,363 native Christians, while in 1878 the latter figures rose to 460,000. When we look at the share that each of the societies has had in this increase, we find that the Society for the Propagation of the Gospel and the Church Missionary Society together have since 1850 increased in membership from 61,442 to upwards of 164,000; the London Missionary Society from 20,000 to upwards of 48,000; the Presbyterian missions of Scotland, England, Ireland, and America from 800 to 10,000; the Basel mission in India from 1000 to 6805; the Baptist missionary societies (including the American as well as the English) from 30,000 to 90,000; the five Lutheran societies from 3316 to about 42,000. In some places the progress made has been excep-

[1] See Lightfoot, *Ancient and Modern Missions*, p. 10.

[2] The Roman Catholic Mission had 404,530 converts in China in 1876, with a yearly increase of about 2000.

[3] Christlieb, *Foreign Missions*, p. 222.

tionally rapid. In Cuddapah, *e.g.*, in the Telugu territory, the Society for the Propagation of the Gospel and the London Missionary Society laboured side by side for upwards of thirty years without winning over more than 200 converts. Then on a sudden there sprang up a revival among the non-caste population, and the 200 became nearly 11,000. Among the Kols, after five years' waiting, the Gossner missionaries baptized their first converts in 1850; now in the German and English stations together these amount to about 40,000. Since the famine, however, in 1878–79, the increase of new converts has been still more rapid, and the practical experience of the superiority of Christian pity to heathen selfishness and of the helplessness of their heathen deities, united with the effect produced by persistent missionary labour in past years, brought thousands into the fold of the church. Thus in the Tinnevelly district, where the Church Missionary Society carries on its operations, upwards of 11,000 heathens applied in 1878 to Bishop Sargent and his native clergy for instruction preparatory to baptism.[1] In the same district, in connexion with the Society for the Propagation of the Gospel, between July 1877 and the end of June 1878 upwards of 23,564 persons betook themselves to Bishop Caldwell and his fellow-labourers for Christian teaching. Thus the English Church missions in Tinnevelly and Ramnad received in little more than a year and a half an increase of 35,000 souls,[2] and the Propagation Society is now proclaiming the gospel in nearly six hundred and fifty villages in the Tinnevelly district, amongst not merely food-seeking "rice Christians" but those who have had the courage to face severe persecution for joining the Christian church. Encouraging progress has also been made among the Santals and the Karens in Burmah and Pegu. Speaking generally, it may be said that the largest proportion of native converts is in the south, in the presidency of Madras; next to southern India the most fruitful field is Burmah, where the American Baptist missions are carrying on a successful work among the Karens, while the Propagation Society has founded many schools on the Irawadi, and penetrated up to Rangoon, and beyond British territory to Mandalay; next in point of numbers stand Bengal and the North-West Provinces. Here the largest contingent is supplied by the missions in Chutiá Nagpúr, among the aboriginal tribes of the Kols, while the Santal mission also presents many promising features. For the Punjab district and that of Sind, the Church Missionary Society has planted in Lahore a flourishing theological seminary for Christian Hindus, Sikhs, and Mohammedans, and Christianity has advanced thence by way of Peshawar into Afghanistan and Kashmir. It thus appears that by far the greatest measure of success has been obtained amongst the aboriginal races and those who are either of low caste or of no caste at all, while the real strongholds of the Hindu religion and civilization still stand out like strong fortresses and defy the attempts of the besiegers. Still the disintegrating agency of contact with Christianity is working out its slow but sure results. "Statistical facts," writes Sir Bartle Frere, "can in no way convey any adequate idea of the work done in any part of India. The effect is often enormous where there has not been a single avowed conversion. The teaching of Christianity amongst 160 millions of civilized industrious Hindus and Mohammedans in India is effecting changes, moral, social, and political, which for extent and rapidity in effect are far more extraordinary than any that have been witnessed in modern Europe." "The number of actual converts to Christianity in India," says Lord Lawrence, "does not by any means give an adequate result of missionary labours. There are thousands of persons scattered over India who from the knowledge they have acquired either directly or indirectly through dissemination of Christian truth and Christian principles have lost all belief in Hinduism and Mohammedanism, and are in their conduct influenced by higher motives, who yet fear to make an open profession of the change in them lest they should be looked upon as outcasts and lepers by their own people." To some such a negative result may at first sight appear discouraging; but, read by the light of history, it marks a natural, almost a necessary, stage of transition from an ancient historical religion to Christianity. The Brahma Somaj is not the first instance where a system too vague and shadowy and too deficient in the elements of a permanent religion has filled the interval between the abandonment of the old and the acceptance of a new faith. The cultured classes amongst the Greeks and Romans experienced in their day, after the popular mythology had ceased to satisfy, a period of semi-scepticism before Christianity had secured its hold. Meantime in India the indirect agencies which are at work—the results of war and conquest, of European science and European literature, of the telegraph and the railway, the book and the newspaper, the college and the school, the change of laws hallowed by immemorial usage, the disregard of time-honoured prejudices, the very presence of Europeans in all parts of the country—all these various influences are gradually bringing about results analogous to that to which Sir James Mackintosh referred in a conversation with Henry Martyn, when the Oriental world was made Greek by the successors of Alexander in order to make way for the religion of Christ. But when to these indirect influences we add the effects of direct missionary instruction, of training schools like those of the Free Church of Scotland in Madras, of Bishop Sargent in Tinnevelly, of Bishop Cotton in the North-West Provinces, of Zenana missions now carried on on an extensive scale amongst the female population, of the numerous missionary presses at work circulating thousands of copies of the Holy Scriptures and of Christian books, it is obvious that, small and insignificant as these agencies may seem compared with the magnitude of the work required to be done, there has been a great advance made during recent years. The present century of missions may favourably compare with the primitive and mediæval ages of the church, and the continuity of the missionary spirit operating, as we have seen, after long periods of stagnation and depression is the best guarantee of its ultimate and more complete success at the close of the present epoch, during which, to use Karl Ritter's expression, "almost all the rivers of the earth have begun to run in double currents, and nearly all the seas and rivers have become the seas and rivers of civilization." (G. F. M.)

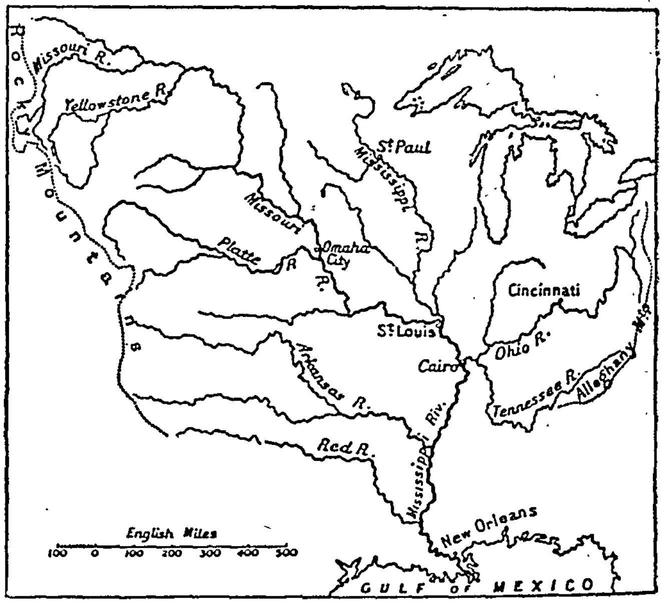
MISSISSIPPI. The territory drained by the Mississippi river and its tributaries includes the greater part of the United States of America lying between the Alleghany Mountains on the east and the Rocky Mountains on the west, and has an area (1,244,000 square miles) considerably larger than all central Europe. The central artery through which the drainage of this region passes is called the Mississippi river for about 1300 miles above its mouth. The name is then usurped by a tributary, while the main



The Mississippi and its Tributaries.

stream becomes known as the Missouri. From its remote sources in the Rocky Mountains to the Gulf of Mexico the total length of the river is about 4200 miles. The other principal tributaries are the Ohio, the Arkansas, and the Red River, but the Yazoo and the St Francis often make dangerous contributions in seasons of flood.

The tables given below exhibit the hydraulic features of the Mississippi and its principal tributaries.

Below the influx of the Ohio the Mississippi traverses alluvial bottom lands liable to overflow in flood seasons. The soil is of inexhaustible fertility, producing large crops of corn in the northern portion, cotton in the middle district, and sugar, rice, and orange groves near the mouth. These bottom lands, averaging about 40 miles in width, extend from north to south for a distance of 500 miles, having a general southern slope of 8 inches to the mile. The river winds through them in a devious course for 1100 miles, occasionally on the east side washing bluffs from 100 to 300 feet in height, but usually confined by banks of its own creation, which, as with all sediment-bearing rivers of like character, are highest near the stream itself. The general lateral slope towards the foot hills is about 6 inches

in 5000 feet, but the normal fall in the first mile is about 7 feet. Thus apparently following a low ridge through the bottom lands, the tawny sea sweeps onward with great velocity, eroding its banks in the bends and rebuilding them on the points, now forming islands by its deposits, and now removing them as the direction of the flow is modified by the never-ending changes in progress. Chief among such changes is the formation of cut-offs. Two eroding bends gradually approach each other until the water forces a passage across the narrow neck. As the channel distance between these bends may be many miles, a cascade perhaps 5 or 6 feet in height is formed, and the torrent rushes through with a roar audible for miles. The banks dissolve like sugar. In a single day the course of the river is changed, and steamboats pass where a few hours before the plough had been at work. The checking of the current at the upper and lower mouths of the abandoned channel soon obstructs them by deposit, and forms in a few years one of the characteristic crescent lakes which are so marked a feature on the maps.

The total area of the bottom lands is about 32,000 square miles, of which only a narrow strip along the immediate banks of the main river and of its principal bayous and tributaries has even yet been brought under cultivation. A proper system of protection against overflow would throw open 2,500,000 acres of rich sugar land, 7,000,000 acres of the best cotton land in the world, and 1,000,000 acres of corn land of unsurpassed fertility.

The work of embankment began in 1717, when the engineer De la Tour erected a dyke or levee 1 mile long to protect the infant city of New Orleans from overflow. Progress at first was slow. In 1770 the settlements extended only 30 miles above and 20 miles below New Orleans; but by 1828 the levees, although quite insufficient in dimensions, had become continuous nearly to the mouth of Red River. In 1850 a great impulse was given to systematic embankment by the U.S. Government, which gave over to the several States all unsold swamp and overflowed lands within their limits to provide a fund for reclaiming the districts liable to inundation. The action

resulting from this caused alarm in Louisiana, for the great bottom lands above were believed to act as reservoirs to receive the highest flood wave; and it was imagined that if they were closed by levees the lower country would be overwhelmed whenever the river in flood rose above its natural banks. The aid of the Government was invoked, and Congress immediately ordered the necessary investigations and surveys. This work was placed in charge of Captain (now General) Humphreys, and an elaborate report covering the results of ten years of investigation was published just after the outbreak of the civil war in 1861. The second of the tables given above, and indeed most of the physical facts respecting the river, are quoted from this standard authority.

To understand the figures of the table it should be noted that at the mouth of Red River, 316 miles above the passes, the water surface at the lowest stage is only $5\frac{2}{10}$ feet above the level of the Gulf, where the mean tidal oscillation is about $1\frac{2}{10}$ feet. The river channel in this section is therefore a freshwater lake, nearly without islands, 2600 feet wide and 100 feet deep along the deepest line. At the flood stage the surface rises 50 feet at the mouth of Red River, but of course retains its level at the Gulf, thus giving the head necessary to force forward the increased volume of discharge. Above the mouth of Red River the case is essentially different. The width increases and the depth decreases; islands become numerous; the oscillation between high and low water varies but little from 50 feet until the mouth of the Ohio is reached—a distance of about 800 miles. Hence the general slope in long distances is here nearly the same at all stages, and the discharge is regulated by the varying resistances of cross section, and by local changes in slope due to the passage of flood waves contributed by the different tributaries. The effect of these different physical conditions appears in the comparative volumes which pass through the channel. At New Orleans the maximum discharge hardly reaches 1,200,000 cubic feet per second, and a rising river at high stages carries only about 100,000 cubic feet per second more than when falling at the same absolute level; while just below the mouth of the Ohio the maximum flood volume reaches 1,400,000 cubic feet per second, and at some stages a rising river may carry one-third more water than when falling at the same absolute level.

The percentage of sedimentary matter carried in suspension by the water varies greatly at different times, but is certainly not dependent upon the stage above low water. It is chiefly determined by the tributary whence the water proceeds, but is also influenced by the caving of the banks, which is always excessive when the river is rapidly falling after the spring flood. In long periods the sedimentary matter is to the water by weight nearly as 1 to 1500, and by bulk as 1 to 2900. The amount held in suspension and annually contributed to the Gulf constitutes a prism 1 mile square and 263 feet high. In addition to this amount a large volume, estimated at 1 mile square and 27 feet high annually, is pushed by the current along the bottom and thus transported to the Gulf.

The mean annual succession of stages for long periods is quite uniform, but so many exceptions are noted that no definite prediction can safely be made for any particular epoch. The river is usually lowest in October. It rises rapidly until checked by the freezing of the northern tributaries. It begins to rise again in February, and attains its highest point about the 1st of April. After falling a few feet it again rises until, early in June, it attains nearly the same level as before. After this it rapidly recedes to low-water mark. As a rule the river is above mid-stage from January to August inclusive, and below that level for the remainder of the year.

It has been established by measurement and observation that the great bottom lands above Red River before the construction of their levees did not serve as reservoirs to diminish the maximum wave which passed through Louisiana in great flood seasons. They had already become filled by local rains and by water escaping into them from the Mississippi through numerous bayous, so that at the date of highest water the discharge into the river near their southern borders was fully equal to the volume which the wave had lost in passing along their fronts.

In fine, the investigations between 1850 and 1860 established that no diversion of tributaries was possible; that no reservoirs artificially constructed could keep back the spring freshets which caused the floods; that the making of cut-offs, which had sometimes been advocated as a measure of relief, so far from being beneficial, was in the highest degree injurious; that, while outlets within proper limits were theoretically advantageous, they were impracticable from the lack of suitable sites; and, finally, that levees properly constructed and judiciously placed would afford protection to the entire alluvial region.

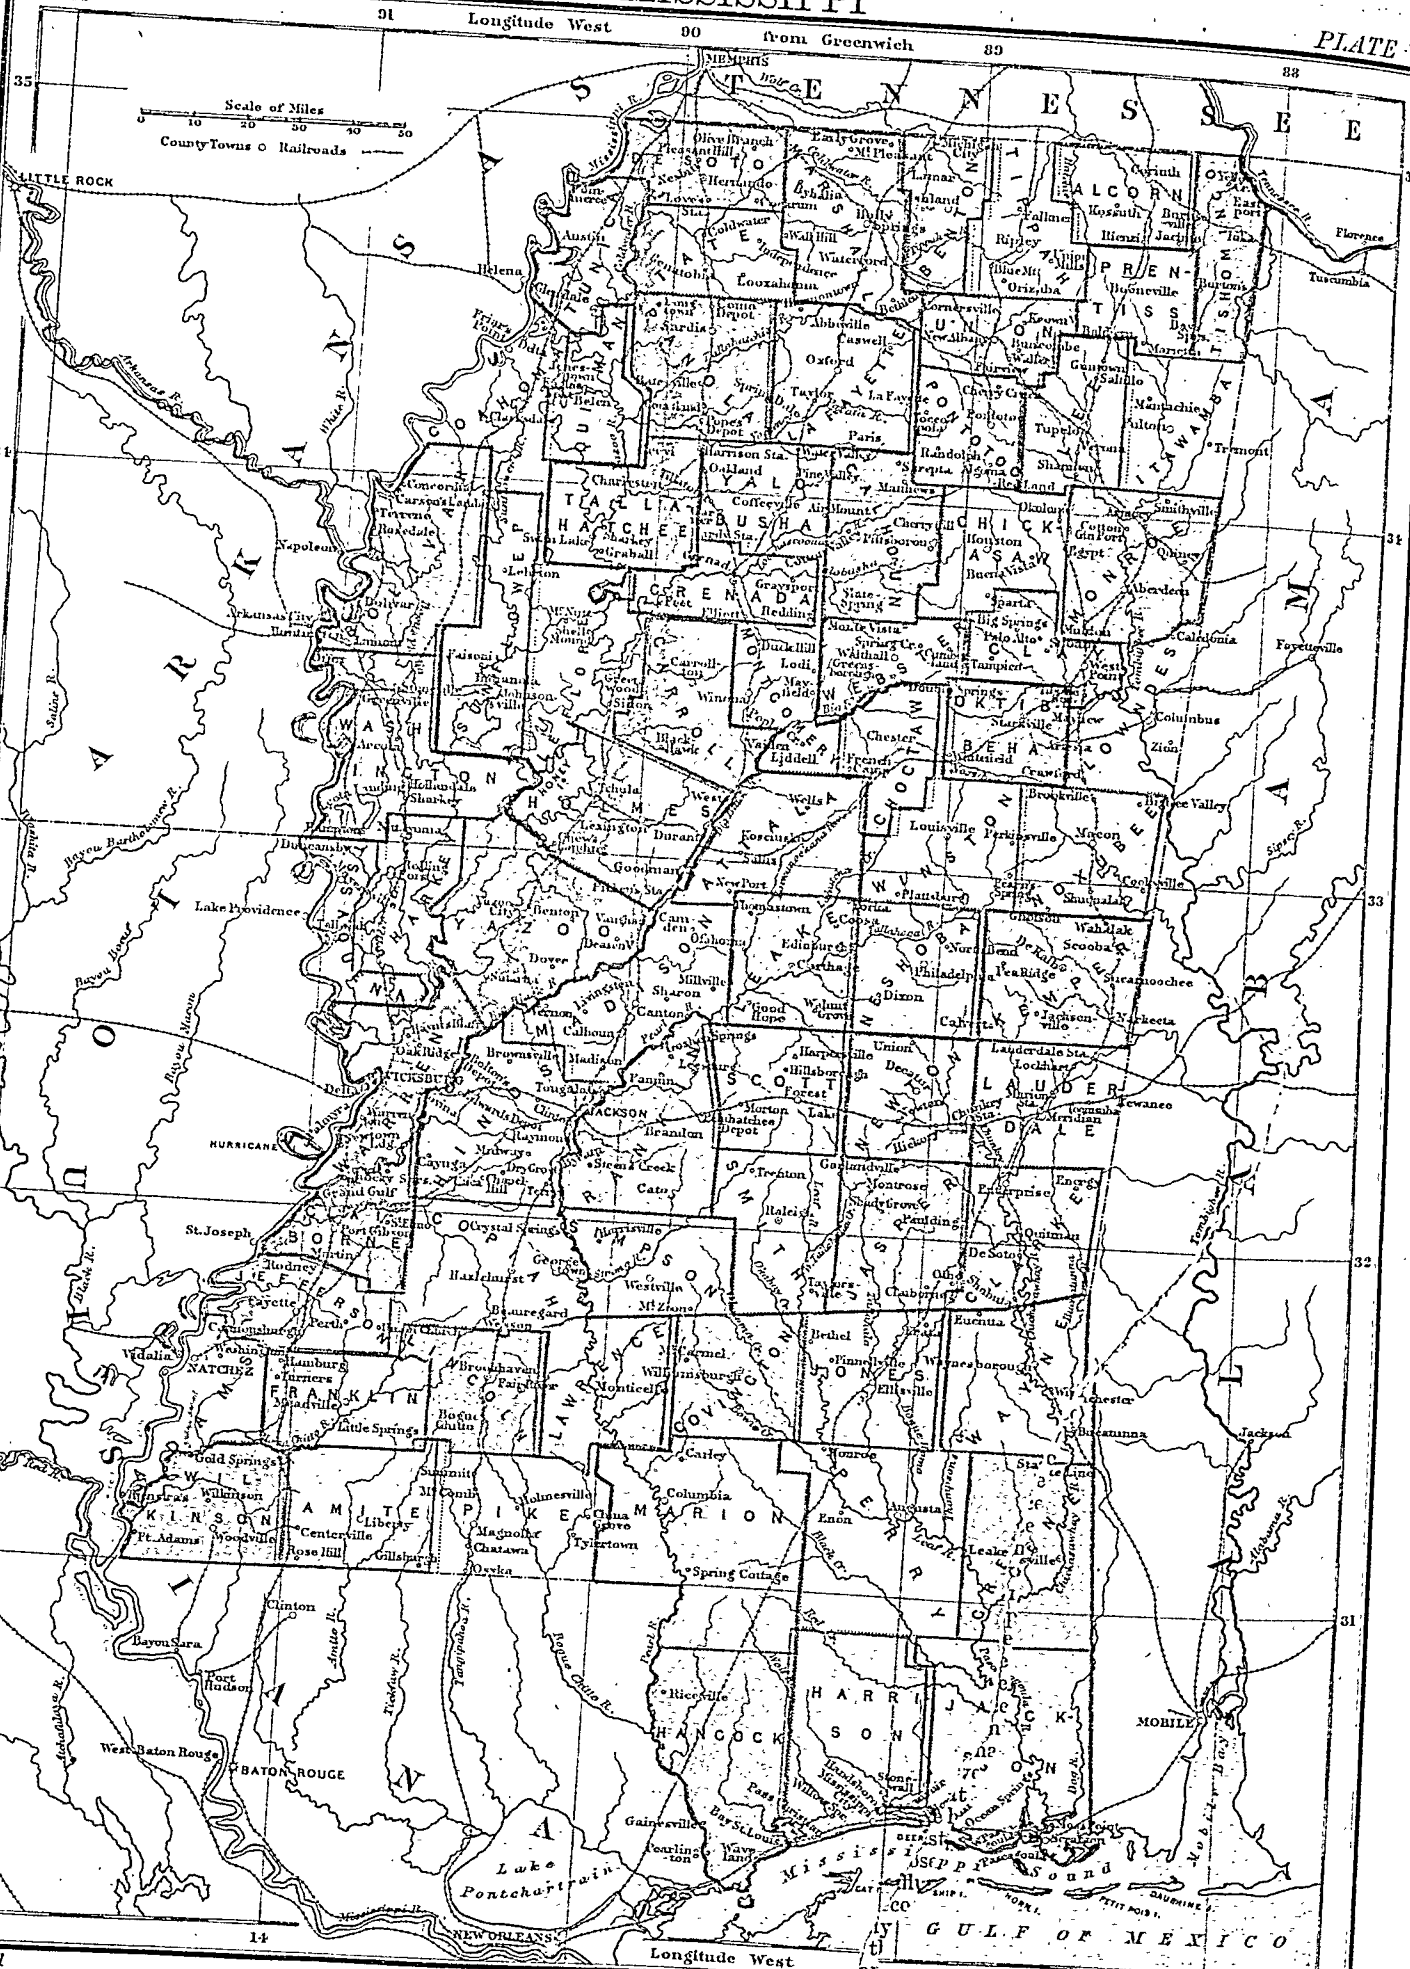
During the civil war (1861–65) the artificial embankments were neglected; but after its close large sums were expended by the States directly interested in repairing them. The work was done without concert upon defective plans, and a great flood early in 1874 inundated the country, causing terrible suffering and loss. Congress, then in session, passed an Act creating a commission of five engineers to determine and report on the best system for the permanent reclamation of the entire alluvial region. Their report, rendered in 1875, endorsed the conclusions of that of 1861, and advocated a general levee system on each bank. This system comprised—(1) a main embankment raised to specified heights sufficient to restrain the floods; and (2), where reasonable security against caving required considerable areas near the river to be thrown out, exterior levees of such a height as to exclude ordinary high waters but to allow free passage to great floods, which as a rule only occur at intervals of five or six years. The back country would thus be securely protected, and a safe refuge would be provided for the inhabitants and domestic animals living upon the portion subject to occasional overflow. An engineering organization was proposed for constructing and maintaining these levees, and a detailed topographical survey was recommended to determine their precise location. Congress promptly approved and ordered the survey; but strong opposition on constitutional grounds was raised to the construction of the levees by the Government.

In the meantime complaints began to be heard respecting the low-water navigation of the river below the mouth of the Ohio. Forty-three places above the mouth of Red River afforded depths of less than 10 feet, and thirteen places depths less than 5 feet, the aggregate length of such places being about 150 miles. A board of five army engineers, appointed in 1878 to consider a plan of relief, reported that 10 feet could probably be secured by narrowing the wide places to about 3500 feet with hurdle work, brush ropes, or brush dykes designed to cause a deposit of sediment, and by protecting caving banks, when necessary, by such light and cheap mattresses as experience should show to be best suited to the work. Experiments in these methods were soon begun upon the river above Cairo, and have since proved of decided benefit.

In June 1879 Congress created a commission of seven members to mature plans to correct, permanently determine, and deepen the channel, to protect the banks of the river, to improve and give safety to navigation, to prevent destructive floods, and to promote and facilitate commerce. Up to 1882 appropriations amounting to £1,285,000 were made to execute the plans of this commission, but with provisos that none of the funds were to be expended in repairing or building levees for the protection of land against overflow, although such levees might be constructed if necessary to deepen the channel and improve navigation. Acting under this authority, the commission have allotted considerable sums to repair existing breaks in the levees; but their chief dependence is upon contracting the channel at low water by promoting lateral deposits, and upon protecting the high-water banks against caving by mats of brush, wire, &c., ballasted where necessary with stone,—substantially the plans proposed by the army board of 1878.

The bars at the efflux of the passes at the mouth of the Mississippi have long been recognized as serious impediments to commerce. The river naturally discharges through three principal branches, the south-west pass, the south pass, and the north-east pass, the latter through two channels, the most northern of which is called Pass à l'Outre. The ruling depth on the several bars varies with the discharge over them, which in turn is controlled by the successive advances of the passes. In the natural condition the greatest

MISSISSIPPI



ENCYCLOPÆDIA BRITANNICA, NINTH EDITION

depth does not exceed 12 or 13 feet. The first appropriation by Congress to secure increased depth was made in 1837, and was expended in an elaborate survey and in a system of dredging by buckets, but the plan of a ship canal was also discussed. At the next appropriation, made in 1852, a board of officers, appointed by the war department, recommended trying in succession—(1) stirring up the bottom by suitable machinery, (2) dredging by buckets, (3) constructing parallel jetties 5 miles long at the south-west pass, to be extended as found necessary, (4) closing lateral outlets, and (5) constructing a ship canal. A depth of 18 feet was secured by the first plan, and was maintained until the available funds were exhausted. Under the next appropriation (1856) an abortive attempt was made to apply the plan of jetties to the south-west pass. This failed from defects in execution by the contractors, but a depth of 18 feet was finally secured by dredging and scraping. The report of 1861 discussed the subject of bar formation at length. Although it approved the plan of jetties and closure of outlets as correct in theory, the stirring up of the bottom by scrapers during the flood stages of the river (six months annually) was recommended by it as the most economical and least objectionable. After the war this recommendation was carried into effect for several years with improved machinery, giving at a moderate annual cost a depth at times reaching 20 feet at extreme low water, but experience indicated that not much more than 18 feet could be steadily maintained. This depth, entirely satisfactory at first, soon became insufficient to meet the growing demands of commerce, and in 1873 Major Howell, the engineer in charge, revived the project of a ship canal. The subject was discussed carefully by a board of army engineers, the majority approving a ship canal. In 1874 Congress constituted a special board which, after visiting Europe and examining similar works of improvement there, reported in favour of constructing jetties at the south pass, substantially upon the plan used by Mr Caland at the mouth of the Meuse; and in March 1875 Captain J. B. Eads and associates were authorized by Congress to open by contract a broad and deep channel through the south pass upon the general plan proposed by this board. This contract called for "the maintenance of a channel of 30 feet in depth and 350 feet in width for twenty years" by "the construction of thoroughly substantial and permanent works by which said channel may be maintained for all time after their completion." The jetties were to be not less than 700 feet apart. The sum of £1,080,000 was to be paid for obtaining this channel, and £412,000 for maintaining it for twenty years. In addition, the contractors were authorized to use any materials on the public lands suitable for and needed in the work. The south pass was $12\frac{9}{10}$ miles long. It had an average width of 730 feet and a minimum interior channel depth of 29 feet. The distance from the 30-foot curve inside the pass across the bar to the 30-foot curve outside was 11,900 feet. The minimum depth at average flood tide on the bar was about 8 feet. The discharge at the mouth was about 57,000 cubic feet of water per second, transporting annually about 22 million cubic yards of sediment in suspension to the Gulf. A small island and shoal existed at the head of the pass, the channel there having a minimum depth of 17 feet. The work was begun on June 2, 1875, and has been so far successful that during the year ending June 30, 1882, a channel was maintained having a least depth of 30 feet between the jetties and extending through the bar. Its least width was 20 feet, the average being 105 feet. The 26-foot channel had a least width of 200 feet, except for a few days. In the pass itself the 26-foot channel had a least width of 50 feet. A very powerful dredge-boat was at work between and beyond the jetties 87 days, of which 51 were devoted to the channel in the Gulf. A deepening of 6 feet has occurred in Pass à l'Outre near its head since 1875. Up to the present time the work has proved of great benefit to the commerce of New Orleans.

For further details, see RIVER ENGINEERING. (H. L. A.)

VI. MISSISSIPPI, one of the Southern States of the American Union, derives its name from the river which for more than 500 miles forms its western boundary between the 35th and 31st parallels of north latitude, separating it from Arkansas and Louisiana. The boundary with the latter State is continued along the 31st parallel, for 110 miles, to the Pearl river, and then down the Pearl to its mouth. The Gulf of Mexico, eastward from the mouth of Pearl river, completes the southern boundary. On the north the 35th parallel, from the Mississippi river to the Tennessee, separates the State from Tennessee, and the boundary then follows the latter river to the mouth of Bear Creek, in 34° 53′ N. lat. and 88° 15′ W. long. The eastern boundary of the State, separating it from Alabama, follows a line drawn from the mouth of Bear Creek about seven degrees west of south to what was "the north-western corner of Washington county on the Tombigbee," and thence due south to the Gulf of Mexico. Ship, Horn, Cat, and Petit Bois Islands, and those nearer the shore, form a part of Mississippi. The extreme length of the State, north and south, is 330 miles, and its maximum breadth is 188 miles. Under the United States surveys, begun in 1803, the State has been divided into townships and sections, except such parts as were at the first owned by individuals. The area of the State is given in the census reports for 1880 as 46,340 square miles.

Topography.—There are no mountains in Mississippi, but a considerable difference of level exists between the continuously low, flat, alluvial region lying along and between the Mississippi and Yazoo rivers, called "the Bottom," and nearly all the remainder of the State, which is classed as upland. The latter part, comprising five-sixths of the whole, is an undulating plateau whose general elevation above the water of the Gulf of Mexico increases to 150 feet within a few miles of the coast, and varies elsewhere from 150 to 500 or 600 feet. Some exceptional ridges are probably 800 feet high. The streams of this region flow in valleys varying in width from a few hundred yards to several miles. The fall of each river is not great, and is quite uniform. Usually a considerable part of the valley of each larger stream is several feet above its present high water mark, and forms the "hommock," or "second bottom" lands. On some of the rivers the lowest part of the valley, subject to overflow, is several miles in width, and bears a resemblance to the Mississippi Bottom.

Ridges or plateaus everywhere in the upland region divide the contiguous basins of creeks and rivers, descending more or less abruptly to their valleys. In the north-eastern part of the State, almost level prairies cover large areas overlying a Cretaceous formation called Rotten Limestone.

A line of abrupt bluffs, extending southward from the north-west corner of the State, divides the upland region from the Bottom, where the general surface lies below the high-water level of the Mississippi river. A few low ridges, running north and south, and embracing about 200,000 acres, are barely above high water. The cultivated lands in the Bottom lie on these, and on the borders of the rivers and the numerous lakes and bayous, where the surface is slightly elevated. Low swamps or marshes, in which flourish large cypress trees (*Taxodium distichum*), lie between the streams, and frequently receive the surface drainage from their banks. Large forest trees and dense cane-brakes (*Arundinaria gigantea*) occupy the drier ground. The Mississippi river is prevented from flooding the Bottom during high water by a system of levees or embankments built by a fund derived partly from taxation on the land and partly from the proceeds of the sale of public lands in the State classed as "swamp lands," which were given over for this purpose by Congress. The only compensation for the injury done when breaks in the levees ("crevasses") occur is the deposit of alluvial matter left by the overflow, which adds to the productiveness of the already wonderfully fertile soil. The present levee system usually protects about one-fourth of the 4,000,000 acres in the Bottom. Many crescent-shaped lakes ("cut-offs") occur in the Bottom. Similar phenomena present themselves in the channels of the other rivers having wide bottoms.

The volume of water in the streams varies greatly during the year, and is usually largest between the months of January and April. During high water all the larger streams are navigable by steamboats. These ply upon the Mississippi, Tennessee, and Yazoo rivers throughout the whole year. The rivers flowing into the Gulf are much obstructed by sand-bars, and are chiefly used for floating logs to the saw-mills on the coast.

The best and only deep harbour on the coast is the well-protected roadstead inside of Ship Island. It has a depth of 27 feet, a firm clay bottom, and is readily accessible to lighters from the shallower harbours along the coast.

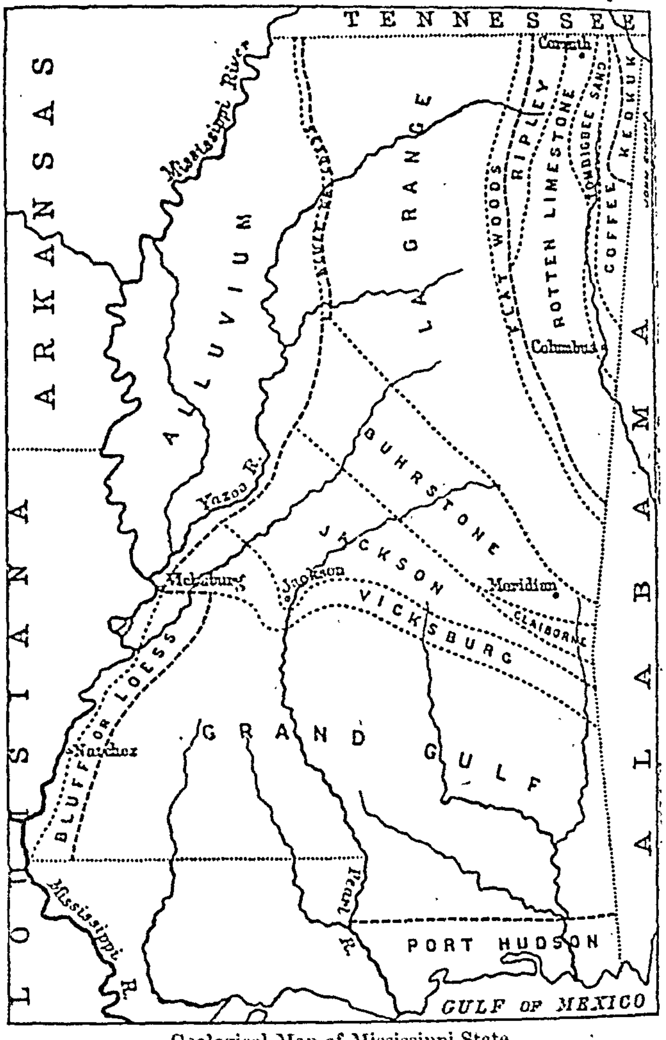
Climate.—Near the waters of the Gulf of Mexico the climate is much milder than in the northern parts of the State. On the southern borders the temperature rarely falls to 32° Fahr., or exceeds 95°, the annual mean being about 68°. The orange, lemon, almond, banana, and olive can be grown without protection. In the latitude of Vicksburg the temperature ranges from 98° to 20°, very rarely lower; the annual mean is 65°. The range in the northern part of the State is from 98° to 15°, or rarely 10°, and the annual mean is 61°. The first and last hoar-frosts occur, in the central parts of the State, usually in the latter parts of October and March. The ground is seldom frozen to the depth of 3 inches, and only for a few days at a time. The rainfall on the coast is 60 to 65 inches per annum, and at the northern boundary 50 inches. While about two-thirds of this precipitation occurs in winter and spring, a month seldom passes without several inches of rainfall.

Land and sea breezes in the south, and variable winds elsewhere, make the heat of summer tolerable. In healthfulness Mississippi compares favourably with other States. The average death-rate of thirteen States, variously situated, as given in the census of 1880, is 1·38 per cent.; that of Mississippi is 1·19 per cent. Where the surface is flat and poorly drained malarial fevers are prevalent during the warm season. Yellow fever has become epidemic after importation, but strict quarantine has been successful in preventing it.

Geology.—In accordance with an Act of the legislature passed in 1850, an agricultural and geological survey of the State was begun, which continued, with interruptions, until 1871. Two reports have been published, one in 1854 and another in 1860.

The geological structure of the State is comparatively simple, and closely related to that of the adjacent States. The older formations are nearly all overlaid by deposits of the Quaternary period, which will be described last. In the extreme north-eastern portion are found the oldest rocks in the State,—an extension of the Subcarboniferous formation which underlies the Warrior coal-fields of Alabama. The strata here show some traces of the upheaval which formed the Appalachian mountain chain, whose south-west termination is found in Alabama. When this chain formed the Atlantic mountain-border of the continent, excepting this north-east corner, Mississippi had not emerged from the waters of the ancient Gulf of Mexico. As the shore-line of the Gulf slowly receded southward and westward, the sediment at its bottom gradually came to the surface, and constituted the Cretaceous and Tertiary formations of this and adjacent States. Wherever stratification is observed in these formations in Mississippi, it shows a dip west and south of 20 or 30 feet to the mile. The Cretaceous region includes, with the exception of the Subcarboniferous, all that part of the State eastward of a line cutting the Tennessee boundary in 89° 3′ W. long., and drawn southward and eastward through the towns of Ripley, Pontotoc, and Starkville, crossing into Alabama in latitude 32° 45′. Four groups of Cretaceous strata have been determined in Mississippi, defined by lines having the same general direction as the one just described. The oldest, bordering the Subcarboniferous, is the Eutaw or Coffee group, characterized by bluish-black or reddish laminated clays, and yellow or grey sands, containing lignite and fossil resin. Westward and southward to the city of Columbus is the Tombigbee sand group, consisting chiefly of fine-grained micaceous sands of a greenish tint, with many marine fossils. Next in order, westward and southward, is the Rotten Limestone group, made up of a material of great uniformity,—a soft chalky rock, white or pale blue, composed chiefly of tenacious clay, and white carbonate of lime in minute crystals. Borings show the total thickness of this group to be about 1000 feet. Fossils are abundant, but species are few. The latest Cretaceous is the Ripley group, lying west of the northern part of the last-named group, and characterized by hard crystalline white limestones, and dark-coloured, micaceous, glauconitic marls, whose marine fossils are admirably preserved. One hundred and eighty species have been described. The total thickness of the Cretaceous is about 2000 feet. Deposits of the Tertiary period form the basis of more than half the State, extending from the border of the Cretaceous westward nearly or quite to the Yazoo and Mississippi Bottom, and southward to within a few miles of the Gulf coast. Seven groups of the Tertiary strata have been distinguished. Beginning nearest the Cretaceous, the Flatwoods group is characterized by grey or white clays, and a soil which responds poorly to tillage. The Lagrange group, lying to the west of the last, is marked by grey clays and sands, fossil plants, and beds of lignite or brown coal, sometimes 8 feet in thickness. The Buhrstone group, lying south-westward from the last, is characterized by beds of white siliceous clays, and of silicified shells, and sandy strata containing glauconite in valuable quantities. The Claiborne group lies south of the last, and is slightly developed in Mississippi, but well-marked in Alabama. The Jackson group, south-west of the last two, is made up chiefly of soft yellowish limestones or marls, containing much clay, and sandy strata with glauconite. Zeuglodon bones and other marine fossils are abundant. The Vicksburg group lies next in order south-westward, and is characterized by crystalline limestones and blue and white marls. Marine fossils are very abundant. More than one hundred and thirty species have been determined. The Grand Gulf group, showing a few fossil plants and no marine fossils, extends southward from the last to within a few miles of the coast.

The oldest formation of the Quaternary period is the "orange-sand" or "stratified drift," which immediately overlies all the Cretaceous groups except the prairies of the Rotten Limestone, and all the Tertiary except the Flatwoods and Vicksburg groups and parts of the Jackson. Its depth varies from a few feet to over 200 feet, and it forms the body of most of the hills in the State. Its materials are pebbles, clays, and sands of various colours from white to deep red, tinged with peroxide of iron, which sometimes cements the pebbles and sands into compact rocks. The shapes of



Geological Map of Mississippi State.

these ferruginous sandstones are very fantastic,—tubes, hollow spheres, plates, &c., being common. The name stratified drift is used by the geologist of Alabama to indicate its connexion with the northern drift. The fossils are few, and in some cases probably derived from the underlying formations. Well-worn pebbles of amorphous quartz, agate, chalcedony, jasper, &c., are found in the stratified drift along the western side of the Tertiary region of the State, and from Columbus northward. "While this formation is not well understood, it seems tolerably well established that the melting of the great glaciers of the north furnished the water which brought with it fragments of the rocks over which it passed, and flowed into the Gulf with a current which was most rapid where the pebbles were dropped, but overspread the remainder of the State with a gentler flow, leaving sands and clays" (E. A. Smith). The second Quaternary formation is the Port Hudson, occurring within 20 miles of the Gulf coast, and probably outcropping occasionally in the Mississippi Bottom. Clays, gravel, and sands, containing cypress stumps, drift-wood, and mastodon bones, are characteristic. The loess or bluff formation lies along the bluffs bordering the Bottom, nearly continuously through the State. Its fine-grained, unstratified silt contains the remains of many terrestrial animals, including fifteen mammals.

The surface and subsoil of nearly all the upland region of Mississippi, the southern part being the exception, is composed of yellow loam or brick-clay containing no fossils, and showing no stratification. The soil of the Rotten Limestone region is similar in its general make up, but is black, and contains more lime and clay. Both are regarded as an independent aqueous deposit, posterior to the stratified drift and bluff formations, and anterior to the alluvium of the present epoch. The "second bottoms," probably, are later than the yellow loam, and belong to the "terrace epoch." The latest formation, alluvium, is strongly marked, and covers a large area in the Yazoo and Mississippi Bottom, and along other streams.

The following are the equivalents of the Mississippi groups in Dana's *Geology*:—

Quaternary	20*d* Alluvium		Alluvium.
	20*c* Loam and loess		Loam and loess.
	20*b* Port Hudson		Port Hudson.
	20*a* Drift		Stratified drift.
Tertiary	19*a* Eocene	*Upper*	Grand Gulf. Vicksburg.
		Middle	Jackson. Claiborne.
		Lower	Buhrstone, Lagrange. Flatwoods.
Cretaceous	18*b* Upper		Ripley. Rotten Limestone.
	18*a* Lower		Tombigbee. Coffee.
Subcarboniferous			Keokuk.

Minerals.—Metallic ores are not found in Mississippi in paying quantities. The only valuable minerals are sandstones and limestones, marls, sands, lignite or brown coal, and fire-clays. None of these have been extensively brought into market. Potable water is found almost everywhere. Artesian wells furnish it in the Rotten Limestone region, when bored into the underlying Coffee strata.

Fauna.—Mississippi affords perhaps no species which are not found in the neighbouring States. There are thirty or forty species of *Mammalia*, the most remarkable being the American opossum, still quite abundant. The deer (*Cervus virginianus*), black bear (*Ursus americanus*), wolves (*Canis lupus* and *Lupus americanus*), catamount (*Felis concolor*), and wild-cat (*Lyncus rufus*) have much decreased in number, and may, like the buffalo and elk, shortly become extinct. About one hundred and fifty species of birds are found during at least part of the year. Many are seen only *in transitu*, and about twenty species from the north spend the winter here. The mocking bird (*Mimus polyglottus*), the most remarkable songster, is very abundant. The wild turkey (*Meleagris gallipavo*) survives by virtue of its wary and watchful character. Over fifty species of *Reptilia* have been found, prominent among which is the alligator (*A. mississippiensis*), which attains a length of 12 or 15 feet, and is common in the southern river bottoms. The rattlesnake, moccasin, and copperhead, venomous serpents, are occasionally found. About half of the sixty-three species of fish abounding in the fresh and salt waters of the State are valuable for food. The edible oysters and crustaceans of the coast are remarkably fine.

Flora.—Originally nearly the entire State was covered with a growth of forest trees of large size, mostly deciduous. The undergrowth was kept down by annual burnings by the natives, and the ground became carpeted with grasses and herbs. Over 120 species of forest trees are found; many valuable ones are abundant, and their timber constitutes a large item in the resources of the State. Of the 15 species of oak the most valuable are the live-oak (*Q. virens*), found near the coast, and the white-oak (*Q. alba*), widely distributed. The cypress (*Taxodium distichum*) is very abundant in the bottoms. Various species of hickory, the chestnut, black walnut, sweet gum, cucumber tree, cottonwood (*Populus deltoides*), red cedar, elms, holly, magnolias, maples, ash, persimmon, sycamore, tupelo, and many others valuable for their timber, are abundant and of large size. The long-leaved pine (*P. australis*) forms the principal forest growth south of lat. 32° 15'. It attains a diameter of 2 or 3 feet, has a tall and shapely trunk, and its timber is unsurpassed in the variety of its uses. The census reports estimate the merchantable timber of this species now standing in the State at 18,200,000,000 feet, board measure. The amount cut in 1880 was 108,000,000 feet. The short-leaved pine (*P. mitis*), almost as valuable, is found in various parts, the quantity now standing being estimated at 6,775,000,000 feet. The total value of the pine timber of the State is about $250,000,000.

Agriculture is the leading industry in Mississippi. Over 300,000 of the population are directly engaged in the cultivation of 4,895,000 acres of land. The character of the soil is varied, and all is productive, except that in the Flatwoods region and in the district covered with long-leaved pine, where only the valleys are fertile. At least half the State is exceptionally fertile. Not more than one-fourth of the arable land has been brought into cultivation, and two millions of acres of the best lands in the State, lying in the Bottom, might be made arable by proper drainage.

Cotton is the chief agricultural product; in 1880 Mississippi ranked first among the States in the amount raised. The crop of 1879-80 amounted to 955,808 bales, worth $43,000,000. There were produced also of cotton seed 28,000,000 bushels, worth $3,000,000; of Indian corn, 21,340,800 bushels; of oats, 1,959,620 bushels; of wheat, 218,890 bushels; of rice, 1,718,950 lb. Small quantities of rye, barley, molasses, and tobacco, and abundant crops of potatoes, yams, pease, and all garden vegetables, are annually produced.

Fruits of various kinds flourish in many parts of the State, and, with early vegetables, are largely shipped to the northern markets in spring and early summer. The value of the cotton crop is about three times as great as that of all the other products of the soil, which are sometimes insufficient for home consumption. Economically this specialization of agriculture is to be regretted; but successful efforts are being made to diversify it by growing other crops to which the soil and climate are equally well suited.

Manufactures.—The principal articles manufactured are lumber, cotton and woollen goods, cotton seed oil, and agricultural implements.

Population.—The number of inhabitants according to the different census returns from 1850 is given in the following table:—

Census.	Total.	White.	Coloured.	Density per Sq. Mile.
1850	606,526	295,718	310,808	13·09
1860	791,314	353,910	437,404	17·07
1870	829,609	381,519	445,060	17·9
1880	1,131,592	479,371	652,221	24·42

Of the coloured population, mostly freedmen and their descendants, 1738 were Indians or half-breeds in 1880, and about 60,000 mulattoes. The whites own nearly all the farms and other real property. The total property valuation in the State decreased from $607,324,911 in 1860 to $209,197,345 in 1870, on account of the losses in war and the liberation of the slaves. There has been, however, a rapid increase in the last decade. The towns in the State have small populations: in 1880 Vicksburg had 11,814 inhabitants, Natchez 7058, and Jackson, the State capital, 5204.

Administration.—The three departments, legislative, executive, and judiciary, are similar to those of other States. The governor and other executive officers are elected for four years. The legislature, which meets biennially, is composed of forty senators, serving four years, and one hundred and twenty representatives, serving two years. These are apportioned to the seventy-four counties according to population, and elected by the people. The judiciary officers, consisting of three justices of the supreme court, twelve circuit judges, and twelve chancellors, are appointed by the governor with the consent of the senate. One attorney-general and twelve district attorneys are elected by the people. The State maintains a public school system, with separate schools for the two races, costing in 1880 $830,704, besides a State university and other schools of high grade for each of the races.

History.—Mississippi was first visited by Europeans in 1540, when the adventurous expedition of De Soto reached its northern parts. After the disastrous termination of this expedition no other Europeans visited this region until 1673, when Joliet and Père Marquette descended the Mississippi to lat. 33°. In 1682 La Salle and Tonty descended to the mouth of the river, and claimed the whole region drained by it for the king of France, giving it the name Louisiana. In 1699 the first colonists reached the coast of Mississippi, sent from France under Iberville. Settlements were made on Ship Island and Cat Island, and upon the mainland on the eastern side of Biloxi Bay, at Bay St Louis, and at Mobile. The colony did not prosper, and in 1712 Anthony Crozat obtained by charter from the king all the commercial privileges of the lower Mississippi valley. Under his management the colony languished, and in 1717 the king accepted the surrender of his charter, and granted another with more extended privileges to the "Western Company," or "Mississippi Scheme," with John Law as director-general, and Bienville as governor of the colony. Under this management the rich alluvial lands on the Mississippi river began to be occupied; tobacco, rice, and indigo were cultivated, and African slaves were introduced. Settlements were made near the present city of Natchez in 1720. Two years later, Law's company becoming bankrupt, much embarrassment in the colony followed, and troubles also began with the natives. On November 28, 1729, the Natchez Indians surprised and murdered about 200 of the white male residents, and made captives of about 500 women and children and negroes. A war followed, resulting in the destruction of the Natchez tribe. The representatives of the "Western Company" returned their franchises to the king in 1732, the number of colonists and slaves being then about 7000. After two unsuccessful campaigns against the Chickasaw Indians in the northern part of what is now Mississippi, Bienville was superseded by the Marquis de Vaudreuil in 1740.

By the treaty of Paris, in 1763, France ceded all her possessions east of the Mississippi river to England, excepting the island of New Orleans, ceded to Spain. The British province of West

Florida at first extended eastward from the Mississippi river along the Gulf coasts, with its northern limit at the 31st parallel of north latitude. Soon afterwards the northern boundary was fixed at a line drawn eastward from the point where the Yazoo river unites with the Mississippi.

Under British rule the Natchez country, which had been deserted since the massacre of 1729, and the southern part of the present State of Mississippi, rapidly filled with settlers, many of them emigrants from the Atlantic colonies. Cotton, indigo, and sugar were cultivated, and negro slaves continued to be freely introduced. During the revolutionary war of the Atlantic colonies, West Florida, being far removed, remained undisturbed until 1779. Spain and England being then at war, Galvez, the governor of New Orleans, aided by sympathizers with the revolutionary colonists, took possession of the whole of West Florida for the king of Spain. At the peace of 1783 England acknowledged the 31st parallel as the southern boundary of the United States, and ceded West Florida to Spain. The district between the 31st parallel and the parallel through the mouth of the Yazoo was therefore claimed by the United States and by Spain, the latter being in possession. After tedious negotiations the latter power relinquished the district in March 1798, and Congress at once formed it into "the Mississippi Territory," which extended from the Mississippi river eastward between the two above-mentioned parallels of latitude to the Chattahoochee river.

The State of Georgia claimed as a part of its domain all of the district east of the Mississippi river, and between the 31st and 35th parallels. In 1802 it ceded its claims to the Federal Government for certain considerations, and in 1804 Congress extended the imits of the Mississippi Territory northward to the 35th parallel. Nearly all of the Territory was then owned by the native Indians. The Choctaws occupied the southern part, and the Chickasaws the northern part of what is now the State of Mississippi. In 1812 the United States troops occupied Spanish West Florida, and the district east of Pearl river and south of lat. 31° was added to the Mississippi Territory. The Territory was divided by the present line between Alabama and Mississippi, and the State of Mississippi admitted into the Union in 1817. In 1830–32 the native tribes exchanged their lands for others west of the Mississippi river and were nearly all removed, and a rapid influx of settlers followed. In January 1861 the State seceded from the Federal Union, and, joining the Southern Confederacy, furnished a large number of troops during the civil war. It was the field of many important campaigns, and suffered great losses. Exhausted by the conflict, and harassed by processes of political reconstruction, the State was in a deplorable condition for several years. But within the last decade an era of prosperity commenced, marked by a large increase in population and great activity in agricultural and other pursuits.

(R. B. F.)

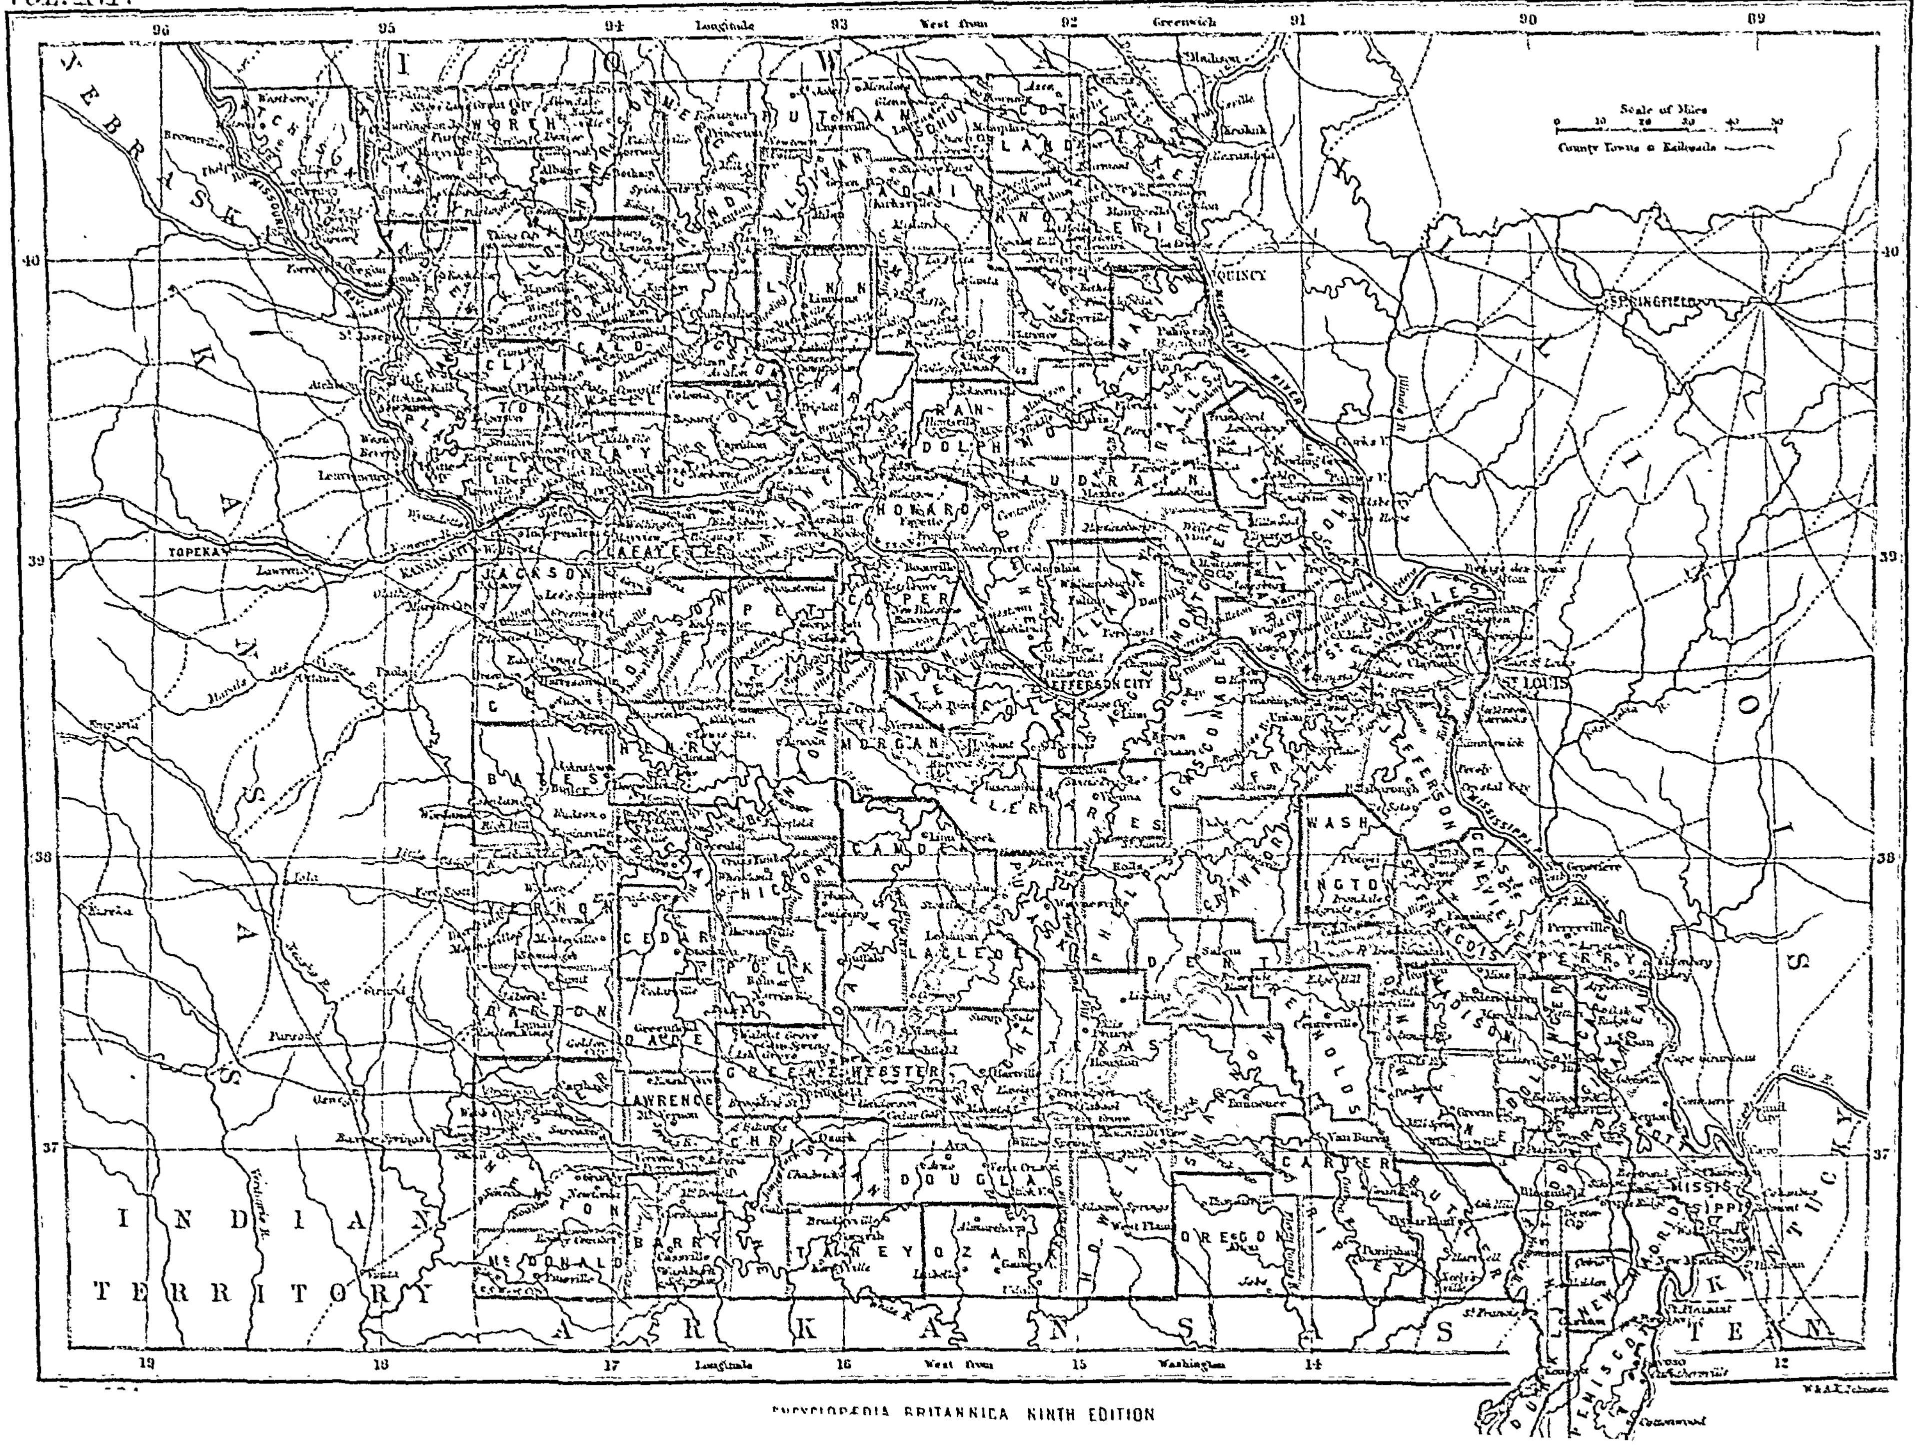
MISSOLONGHI, or Mesolonghi (Μεσολογγίον), a city of Greece, the chief town of the nomarchy of Acarnania and Ætolia, situated on the north side of the Gulf of Patras, about 7 miles from the coast, in the midst of a shallow lagoon, with a population of 6324 in 1879, is notable for the siege of two months which Mavrocordatos with a handful of men sustained in 1821 against a Turkish army 11,000 strong, and for the more famous defence of 1825–26 (see vol. xi. p. 125). Byron died there in 1824, and is commemorated by a cenotaph.

Plate VII. MISSOURI, a Central State of the American Union, lying almost midway between the Atlantic and the Rocky Mountains, British America and the Gulf of Mexico. Its eastern boundary is the Mississippi, separating it from Illinois, Kentucky, and Tennessee. North and south its boundaries with Iowa and Arkansas respectively are mainly coincident with the parallels of 40° 30′ and 36° 30′ N. lat.; but a small peninsula between the Mississippi and St François rivers stretches 34 miles farther south between Arkansas and Tennessee. The western border, with Nebraska, Kansas, and the Indian Territory, is nearly coincident with the course of the Missouri to the junction of that stream with the Kansas, and then follows the meridian of 17° 40′ W. of Washington (94° 43′ W. of Greenwich). The area of the State is 65,350 square miles, the extreme length from north to south 282 miles, the extreme width 348 miles. Missouri is divided into a northern and southern portion by the Missouri river, flowing 400 miles in a generally easterly direction from its junction with the Kansas to the point 12 miles above St Louis where it unites with the Mississippi. Northern Missouri has a surface broken and hilly, but not mountainous. It is mainly prairie land, well watered by streams, and fit for agriculture; but there is a good deal of timber in the eastern parts, especially along the bold bluffs of the two great rivers. Southern, Missouri is almost equally divided between timber land in the east and prairie in the west. In its south-western portion rises the table-land of the Ozark hills (highest point 1600 feet above the sea). The Osage, the Gasconade, and other streams flow northward and eastward into the Missouri. The south-eastern lowlands form an undulating country, readily drained after rain, with fertile ridges generally running north and south, occasional abrupt isolated hills, forests of oak, hickory, elm, maple, ash, locust, willow, persimmon, pecan, chestnut, and cherry trees, and in the lowest parts swamps and morasses. High rocky bluffs extend along the banks of the Mississippi from the mouth of the Meramec river to Ste Genevieve, rising sometimes precipitously to the height of 350 feet above the water, and low bottom lands with many lakes and lagoons extend from Ste Genevieve to the Arkansas border. The south-east corner of the State is 275 feet above the sea, the north-east corner 445 feet, and the north-west corner 1000 feet.

Climate.—The climate of Missouri, lying as it does far from the ocean and unprotected by mountain ranges, is one of extremes in heat and cold, moisture and drought. The Ozark range is high enough to influence the climate locally, but not to affect that of the whole State. The mean summer temperature for the ten years 1870–80 ranged from 75° in the north-west of the State to 78°·5 in the south-east; but the thermometer has been known to rise to 104°. The winter temperature averaged 33°·87 for the whole State, varying from 28°·5 in the north-west to 39°·5 in the south-east. In some winters the temperature hardly falls to zero; in others 20° below zero have been registered. The Mississippi at St Louis freezes over once in four or five years; but this is partly caused by the accumulations of floating ice coming down from the north. The river has closed as early as the first week in December, and, again, has remained open until the last week in February. It is in cold seasons sometimes passable for the heaviest teams. The Missouri river is often closed during the whole winter. The mean annual temperature of the State varies from 53° to 58°. The climate is, on the whole, dry; for, in spite of the abundant rains, especially in the spring, evaporation is so rapid that the atmosphere is rarely overloaded with moisture. April is the driest month. The greatest amount of rain falls in the south-eastern part of the State. An unusual amount of fair weather, prevailing clearness of sky, general salubrity of soil and climate, are chief among the natural advantages of this great State.

Geology.—The stratified rocks of Missouri belong to the following divisions:—Quaternary, Tertiary, Carboniferous, Devonian, Silurian, and Archæan. The Quaternary system comprises the drift, 155 feet thick; the bluff, 200 feet above the drift; then the bottom prairie, 35 feet thick; and on the surface the alluvium, 30 feet in thickness. Clays with strata of sands, marls, and humus form the alluvial bottoms of the two great rivers of the State, and make up a soil deep, light, and incomparably rich. Beneath the alluvium is found the bottom prairie, made up also of sands, clays, and vegetable moulds. This formation is found only in the bottom lands of the Missouri and Mississippi rivers, and more abundantly in those of the former. Numerous and well-preserved organic remains are found in the bottom prairie,

MISSOURI



ENCYCLOPÆDIA BRITANNICA NINTH EDITION

including the shells found in great quantities in the bluff and remains of the mastodon and many trees and plants. Below this formation, resting upon the drift, is the bluff. This rests upon the ridges and river bluffs, and thus is topographically higher, although geologically lower, than the bottom prairie. It is composed chiefly of a grey siliceous marl, coloured sometimes to a deep brown or red by the stains of oxide of iron. This formation extends along the bluffs of the Missouri from Fort Union to its mouth, and is found capping those of the Mississippi from Dubuque to the mouth of the Ohio. It is sometimes 200 feet thick; at St Joseph it is 140, at Booneville 100, at St Louis 50, in Marion county only 30 feet. This formation has interesting fossils (*Elephas primigenius*, &c.). The drift, the lowest of the Quaternary system, appears in the altered drift, the boulder formation, made up largely of the igneous and metamorphic rocks, with rocks from the Palæozoic strata upon which the others rest. Large boulders, five or six feet in diameter, are found, usually of granite or metamorphic sandstone; no fossils except a few logs in the altered drift have been found in this formation. The Tertiary formation in Missouri is composed of clays, shales, iron ores, sandstone, and sand, and extends along the bluffs and bottoms of the south-east part of the State. Iron ore is found in this formation in great abundance; sand of the best quality for glass-making and clays for pottery and stoneware also abound. Below the Tertiary bed are found rocks which strongly resemble Cretaceous beds found in other places in the United States. These strata are in such a state of irregularity and disturbance as to indicate the occurrence of some great movements after their deposition and before the formation of the Tertiary strata. The Upper Carboniferous system, or coal measures, made up of sandstone, limestone, marl, coal, and iron ores, covers an area of more than 23,000 square miles in Missouri, occupying the western and northern portions of the State. The supply of bituminous and cannel coals found here would seem to be well-nigh inexhaustible. In the Lower Carboniferous rock are found many varieties of limestone and sandstone. Among these are the Upper Archimedes Limestone, 200 feet; Ferruginous Sandstone, 195 feet; Middle Archimedes Limestone, 50 feet; St Louis Limestone, 250 feet. The Devonian system is represented by limestone in Marion, Ralls, Pike, Callaway, Saline, and Ste Genevieve counties, among which occur the Chouteau Limestone, 85 feet; Lithographic Limestone, 125 feet; Onondaga Limestone, 100 feet. Of the Upper Silurian series are the following formations:—Lower Helderberg, 350 feet; Niagara Group, 200 feet; Cape Girardeau Limestone, 60 feet. Prominent among the Lower Silurian formations are the Trenton Limestone, 360 feet; the Black River and Bird's Eye Limestone; and the Magnesian series. The last-named series is valuable both in a scientific and an economic sense. It covers much of the southern and south-eastern portions of the State, and in it are found vast deposits of lead, zinc, copper, cobalt, iron ores, and marble. The Archæan rocks occur below the Silurian deposits, and contain siliceous and other slates in which no fossils are found. The porphyry rocks of this formation also contain iron ores.

Coal.—The exposed coal in Missouri includes upper, middle, and lower measures. In the first are about 4 feet of coal, and the area of exposure is about 8400 square miles. The middle coal measures contain about 7 feet of coal, and cover an exposed area of about 2000 square miles. The lower measures have five workable seams, varying from 18 inches in thickness to 4½ feet, and also some thin seams of only a few inches. In 1880 556,304 bushels of bituminous coal were raised in thirty-five counties of Missouri, the value at the pit mouth being $1,060,225. $642,772 were paid in wages to 2599 persons. The Missouri coal mines are easily worked.

Iron.—The iron ores are red hæmatite, red oxide, specular iron, brown hæmatite or limonite, and clay ironstone. Manganiferous and siliceous specular ores occur in the porphyries of the Archæan rocks, and in the granites. The greatest exposure of specular iron yet discovered is Iron Mountain, the purest mass or body of iron ore known. Analysis shows it to contain from 65 to 69 per cent. of metallic iron. The ore of Shepherd Mountain is not so rich as that of Iron Mountain, but is uniform in character, free from sulphur and phosphoric acid and on the whole superior to any other yet developed in Missouri. Pilot Knob ore gives 53 to 60 per cent. metallic iron, and has few deleterious substances. It is fine-grained, light bluish grey in colour. The ore of the Scotia iron banks and Iron Ridge are much alike in appearance and character, being specular boulders imbedded in soft red hæmatite. In some of these boulders are cavities in which the ore has taken botryoidal form, and upon these peroxide of iron crystallizations are so formed that a gorgeous show of prismatic colours is presented. The above are the chief deposits of iron ores, but limonites are found mostly in the southern parts of the State. The counties of Ste Genevieve, Madison, St François, Cape Girardeau, Bollinger, Wayne, Stoddard, Washington, Reynolds, Shannon, Carter, and Ripley have the greatest exposures of these ores, although they are found in many others. The supply of iron ores is, indeed, practically inexhaustible.

Lead.—Second only to iron among the metals of Missouri is the vast deposit of lead found in the southern parts of the State. The great disseminated lead region occupies about one-half of the northern portion of Madison, and about as much of St François county. It is in the magnesian limestone that the largest quantities have been found. In Franklin county galena is found in abundance in ferruginous clay and coarse gravel. In the great mammoth mine in Washington county is a succession of caves in which millions of pounds of lead were found adhering to the sides and roofs. The central lead district of the State comprises the counties of Cole, Cooper, Moniteau, Morgan, Miller, Benton, Maries, Camden, and Osage; the southern lead region the counties of Pulaski, Laclede, Texas, Wright, Webster, Douglass, Ozark, and Christian. The western lead district includes the counties of Hickory, Dallas, Polk, St Clair, Cedar, and Dade; the south-western the counties of Jasper, Newton, Lawrence, Stone, Barry, and M'Donald. The two counties Jasper and Newton produce fully one-half of the pig lead of Missouri. The lead mines of Granby are among the best-known in the State, and millions of pounds of lead have been taken from these lands.

Copper deposits have been found in several counties, chiefly in the south-western part of the State. *Zinc* is found, in the shape of sulphuret and also silicate of zinc, in nearly all the lead mines in south-western Missouri. It has often occurred in such masses as seriously to hinder mining operations, and until very recent years, when railroad facilities have given this ore a market, it was thrown aside as worthless. It is now an important and profitable adjunct of the lead mines of Missouri. *Cobalt* and *nickel* are found at Mine La Motte and in a few other places. *Silver* is found in small quantities in lead mines in Madison county, combined with the lead.

Clays for the manufacture of ordinary brick for building purposes and for fire-brick exist in quantities beyond computation, and kaolin has been found in a few places. *Marble* of various shades and qualities abounds in Missouri, and is an important item in its mineral wealth. *Limestones* and *sandstones* suitable for building purposes are found in many parts of the State.

Agriculture.—Indian corn, wheat, oats, and tobacco are the staple products; but cotton, hemp, and flax are also raised to some extent in the southern counties. The average yield of wheat to the acre is 30 bushels, and that return is often far exceeded. No flour is of a higher quality or more in demand in foreign as well as home markets than that made from Missouri wheat. Indian corn is especially used in fattening live stock. Blue grass, timothy, red-top, and red and white clover grow luxuriantly, and favour stock-raising. In some parts of the State pasturage can be had all the year round, and the cheapness of corn makes the raising of pork, in particular, a very profitable business. All varieties of fruit can be very successfully cultivated. The more tender fruits, such as apricots, nectarines, figs, and many choice kinds of grapes, grow here as well as the more northern fruits—the apple, the pear, the plum, and the cherry. Apples and peaches do well in all parts of the State. Six native varieties of grapes are found in luxuriant growth, and many cultivated varieties have been successfully introduced. No State, not even California, can hope ultimately to rival Missouri in the production of both red and white wines. Sheep-raising has proved remunerative in the southern counties chiefly, where the mild climate, the fine grasses, and the abundance of good water are especially favourable to this branch of agricultural industry. There are in Missouri, in round numbers, 10,000,000 acres of improved and 13,000,000 of unimproved land, including 9,000,000 acres of woodland. The cash value of the farms is estimated at $90,000,000. In 1880 there were on the farms in the State 667,776 horses, 192,027 mules and asses, 9020 oxen, 661,405 cows, 1,410,507 other cattle, 1,411,298 sheep, and 4,553,123 swine. Missouri is the fourth maize-producing State of the Union; it supplies more wine than any State except California, and is a rival of Kentucky, Virginia, Tennessee, and Maryland in the culture of tobacco, which is a

staple in the rich counties in the northern central part of the State, bordering upon the Missouri river. No State raises so many mules, asses, and hogs. The production of cereals in 1880 was—corn, 202,485,723 bushels; wheat, 24,966,627 bushels; rye, 535,426 bushels; oats, 20,670,958 bushels; barley, 123,031 bushels; buckwheat, 57,640 bushels. The production of tobacco for the same year was 12,015,657 lb from 15,521 acres, valued at $600,256. Three-fourths of this amount was raised in Chariton, Marion, Randolph, Howard, Callaway, and Saline counties.

Wild Animals.—Red-deer are found in every part of the State, especially in the thinly-settled and mountainous districts. Venison, indeed, in its season, is as cheap as good beef in the markets of St Louis. Wild turkeys are numerous in the swampy and mountainous districts, and are found in all parts of the State. Prairie chickens, or pinnated grouse, are found in the prairie portion of Missouri, and are shipped in great numbers to Eastern markets. In all parts of Missouri are found the quail or Virginia partridge, thousands of barrels of which are shipped from the State each season. The rabbit, a species of hare, is so common as to be considered a pest. The grey squirrel and the red fox-squirrel are also found in large numbers all over the State. Black bass, perch, catfish, buffalo fish, suckers, and pike are the leading varieties of native fish.

Manufactures.—In 1880 Missouri had about 20,000 manufacturing establishments, in which a capital of about $125,000,000 was employed. The products of these establishments were valued at upwards of $300,000,000. The leading manufacturing counties outside of the city of St Louis are Jackson, Buchanan, St Charles, Marion, Franklin, Greene, Cape Girardeau, Platte, Boone, and Lafayette; but more than three-fourths of the manufactures are produced at St Louis, which is the fourth manufacturing city of the Union. The chief manufacture is that of flour, which employs about 900 mills, and is rapidly increasing. Twenty-four mills made in St Louis, in 1880, 2,142,949 barrels of flour, having a daily output of more than 11,000 barrels. St Louis millers and dealers sent in 1880 to Europe and South America 619,103 barrels of flour; and at the world's fairs at Paris, Vienna, and Philadelphia, Missouri flour received the first award. The iron industry, which stands second in importance, is yet only in its infancy, and St Louis seems destined to be one of the great centres of iron and steel manufacture. The amount of iron made in Missouri in 1880, in twenty-two establishments employing 3139 hands, was 125,758 tons. St Louis made the same year 102,664 tons of pig-iron, steel, and rolled iron and blooms. The yearly values of a number of other industries are estimated as follows:—meat packing, $20,000,000; lumber, $10,000,000; bags and bagging, $7,000,000; saddlery, $7,000,000; oil, $6,000,000; printing and publishing, $5,500,000; furniture, $5,000,000; carriages and waggons, $4,500,000; marble and stone, $4,000,000; tin, copper, and sheet-iron, $4,000,000; agricultural implements, $2,000,000. The manufacture of glass and glass-ware is carried on to a considerable extent, especially in St Louis. At Crystal City, on the Mississippi, 30 miles below St Louis, is a very large deposit of sand suitable for the manufacture of plate-glass, and a company has been organized and is now in successful operation, with a capital of $1,000,000.

Commerce.—The extensive commerce of Missouri centres at St Louis, between which city and the ports on the Mississippi and Missouri rivers steamboats are constantly plying. Railroad transportation has, in recent years, furnished superior and cheaper facilities for much of the trade which formerly depended upon the rivers. The trade in cotton especially has been greatly increased in Missouri since 1870 by the use of railroad transportation, which has made St Louis one of the great cotton centres of the United States. Extensive cotton presses were built in St Louis in that year, and the receipts of cotton from the more southern States has increased rapidly—from 12,264 bales in 1869-70 to 457,563 bales in 1879-80. Railroad connexions have made the interior portions of Arkansas and Texas more accessible to St Louis than to the southern ports of shipment, and the trade with the south-west, with the Indians, and with Mexico is constantly increasing. In 1870 St Louis was made by Act of Congress a port of entry to which foreign merchandise could be brought in bond. The value of the direct imports for the year ending 30th June 1882 was $1,934,342.

Population.—Missouri is divided into 114 counties. The following table gives the number of inhabitants since 1850:—

Year.	Males.	Females.	Total.	Density per square mile.
1850	357,832	324,212	682,044	14·37
1860	622,201	559,811	1,182,012	18·08
1870	896,347	824,948	1,721,295	26·34
1880	1,127,187	1,041,193	2,168,380	31·55

In 1880 the foreign-born residents numbered 211,578, or 9·7 per cent., of whom 109,974 were Germans and Scandinavians; there were also 145,046 of African descent. The early settlers of the State were French, and their descendants are still found in St [illegible] Ste Genevieve and a few other smaller towns. Many Gern[illegible] recently settled in all parts of the State, while English, Irish[illegible] and Swedes have also made Missouri their home in cons[illegible] numbers. The native American population is mostly des[illegible] from immigrants from the States of Kentucky, Tennessee, North Carolina, and Virginia. During recent years there has been a large accession to the population from the eastern and north-western States.

St Louis, the chief city of the Mississippi valley, situated upon the Mississippi river about 12 miles below the mouth of the Missouri, has a population of 350,518; Kansas City, a thriving town on the western border, situated on the banks of the Missouri, has 55,785; St Joseph, in the north-west, has 32,431; Hannibal, in the north-east, has 11,074; and Jefferson City (the State capital), in the centre, has 5271.

Education.—Missouri has a public school system of education first adopted in 1839. There are district schools, elementary and ungraded; city schools, graded, with high school courses; four normal schools, and a State university. Free public schools for white and coloured children between the ages of six and twenty years are required by law for every district in the State. Besides these public institutions supported by the State there are many private schools and colleges for both sexes. Chief among these are the St Louis University, an institution managed by the Jesuits; the College of Christian Brothers, also under the control of the Roman Catholics; and Washington University, a non-sectarian endowed school, which has property estimated at $1,000,000, and more than 1300 students. The Baptists have a college at Liberty called William Jewell College; the Congregationalists one at Springfield called Drury College; and the Methodists and Presbyterians several colleges and seminaries.

Religion.—The early settlers of Missouri were Roman Catholics, and in the river towns may be found to-day a large number of that faith. The Baptists have 88,999 members, with 1385 churches; the Methodists, 96,270 members and 918 churches; the Protestant Episcopal Church, 25,000 members and 65 church buildings; the Presbyterians, with their various branches, 34,628 members and 706 churches.

Administration.—The legislative power is vested in a body consisting of a senate and a house of representatives, which meets once in every two years, on the Wednesday after the first day of January next after the election of the members thereof. Member[illegible] of the legislature are paid a sum not to exceed $5 a day for th[illegible] first seventy days of the session, and after that not to exceed $1 [illegible] day for the remainder of the session. They are also allowed mil[illegible]age. The executive department consists of a governor, a lie[illegible]tenant-governor, a secretary of state, a State auditor, Sta[illegible] treasurer, an attorney-general, and a superintendent of publi[illegible] instruction; these are all elected by the people. The suprem[illegible] executive power is vested in the governor, who is chosen for fou[illegible] years, as also are the other members of this department. Th[illegible] governor has a qualified veto upon the acts of the legislature, an[illegible] such other powers as are common to that officer in the severa[illegible] States. The judicial power of the State is lodged in a supren[illegible] court, the St Louis court of appeals, circuit courts, crimin[illegible] courts, probate courts, and municipal courts. All judicial office[illegible] are elected by the people. Judges of the supreme court are electe[illegible] for ten years, those of the St Louis court of appeals for twelv[illegible] years, those of the circuit courts for six years. Executive an[illegible] judicial officers are liable to impeachment by the house of repre[illegible]sentatives. All impeachment cases are tried by the senate.

Every male citizen of the United States, and every male perso[illegible] of foreign birth who may have declared his intention to become [illegible] citizen of the United States, according to law, not less than on[illegible] year nor more than five years before he offers to vote, who is ove[illegible] the age of twenty-one years, is entitled to vote at all elections b[illegible] the people, if he has resided in the State one year immediatel[illegible] preceding the election at which he offers to vote, and has reside[illegible] in the county, city, or town where he shall offer to vote at leas[illegible] sixty days immediately preceding the election.

History.—On the 9th April 1682, the French voyager and discoverer La Salle took possession of the country of Louisiana in the name of the king of France. Its limits were quite indefinite, and included the present territory of Missouri (see LOUISIANA). The first settlements of Missouri were made in Ste Genevieve and at New Bourbon, but uncertainty exists as to the exact date. By some the year is fixed at 1763; by others, and by many traditions, as early as 1735. St Louis was settled by Pierre Laclede Liguest, a native of France. The site was chosen in 1763, and in February 1764 Auguste Chouteau went at the order of Liguest to the spot previously selected, and built a small village. For a long time the settlements were confined to the neighbourhood of the river. On the 31st of October 1803 the Congress of the United States passed an Act by which the president was authorized to take possession of the territory according to the treaty of Paris, and the formal transfer of Lower Louisiana was made on 20th December

1803. In 1804 Congress divided the territory into two portions. The northern part, commonly called Upper Louisiana, was taken possession of in March 1804. In June 1812 Missouri was organized as a Territory, with a governor and general assembly. The first governor (1813-1820) was William Clarke. In 1818 Missouri applied for admission to the Union as a State. Two years of bitter controversy followed, which convulsed the country and threatened the dissolution of the Union. This controversy followed a resolution introduced into Congress which had in view an anti-slavery restriction upon the admission of Missouri to the Union. This was at last settled by the adoption of the "Missouri compromise," which forbade slavery in all that portion of the Louisiana purchase lying north of 36° 30′ except in Missouri, and on 19th July 1820 Missouri was admitted to the Union. A convention to frame a constitution had already been called, and the constitution then adopted remained without material change until 1865. The first general assembly under the constitution met in St Louis in September 1820, and Alexander M'Nair was chosen governor in August. The seat of government was fixed at St Charles in 1820, and removed to Jefferson City, the present State capital, in 1826. The first census of the State was taken in 1821, when the number of inhabitants was found to be 70,647, of whom 11,254 were slaves. In the Black Hawk war in 1832, the Florida war in 1837, and the Mexican war in 1846 Missouri volunteer troops did their share of the work. In the troubles in Kansas, and the bitter discussion upon the question of slavery, Missouri was deeply involved. A strong feeling in favour of secession showed itself in many parts of the State. Governor Jackson, in his inaugural address on the 4th of January 1861, said that Missouri must stand by the slaveholding States, whatever might be their course. The election of a majority of Union men, however, as delegates to a convention called to consider the affairs of the nation, showed that public sentiment was hostile to secession, and the convention adjourned without committing the State to the secession party. United States troops were soon gathered at St Louis, and forces were also sent to Jefferson City, and to Rolla. Governor Jackson fled from the capital, and summoned all the State troops to meet him at Booneville. General Lyon defeated these troops, 17th June 1861, and soon most of the State was under the control of the United States forces. The State convention was reassembled. This body declared vacant the offices of governor, lieutenant-governor, and secretary of state, and filled them by appointment. The seats of the members of the legislature were also declared vacant. Governor Jackson soon issued a proclamation declaring the State out of the Union, and Confederate forces were assembled in large numbers in the south-western part of the State. General Lyon was killed at the battle of Wilson's Creek near Springfield, and General Fremont, commanding the department of the west, decreed martial law throughout the State. For a year matters were favourable to the Confederates, and at the opening of 1862 their troops held nearly half the State; but in February a Federal force under General Curtis drove General Price into Arkansas. He returned in 1864, and overran a large part of the State, but was finally forced to retreat, and but little further trouble arose in Missouri during the war. Missouri furnished to the United States army during the war 108,773 troops. In 1865 a new constitution was adopted by the people. In 1869 the XV. Amendment to the United States constitution was adopted by a large majority. In 1875 still another State constitution was drawn up by a convention called for that purpose, and ratified by the people, and is now the fundamental law of the State. (M. S. S.)

MISTLETOE[1] (*Viscum album*, L.), a species of *Viscum*, of the family *Loranthaceæ*. The whole genus is parasitical, and seventy-six species have been described; but only the mistletoe proper is a native of Europe. It forms an evergreen bush, about 4 feet in length, thickly crowded with (falsely) dichotomous branches and opposite leaves. The leaves are about 2 inches long, obovate-lanceolate, yellowish green; the diœcious flowers, which are small and nearly of the same colour but yellower, appear in February and March; the fruit, which when ripe is filled with a viscous semitransparent pulp (whence birdlime is derived), is almost always white, but there is said to be a variety with red fruit. The mistletoe is parasitic both on deciduous and evergreen trees and shrubs, and "it would be difficult to say on what dicotyledonous trees it does not grow" (Loudon). In England it is most abundant on the apple tree, but rarely found on the oak. The fruit is eaten by most frugivorous birds, and through their agency, particularly that of the thrush (hence missel-thrush or mistle-thrush), the plant is propagated. (The Latin proverb has it that "Turdus malum sibi cacat"; but the sowing is really effected by the bird wiping its beak, to which the seeds adhere, against the bark of the tree on which it has alighted.) The growth of the plant is slow, and its durability proportionately great, its death being determined generally by that of the tree on which it has established itself. See Loudon, *Arboretum et Fruticetum Britannicum*, vol. ii. p. 1021 (1838). The mistletoe so extensively used in England at Christmas tide is largely derived from the apple orchards of Normandy.

Pliny (*H. N.*, xvi. 92-95; xxiv. 6) has a good deal to tell about the *viscum*, a deadly parasite, though slower in its action than ivy. He distinguishes three "genera." "On the fir and larch grows what is called *stelis* in Eubœa and *hyphear* in Arcadia." Viscum, called *dryos hyphear*, is most plentiful on the esculent oak (quercus), but occurs also on the robur, *Prunus sylvestris*, and terebinth. Hyphear is useful for fattening cattle if they are hardy enough to withstand the purgative effect it produces at first; viscum is medicinally of value as an emollient, and in cases of tumour, ulcers, and the like; and he also notes it "conceptum fœminarum adjuvare si omnino secum habeant." Pliny is also our authority for the reverence in which the mistletoe when found growing on the robur was held by the Druids. The robur, he says, is their sacred tree, and whatever is found growing upon it they regard as sent from heaven and as the mark of a tree chosen by God. Such cases of parasitism are rare, and when they occur attract much attention (est autem id rarum admodum inventu et repertum magna religione petitur), particularly on the sixth (day of the) moon, with which their months and years and, after the lapse of thirty years, their "ages" begin. Calling it in their own language "all heal" (omnia sanantem), after their sacrifices and banquets have been duly prepared under the tree, they bring near two white bulls whose horns are then for the first time bound. The priest clothed with a white robe ascends the tree, cuts [the mistletoe] with a golden hook; it is caught in a white mantle. They then slay the victims, praying God to prosper His gift to them unto whom He has given it. Prepared as a draught, it is used as a cure for sterility and a remedy for poisons. The mistletoe figures also in Scandinavian legend as having furnished the material of the arrow with which Baldur (the sun-god) was slain by the blind god Höder. Most probably this story had its origin in a particular theory as to the meaning of the word mistletoe.

MITAU (the Lettish Jelgava), a town of Russia, capital of the government of Courland. It is situated 27 miles by rail to the south-west of Riga, on the right bank of the river Aa, in a fertile plain which rises only 12 feet above sea-level, and which probably has given its name to the town (*Mitte in der Aue*). At high water the plain and sometimes also the town are inundated. Mitau is surrounded by a canal occupying the place of former fortifications. Another canal was dug through the town to provide it with water; but this now receives the sewage, and water is brought in cars from a distance of 3 miles. Though so near Riga, Mitau has quite a different character. It has regular broad streets, bordered with the low pretty mansions of the German nobility who reside at the capital of Courland either to enjoy the social amusements for which Mitau is renowned or to provide education to their children. Mitau is well provided with educational institutions. A gymnasium occupies a former palace of the dukes of Courland, and has a rich library; and there are about forty other schools. The town is also the seat of a society of art and literature, of a natural history society, which has a good local museum, and of the Lettish Literary Society. The old castle of the dukes of Courland, which has witnessed so many conflicts, was destroyed by the Duke Biron, who erected in its place a spacious palace, now occupied by the governor and the courts. Mitau has 22,200 inhabitants, mainly Germans, but including also Jews (about 6000), Letts (5000), and Russians. Manufactures are few, those

[1] Greek ἰξία or ἰξός, hence Latin *viscum*, Italian *vischio* or *visco*, and French *gui*. The English word is the Anglo-Saxon *misteltan*, Icelandic *mistelteinn*, in which *tan* or *teinn* means a twig, and *mistel* may be associated either with *mist* in the sense of fog, gloom, because of the prominence of mistletoe in the dark season of the year, or with the same root in the sense of dung (from the character of the berries or the supposed mode of propagation).

of wrought-iron ware and of white-lead being the most important. The river Aa brings Mitau in connexion with the trade of Riga, small vessels carrying goods to the amount of about £150,000 a year.

Mitau is supposed to have been founded in 1266 by the grand-master Conrad Mandern. It has often changed its rulers. In 1345, when it was plundered by Lithuanians, it was already an important town. In 1561 it became the residence of the dukes of Courland. During the 17th century it was thrice taken by the Swedes. Russia annexed it with Courland in 1795. At the beginning of this century it was the residence of the count of Provence (afterwards Louis XVIII.). In 1812 it was taken by Napoleon I.

MITCHEL, ORMSBY M'KNIGHT (1810–1862), American general and writer on astronomy, was born in Union county, Kentucky, August 28, 1810. He began life as a clerk, but, obtaining an appointment to a cadetship at West Point in 1825, he graduated there in 1829, and became assistant professor of mathematics in 1831. Subsequently he was called to the bar, but forsook law to become professor of mathematics and natural philosophy at Cincinnati college. There he established an observatory, of which he became director. From 1859 to 1861 he was director of the Dudley observatory at Albany. He took part in the war as brigadier-general of volunteers, and for his skill and rapidity in seizing certain important strategic points was on April 11, 1862, made major-general. He died of yellow fever at Beaufort, South Carolina, October 30, 1862. Besides making important improvements on several astronomical instruments, Mitchel was the author of several works on astronomy, the principal of which are *The Planetary and Stellar Worlds* (1848) and *The Orbs of Heaven* (1851). See *Memoir* by Headley (1865).

MITCHELL, SIR THOMAS LIVINGSTONE (1792–1855), Australian explorer, was a son of Mitchell of Craigend, Stirlingshire, where he was born, June 16, 1792. From 1808 to the end of the Peninsular War he served in Wellington's army, and for his services received the medal and five clasps, and was raised to the rank of major. He was appointed to survey the battlefields of the Peninsula, and his map of the Lower Pyrenees is still admired. In 1827 he was appointed deputy surveyor-general, and afterwards surveyor-general, of New South Wales. He devoted himself to the exploration of Australia, making four expeditions for that purpose between 1831 and 1846. During these expeditions he discovered the Peel, the Namoi, the Gwyder, and other rivers, traced the course of the Darling and Glenelg, and was the first to penetrate into that portion of the country which he named Australia Felix. His last expedition was mainly devoted to the discovery of a route between Sydney and the Gulf of Carpentaria, and during the journey he explored the Fitzroy Downs, and discovered the Balonne, Victoria, Warrego, and other streams. In 1838, while in England, Mitchell published the narrative of his first three journeys, *Three Expeditions into the Interior of East Australia* (2 vols.). In 1839 he was knighted and made a D.C.L. of Oxford. During this visit he took with him some of the first specimens of gold and the first diamond found in the country. In 1848 the narrative of his second expedition was published in London, *Journal of an Expedition into the Interior of Tropical Australia.* In 1851 he was sent to report on the Bathurst gold-fields, and in 1853 he again visited England and patented his boomerang propeller for steamers. He died at his residence at Darling Point, Sydney, October 5, 1855.

Besides the above works, Mitchell wrote a book on *Geographical and Military Surveying* (1827), an *Australian Geography*, and a translation of the *Lusiad* of Camoens.

MITE. Mites (*Acarina*) are minute creatures which form a large division of the *Arachnida*, distinguished by the absence of any constriction between the cephalothorax and abdomen. Linnæus included all in the single genus *Acarus*. They are now divided into several families (mostly containing numerous genera), viz., *Trombidiidæ* (harvest mites), usually scarlet specks seen running on stones, grass, &c., in hot weather; *Tetranychi*, which, although not bright red, are the red spider of our green-houses, and are distinguished by feet with knobbed hairs; *Bdellidæ*, long-snouted mites with antenniform palpi; *Cheyletidæ* (fig. 1), the so-called book mites,—ferocious, predatory little beings, quite unconnected with books; *Hydrachnidæ*, freshwater mites with swimming legs, mostly beautiful creatures of brilliant colours; *Limnocaridæ*, crawling freshwater or mud mites; *Halicaridæ*, chiefly marine; *Gamasidæ*, hard-skinned brown mites often parasitic on insects, and best known by the females, and young of both sexes, found on the common dung beetle (*Geotrupes stercorarius*); *Ixodidæ*, the true ticks, not to be confounded with the sheep-tick, &c., which are wingless flies; *Oribatidæ*, beetle mites, so called from their resemblance to minute beetles (these are never parasitic; they undergo transformations almost as strange as those of insects, many of the immature forms being quaint and beautiful, see fig. 2); *Myobiadæ*, bizarre parasites of the mouse, &c., with peculiar holding claws; *Tyroglyphidæ*, the cheese mites; *Analgidæ*, found on the feathers of birds; *Sarcoptidæ*, the itch mites; *Arctisconidæ*, the water bears; *Demodicidæ*, found in the sebaceous follicles of the human nose, &c.; and *Phytoptidæ*, the gall mites, which attack the leaves of plants, making tiny gall-like excrescences.

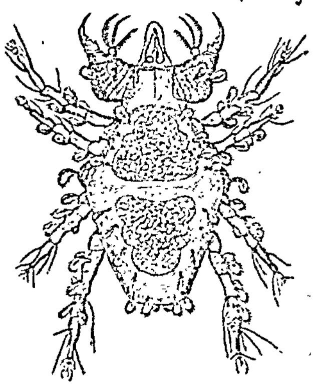


FIG. 1.—*Cheyletus flabellifer.*

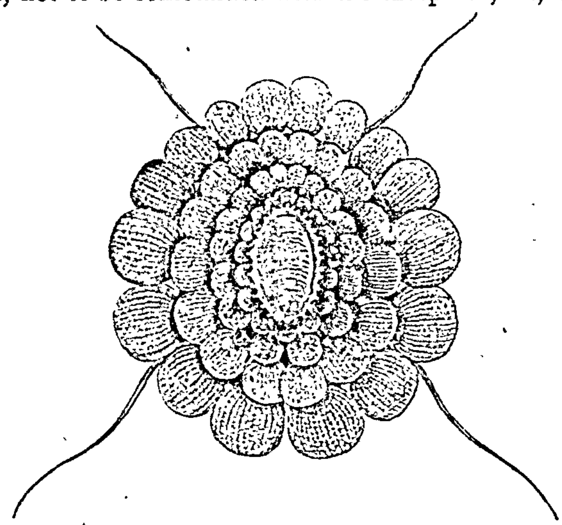

FIG. 2.—*Leiosoma palmicinctum*; nymph.

The sexes are distinct individuals; the reproduction is oviparous; the larva is almost always hexapod, though the later stages have eight legs; that answering to the pupa of insects is active, and is called the nymph. The breathing in the first-named eleven families is tracheal, the position of the stigmata varying greatly; in the last-named six families it is by the general body surface. No heart or circulation of the blood is known to exist; the alimentary canal is usually somewhat on the insect type, but with cæcal prolongations to the stomach, the reproductive organs often more on the crustacean type. There is generally a single very large nerve-ganglion above the œsophagus, sending nerve-branches to the various parts. The legs have ordinarily five to

seven joints, rarely three; the feet are usually terminated by claws or suckers, or both, sometimes by bristles. The mandibles are generally large, oftenest chelate (like a lobster's claw), sometimes style-like piercing organs, and of other forms. The maxillæ vary much: they may be piercing or crushing organs, or may coalesce to form a maxillary lip; there is usually one pair of maxillary palpi, no others. Sometimes there is a lingua, and in the *Gamasidæ* a galea. Antennæ are not found.

Mites are distributed all over the known world. They have been found in Franz-Josef's Land and Spitzbergen and in the hottest tropical regions, as well as the temperate zones. Often very similar species come from all parts. They are numerous in amber of the Tertiary epoch.

The best-known species are probably those which injure man or his works, viz., the itch mite, the cheese mite, the so-called harvest-bug, and the red spider. The dog-tick is also well known.

The itch mite (*Sarcoptes scabiei*, fig. 3) is a minute, almost circular, flattened, colourless creature, with skin covered with wavy wrinkles, and a number of triangular points arising from that of the back; legs short, the two front pairs and the fourth pair in the male terminated by suckers on long stalks, the two hind pairs in the female and third pair in the male having long bristles instead. It is parasitic on human beings: the males and young remain chiefly on the surface of the skin, but are difficult to find; the female burrows under the scarf-skin, causing the intense itching of scabies by the action of her chelate mandibles as she eats her way. A small watery pustule is raised near where the acarus has entered the skin, and others arise; the creature is not found in the pustule, but at the further end of a short tunnel which may be half an inch long. The eggs are laid in the tunnel after the acarus has passed; they hatch and multiply rapidly. The disease can be certainly cured; the usual mode is to rub the whole body with sulphur ointment, which is best done after a warm bath, allow it to remain on all night, and wash off in the morning. This treatment should be repeated once or twice at intervals of a day or two. Other applications of sulphur, as sulphurous acid, sulphur vapour baths, &c., are efficacious. All clothes which have touched the skin must be disinfected by heat. The disease is highly contagious. Most mammals have their peculiar varieties of itch mite.

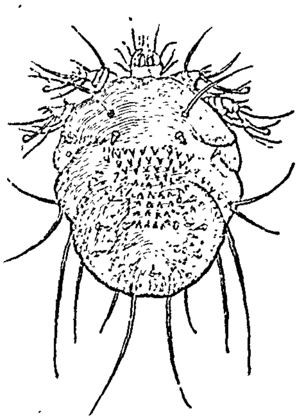

Fig. 3.—The Itch Mite (*Sarcoptes scabiei*); female. After Meguin.

The cheese mite (*Tyroglyphus siro*) is an elliptical, fat-bodied, colourless acarus with smooth skin and very long hairs. It breeds in thousands in old cheese, flour, grain, &c., and does much damage. There are numerous allied species; some belonging to the genus *Glyciphagus* are elegantly ornamented with plumes or leaf-like hairs.

The red-spider (*Tetranychus telarius*) attacks the leaves of plants or trees, and is a great pest in green-houses. It spins a slight web on the surface of the leaves, and lives in companies on the web; it is of a rusty red or brown.

The harvest bugs, thought by some writers to be a species, and by them called *Leptus autumnalis*, are simply the larvæ of several species of *Trombidium*. They are predatory, but will attach themselves temporarily to the human skin, and produce the violent itching felt on the lower parts of the legs after walking through dry grass in autumn. On inspection with a glass the creature may be seen as a minute scarlet point. A drop of benzine will probably get rid of the intruder.

The dog tick, like the harvest-bug, is not really parasitic on mammals, though it attaches itself temporarily; its ordinary food may probably be vegetable. (A. D. M.)

MITFORD, Mary Russell (1786–1855), born at Alresford, Hampshire, on the 16th of December 1786, retains an honourable place in English literature as the authoress of *Our Village*, a series of sketches of village scenes and characters unsurpassed in their kind, and after half a century of imitations as fresh as if they had been written yesterday. Washington Irving was Miss Mitford's literary model, but her work is thoroughly original and spontaneous, the free outflow of a singularly charming character. The shortest account of her life would be incomplete without a reference to the scapegrace father who was the centre of her affections, and the "only begetter" of all that is most delightful and characteristic in her writing. Dr Mitford first spent his wife's fortune in a few years; then he spent also in a few years the greater part of £20,000 which his daughter drew (in 1797, at the age of ten) as a prize in a lottery; then he lived, for most years of his life, on a small remnant of his fortune and the proceeds of his daughter's literary industry. In the little village of Three Mile Cross, near Reading, in a small cottage which Miss Mitford says was "a fine lesson in condensation," the doctor was the stay, support, and admiration of all the loafers in the neighbourhood, while his daughter, who had called herself his mamma, and treated him as her little boy from the time when she was herself a little girl, found an unfailing charm in his "friskings," and was the loving slave of all his good-humoured exactions. The father kept fresh in his daughter the keen delight in incongruities, the lively sympathy with self-willed vigorous individuality, and the womanly tolerance of its excess which inspire so many of her sketches of character. The woman who lived in close attendance on such an "awful dad," refused all holiday invitations because he could not live without her, and worked incessantly for him, except when she broke off her work to read him the sporting newspapers, evidently wrote from the heart in her bright portraits of such characters as the Talking Lady, the Talking Gentleman, Joel Brent, Jack Rapley, Tom Cordery, Lizzy, Lucy, and Harriet. Her writing has all the charm of perfectly unaffected spontaneous humour, combined with quick wit and exquisite literary skill. She died January 10, 1855.

Miss Mitford's youthful ambition was to be "the greatest English poetess," and her first publications were poems in the manner of Coleridge and Scott (*Miscellaneous Verses*, 1810, of sufficient mark to be reviewed by Scott in the *Quarterly*; *Christine*, a metrical tale, 1811; *Blanche*, 1813). Later on she essayed writing plays (*Julian*, 1823; *The Foscari*, 1826; *Dramatic Scenes*, 1827; *Rienzi*, 1828; *Charles the First*, 1828). But the prose to which she was driven by domestic necessities has rarer qualities than her verse. The first series of *Our Village* sketches appeared in 1824, a second in 1826, a third in 1828, a fourth in 1830, a fifth in 1832, and *Belford Regis*, a novel in which the neighbourhood and society of Reading were idealized, in 1835. Her *Recollections of a Literary Life* (1853) is a series of *causeries* about her favourite books. Five volumes of her *Life and Letters* were published in 1870 and 1872, showing her to have been a delightful letter-writer; two volumes of letters to her appeared in 1882.

MITHRADATES, or, as it is often wrongly spelt, Mithridates (*i.e.*, "given by the god Mithras"), was a favourite name of the Pontic kings in the third and second centuries B.C., and was also common in Persia and the neighbouring countries. The dynasty of Pontus was a Persian family, claiming descent from the Achæmenidæ, and the earliest of them known in history was satrap under the Persian empire. When that empire was destroyed Mithradates II. made himself king of Pontus; and he and his successors gradually spread their power over a great

part of Cappadocia and Paphlagonia. Several of them intermarried with the Seleucidæ and other Greek royal families, and something of the Hellenic civilization was engrafted on the native non-Hellenic character of the kingdom. The names Mithradates, Pharnaces, and Ariobarzanes, all non-Hellenic, alternate in the family. The province of Phrygia was sold in the most scandalous way by the Roman consul Aquillius to Mithradates V., who died probably in 120 B.C. He was succeeded by his son Mithradates Eupator, sixth of the name, one of those remarkable conquerors that arise from time to time in the East. He was a boy when his father died, and for seven years lived the wandering life of a hunter pursued by assassins. His courage, his wonderful bodily strength and size, his skill in the use of weapons, in riding, and in the chase, his speed of foot, his capacity for eating and drinking, and at the same time his quick and penetrating intellect, his wonderful mastery of twenty-two languages,—all these qualities are celebrated by the ancients to a degree which is almost incredible. With a surface gloss of Greek education, he united the subtlety, the superstition, and the obstinate endurance of an Oriental. He was a virtuoso, and collected curiosities and works of art; he assembled Greek men of letters round him; he gave prizes to the greatest poets and the best eaters. He spent much of his time in practising magic arts, the interpretation of dreams, and other superstitious ceremonies; and it was believed that he had so saturated his body with poisons that none could injure him. He trusted no one; he murdered his nearest relations, his mother, his sons, the sister whom he had married; to prevent his harem from falling a trophy to his enemies he murdered all his concubines, and his most faithful followers were never safe. He once disappeared from his palace, no one knew whither, and returned after some months, having wandered over all Asia Minor in disguise. Except in the pages of romance or the tales of the *Thousand and One Nights* it would be difficult to find anything to rival the account given of Mithradates by the gravest of historians. These qualities fitted him to be the opponent of Roman arms in Asia Minor, to be the champion of the East in its struggle against the destroying and yet civilizing power of the West. He resisted the Romans for eighteen years, yet we can hardly credit him with much real generalship or organizing power. He could collect masses of men and hurl them against the Roman legions; everything that boundless energy and boundless hatred could do he did; but the strength of his opposition to the Romans lay in the fact that all the dislike inspired by Rome in the worst and most cruel time of her rule was arrayed on his side.

No direct collision took place between the Romans and Mithradates for thirty-two years, though the republic took away Phrygia from him in 120 B.C., and several times thwarted his designs in Paphlagonia and Cappadocia. The rupture came about the time of the Social War. Mithradates, prompted, it is said, by envoys from the Italian allies, took advantage of the intestine struggles in Italy. War broke out in 88, on the ostensible cause of disputes about the kingdom of Bithynia; Mithradates rapidly overran Galatia, Phrygia, and Asia, defeated the Roman armies, and made a general massacre of the Romans resident in Asia. He also sent large armies into European Greece, and his generals occupied Athens. But Sulla in Greece and Fimbria in Asia defeated his armies in several battles; the Greek cities were disgusted by his severity, and in 84 B.C. he concluded peace, abandoning all his conquests, surrendering seventy ships, and paying a fine of 2000 talents. Murena invaded Pontus without any good reason in 83, but was defeated in 82. Difficulties constantly arose between the two adversaries, and in 74 a general war broke out. Mithradates defeated Cotta, one of the Roman consuls, at Chalcedon; but Lucullus worsted him in several engagements, and drove him finally in 72 B.C. to take refuge in Armenia with his son-in-law Tigranes. After two great victories in 69 and 68, Lucullus was disconcerted by mutiny among his troops and the defeat of his lieutenant Fabius (see vol. xv. p. 56). In 66 he was superseded by Pompey, who completely defeated both Mithradates and Tigranes. The former established himself in 64 at Panticapæum, and was planning new campaigns against the Romans when his own troops revolted, and, after vainly trying to poison himself, he ordered a Gallic mercenary to kill him. So perished the greatest enemy that the Romans had to encounter in Asia Minor. His body was sent to Pompey, who buried it in the royal sepulchre at Sinope.

MITHRAS was a Persian god whose worship spread over the Roman world during the 2d and 3d centuries after Christ. His name is found in the oldest records of the East Aryan races. In the Rig-Veda, Mitra, *i.e.*, the friend, and Varuna, *i.e.*, Οὐρανος, are a pair of gods regularly associated: they denote the heaven of day and the heaven of night. Mithras is therefore by origin the god of the bright heaven and of day, closely related in conception to, and yet expressly distinguished from, the sun. In the developed Old Persian religion of Zoroaster Mithras retained a place; he was not one of the greatest gods, but was first of a triad which, while less pure embodiments of the divine nature, were more easy for men to comprehend and to worship. The seventh month, which bears his name, and the sixteenth day of every month were sacred to Mithras; prayers were offered to him at sunrise, at mid-day, and at sunset. When the Persians conquered Assyria and Babylonia their religion was much affected by the worship of these more educated races. The worship of foreign deities was introduced, that of Persian deities was changed in character; and the gods were represented by images. The cultus of Mithras now became far more prominent, he was identified with the sun, and an elaborate ritual with the non-Aryan accompaniment of mysteries was established. This revolution had begun before Herodotus (i. 131) could identify Mithras with the Assyrian goddess Mylitta, and it became more thorough during the 4th century B.C.

It is in this most developed form that we know the cultus of Mithras. The god of light becomes by a ready transition, which is made in the very oldest Aryan records, the god of purity, of moral goodness, of knowledge. There goes on in the world as a whole, and in the life of each man, a continual struggle between the power of good and the power of evil; Mithras is always engaged in this contest, and his religion teaches all, men and women alike, to aid in the battle. Victory in this battle can be gained only by sacrifice and probation, and Mithras is conceived as always performing the mystic sacrifice through which the good will triumph. The human soul, which has been separated from the divine nature and has descended to earth, can reascend and attain union with God through a process of fasting and penance which is taught in the mysteries; the sacrifice which is being always offered by Mithras makes this ascent and union possible. Those who were initiated in the mysteries of Mithras had to pass through a long probation, with scourging, fasting, and ordeal by water, and were then admitted as soldiers fighting on behalf of Mithras. This was the lowest terrestrial grade, but there were still two others to attain, the Bull and the Lion, each involving further probation, before the soul could rise above the earth. It then ascended by the grades of Vulture, Ostrich, and Crow through the region of æther; and then it strove to become pure fire through the grades of Gryphon, of Perses, and of the Sun. Finally

the soul attained complete union with the divine nature through the grades of Father Eagle, of Father Falcon, and of Father of Fathers. A holy cave on a hill was the central point in the worship; and the mystic rites involved watching and fasting all night till sunrise brought the triumph of light.

The worship of Mithras became known to the Romans through the Cilician pirates captured by Pompey about 70 B.C. It gained a footing in Rome under Domitian, was regularly established by Trajan about 100 A.D., and by Commodus about 190. Finally the mysteries were prohibited and the holy cave destroyed in 378. Dedicatory inscriptions to *Deo Soli Invicto Mithræ*, and votive reliefs of Roman work, are very common. The usual representation shows Mithras in the mystic cave performing the mystic sacrifice; a young man in Oriental costume kneels with one knee on a prostrate bull, grasping the head and pulling it back with the left hand, while with the right he plunges his sword into its neck. A dog, a snake, and a scorpion drink the blood that flows from the bull; a crow sits on the rock behind Mithras; the figures of the sun and of the moon occupy the two sides of the relief.

See Lajarde, *Recherches sur le Culte de Mithras.*

MITRE. See COSTUME, vol. vi. p. 463; and HERALDRY, vol. xi. p. 711.

MITSCHERLICH, EILHARDT (1794–1863), was born January 7, 1794, at Neuende near Jever, in the grand-duchy of Oldenburg, where his father was pastor. He was educated at the gymnasium of Jever under the historian Schlosser. In 1811 he went to Heidelberg, where he devoted himself to philology, giving special attention to the Persian language. In 1813 he went to Paris, partly for study, partly with the view of obtaining permission to join a French embassy to Persia. The political events of 1814 put an end to this scheme, and Mitscherlich returned to Germany. He then set to work on a history of the Ghurides and Kara-Chitayens, manuscript materials for which he found in the university library of Göttingen, and a portion of which he published in 1815. Still anxious to visit Persia, he resolved to study medicine in order that he might enjoy that freedom of travel usually allowed in the East to physicians. He began at Göttingen with the study of chemistry, and this so completely arrested his attention that he gave up the idea of the journey to Persia and the medical profession. In 1818 he went to Berlin, where he worked in the laboratory of Professor Link. He made analyses of phosphates and phosphites, arseniates and arsenites, confirming the observations of Berzelius as to their composition. In the course of these investigations he observed that corresponding phosphates and arseniates crystallized in the same form.

This was the germ from which grew the theory of isomorphism. In order to follow out his discovery Mitscherlich set to work to learn crystallography. His teacher was a fellow student, Gustav Rose, to whose penetrating mind and profound knowledge of mineralogy have been due some of the most interesting developments and illustrations of the theory of isomorphism. Having measured the inclinations of the faces of a vast number of natural and artificial crystals, he established the principles of isomorphism very much as we now hold them.

It is right that we should remember that Mitscherlich was not the first to notice the fact that two different substances might have the same crystalline form, or that one element could partially replace another without great change of form. Romé de l'Isle in 1772 mentions mixed vitriols containing variable proportions of iron and copper, and Leblanc in 1802 showed that the crystalline form remains the same although the proportions vary both in the case of these mixed vitriols and in that of mixed alums. Vauquelin had already, in 1797, proved that alum might contain variable quantities of ammonia without any corresponding variation of crystalline form.

The authority of Haüy, who laid down as one of his principles that each compound has its own crystalline form, for a time kept these observations in the background. Further cases were, however, observed. Wollaston (1812) accurately measured the angles of the rhombohedral carbonates, and proved that the forms of these minerals, although nearly the same, are not absolutely identical. He showed that a similar close approximation to identity exists in the case of the vitriols. Fuchs in 1815 brought forward his theory of "vicarious constituents." Gay-Lussac proved that a crystal of common alum continues to grow when placed in a solution of ammonia alum, and cases of crystallized mixtures were pointed out by the French mineralogist Beudant. But notwithstanding these foreshadowings, of which we know, on the evidence of Gustav Rose, that Mitscherlich was wholly ignorant, there was at the time of which we are now speaking no trace of a theory, but merely isolated observations. The theory of isomorphism is the work of Mitscherlich. It was communicated to the Berlin Academy on December 9, 1819.

In that year Berzelius paid a visit to Berlin, and was so struck with Mitscherlich's ability that he suggested him to the minister Altenstein as the most fitting successor to Klaproth in the chair of chemistry in that university. It is not surprising that this idea was not carried out. It was only four years since Mitscherlich had begun to study chemistry; he had never lectured, nor had he published anything on the subject.

Although Altenstein did not at that time carry out the proposal of Berzelius, he was so far impressed by it that he obtained for Mitscherlich a Government grant to enable him to continue his studies under Berzelius.

In 1820 he went to Stockholm, where he worked for a year in Berzelius's laboratory. In 1822 he was appointed extraordinary and in 1825 ordinary professor in Berlin. In the course of an investigation into the slight differences discovered by Wollaston in the angles of the rhombohedra of the carbonates isomorphous with calc-spar, Mitscherlich observed that the angle in the case of calc-spar varied with the temperature. On extending his inquiry to other non-isotropic crystals he observed a similar variation, and was thus led, in 1825, to the discovery that non-isotropic crystals, when heated, expand unequally in the direction of dissimilar axes. In the following year he discovered the change, produced by change of temperature, in the direction of the optic axes of selenite. The discovery (also in 1826) that sulphur can be obtained in two absolutely distinct crystalline forms threw much light on the fact that the two minerals calc-spar and aragonite have the same composition but perfectly different forms. Other cases of this property, to which Mitscherlich gave the name of dimorphism, were arrived at not long after.

In 1833 he made a series of careful determinations of the vapour densities of a large number of volatile substances, and proved that Gay-Lussac's law as to the proportions by volume in which oxygen, nitrogen, hydrogen, and chlorine unite with one another holds generally for volatile elements, and that the simplicity of the relation of the volume of the compound to that of the component gases is also general.

In pure chemistry Mitscherlich's discoveries were mainly connected with isomorphism. Thus he obtained selenic acid in 1827, and showed the isomorphism of its salts with the sulphates, and examined with great care the manganates and permanganates, showing their isomorphism with the sulphates and with the perchlorates respectively. But he did much important work unconnected with this special

subject. We may in particular refer to his discovery of the relation of benzene to benzoic acid, of nitro-benzene, and of a considerable number of the derivatives of benzene.

In 1833 he published his *Lehrbuch der Chemie*, a student's text-book of chemistry of the most thoroughly practical and yet rigidly scientific kind, from the study of which teachers of chemistry may still derive many a valuable hint. His interest in mineralogy led him to the study of the geology of volcanic regions, and he made frequent visits to the Eifel with a view to the discovery of a theory of volcanic action. He did not, however, publish any papers on the subject, but since his death his notes have been arranged and published by Dr Roth in the *Memoirs* of the Berlin Academy (1866). In December 1861 symptoms of heart disease made their appearance, but he was able to carry on his academical work till December 1862. He died at Schöneberg near Berlin on 28th August 1863.

Mitscherlich's published papers are chiefly to be found in the *Abhandlungen* of the Berlin Academy, in *Poggendorff's Annalen*, and in the *Annales de Chimie et de Physique*. The fourth edition of the *Lehrbuch der Chemie* was published in 1844; a fifth was begun in 1855, but was not completed. (A. C. B.)

MITYLENE, or MYTILENE. See LESBOS.

MIZPAH (מִצְפָּה) and MIZPEH (מִצְפֶּה) are Hebrew words for a "place of prospect," or high commanding point. The cities of Palestine generally occupied such positions; and so in the Old Testament we find several places bearing the name of "The Mizpah" (Mizpeh). Sometimes a determining genitive is added; "The Mizpeh of Gilead" (Judg. xi. 29), "The Mizpeh of Moab" (1 Sam. xxii. 3).

(1) The most famous of these places is that in Gilead, a noted sanctuary (Judg. xi. 11; Hosea v. 1), claiming consecration from the sacrifice of Jacob (Gen. xxxi. 54) and the *maṣṣeba* or sacred stone erected by him (ver. 45). The narrative of Gen. xxxi. 45 *sq.* is somewhat obscure, and not all from one hand. We gather, however, from it that another name of "The Mizpah" was Galeed, *i.e.*, Gilead. Thus Mizpah, Mizpeh Gilead, Gilead (Hos. vi. 8), Ramath Mizpeh (*i.e.*, the height of Mizpeh, Josh. xiii. 26), and Ramoth Gilead (the heights of Gilead), or simply The Ramah (2 Kings viii. 28, 29), are almost universally taken to be one place. With this it agrees that Ramoth Gilead was a city of refuge, which points to an early sanctity. The place is prominent throughout the history. It was the seat of Jephthah (Judg. xi.), the mourning for whose daughter probably gives us a glimpse into the ancient rites of a provincial sanctuary, the residence of one of Solomon's officers (1 Kings iv. 13), and a hotly disputed frontier city in the wars between Syria and the house of Omri, before which Ahab fell (1 Kings xxii.), and in which the military revolt of Jehu was organized (2 Kings ix.). Maspha was still a strong place in the Greek period, and was taken by Judas Maccabæus (1 Mac. v. 35). Eusebius knows Ramoth as a place 15 miles west of Philadelphia or Rabbah of Ammon. It is therefore commonly identified with El-Salt, the modern capital of the Belká; but this cannot be said to be made out. (2) The Benjamite Mizpah or Mizpeh, also a sanctuary, is often named in the history of Samuel. It was a border fortress of King Asa (1 Kings xv. 22), and the residence of Gedaliah as governor of Judæa after the fall of Jerusalem (Jer. xl.). Its old sanctity was still remembered in the Maccabee times, and from 1 Mac. iii. 46 we conclude that it commanded a view of Jerusalem. The most probable identification is with the prominent hill-top of Neby Samwíl. There was (3) another Mizpeh in the low country of Judah (Josh. xv. 38), and (4) a land or valley of Mizpeh (Josh. xi. 3, 8) under Mount Hermon.

MNEMONICS, or artificial helps to the memory, have been employed in a more or less systematic form from a very early period. Mnemonics (τὸ μνημονικόν, sc. τέχνημα or παράγγελμα) were much cultivated by Greek sophists and philosophers, and are repeatedly referred to by Plato and Aristotle. In later times the invention was ascribed to the poet Simonides,[1] perhaps for no other reason than that the strength of his memory was famous. Cicero, who attaches considerable importance to the art, but more to the principle of order as the best help to memory, speaks of Carneades (or perhaps Charmades) of Athens and Metrodorus of Scepsis as distinguished examples of the use of well-ordered images to aid the memory. The latter is said by Pliny to have carried the art so far *ut nihil non iisdem verbis redderet auditum*. The Romans valued such helps as giving facility in public speaking. The method used is described by the author of *Rhet. ad Heren.*, iii. 16-24; see also Quintilian (*Inst. Or.*, x. 1, 2), whose account is, however, somewhat incomplete and obscure. In his time the art had almost ceased to be practised. The Greek and Roman system of mnemonics was founded on the use of mental places and signs or pictures. The thing to be remembered was localized in the imagination, and associated with a symbol which concretely represented what it was desired to retain in the memory, special care being taken that the symbols should be as vivid, pleasing, and impressive as possible. The most usual method was to choose a large house, of which the apartments, walls, windows, statues, furniture, &c., were severally associated with certain names, phrases, events, or ideas, by means of symbolic pictures; and to recall these it was only necessary to search over the apartments of the house, till the particular place was discovered where they had been deposited by the imagination. As the things to be remembered increased, new houses could be built, each set apart to a certain class of ideas or events, and these houses were again constructed into a mnemonic town. In accordance with this system, if it were desired to fix an historic date in the memory, it was localized in an imaginary town divided into a certain number of districts, each with ten houses, each house with ten rooms, and each room with a hundred quadrates or memory-places, partly on the floor, partly on the four walls, partly on the roof. Thus, if it were desired to fix in the memory the date of the invention of printing (1436), an imaginary book, or some other symbol of printing, would be placed in the thirty-sixth quadrate or memory-place of the fourth room of the first house of the historic district of the town. The success of the method depended largely on the power of the imagination to give the different houses, rooms, &c., characteristic varieties of aspect, and we may suppose that it was the effort to frame suitable images and places, giving an adventitious interest to dry details, that constituted the real advantage of the system. Except that the rules of mnemonics are referred to by Martianus Capella, nothing further is known regarding the practice of the art until the 13th century, when the system of the Romans was revived and a good many treatises were published on the subject. Among the voluminous writings of Roger Bacon is a tractate *De Arte Memorativa*, which exists in MS. at Oxford. Raymond Lully devoted special attention to mnemonics in connexion with his *ars generalis*. The first important modification of the method of the Romans was that invented by Conrad Celtes, a German poet, who, in his *Epitoma in utramque Ciceronis rhetoricam cum arte memorativa nova* (1492), instead of places made use of the letters of the alphabet. About the end of the 15th century Petrus de Ravenna awakened such astonishment in Italy by his mnemonic feats that he was believed by many to be a necromancer. His *Phœnix Artis Memoriæ*, published at Venice in 1491 in four volumes, went through as many as nine editions, the seventh appearing at Cologne in 1608. An impression equally great was produced about the end of the 16th century by Lambert Schenkel, who taught mnemonics in France, Italy, and Germany, and, although he was denounced as a sorcerer by the university of Louvain, published in 1593 his tractate *De Memoria* at Douai with the sanction of that celebrated theological faculty. The most complete account of his system is given in two works by his pupil Martin Sommer, published at Venice in 1619. Giordano Bruno, in connexion

[1] Pliny, *H. N.*, vii. 24. Cicero, *De Or.*, ii. 86, mentions this belief without committing himself to it.

with his exposition of the *ars generalis* of Lully, included a *memoria technica* in his treatise *De Umbris Idearum.*

About the middle of the 17th century Winckelmann made known what he called the "most fertile secret" in mnemonics, namely the use of letters with figures so as to express numbers by words; and the philosopher Leibnitz adopted an alphabet very similar to that of Winckelmann in connexion with his scheme for a form of writing common to all languages. Winckelmann's method was modified and supplemented in regard to many details by Richard Grey, who published a *Memoria Technica* in 1730. The principal part of Grey's method is briefly this: "To remember anything in history, chronology, geography, &c., a word is formed, the beginning whereof being the first syllable or syllables of the thing sought, does, by frequent repetition, of course draw after it the latter part, which is so contrived as to give the answer. Thus, in history, the Deluge happened in the year before Christ two thousand three hundred forty-eight; this is signified by the word Del*etok*, Del standing for Deluge and *etok* for 2348." To assist in retaining the mnemonical words in the memory they were formed into memorial lines. The vowel or consonant which Grey connected with a particular figure was chosen arbitrarily; but in 1806 Feinaigle, a monk from Salem near Constance, began in Paris to expound a system of mnemonics, one feature of which was to represent the numerical figures by letters chosen on account of some similarity to the figure to be represented or some accidental connexion with it. This alphabet was supplemented by a complicated system of localities and signs, with the aim of expressing, by a more vivid and impressive symbol, ideas which for want of this are apt to pass from the memory, and of establishing between ideas of the same group an intimate relation, so that the mention of the one would suggest the other. Feinaigle, who published a *Notice sur la mnémonique* at Paris in 1806, came to England in 1811, and in the following year published *The New Art of Memory.* A simplified form of Feinaigle's method was published in 1823 by Aimé Paris, and the use of symbolic pictures was revived in connexion with the latter by a Pole, Jazwinsky, of whose system an account was published by J. Bem, under the title *Exposé Général de la Méthode Mnémonique Polonaise, perfectionnée à Paris*, Paris, 1839. Various other modifications of the systems of Feinaigle and Aimé Paris were advocated by subsequent mnemonists, among them being the Phrenotyping or Brain-Printing method of Beniowsky, the Phreno-Mnemotechny of Gouraud, and the Mnemotechnik of Carl Otto, a Dane. The more complicated mnemonic systems have fallen almost into complete disuse; but methods founded chiefly on the laws of association have been taught with some success in Germany by, among others, Kothe, who is the author of *Lehrbuch der Mnemonik*, and *Katechismus der Gedächtnisskunst*, both of which have gone through several editions; and in England by Dr. Edward Pick, whose *Memory and the Rational Means of Improving it* has also obtained a wide circulation. In certain cases mnemonical devices may be found of considerable service; but all systems which have aimed at completeness have been found rather to puzzle than aid the memory. The fullest history of mnemonics is that given by J. C. F. von Aretin in his *Systematische Anleitung zur Theorie und Praxis der Mnemonik*, 1810.

MOA. See DINORNIS.

MOAB. Moab and Ammon (children of Lot) constitute along with Edom and Israel (children of Isaac) that group of four Hebrew peoples which in early antiquity had issued from the Syro-Arabian wilderness, and settled on the border of the cultivated country eastward of the great depression which extends from the Gulf of Elath to the Dead Sea, and up the valley of the Jordan. According to the book of Genesis, they had come out of Mesopotamia, and so were precursors of the larger wave which followed from the same quarter, forming the most southern outpost of the Aramæan immigration into the lands of Canaan and Heth. Whether the Hebrews were originally Aramæans is questionable, but it is certain that, like the Aramæans, they were distinct from the Canaanites, whose conquerors they were. Such was the relation of the old and new inhabitants, not only in Western Palestine after the Israelite occupation, but also, and from a much earlier period, in Eastern Palestine, where the aborigines were Amorites—that is, Canaanites—and where the Bne Ammon and Moab and the Bne Isaac successively settled in their lands. The old population did not disappear before the conquerors, but continued to subsist among them. In a considerable district—namely, in Gilead—the Amorites even remained unsubdued, and thus formed a gap, only imperfectly filled up by the Bne Ammon, between the Hebrew line of immigration on the south and the Aramæan line more to the north,—a gap which did not begin to close until the historical period. From this district they even endeavoured, and with some success, as will be afterwards seen, to recover the territory which had been taken from them in the south. But where they were the subjects of the Hebrews they constituted the basis of the population, the mainstock of the working and trading classes. The extent of their influence over the conquerors may be judged from the fact that it was their speech which gained the upper hand. The Moabites, and doubtless also the Ammonites and Edomites, spoke the language of Canaan as well as the Israelites. They must have learned it from the Canaanites in the land eastward of Jordan, prior to the period at which Jacob immigrated to and returned from Egypt. Our knowledge is extremely imperfect as regards other departments of the Canaanite influence; but in religion it has left a noticeable trace in the cultus of Baal-Peor, which was carried on in Moabite territory, but was certainly of Canaanite origin.

The assumption that the change of language was first brought about by the Israelites in the land which is called by preference that of Canaan, is rendered untenable by the fact that the Moabites also spoke Canaanitish. It is vain to urge against the identity of Hebrew and Canaanitish the distinction between Phœnician and Hebrew; for doubtless similar distinctions existed between the dialect of the Phœnician coast towns and that of the Hivites, Amorites, and Canaanites generally, whose language the Hebrews borrowed. That the Aramæans of Damascus, who also were compelled to mingle with the Hethites in the country of which they had taken possession, nevertheless retained their original tongue is to be explained by the circumstance that they continued to maintain direct relations with the mother-country of Mesopotamia, and moreover had greater internal cohesion. The designation Amorites, usually given in the Old Testament to the original inhabitants of Eastern Palestine, is substantially synonymous with that of Canaanites, although not quite so comprehensive. The Palestine of the Pre-Israelitic period, which in the Pentateuch is called the Land of Canaan, figures in Amos as the Land of the Amorites. While, however, the former name is bestowed chiefly upon that portion of the earlier population which had remained unconquered, the latter is given to the portion against which the Israelites first directed their attack and in whose territory they settled. This took place in the mountain district, first to the east and afterwards to the west of Jordan. For this reason the Amorites, as contrasted with the Canaanites of the cities of the level country, are a highland race, like the Hebrews themselves, but belong exclusively to the past. In the time of the Biblical narrators, the Canaanites are still living here and there in the land, but the Amorites have once lived where the Israelites now are. This explains the fact that, while in ordinary peaceful circumstances the Canaanites are named as the old inhabitants, the Amorites are immediately substituted for them wherever war and conquest are spoken of. Sihon and Og, with whom Moses does battle, are kings of the Amorites; in like manner it is with the twelve kings of the Amorites that Joshua has to deal westward of the Jordan. The Amorites as an extinct race of course assume a half-mythical character, and are represented as giants, tall as cedars and strong as oaks.

Just as Israel was the people of Jehovah, and Ammon the people of Milcom, Moab was the people of Chemosh (כְּמוֹשׁ, Num. xxi. 29). The kingship of Chemosh was regarded as thoroughly national and political in its character, but did not on that account exclude the institution of a human king, which existed in Moab much earlier than in Israel; in the time of Moses the Moabites had a king, and the institution was even then an old one. The capitals of the kingdom were Ar-Moab and Kir-Moab, south from the Arnon; these were not, however, the constant residences of the kings, who continued to live in their native places, as, for example, Mesha in Dibon. Doubtless there were changes of dynasty, and traces exist of a powerful aristocracy (Ariele Moab; 2 Sam. xxiii. 20).

The land of the Moabites, the Balḳá, is bounded northward and southward by Mount Gilead and Wadi 'l-Ahsá, westward and eastward by the Dead Sea and the Wilderness; it is divided into two portions by the deep bed of the Arnon, that to the north being the more level (Mishôr), and that to the south being more broken up, and constituting the proper stronghold of the nation. The soil is peculiarly adapted for sheep-farming (2 Kings iii.) and the culture of the vine (Isa. xvi.).[1]

The historical importance of the Moabites lies wholly in their contact with Israel, and we have no knowledge of them apart from this. After the Israelites had quitted Egypt and passed a nomadic life for about a generation in the neighbourhood of Kadesh, they migrated thence, still under the leadership of Moses, into northern Moab, dispossessing the Amorites, who had made themselves masters of that district. The interval from Kadesh to the Arnon could be passed only by a good understanding with Edom, Moab, and Ammon,—a proof that the ethnical relationships, which at a later period were expressed only in legend, were at that time still living and practical. In all probability the Moabites called the Israelites to their aid; they were not as yet aware that this little pastoral people was destined one day to become to them a greater danger than the Canaanites by whom they were threatened at the moment.[2]

As the story of Balaam indicates, the Moabites would willingly have been rid of their cousins after their service had been rendered, but were unable to prevent them from settling in the land of Sihon. The migration of the tribes of Israel into Western Palestine, however, and the dissolution of their warlike confederation soon afterwards made a restoration of the old frontiers possible. If King Eglon took tribute of Benjamin at Jericho, the territory between Arnon and Jordan must also have been subject to him, and Reuben must even then have lost his land, or at least his liberty. It would appear that the Moabites next extended their attacks to Mount Gilead, giving their support to the Ammonites, who, during the period of the judges, were its leading assailants. So close was the connexion between Moab and Ammon that the boundary between them vanishes for the narrators (Judges xi.).

Gilead was delivered from the Ammonites by Saul, who at the same time waged a successful war against Moab; the fact is lightly touched upon in 1 Sam. xiv. 47, as if this were a matter of course. The establishment of the monarchy necessarily involved Israel in feuds with its neighbours and kin. The Moabites being the enemies of the Israelite kingdom, David naturally sent his people for shelter thither when he had broken with Saul; the incident is precisely analogous to what happened when he himself at a later period took refuge from Saul's persecution in Philistine territory, and needs no explanation from the book of Ruth. As soon as he ceased to be the king's enemy by himself becoming king, his relations with Moab became precisely those of his predecessor. The war in which apparently casual circumstances involved him with Hanun ben Nahash of Ammon really arose out of larger causes, and thus spread to Moab and Edom as well. The end of it was that all the three Hebrew nationalities were incorporated with the kingdom of Israel; the youngest brother eclipsed and subdued his seniors, as Balaam had foreseen. Through the work of Saul and David the political system of Palestine was altogether changed: the smaller peoples were no longer a match for Israel, which established a decisive preponderance, and transformed what had hitherto been jealousy on the part of Moab and Ammon as well as of Edom into bitter hatred; this hatred did not cease even after nothing but a religious shadow remained of what had once been the political supremacy of the people of Jehovah.

The struggle with Ammon which David began ultimately assumed larger dimensions, and brought the Aramæans also into the field against him. He was successful, indeed, against them also, and destroyed their most powerful kingdom; but after his death they recovered themselves, and pressed steadily on from the borders of the wilderness towards the sea; at their head were those kings of Damascus who had established themselves on the ruins of Zoba. In presence of these enemies the already fading distinction between the ruling and the subject nationality within the kingdom of Israel now completely disappeared; and even towards the Canaanites outside the relations of the kings became friendly. It is in one instance expressly stated that the common danger threatening from the East had to do with this (2 Sam. viii. 9 *sqq.*). But, conversely, it was natural that Ammon and Moab should make common cause with the Aramæans; such an attitude was suggested by geographical position and old connexions, but above all by their helpless fury against Israel. Both nationalities must have succeeded in emancipating themselves very soon after David's death, and only now and then was some strong king of Israel able again to impose the yoke for a time, not upon the Ammonites indeed, but upon Moab. The first to do so was Omri, who garrisoned a number of their towns and compelled the king to acknowledge Israel's suzerainty by a yearly tribute of sheep,—a state of matters which continued until the death of Ahab ben Omri. But when that brave king fell in battle with the Aramæans at Ramoth Gilead (about 850 B.C.), Mesha of Dibon, then the ruler of Moab, seized the favourable opportunity to make himself and his people independent. In his famous inscription he tells how, through the wrath of Chemosh, the land had fallen into the enemy's power and endured forty years of slavery, and how by the grace of Chemosh the yoke is now broken and the Israelites ignominiously driven off. In

[1] There does not seem to have been any difference in this respect between the northern and southern portions; instead of Heshbon, Sibmah, and Jaezer (Isa. xvi.), the poet Hátim of Tayyi, a little before Mohammed, names Maáb and Zoar as the chief wine centres (Yáḳút, iv. 377, 19).

[2] The facts as a whole are indubitable; it cannot be an invention that the Israelites settled first in Kadesh, then in northern Moab, and thence passed into Palestine proper. The only doubtful point is whether the song in Num. xxi. 27 *sqq.* is contemporary evidence of these events. It is certainly not a forgery, but it is a question whether it really refers to the destruction of the kingdom of the Amorites at Heshbon. This reference rests entirely upon the words למלך אמרי סיחן, which might very well be omitted as a mere gloss, in which case the song would naturally be understood as directed against the Moabites themselves; it is in this last sense that it is taken by the author of Jer. xlviii. (Comp. E. Meyer in Stade's *Zeitschr. f. ATliche Wissensch.*, 1881, p. 129 *sqq.*) As Israel got the better of the Amorites on the plain of Moab, so did Hadad king of the Edomites vanquish the Midianites on the "field" of Moab (Gen. xxxvi. 35); this took place in Gideon's time, as is borne out by the fact that between Hadad and the downfall of the ancient Edomite monarchy, *i.e.* to the period of David, there were four reigning princes. Confused recollections of a former settlement of the Midianites in northern Moab are seen in Num. xxii. 4, 7; xxv. 18.

the Bible we find only the curt statement that Moab rebelled against Israel after the death of Ahab (2 Kings i.); on the other hand, there is a full narrative of a later attempt on the part of Joram ben Ahab to bring Mesha again into subjection—an attempt which promised very well at first, but ultimately failed completely. Joram's invasion took place not from the north but (probably very unexpectedly to the enemy) from the frontier of Edom over the Wadi 'l-Aḥsá; he marched through Judah and Edom, and the kings of those countries served as auxiliaries. He defeated a Moabite army on the frontier, penetrated into the country and laid it waste; he laid siege to the fortress of Kir-Moab so closely as to reduce it to great straits. But these straits seem to have filled the besieged with a desperate courage, for the fortunes of war suddenly changed. The Israelites were compelled to retire homeward, a great wrath (of Jehovah) having come upon them, that is, a severe disaster having befallen them, which is not described, but, from the nature of the case, must have been a sudden surprise and defeat by the enemy.[1]

As the Moabites owed their liberation from Israelite supremacy to the battle of Ramah—that is, to the Aramæans—we accordingly find them (as well as the Ammonites) afterwards always seconding the Aramæans in continual border warfare against Gilead, in which they took cruel revenge on the Israelites. With what bitterness the latter in consequence were wont to speak of their hostile kinsfolk can be gathered from Gen. xix. 30 *sqq.*—the one trace of open malice in the story of the patriarchs, and all the more striking as it occurs in a narrative of which Lot is the hero and saint, which therefore in its present form is of Moabite origin, although perhaps it has a still older Canaanite nucleus. Of these border wars we learn but little, although from casual notices it can be seen (2 Kings xiii. 20; Amos i. 13; comp. 2 Kings v. 2) that they were long kept up, although not quite uninterruptedly. But when at length the danger from the Aramæans was removed for Israel by the intervention of the Assyrians, the hour of Moab's subjection also came; Jeroboam II. extended his frontier over the eastern territory, as far as to the brook of the willows (Wadi 'l-Aḥsá). (Perhaps the song of Num. xxi. 27 *sqq.* has reference to these events.) A vivid picture of the confusion and anguish then prevalent in Moab has been preserved to us in the ancient prophecy of Isa. xv., xvi., which indeed would have greater historical value if we were able to tell precisely what in it depicts the present, and what is prediction of the future.[2]

This utterance of an older prophet was repeated some decennia later by the prophet Isaiah, with the addition of a clause adapting it to his time, to the effect that the Assyrians would carry out in all its fulness the hitherto imperfectly-executed threat. The Assyrians actually subjugated the Moabites, as well as the other small peoples of that region; but the blow was apparently not so grave as Isaiah had predicted. They lay more out of the way than their western neighbours, and perhaps their resistance to the scourge of God was not so obstinate as to demand the sharpest measures. What made it all the easier for them to reconcile themselves to the new situation was the fact that the Israelites suffered much more severely than they. From these their deadly enemies they were henceforth for ever free. They did not on that account, however, give up their old hatred, but merely transferred it from Israel to Judah. The political annihilation of the nation only intensified in Jerusalem the belief in its religious prerogative, and against this belief the hostility of neighbours was aroused more keenly than ever. The deepest offence at the religious exclusiveness of the people of Judæa, which then first began to manifest itself, was, as is easily understood, taken by their nearest relatives, Edom and Moab. They gave terrible expression to their feelings when the Chaldæans urged them on like uncaged beasts of prey against the rebellious Jews; and they joined loudly in the general chorus of malignant joy which was raised over the burning of the temple and the ruin of the holy city.[3]

"Because Moab saith: Behold the house of Judah is like all the other nations, therefore do I open his land to the Bne Kedem," says the prophet Ezekiel (xxv. 8 *sqq.*). His threat against the Moabites as well as against the Edomites and Ammonites is that they shall fall before the approach of the desert tribes. Probably in his day the tide of Arabian invasion was already slowly rising, and of course it had first to overtake the lands situated on the desert border. At all events the Arab immigration into this quarter began at an earlier date than is usually supposed; it continued for centuries, and was so gradual that the previously-introduced Aramæizing process could quietly go on alongside of it. The Edomites gave way before the pressure of the land-hungry nomads, and settled in the desolate country of Judah; the children of Lot, on the other hand, appear to have amalgamated with them,—the Ammonites maintaining their individuality longer than the Moabites, who soon entirely disappeared.

Israel and Moab had a common origin, and their early history was similar. The people of Jehovah on the one hand, the people of Chemosh on the other, had the same idea of the Godhead as head of the nation, and a like patriotism derived from religious belief,—a patriotism capable of extraordinary efforts, and which has had no parallel in the West either in ancient or in modern times. The mechanism of the theocracy also had much that was common to both nations; in both the king figures as the deity's representative, priests and prophets as the organs through whom he makes his communications. But, with all this similarity, how different were the ultimate fates of the two! The history of the one loses itself obscurely and fruitlessly in the sand; that of the other issues in eternity. One reason for the difference (which, strangely enough, seems to have been felt not by the Israelites alone but by the Moabites also) is obvious. Israel received no gentle treatment at the hands of the world; it had to carry on a continual conflict with foreign influences and hostile

[1] The narrative of Mesha in his inscription has, strange to say, not unfrequently been regarded as parallel with 2 Kings iii., and the conclusion been drawn that the Biblical narrative completely inverts the true state of the case,—it is difficult to see for what motives, for there is no braggadocio in 2 Kings iii. But it is perfectly clear that the narrative of 2 Kings iii. presupposes the revolt of Mesha as an old affair; while, *on the other hand*, Mesha's story on the stele in the Louvre is a narrative of this very revolt and its immediate consequences; it is accordingly to be regarded as parallel with 2 Kings i. 1. Elisha's miracle in Wadi 'l-Aḥsá (2 Kings iii. 16) is explained by the locality; Aḥsá means a sandy ground with moist subsoil, where, by digging trenches, water is always obtainable. The (probably compulsory) participation of the king of Edom in Joram's expedition against Moab may perhaps be brought into connexion with the fact that the Moabites burned to lime the bones of a king of Edom (Amos ii. 1).

[2] In Isa. xv. xvi. it is presupposed that the attack upon Moab has been made from the north, at a time when Judah is a comparatively powerful kingdom, exercising sovereignty over Edom also, and in a position to afford shelter to the fugitive Moabites, thus not being itself at war with them. These marks taken together can only apply to the period of Jeroboam II. and Uzziah. Hitzig will have it that Jonah ben Amittai wrote Isa. xv. xvi.; but according to 2 Kings xiv. 25 that prophet preached prosperity to Jeroboam, and not disaster to the Moabites.

[3] Zeph. ii. 8 *sq.*; 2 Kings xxiv. 2, and Jer. xii. 9 *sqq.*; Ezek. xxv. 8 *sqq.* It need hardly be said that the Moabites shared the fate of all the Palestinian peoples when supremacy passed from the Assyrians to the Chaldæans, and that, notwithstanding their hatred of the Jews, they had no difficulty in seeking alliances with them, when occasions arose on which they could be made useful (Jer. xxvii. 3).

powers; and this perpetual struggle with gods and men was not profitless, although the external catastrophe was inevitable. Moab meantime remained settled on his lees, and was not emptied from vessel to vessel (Jer. xlviii. 11), and corruption and decay were the result. This explanation, however, does not carry us far, for other peoples with fortunes as rude as those of Israel have yet failed to attain historical importance, but have simply disappeared. The service the prophets rendered at a critical time, by raising the faith of Israel from the temporal to the eternal sphere, has already been spoken of in the article ISRAEL.

Sources.—The Old Testament (Ruth and Chronicles, however, being of no historical worth in this connexion), and the inscription of Mesha, on the stone of Dibon, discovered in 1868, and now in the Louvre. The Berlin *Moabitica* are valueless,—Schlottmann himself, the unshaken champion of their genuineness, conceding that they are mere scribbling, and do not even form words, much less sentences. The literature of the subject is to be found in the commentaries on the Old Testament books, and in those on the inscription of Mesha. (J. WE.)

MOʻALLAKÁT. *Al-Moʻallakát* is the title of a group of seven longish Arabic poems, which have come down to us from the time before Islam. The name signifies "the suspended" (pl.), the traditional explanation being that these poems were hung up by the Arabs on or in the Kaʻba at Mecca. The oldest passage known to the writer where this is stated occurs in the *ʻIkd* of the Spanish Arab, Ibn ʻAbd-Rabbih (A.D. 861-940), Búlák ed. vol. iii. p. 116 *sq.* We read there: "The Arabs had such an interest in poetry, and valued it so highly, that they took seven long pieces selected from the ancient poetry, wrote them in gold on rolls (?) of Coptic cloth, and hung them up (*ʻallakat*) on the curtains which covered the Kaʻba. Hence we speak of 'the golden poem of Amraalkais,' 'the golden poem of Zohair.' The number of the golden poems is seven; they are also called 'the suspended' (*al-Moʻallakát*)." Similar statements are frequent in later Arabic works. But against this we have the testimony of a contemporary of Ibn ʻAbd-Rabbih, the grammarian Naḥḥás (*ob.* A.D. 949), who says in his commentary on the Moʻallakát: "As for the assertion that they were hung up in [*sic*] the Kaʻba, it is not known to any of those who have handed down ancient poems."[1] This cautious scholar is unquestionably right in rejecting a story so utterly unauthenticated. The customs of the Arabs before Mohammed are pretty accurately known to us; we have also a mass of information about the affairs of Mecca at the time when the Prophet arose; but no trace of this or anything like it is found in really good and ancient authorities. We hear, indeed, of a Meccan hanging up a spoil of battle on the Kaʻba (Ibn Hishám, ed. Wüstenfeld, p. 431). Less credible is the story of an important document being deposited in that sanctuary, for this looks like an instance of later usages being transferred to pre-Islamic times. But at all events this is quite a different thing from the hanging up of poetical manuscripts. To account for the disappearance of the Moʻallakát from the Kaʻba we are told, in a passage of late origin (De Sacy, *Chrestom.*, ii. 480), that they were taken down at the capture of Mecca by the Prophet. But in that case we should expect some hint of the occurrence in the circumstantial biographies of the Prophet, and in the works on the history of Mecca; and we find no such thing. That long poems were *written* at all at that remote period is improbable in the extreme. All that we know of the diffusion of Arabic poetry, even up to a time when the art of writing had become far more general than it was before the spread of Islam, points exclusively to *oral* tradition. Moreover, it is quite inconceivable that there should have been either a guild or a private individual of such acknowledged taste, or of such influence, as to bring about a consensus of opinion in favour of certain poems. Think of the mortal offence which the canonization of one poet must have given to his rivals and their tribes! It was quite another thing for an individual to give his own private estimate of the respective merits of two poets who had appealed to him as umpire; or for a number of poets to appear at large gatherings, such as the fair of ʻOkáẓ, as candidates for the place of honour in the estimation of the throng which listened to their recitations. In short, this legend, so often retailed by later Arabs, and still more frequently by Europeans, must be entirely rejected.[2] The story is a pure fabrication based on the name "suspended." The word was taken in its literal sense; and as these poems were undoubtedly prized above all others in after times, the same opinion was attributed to "the [ancient] Arabs," who were supposed to have given effect to their verdict in the way already described. A somewhat simpler version, also given by Naḥḥás in the passage already cited, is as follows: "Most of the Arabs were accustomed to meet at ʻOkáẓ and recite verses; then if the king was pleased with any poem, he said, 'Hang it up, and preserve it among my treasures.'" But, not to mention other difficulties, there was no king of all the Arabs; and it is hardly probable that any Arabian king attended the fair at ʻOkáẓ. The story that the poems were written in gold has evidently originated in the name "the golden poems" (literally "the gilded"), a figurative expression for excellence. We must interpret the designation "suspended" on the same principle. In all probability it means those (poems) which have been raised, on account of their value, to a specially honourable position. Another derivative of the same root is *ʻilk*, "precious thing."

The selection of these seven poems can scarcely have been the work of the ancient Arabs at all. It is much more likely that we owe it to some connoisseur of a later date. Now Naḥḥás says expressly in the same passage: "The true view of the matter is this: when Ḥammád arráwiya (Ḥammád the Rhapsodist) saw how little men cared for poetry, he collected these seven pieces, urged people to study them, and said to them: 'These are the [poems] of renown.'" And this agrees with all our other information. Ḥammád (who lived in the first three quarters of the 8th century A.D.) was perhaps of all men the one who knew most Arabic poetry by heart. The recitation of poems was his profession. To such a rhapsodist the task of selection is in every way appropriate; and it may be assumed that he is responsible also for the somewhat fantastic title of "the suspended."

The collection of Ḥammád appears to have consisted of the same seven poems which are found in our modern editions, composed respectively by Amraalkais, Ṭarafa, Zohair, Labíd, ʻAntara, ʻAmr ibn Kolthúm, and Ḥárith ibn Ḥilliza. These are enumerated both by Ibn ʻAbd-Rabbih, and, on the authority of the older philologists, by Naḥḥás; and all subsequent commentators seem to follow them. We have, however, evidence of the existence, at a very early period, of a slightly different arrangement. Two of the foremost authorities in Arabic poetry are Abú ʻObaida and Mofaḍḍal,—men who for care and accuracy in preserving the genuine text were far ahead of their much older contemporary Ḥammád. Both of these inserted a poem by Nábigha and one by Aʻshá in place of those of ʻAntara and Ḥárith;[3] and, if our informant has expressed

[1] Ernst Frenkel, *An-Naḥḥás' Commentar zur Muʻallaqa des Imruul-Qaʻis* (Halle, 1876), p. viii.

[2] Doubts had already been expressed by various scholars, when Hengstenberg—rigid conservative as he was in theology—openly challenged it: and since then it has been controverted at length in Nöldeke's *Beiträge zur Kenntniss der Poesie der alten Araber* (Hanover, 1864), p. xvii. *sqq.* Our highest authority on Arabic poetry, Professor Ahlwardt, concurs in this conclusion; see his *Bemerkungen über die Aechtheit der alten arabischen Gedichte* (1872), p. 25 *sq.*

[3] The passage is cited by Nöldeke, *Beiträge*, p. xx. *sq.*

himself correctly, they also called this modified collection *Mo'allakát.* Mofaddal employs, besides, the names "the seven long [poems]" and "the necklaces." This last became afterwards a common title for the seven poems. The comparison of songs to strings of pearls is a very apt one, from the nature of the Arabic poem, composed as it is of separate loosely-connected parts. Hence it became so popular that even in ordinary prose to speak in rhythmical form is called simply *nazm*, "to string pearls." Mofaddal expressly opposes the view of those who did not acknowledge the pre-eminence of the seven poets selected by him. This appears to be an attack on Hammád for including in his collection the works of two men who for poetic fame could certainly never enter the lists with Nábigha and A'shá. It is *prima facie* more likely that a later writer should have replaced the less famous poets by those who were universally placed in the first rank, than *vice versa.* Perhaps another fact is of some importance here. Hammád, a Persian by descent, was a client of the Arab tribe, Bakr *ibn* Wáil. In the heathen period this tribe was much at war with the closely-related tribe Taghlib. Now of all Arabic poems none was more famous than that in which 'Amr ibn Kolthúm celebrates in glowing terms the praises of his tribe Taghlib. If, therefore, Hammád's collection embraced this poem, it was very natural for him to gratify his patrons the Bakrites by placing alongside of it that of Hárith—a Bakrite and contemporary of 'Amr—where he extols his own tribe and assails the Taghlibites with bitter scorn. Such considerations did not affect Abú 'Obaida and Mofaddal.

The authority of these men has so far prevailed that the poems of their favourites Nábigha and A'shá often appear in the manuscripts, not indeed instead of those of 'Antara and Hárith, but after the other seven. Thus we sometimes read of *nine* Mo'allakát. The first author in whom the writer has observed this is the great philosophic historian Ibn Khaldún (A.D. 1332-1406); he mentions instead of Hárith the far more celebrated 'Alkama; whether relying on ancient authority, or by an oversight, we cannot tell. In an excellent collection of forty-nine long poems by Abú Zaid al-Korashí (date unknown) Mofaddal's seven poets appear in the first class, "the necklaces;" but Nábigha and A'shá are each represented by a different piece from that usually reckoned among the Mo'allakát. By this editor the name "golden poems," which, as we have seen, sometimes occurs as a synonym of "Mo'allakát," is applied to seven quite distinct songs.[1] This uncertainty as to the selection and the titles may serve as an additional proof that the "suspension," on the Ka'ba or anywhere else, is a fable.

The lives of these seven (or nine) poets were spread over a period of more than a hundred years. The earliest of them, according to the common and probably correct opinion, was AMRAALKAIS (pronounced also Imroolkais, Imraalkais, &c.), regarded by many as the most illustrious of Arabian poets. His exact date cannot be determined; but probably the best part of his career fell within the first half of the 6th century. He was a scion of the royal house of the tribe Kinda, which lost all its power at the death of King Hárith ibn 'Amr in the year 529.[2] The poet's royal father, Hojr, by some accounts a son of this Hárith, was killed by Bedouins. The son led an adventurous life as a refugee, now with one tribe, now with another, and appears to have died young. The anecdotes related of him—which, however, are very untrustworthy in detail—as well as his poems, imply that the glorious memory of his house and the hatred it inspired were still comparatively fresh, and therefore recent.

The Mo'allaka of 'AMR hurls defiance against the king of Híra, 'Amr son of Mundhir, who reigned from the summer of 554 till 568 or 569, and was afterwards slain by our poet.[3] This prince is also addressed by HÁRITH in his Mo'allaka. Of TARAFA, who is said to have attained no great age, a few satirical verses have been preserved, directed against this same king. This agrees with the fact that a grandson of the Kais ibn Khálid, mentioned as a rich and influential man in Tarafa's Mo'allaka (v. 80 or 81), figured at the time of the battle of Dhú Kár, in which the tribe Bakr routed a Persian army. This battle falls between A.D. 604 and 610 (Nöldeke's *Tabarí*, p. 311).

The Mo'allaka of 'ANTARA and that of ZOHAIR contain allusions to the feuds of the kindred tribes 'Abs and Dhobyán. Famous as these contests were, their time cannot be ascertained. But the date of the two poets can be approximately determined from other data. Ka'b, son of Zohair, composed first a satire, and then, in the year 630, a eulogy on the Prophet; another son, Bojair, had begun, somewhat sooner, to celebrate Mohammed. 'Antara killed the grandfather of the Ahnaf ibn Kais who died at an advanced age in A.D. 686 or 687; he outlived 'Abdalláh ibn Simma, whose brother Doraid was a very old man when he fell in battle against the Prophet (early in A.D. 630); and he had communications with Ward, whose son, the poet 'Orwa, may perhaps have survived the flight of Mohammed to Medina. From all these indications we may place the productive period of both poets in the end of the 6th century.[4] The historical background of 'Antara's Mo'allaka seems to lie somewhat earlier than that of Zohair's.

To the same period appears to belong the poem of 'ALKAMA, which, as we have seen, Ibn Khaldún reckons amongst the Mo'allakát. This too is certainly the date of NÁBIGHA, who was one of the most distinguished of Arabic poets. For in the poem often reckoned as a Mo'allaka, as in many others, he addresses himself to the above-named No'mán, king of Híra, who reigned in the two last decades of the 6th century. The same king is mentioned as a contemporary in one of 'Alkama's poems.

The poem of A'SHÁ, which Mofaddal placed among the Mo'allakát, contains an allusion to the battle of Dhú Kár (under the name "Battle of Hinw," v. 62). This poet, not less famous than Nábigha, lived to compose a poem in honour of Mohammed, and died not long before A.D. 630.

LABÍD is the only one of these poets who embraced Islam. His Mo'allaka, however, like almost all his other poetical works, belongs to the pagan period. He is said to have lived till 661 or even later; certainly it is true of him, what is asserted with less likelihood of several others of these poets, that he lived to a ripe old age.

We have already mentioned that the old Arabic poetry was transmitted not by manuscripts but simply through oral tradition. Many pieces, especially the shorter ones, may have owed their preservation to their hold on the popular memory. But, fortunately, there was a class of men who made it their special business to learn by rote, and repeat, the works either of a single poet or of several. The poets themselves used the services of such rhapsodists (*ráwis*). The last representative of this class is Hammád, the man who formed the collection of Mo'allakát; but he, at the same time, marks the transition from

[1] See Nöldeke, *Beiträge*, p. xxi., and the catalogue of the Arabic codd. in the British Museum, p. 480 *sqq.*

[2] See *Tabarí's Geschichte der Perser und Araber . . . übersetzt von Th. Nöldeke* (Leyden, 1879), p. 171.

[3] See Nöldeke's *Tabarí*, pp. 170, 172.

[4] This evidence might be supplemented from a poem in Zohair's name, whose author describes himself as a man of ninety years, and in which the downfall of King No'mán of Híra (A.D. 601, see *Tabarí*, p. 347) is spoken of as a not very recent event. But the genuineness of this poem is more than doubtful (see Ahlwardt, *op. cit.* p. 64, and C. J. Lyall in the *Academy*, March 13, 1880, p. 192).

the rhapsodist to the critic and scholar. Now, when we consider that more than a century—in some cases two centuries—elapsed before the poems were fixed by literary men, we must be prepared to find that they have not retained their original form unaltered. The most favourable opinion of the rhapsodists would require us to make allowance for occasional mistakes; expressions would be interchanged, the order of verses disarranged, passages omitted, and probably portions of different poems pieced together. The loose structure of the ancient poems rendered them peculiarly liable to corruptions of this kind. But the fact is that Hammád in particular dealt in the most arbitrary fashion with the enormous quantity of poetry which he professed to know thoroughly. He is even charged with falsifications of all sorts in this department. Of others, again—and notably of the great philologist Khalaf, "the Red"—it is credibly reported that they used their intimate knowledge of the style and language of the ancients to pass off whole poems of their own making as the productions of earlier authors. The worst anticipations are only too completely confirmed by an examination of such pieces as are still preserved, as is shown most conclusively in Ahlwardt's *Bemerkungen*, already cited. The seven Mo'allakát are indeed free from the suspicion of forgery, but even in them verses are frequently transposed; in all there are lacunæ; and probably all contain verses which do not belong to them. Some of them have more than one introduction. This is the case even with the poem of 'Amr, although, as the finest panegyric of his very powerful tribe, it must have had a wide circulation. The true introduction begins at v. 9; before that we find another which certainly does not belong to this poem, and can hardly be the work of the same poet. 'Amr lived in the desert regions near the lower Euphrates, under the Persian dominion; whereas the author of v. 8 boasts of his carousals in several parts of Roman Syria, and in v. 1 he speaks of drinking wine from a place in Northern Syria. It is evident that all attempts to restore the original order, to fill up blanks, or to remove interpolations, can only be carried to a certain degree of probability at the best; there must always be a large subjective element in judgments on points of the kind. Still less can we hope to discover and rectify the minor changes, in single expressions or grammatical forms, which the text may have undergone before it was fixed in writing. It may be remarked in this connexion that where any ancient song has been transmitted through two different grammatical schools it generally appears in two considerably divergent forms, each having been taken down from the lips of a separate ráwí. Of secondary importance are the errors due to later copyists. Considerable as these often are, we are, at least in many cases, better able to correct them.

Even the masters of old Arabian poetry do not exhibit such characteristic differences in their general manner and style as to leave in the mind a clear idea of their individuality. A few distinct poetic types emerge, but the great majority of these poets present a somewhat monotonous aspect to the Western scholar, who indeed can at best have but a very imperfect feeling for *nuances* of style in this field. But if we are thus unable to isolate the various constituent parts of this poetical literature, and pass a critical opinion on each, we do get from this literature, as a whole, what is of far greater importance than an æsthetic estimate of this or that particular poet, viz. a poetic picture of the whole life and activity of that remarkable people which, amid the endless agitation and endless sameness of its existence, and in an extremely inhospitable region, was preparing one of the mightiest revolutions in the history of the world. This collective impression is hardly impaired by the involuntary alterations made by the ráwís; nor is it greatly distorted by the forgers of the 2d century of Islam, who were thoroughly familiar with the spirit and style of antiquity, and seldom did violence to them.

The critics of the 2d and 3d centuries A.H. unanimously ranked the poets of the heathen period above those of Islam; and in that verdict we must concur. The older Moslem poets were for the most part mere Epigoni, content, for better or worse, to borrow the style of their pagan predecessors. It is only natural, therefore, that the seven best poems should have been selected from the productions of heathenism. But how these particular seven came to be fixed upon, it is difficult to decide. It is remarkable that people who knew thousands of such poems should have agreed as to the superiority of five, and only differed about two. No doubt the selection was greatly influenced by the widely-established reputation of certain poets, like Amraalkais, Zohair, and Ṭarafa; while in other cases single poems, such as that of 'Amr, stood in high repute for special reasons. Still, even we, with a much narrower range of selection, should hardly pick out these seven as the finest. In all probability our choice would not light on a single one of them. The truth is, our æsthetic ideal is essentially different from that of those old *littérateurs*. And, while we may certainly consider our own taste, formed on the model of the Greeks and the best of the moderns, to be on the whole purer than theirs, we must not forget that they had the advantage of perfect knowledge of the language and the subject-matter, and could thus perceive a multitude of beautiful and delicate touches, which we either miss entirely or realize with laborious effort. The world of the old Arabian poet lay at an infinite remove from ours. His mental horizon was narrow; but within that horizon every minute detail was seized and designated with precision. Among the nomads, for example, the smallest point of the horse or camel that the eye can see has its importance; the language has precise and generally understood words for them all, where ours has only technical terms. It is the same with all the physical properties of the animal—its paces, etc. Thus, when a poet faithfully described the exterior and the deportment of his camel, that was to his hearers—and the same is true of later critics—a genuine pleasure, because the description conveyed to them a definite pictorial impression. But we do not understand the details of the picture; or, when at best with all the resources of tradition and natural history we have gained some tolerable comprehension of them, the whole still leaves us indifferent. A camel to us is simply not a poetical object; and even a horse ceases to be æsthetically interesting—except perhaps to a sportsman—when one is asked to go over his points in detail. For this reason we are apt to find a great part of Ṭarafa's Mo'allaḳa, and many parts of the poems of Amraalḳais, viewed as poetry, distasteful rather than interesting. More attractive are the descriptions of the life and habits of wild animals in the desert, such as the wild ass and some species of antelope, which the poets are fond of introducing (see, *e.g.*, the Mo'allaḳa of Labid). There are also many vivid sketches from nature to be met with,—nature, of course, as seen in the very monotonous Arabian landscape. Monotony, indeed, is a predominant characteristic of this poetry. When one first reads poems where the bard begins by shedding tears over the scarcely perceptible traces of the dwelling of his beloved in years gone by, one's sympathy is aroused. But when poem after poem is found to commence with the same scene, and possibly with almost the same words, the emotion is somewhat damped. No doubt such occurrences must really have been very common in the nomad life; nevertheless the suspicion becomes at last irresistible that for the most part all this is pure fiction. Nor can we be sure that the

poets are always to be taken *au sérieux* when they describe those carousals, and other adventures in peace and war, of which they love to boast. They are probably more serious in the narratives of their love experiences: these are often very highly coloured, and yet are always pervaded by a certain natural refinement, which is too often wanting in the later erotic poetry of the Moslems. But there, too, our enjoyment is frequently marred by minute and even prosy descriptions of the physical charms of the object of affection.

The lyrical and even the more rhetorical passages of the poems make in general a deeper impression upon us than the descriptive portions, to which they owe their distinctive character, and which are often intimately blended with the former. When those old Arabs are really moved by love, or rage, or grief, when personal or tribal vanity vents itself in immoderate boasting, invective, or banter, then they strike chords that thrill our breasts. In those passages where genuine human feeling is stirred, they also display far greater individuality than in the more conventional descriptions. Especially affecting are the numerous passages or complete poems which mourn over the beloved and venerated dead. Their sober practical philosophy too, as it is presented in the Moʻallaḳa of Zohair and in many of Labíd's poems, is really impressive.

The Moʻallaḳát are highly characteristic specimens of this poetry. They exhibit nearly all its merits as well as most of its defects. Amongst its merits we ought, perhaps, to include the unfailing regularity of the verse. That a people living under such extremely simple conditions should have cultivated a purely quantitative metre, so euphonious and so rigorously adhered to, is a fact worthy of our highest admiration. It is one evidence of that sense of measure and fixed form which is, in other directions also, a marked feature in the life and speech of the Arabs. The mere fact that in their verses they give so much attention to elegance of expression deserves commendation. Amongst the defects of this poetry we must emphasize the loose connexion between the separate parts. *We* require a poem, like any other work of art, to be a compact unity; the Arabs and many other Orientals lay all the stress on the details. In the Moʻallaḳa of Ṭarafa, for instance, after the poet has spoken long enough about his beloved, he starts off in this fashion: "But I banish care when it comes near with a"—she-camel of such and such qualities, and then proceeds to give a description of his riding-camel. Equally abrupt transitions occur in almost all these poems, generally more than once in the same poem. In many cases a sort of unity is preserved by making the different sections represent so many scenes from the life of the poet or from the common life of the Bedouins; but even then there is something unsatisfactory in the want of real connexion. It does not mend matters much when the poet keeps up a merely mechanical transition; as, for example, when he speaks first of his camel, then with the words "it is as swift as a wild ass which," &c., passes to a description of that animal, and again proceeds, "or as swift as an ostrich which," &c., in order to introduce the ostrich.

This loose structure of the poems explains the fact that from a very early period particular pieces were culled from larger works and recited by themselves. For the town-Arabs of later times this procedure was especially convenient. For them the wild ass or oryx-antelope had little attraction; and on the camel they bestowed about as much notice as we do on our dray-horses and waggons. But the love and hate, the pride and scorn, the fierce lust of revenge and the wailing grief, the bravery and the gaiety, which breathed through the old Bedouin songs, had an intense fascination for them. We see that their attitude towards that poetry had in some degree approximated to our own. Hence it is that some anthologies from the old poetry, made by men of learning and ability, with an eye to contemporary tastes, are on the whole much more pleasing to us than the complete poems themselves. This is eminently true of the excellent collection edited by Abú Tammám, himself a considerable poet (first half of the 9th century), under the title "Ḥamása" (Valour). This collection, which, however, embraces many pieces of the Moslem period, is certainly fitted to give a European a rather too favourable idea of ancient Arabic poetry. Whoever wishes really to know that poetry—and without this knowledge it is impossible to understand the Arabs themselves or their language—must betake himself to those which, like the Moʻallaḳát and others, have been preserved more or less in their integrity.

The Moʻallaḳát have been repeatedly printed, separately and collectively, both in the West and the East, generally with an Arabic commentary. A good commentary by a competent European is a real desideratum. A work of this kind would do more for the understanding of the poems than any poetical translation, which must always fail in rendering these definite concrete expressions of the Arabs for which we possess neither the idea nor the image. A translation must either be a mere paraphrase or else substitute something utterly vague. (TH. N.)

MOBILE, a city and port of entry of the United States, the capital of Mobile county, and, though not the capital, the largest city of Alabama, lies 140 miles east of New Orleans, on a sandy plain on the west bank of Mobile river, one of the arms of the Alabama. The municipal boundary includes an area about 6 miles long by 2 or 3 in breadth; but, excluding the suburban villas scattered about the nearer hills, the portion occupied by the buildings of the city proper is not more than a mile square. In the matter of paving and shade the streets are generally good, and Government Street especially, with its fine oak trees and gardens, forms an attractive promenade. Besides the spacious granite building erected in 1859 to accommodate the Custom-House, the Post Office, and the United States courts, the principal edifices are the Roman Catholic cathedral of the Immaculate Conception (1833), Christ Church (Episcopal) (1837), the City Hospital (1830), the United States Marine Hospital (1836), the Providence Infirmary, the conjoint market-house and municipal buildings, Barton Academy (occupied by the high schools), and the Alabama Medical College (founded in 1859). About 6 miles out, at Spring Hill, is the Jesuit College of St Joseph, established by Bishop Portier in 1832. As a commercial centre Mobile is in some respects very favourably situated. It is the only port of Alabama; the estuary on which it stands is the outlet for several navigable rivers; and it is the seaward terminus of the Mobile and Ohio railroad, the Mobile and Montgomery, and the Grand Trunk. But, on the other hand, it lies 25 miles from the coast; the lagoon-like bay cut off from the Gulf of Mexico by the narrow isthmus of Mobile Point is extremely shallow; and in 1879 no vessel drawing more than 13 feet could load and unload in the harbour with safety. Since 1827, it is true, various works have been undertaken to improve the approaches: the Choctaw Pass and the Dog River Bar, which had formerly a depth of little more than 5 and 8 feet respectively, were deepened to 17 feet by 1882; but Mobile will not take rank as a satisfactory ocean port till the scheme (now in operation) for constructing a wide channel more than 20 feet deep right through the bay has been fully carried out. The cost of the necessary works being beyond the power both of the city and State, Congress has granted $270,000 for the purpose of widening the channel to 200 feet, and deepening it to 23 feet. A private company, established in 1876, has built a breakwater in the bay, and greatly increased the safety of the harbour. For the years between 1855 and 1859 the average value of exports and imports was respectively

$23,419,266 and $711,420; the following figures for recent years show a considerable decline on the total:—

Years ending in June	Exports.	Imports.
1877	$12,784,171	$648,404
1878	9,493,306	1,148,442
1879	6,219,818	544,628
1880	7,188,740	425,519
1881	6,595,140	671,252
1882	3,258,605	396,573

In cotton, which forms the staple export, the falling off is particularly noticeable, 632,308 bales being the average for 1855 to 1859, and 365,945, 392,319, and 265,040 bales the quantities for 1879, 1880, and 1881. A great deal of what comes to the Mobile market is sent to New Orleans for shipment, partly that it may obtain a higher price as "Orleans" cotton. Lumber shingles, turpentine and rosin, fish and oysters, and coal, are also important items, but do not make in the aggregate so much as half the value of the cotton. Among the local industrial establishments are several spinning-mills, breweries, cooperages, shipbuilding yards, foundries, and sash and door works. The market gardeners of the outskirts produce a large quantity of cabbages, potatoes, watermelons, tomatoes, &c., to supply the cities of the western and northern States (value in 1879, $112,520; 1880, $174,483; 1881, $159,706; 1882, $367,194; 1883, estimated $700,000). Though in 1820 it had no more than 2672 inhabitants, Mobile had 31,255 in 1880; the figures for the intermediate decades being 3194 (1830), 12,672 (1840), 20,515 (1850), 29,258 (1860), and 32,034 (1870).

Founded as a fort by Lemoyne d'Iberville (de Bienville) in 1702, Mobile continued to be the capital of the colony of Louisiana till 1723, when this rank was transferred to New Orleans. The site selected by Lemoyne was probably about 20 miles above the present position, which was first occupied after the floods of 1711. By the Treaty of Paris, 1763, Mobile and part of Louisiana were ceded to Britain; but in 1780 the fort (now Fort Charlotte) was captured by the Spanish general Galvez, and in 1783 it was recognized as Spanish along with other British possessions on the Gulf of Mexico. General Wilkinson, ex-governor of Louisiana, recovered the town for Louisiana in 1813, and in 1819, though its population did not exceed 2500, it was incorporated as a city. In 1864-65 Mobile and the neighbourhood was the scene of important military and naval engagements. The Confederates had surrounded the city by three lines of defensive works, but the defeat of their fleet by Admiral Farragut, and the capture of Fort Morgan, Spanish Fort, and Fort Blakelly, led to its immediate evacuation. As a municipal corporation, Mobile had got into such financial difficulties by 1879 that its city charter was repealed, and a board of commissioners established for the liquidation of its debt of $2,497,856.

MÖBIUS, August Ferdinand (1790-1868), astronomer and mathematician, was born at Schulpforta, November 17, 1790. At Leipsic, Göttingen, and Halle he studied for four years, ultimately devoting himself to mathematics and astronomy. In 1815 he settled at Leipsic as privat-docent, and the next year became extraordinary professor of astronomy in connexion with the university. Later he was chosen director of the university observatory, which was erected (1818-21) under his superintendence. In 1844 he was elected ordinary professor of higher mechanics and astronomy, a position which he held till his death, September 26, 1868. His doctor's dissertation, *De computandis occultationibus fixarum per planetas* (Leipsic, 1815), established his reputation as a theoretical astronomer. *Die Hauptsätze der Astronomie* (1836), *Die Elemente der Mechanik des Himmels* (1843), may be noted amongst his other purely astronomical publications. Of more general interest, however, are his labours in pure mathematics, which appear for the most part in Crelle's Journal from 1828 to 1858. These papers are chiefly geometrical, many of them being developments and applications of the methods laid down in his great work, *Der Barycentrische Calcul* (Leipsic, 1827), which, as the name implies, is based upon the properties of the mean point or centre of mass. Any point in a plane (or in space) can be represented as the mean point of three (or four) fixed points by giving to these proper weights or coefficients,—an obvious principle which leads in the hands of Möbius to what no doubt is the chief novel feature of the work, a system of homogeneous coordinates. Besides this, however, the work abounds in suggestions and foreshadowings of some of the most striking discoveries in more recent times—such, for example, as are contained in Grassmann's *Ausdehnungslehre* and Hamilton's *Quaternions*. He must be regarded as one of the leaders in the introduction of the powerful methods of modern geometry that have been developed so extensively of late by Von Standt, Cremona, and others.

MOCHÁ, a town of Yemen on the coast of the Red Sea, in E. long. 43° 20′, N. lat. 13° 19′. The point of the coast where Mochá lies appears to have owed early importance to its good anchorage, for the Muza of the *Periplus* (*Geog. Gr. Min.*, i. 273 *sqq.*), a great seat of the Red Sea trade in antiquity, seems to be identical with the modern Múza' (Yáḳút, iv. 680; Niebuhr, *Desc. de l'Arabie*, p. 195), a few miles inland from Mochá. Mochá itself is a modern town, which rose with the coffee trade into short-lived prosperity. The French expedition of 1709 found it a place of some 10,000 inhabitants, and its importance had increased half a century later, when Niebuhr visited it. The chief trade was then with British India. Lord Valencia in 1806 still found the town to present an imposing aspect, with its two castles, minarets, and lofty buildings; but the population had sunk to 5000. The internal disorders of Arabia and the efforts of Mohammed Ali to make the coffee trade again pass through India accelerated its fall, and the place is now a mere village. Mochá never produced coffee, and lies indeed in a quite sterile plain; the European name of Mochá coffee is derived from the shipment of coffee there. The patron saint, Sheikh Shadali, was, according to legend, the founder of the city and father of the coffee trade.

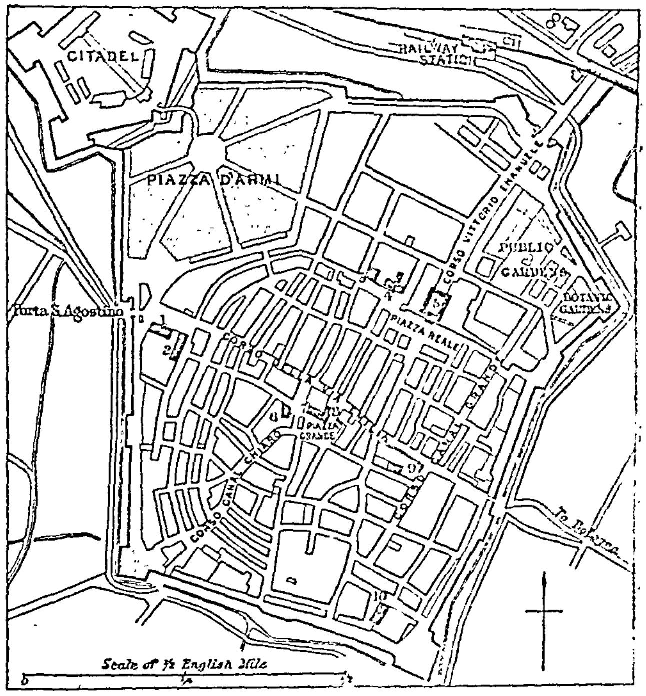
MOCKING-BIRD, or Mock-Bird (as Charleton, Ray, and Catesby wrote its name), the *Mimus polyglottus* of modern ornithologists, and the well-known representative of an American group of birds usually placed among the Thrushes (*q.v.*), *Turdidæ*, though often regarded as forming a distinct section of that Family, differing by having the tarsus scutellate in front, while the typical Thrushes have it covered by a single horny plate. The Mocking-bird inhabits the greater part of the United States, being in the north only a summer-visitant; but, though breeding yearly in New England, is not common there, and migrates to the south in winter, passing that season in the Gulf States and Mexico. It appears to be less numerous on the western side of the Alleghanies, though found in suitable localities across the continent to the Pacific coast, but not farther northward than Wisconsin, and it is said to be common in Kansas. Audubon states that the Mocking-birds which are resident all the year round in Louisiana attack their travelled brethren on the return of the latter from the north in autumn. The names of the species, both English and scientific, have been bestowed from its capacity of successfully imitating the cry of many other birds, to say nothing of other sounds, in addition to uttering notes of its own which possess a varied range and liquid fulness of tone that are unequalled, according to its admirers, even by those of the Nightingale (*q.v.*). This opinion may perhaps be correct; but, from the nature of the case, a satisfactory judgment can scarcely be pronounced, since a comparison of the voice of the two songsters can only be made from memory, and that is of course affected by associations of ideas which would preclude a fair estimate. To hear either bird at its best it must be at liberty; and the bringing together of captive examples, unless it could be done with so many of each species as to ensure an honest trial, would be of little avail. Plain in plumage, being greyish-brown above and dull white below, while its quills are dingy black, variegated with white, there is little about the Mocking-bird's appear-

ance beyond its graceful form to recommend it; but the lively gesticulations it exhibits are very attractive, and therein its European rival in melody is far surpassed, for the cock-bird mounts aloft in rapid circling flight, and, alighting on a conspicuous perch, pours forth his ever-changing song to the delight of all listeners; while his actions in attendance on his mate are playfully demonstrative and equally interest the observer. The Mocking-bird is moreover of familiar habits, haunting the neighbourhood of houses, and is therefore a general favourite. The nest is placed with little regard to concealment, and is not distinguished by much care in its construction. The eggs, from three to six in number, are of a pale bluish-green, blotched and spotted with light yellowish-brown. They, as well as the young, are much sought after by snakes, but the parents are often successful in repelling these deadly enemies, and are always ready to wage war against any intruder on their precincts, be it man, cat, or hawk. Their food is various, consisting of berries, seeds, and insects.

Some twelve or fourteen other species of *Mimus* have been recognized, mostly from South America; but *M. orpheus* seems to be common to some of the Greater Antilles, and *M. hilli* is peculiar to Jamaica, while the Bahamas have a local race in *M. bahamensis*. The so-called Mountain Mocking-bird (*Oreoscoptes montanus*) is a form not very distant from *Mimus*; but, according to Mr. Ridgway, it inhabits exclusively the plains overgrown with *Artemisia* of the interior tableland of North America, and is not at all imitative in its notes, so that it is an instance of a misnomer. Of the various other genera allied to *Mimus*, those known in the United States as Threshers, and belonging to the genus *Harporhynchus*—of which six or eight species are found in North America, and are very Thrush-like in their habits—must be mentioned; but there is only room here to dwell on the Cat-bird (*Galeoscoptes carolinensis*), which is nearly as accomplished an imitator of sounds as its more celebrated relative, with at the same time peculiar notes of its own, from one of which it has gained its popular name. The sooty-grey colour that, deepening into blackish-brown on the crown and quills, pervades the whole of its plumage—the lower tail-coverts, which are of a deep chestnut, excepted—renders it a conspicuous object; and though, for some reason or other, far from being a favourite, it is always willing when undisturbed to become intimate with men's abodes. It has a much wider range on the American continent than the Mocking-bird, and is one of the few species that are resident in Bermuda, while on more than one occasion it is said to have appeared in Europe.

The name Mocking-bird, or more frequently Mock-Nightingale, is in England occasionally given to some of the Warblers (*q.v.*), especially the Blackcap (*Sylvia atricapilla*), and the Sedge-bird (*Acrocephalus schœnobænus*). In India and Australia the same name is sometimes applied to other species. (A. N.)

MODENA, one of the principal cities of Northern Italy, formerly the capital of a duchy, and still the chief town of a province and the seat of an archbishop, is situated in the open country in the south side of the valley of the Po, between the Secchia to the west and the Panaro to the east. By rail it is 31 miles E.S.E. of Parma, 24 W.N.W. of Bologna, and 37 S. of Mantua. The observatory stands 135 feet above the level of the sea, in 44° 38′ 52″ N. lat. and 10° 55′ 42″ E. long. Dismantled since 1816, and now largely converted into promenades, the fortifications still give the city an irregular pentagonal contour, modified at the north-west corner by the addition of a citadel also pentagonal. Within this circuit there are various open areas—the spacious Piazza d'Armi in front of the citadel, the public gardens in the north-east of the city, the Piazza Grande in front of the cathedral, and the Piazza Reale to the south of the palace. The Æmilian Way crosses obliquely right through the heart of the city, from the Bologna Gate in the east to that of Sant' Agostino in the west. Commenced by the countess Matilda in 1099, after the designs of Lanfranc, and consecrated in 1184, the cathedral (St Geminian's) is a low but handsome building, with a lofty crypt, three eastern apses, and a façade still preserving some curious sculptures of the 12th and 15th centuries. The bell-tower, named La Ghirlandina from the bronze garland surrounding the weathercock, is lined with white marble, and is 315 feet high; in the basement may be seen the wooden bucket captured by the Modenese from the Bolognese in the affray at Zappolino (1325), and rendered famous by Tassoni's *Secchia Rapita*. Of the other churches in Modena, San Pietro has terra-cottas by the local artist Begarelli, and S. Agostino (now S. Michele) contains the tomb of Sigonius and the tombstone of Muratori. The old ducal palace, begun by Duke Francis I. in 1635 from the designs of Avanzini, and finished by Francis Ferdinand V., is an extensive marble building, and now contains the library (*Bib. Palatina*, see vol. xiv. p. 530), picture-gallery, and museum. Many of the best pictures in the ducal collection were sold in the 18th century, and found their way to Dresden. The valuable *Museo Lapidario* in a building near Porta Sant' Agostino is well known to the



Plan of Modena.

classical antiquary through Cavedoni's *Dichiarazione degli antichi marmi Modenesi* (1828), and the supplements in the *Memoirs* of the Academy, vol. ix., &c. The university of Modena, originally founded in 1683 by Francis II., is mainly a medical and legal school, but has also a faculty of physical and mathematical science. It has about twenty-five professors, and from 200 to 250 students; a library of 20,000 volumes, an observatory, botanical gardens, an ethnographical museum, &c. The old academy of the *Dissonanti*, dating from 1684, was restored by Francis in 1814, and now forms the flourishing Royal Academy of Science and Art (*Memoirs* since 1833); and there are besides in the city an Italian Society of Science founded by Anton Mario Lorgna, an academy of fine arts, a military college (1859), an important agricultural college, and a lyceum and gymnasium, both named after Muratori. In industrial enterprise the Modenese show but little activity, silk and linen goods and iron-wares being almost the only products of any note. Commerce is stimulated by a good position in the railway system, and by a canal which opens a water-way by the Panaro and the Po to the Adriatic. The population of the city was 32,248 in 1861, and 30,854 in 1871; that of the commune 55,512 in 1861, and 58,058 in 1881.

The Duchy of Modena, an independent sovereign state

(1452 to 1859), ultimately extended from the Po to the Mediterranean, and was bounded N. by Lombardy and the Papal States, E. by the Papal States and Tuscany, S. by Tuscany, Sardinia, and the Mediterranean, and W. by Sardinia and the duchy of Parma. Its greatest length, from Porto-Vecchio, on its northern frontier towards Mantua, to the outlet of the Parmignola torrent, on the Sardinian frontier, was 84½ miles; and its greatest width, from the pass of Calama, on the Papal and Tuscan frontier, to the right bank of the Enza, on the frontier of Parma, was 37 miles. The area was 2371 square miles, of which three-fifths were mountainous. In 1855 the population was 606,159. The duchy had six provinces—Modena, Reggio, Guastalla, Frignano, Garfagnana, Massa-Carrara.

Modena is the ancient Mutina, which was annexed by the Romans along with the rest of the territory of the Boii. In 183 B.C. Mutina became the seat of a Roman colony. During the civil wars Marcus Brutus held out within its walls against Pompeius in 78 B.C., and in 44 B.C. the place was defended by D. Brutus against M. Antony. The 4th century found Mutina in a state of decay; the ravages of Attila and the troubles of the Lombard period left it a ruined city in a wasted land. In the 8th century its exiles founded, at a distance of 4 miles to the north-west, a new city, Città Geminiana (still represented by the village of Cittanova); but about the close of the 9th century Modena was restored and refortified by its bishop, Laedoinus. When it began to build its cathedral (1099 A.D.) the city was part of the possessions of the countess Matilda of Tuscany; but when, in 1184, the edifice was consecrated by Lucius III., it was a free community. In the wars between Frederick II. and Gregory IX. it sided with the emperor, though ultimately the papal party was strong enough to introduce confusion into its policy. In 1288 Obizzo d'Este was recognized as lord of the city; after the death of his successor, Azzo VIII. (1308), it resumed its communal independence; but by 1336 the Este family was again in power. Constituted a duchy in 1452 in favour of Borso d'Este, and enlarged and strengthened by Hercules II., it became the ducal residence on the incorporation of Ferrara with the States of the Church (1598). Francis I. (1629-1658) erected the citadel and commenced the palace, which was largely embellished by Francis II. Rinaldo (*ob.* 1737) was twice driven from his city by French invasion. To Francis III. (1698-1780) the city was indebted for many of its public buildings. Hercules III. (1727-1803) saw his states transformed by the French into the Cispadine Republic, and, having refused the principality of Breisgau and Ortenau, offered him in compensation by the treaty of Campo Formio, died an exile at Treviso. His only daughter, Maria Beatrice, married Ferdinand of Austria (son of Maria Theresa), and in 1814 their eldest son, Ferdinand, received back the *Stati Estensi.* His rule was subservient to Austria, reactionary, and despotic. On the outbreak of the French Revolution of 1830, Francis IV. seemed for a time disposed to encourage the corresponding movement in Modena; but no sooner had the Austrian army put an end to the insurrection in Central Italy than he returned to his previous policy. Francis Ferdinand V., who succeeded in 1846, followed in the main his father's example. Obliged to leave the city in 1848, he was restored by the Austrians in 1849; ten years later, on 20th August 1859, the representatives of the Modenese, under the direction of Carlo Farini, declared their territory part of the kingdom of Italy, and their decision was confirmed by the plebiscite of 1860.

Natives of Modena are Fallopius the anatomist, Tarquinia Molza, Sadoletius, Sigonius, Tassoni, and Cavedoni the archæologist; the names of Zaccaria, Tiraboschi, and Muratori are associated with its library. Tiraboschi's *Bibliotheca Modenensis*, 6 vols., contains an account of all the literary personages of the duchy.

See Vedriani, *Storia di Modena*, 1666; Tiraboschi, *Mem storiche modenesi*, 1793; Scharfenberg, *Gesch. des Herzogth. Modena*, 1859; Oreste Raggi, *Modena descritta*, 1860; Baraldi, *Storia di Modena*; Valdrighi, *Diz. Storico, &c., delle contrade di Modena*, 1879-80; Crespellani, *Guida di Modena*, 1879; Galvani, *Mem. stor. intorno la vita di Francesco IV.*, 4 vols.

MODICA, a city of Italy, in the province of Syracuse in Sicily, 8 miles from the south coast, on the line of railway decreed in 1879 between Syracuse and Licata. It has increased its communal population from 30,547 in 1861 to 41,231 in 1881, and is a well-built and flourishing place. Of note among the public buildings are the old castle on the rock, the mediæval convent of the Franciscans, and the churches of S. Maria del Carmine (1150) and S. Maria di Betlem—this last containing ruins of the ancient temple destroyed by the earthquake of 1693. Modica is the point from which the remarkable prehistoric tomb and dwelling-caves of Val d'Ispica are usually visited. An early dependency of Syracuse, Motyca or Mutyca was in Cicero's days a fairly important municipium. In modern times it was held as a countship by the dukes of Alba. Placido Caraffa has written a prolix history of the city, which may be found in Grævius, *Thes. Ant. et Hist. Ital.*, vol. xii.

MOE, JÖRGEN ENGEBRETSEN (1813-1882), Norwegian poet and comparative mythologist, was born at Hole in Sigdal, Ringerike, Norway, on 22d April 1813, and entered the university of Christiania as a theological student at the age of seventeen. After leaving the university in 1839 he acted as tutor in various schools and families, and in 1845 was appointed professor of theology in the Military School of Norway, which post he held until 1853, when he became resident chaplain in his native parish of Sigdal. In 1863 he received the living of Bragernæs, Drammen; in 1870 that of Vest Aker, near Christiania; and in 1875 the bishopric of Christiansand, where he died on 27th March 1882.

Moe's first publication was a volume of Norse "songs, ballads, and staves," which appeared in 1840; it was followed in 1841 by the *Norske Folke-eventyr* (Norwegian Popular Tales), which he had collected along with his schoolfellow Asbjörnsen. The work excited such interest as a contribution to the study of comparative mythology that in 1847 he was sent by the Government through Thelemark and Sætersdal to increase his collection of stories. The second (enlarged) edition, with a preface by Moe, appeared in 1852. In 1851 his *I Brönden og i Tjernet* (In the Well and in the Tarn), a delightful collection of prose stories for children, appeared, and it was followed in 1859 by a volume of poems entitled *En liden Julegave* (A Little Christmas Present). In 1877 he prepared a collected edition of his works in two volumes, the stories he had published along with Asbjörnsen being excluded. Many of the *Folke-eventyr* (*Popular Tales from the Norse*) were translated by Sir George Dasent in 1859.

MŒSIA (in Greek Mysia, or, to distinguish it from the country of the same name in Asia, Mysia in Europe), in ancient geography the territory immediately to the south of the Danube corresponding in the main to Servia and Bulgaria. It became a Roman province between 27 B.C. and 6 A.D., probably about 16 B.C.[1] In the time of Tiberius and Caius the province was under the same governor with Macedonia and Achaia. It was divided by Domitian into two provinces, Mœsia Superior (Servia) and Mœsia Inferior (Bulgaria); and the same emperor completed the great military road along the line of the Danube, increased the strength of the Roman forces in the country, and, by the conquest of Dacia, saved it from the inroads by which it had been harassed from the time of Tiberius. The Goths invaded Mœsia in 250 A.D., and at last, in 395, a number of them, afterwards known as Mœsogoths, obtained permission to settle in the province. The Slavonians and Bulgarians appear in the 7th century.

The boundary between Upper and Lower Mœsia was not marked, as Ptolemy (iii. 9, 10) states, by the river Cebrus or Ciabrus (Cibritza or Zibru), but, as may be inferred from an inscription (6125, *C. Inscr. Lat.*, vol. iii. 2, *additamenta*), lay between Almus (Lom) and Ratiaria (Artcher). Upper Mœsia, or, as it was often called, Mœsia Prima, contained—Singidunum (Belgrade), headquarters of Legio IV. Flavia, and in the 3d century a colonia; Viminacium (Kostolatz), headquarters of Leg. VII. Claud., and designated sometimes municipium Ælium, but more usually colonia (a rank bestowed on it by Gordianus); Bononia (Widin); Ratiaria, which, on the loss of Dacia, became the headquarters of Leg. XIII. gemina, and remained a large town till it was destroyed by Attila; Remesiana (Mustapha Pasha Palanka), which has furnished inscriptions belonging to the unidentified Ulpiana; and Naissus (Nissa or Nish), the birthplace of Constantine the Great. Lower Mœsia (Mœsia Secunda) contained—Oescus (Colonia Ulpia, mod. Gigen), headquarters, after loss of Dacia, of Leg. V. Maced.; Novæ (Sistova), at a late date a camp of Leg. I. Ital., and afterwards chief seat of Theodoric king of the Goths; Nicopolis ad Istrum (Nikup), really on the Iatrus or Yantra, a memorial of Trajan's victory over the Dacians; Pristra (Rustchuk), Asamus (Nicopoli on the Osma), Darostorum (Silistria), Odessus (Varna), Tomi (Kustendje), Troesmis (Iglitza).

See Roesler, *Romanische Studien*, 1871; Pfitzner, *Gesch. der Röm. Kaiser-legionen*, 1881, pp. 152-161; Hahn, in *Dkschr. K. Ak. der Wiss.*, *Ph. H. Cl.*, Vienna, 1861, p. 228.

MOFFAT, a health resort of some note in Scotland, is situated in Upper Annandale, Dumfriesshire, occupying an

[1] See A. W. Zumpt, *Commentat. Epigraph.*, ii. 253 *sqq.*

agreeable position at the base of the Gallow Hill, 63 miles from Edinburgh, and 42 miles from Carlisle by railway. The Spa, which is 1½ miles above the town (525 feet above sea-level), is sulphureous with some saline ingredients, and is used in gout, rheumatism, and dyspepsia. Population (1881) 2161; in the season about 4000.

MOFFAT, ROBERT, D.D. (1795-1883), African missionary, was born at Ormiston, Haddingtonshire, Scotland, on 21st December 1795, of humble parentage. Moffat learned the craft of gardening, but in 1814 offered himself to the London Missionary Society, who, in 1816, sent him out to South Africa. After spending a year in Namaqua Land, with the powerful and dreaded chief Africaner, whom he converted, Moffat returned to Cape Town in 1819, and married Miss Mary Smith, a remarkable woman and most helpful wife. In 1820 Moffat and his wife left the Cape and proceeded to Griqua Town, and ultimately settled at Kuruman, among the Bechuana tribes lying to the west of the Vaal river. Here he worked as a missionary till 1870, when he reluctantly returned finally to his native land. He made frequent journeys into the neighbouring regions, as far north as the Matabele country, to the south of the Zambesi. The results of these journeys he communicated to the Royal Geographical Society (*Jour. R. G. S.*, xxv. xxviii., and *Proc.* ii.), and when in England in 1842 he published his well-known *Missionary Labours and Scenes in South Africa*. Single-handed he translated the whole of the Bible into Bechuana. While solicitous to turn the people to Christian belief and practice, Moffat was perhaps the first to take a broad view of the missionary function, and to realize the importance of inducing the savage to adopt the arts of civilization. He himself was builder, carpenter, smith, gardener, farmer, all in one, and by precept and example he succeeded in turning a horde of bloodthirsty savages into a "people appreciating and cultivating the arts and habits of civilized life, with a written language of their own." Now we find more or less Christianized communities extending from Kuruman to near the Zambesi. Moffat met with incredible discouragement and dangers at first, which he overcame by his strong faith, determination, and genial humour. It was largely due to him that the work of Livingstone, his son-in-law, took the direction which it did. On his return to England, Moffat received a testimonial of about £6000. He died at Leigh, near Tunbridge Wells, 9th Aug. 1883.

See *Scenes and Services in South Africa, the Story of Moffat's Missionary Labours*, London, 1876; and publications of the London Missionary and the B. and F. Bible Societies.

MOGADOR, or SUERAH (Berber *Tasurt*), the most southern seaport town on the Atlantic coast of Morocco, and the capital of the province of Haha, stands from 10 to 20 feet above high water on a projecting ridge of calcareous sandstone in 31° 30′ N. lat. and 10° 44′ W. long. In certain states of wind and sea it is turned almost into an island, and a sea-wall protects the road to Saffi. The streets are regular and, for a Moorish town, broad and clean. Within the walls there are three distinct divisions: the citadels old and new with the government buildings; to the north-west the outer town with its spacious markets in the centre; and at the north-west corner the Mellah, or Jews' quarter. In the citadels the houses are fairly good, and considerable attention is paid to sanitary matters. Water is brought from the Kseb, about 1½ miles to the south, by an aqueduct. The prosperity of Mogador is due to its commerce; only a few gardens break the barrenness of the immediate vicinity. The harbour or roadstead, though apparently protected by the island and quarantine station of Mogador, is extremely dangerous during west and south-west winds. Trade is carried on mainly with Marseilles, London, Gibraltar, and the Canaries,—the principal exports being almonds, goat-skins, gums, olive oil, and ostrich feathers, and the principal imports cotton goods (half of the total) and tea. The average value of the exports for the five years 1877-1881 was about £210,000, the imports rather less. Attention has been frequently directed to the value of Mogador as a health resort, especially for consumptive patients. The climate is remarkably steady: mean temperature of the hottest month 71·06, of coldest month 58·69. The annual rainfall is only 10 or 12 inches, and the rainy days of winter and spring about 28. The sirocco is but rarely felt. The population is about 15,000 (7000 Jews, about 150 foreigners). Jews, Protestants, and Roman Catholics have religious edifices in the town.

A place called Mogador is marked in the 1351 Portulan of the Laurentian Library, and the map in Hondius's *Atlas Minor* shows the island of Mogador *I. Domegador*; but the origin of the present town is much more recent. Mogador was founded by Sultan Mohammed, and completed in 1770. The town received from the Moors the name of Suerah (little picture), while the Portuguese called it after the shrine of Sidi Mogadul, which lies towards the south half-way to the village of Diabat, and forms a striking landmark for seamen. In 1844 the citadel was bombarded by the French.

MOGHILEFF, a north-western government or province of the Russian empire, situated on the upper Dnieper, between the provinces of Vitebsk and Smolensk on the north and east, Tchernigoff and Minsk on the south and west. In the north it is occupied by the watershed which separates the basins of the Dwina and the Dnieper, an undulating tract from 650 to 900 feet above the sea-level, and covered nearly everywhere with forests. This watershed slopes gently to the south, that is, to the valley of the Dnieper, which enters the province from the north-east and flows west and afterwards due south. The southern part of the province is flat and has much in common with the Polyesie of the province of Minsk; it is, however, more habitable, the marshes being less extensive.

The province is covered by the Tertiary formation; Devonian sandstone appears in the north, and Carboniferous limestones in the east. The soil is mostly sand, clay (brick-clay and potter's-clay are not uncommon), and peat-bogs, with a few patches of "black-earth." The climate is rude and wet, the average yearly temperature at the Gorki meteorological observatory being 40°·4 Fahr. (14°·2 in January, and 63°·8 in July); cold nights in summer are often the cause of bad crops. The province has about 1,140,000 inhabitants (947,625 in 1870), mostly White-Russians (78 per cent.), belonging to the Greek Church; Jews are numerous (16 per cent.); Poles, belonging mostly to the nobility, make only 3 per cent. of the population. Agriculture is the chief occupation; nearly one half (46 per cent.) of the surface of the province is under crop; but, except after unusually good harvests, corn is imported, chiefly by the navigable channels of the Dnieper and Sozh. There are many distilleries on the estates of landowners, and wine-spirit is exported. The hemp culture is important; hemp and hemp-seed oil are exported to Riga. The province has one large paper-mill, a few iron and copper works, and minor manufactures.

The province of Moghileff is divided into eleven districts, with the chief towns: Moghileff (40,500 inhabitants), Chausy (4200), Tcherikoff (3900), Gomel (13,030), Gorki, formerly the seat of an agricultural institute (5050), Klimovichi (4000), Mstislavl (6700), Orsha (5350), Rogacheff (7750), Staryi Bykhoff (5200), and Syenno (2550). Of about 80 other municipal towns, we name Shkloff (13,000 inhabitants), Dubrovka (7000), Kricheff (1000).

This province was inhabited in the 10th century by the Krivichi and Radimichi. In the 14th century it became part of Lithuania and afterwards of Poland. Russia annexed it in 1772.

MOGHILEFF ON THE DNIEPER, a town of Russia, capital of the province of same name. It is situated on both banks of the Dnieper, 40 miles south of the Orsha station of the railway between Moscow and Warsaw. A railway along the Dnieper will soon bring Moghileff into railway communication with these capitals.

Moghileff is mentioned for the first time in the 11th century as a dependency of the Vitebsk, or of the Mstislavl principality. At the beginning of the 15th century it became the personal property of the Polish kings. But it was continually plundered—either by Russians, who attacked it six times during the 16th century, or by Cossacks, who plundered it three times. In the 17th century its inhabitants who belonged to the Greek Church suffered much from the persecutions of the Union. In 1651

it surrendered to Russia, but in 1661 the Russian garrison was massacred by the inhabitants. In the 18th century it was taken several times by Russians and by Swedes, and in 1708 Peter I. ordered it to be destroyed by fire. It was annexed to Russia in 1772. Of 40,500 inhabitants two-thirds are Jews and the remainder White-Russians, with a few Poles (2500). Its manufactures are without importance; but one branch of trade, namely, the preparation of skins, has maintained itself for many centuries. The commerce is mostly in the hands of Jews: corn, salt, sugar, and fish are brought from the south, whilst skins and manufactured ware imported from Germany (partly by smugglers) are sent to the southern provinces.

MOGHILEFF ON THE DNIESTER (*Mohîlov*), a district town of Russia, situated in the province of Podolia, on the left bank of the Dniester, 87 miles east-south-east of Kamenets-Podolsk, and 43 miles from the Zhmerinka railway junction. It has 18,200 inhabitants, nearly one-half of whom are Jews; the remainder are Little Russians, Poles (1500), and a few Armenians. The Little-Russian inhabitants of Moghileff carry on agriculture, gardening, wine, and mulberry culture. The Jews and Armenians are engaged in a brisk trade with Odessa, to which they send corn, wine, spirits, and timber, floated down from Galicia, as well as with the interior, to which they send manufactured wares imported from Austria.

Moghileff, named in honour of the Moldavian hospodar Mohila, was founded by Count Potocki about the end of the 16th century. Owing to its situation on the highway from Moldavia to the Ukraine, at the passage across the Dnieper, it developed rapidly. For more than 150 years it was disputed by the Cossacks, the Poles, and the Turks. It remained in the hands of the Poles, and was annexed to Russia in 1795. The Crown purchased it from Count Potocki in 1806.

MOGILAS, PETRUS (*c.* 1600-1647), metropolitan of Kieff from 1632, belonged to a noble Wallachian family, and was born about the year 1600. He studied for some time at the university of Paris, and first became a monk in 1625. He was the author of a *Catechism* (Kieff, 1645) and other minor works, but is principally celebrated for the *Orthodox Confession*, drawn up at his instance by the abbot Kosslowski of Kieff, approved at a provincial synod in 1640, and accepted by the patriarchs of Constantinople, Jerusalem, Alexandria, and Antioch in 1642-3, and by the synod of Jerusalem in 1672. See GREEK CHURCH, vol. xi. p. 158.

There are numerous editions of the *Confession* in Russian; it has been edited in Greek and Latin by Panagiotes (Amsterdam, 1662), by Hofmann (Leipsic, 1695), and by Kimmel (Jena, 1843), and there is a German translation by Frisch (Frankfort, 1727).

MOGUL, or MUGHAL, مغل, the Arabic and Persian form of the word Mongol, usually applied to the Mongol empire in India. See INDIA, vol. xii. p. 793 *sqq.*

MOHÁCS, a market town in the Trans-Danubian county of Baranya, Hungary, stands on the right bank of the west arm of the Danube, 25 miles east-south-east of Pécs (Fünfkirchen), with which it is connected by railway, 45° 58′ N. lat., 18° 37′ E. long. At Mohács there are several churches and schools belonging both to the Roman Catholics and the Calvinists, also the summer palace of the bishop of Pécs, a monastery, an old castle, and a station for steamers plying on the Danube, by which means a considerable commerce in wine and the agricultural produce of the neighbourhood is carried on with Budapest and Vienna. Not far from Mohács are coal mines, and the town is an important coal depôt of the Danubian Steam Navigation Company. The population in 1880 was 12,047 (Magyars, Serbs, and Germans).

Two great battles fought in the vicinity of the town mark the commencement and close of the Turkish dominion in Hungary. In the first, 29th August 1526, the Hungarian army under Louis II. was annihilated by the Ottoman forces led by Soliman the Magnificent (see vol. xii. p. 369). In the second, 12th August 1687, the Austrians under Charles of Lorraine gained a great and decisive victory over the Turks, whose power was afterwards still further broken by Prince Eugene of Savoy.

MOHAIR is the woolly hair of a variety of the common or domestic goat inhabiting the regions of Asiatic Turkey, of which Angora is the centre, whence the animal is known as the Angora Goat (see GOAT, vol. x. p. 708). Goat's hair has been known and used as a textile material in the East from the most remote periods; but neither the Angora goat nor its wool was known in Western Europe till, in 1655, the animal was described by the naturalist Tournefort. That textures of mohair were in use in England early in the 18th century is obvious from Pope's allusion:—

> "And, when she sees her friend in deep despair,
> Observes how much a chintz exceeds mohair."

Owing, however, to the jealous restrictions of the Turkish power, it was not till 1820 that mohair became a regular article of import into the United Kingdom. In that year a few bales came into the market; but so little was the material appreciated that it only realized 10d. per ℔. In 1870 average mohair fleece was selling at five times that price. From the small beginning of 1820 the imports gradually waxed, and the trade received a very considerable impetus through the introduction in 1836, by Titus Salt, of the analogous fibre alpaca. The increasing demand for and value of mohair early stimulated endeavours to acclimatize the Angora goat in other regions; but all European attempts have failed, owing to humid and ungenial climates. In 1849 a flock was taken by Dr J. P. Davis to the United States of America, and since that time many fresh drafts have been obtained and distributed to Virginia and various Southern States, and to California and Oregon in the west. In these high and dry regions the goats thrive; and the flocks in the Western States now number many thousands. The Angora goat has also been introduced into the Cape of Good Hope with much success. The first importation of mohair from the Cape, made in 1862, amounted to 1036 ℔; and now about one-tenth of the total British supply is received from that source. Mohair has also been received in England from goats reared successfully in Fiji, where they were first introduced in 1874, and there are also thriving flocks in Australia.

The trade in mohair between Asia Minor and western Europe is controlled in Constantinople. There upwards of twenty varieties of fleeces are distinguished according to the localities of their production, the richest and most lustrous qualities being produced in hilly and forest regions, while the fleeces from the open plains are comparatively kempy, coarse, and cottony. From the Lake Van district on the eastern borders of Asiatic Turkey a distinct and inferior variety of wool is obtained. It is known in commerce as Van mohair, and consists, to the extent of about 70 per cent., of white wool slightly streaked with black, with 30 per cent. of coloured red and black wool. At Konieh in the south, also, an inferior mohair known as Pelotons is produced, 80 per cent. of which is black and red, and the remainder white. The average weight of an Angora goat fleece is from 5 to 6 ℔. The finest quality of wool is obtained from the first clip, which is made in the second year of the animal. She-goats yield the best wool, after which come wethers, while the rams give the coarsest fleeces. Angora mohair is a brilliant white lustrous fibre, elastic and wiry in character, and devoid of felting properties. It attains the length of four or five inches, but the long fibre is mixed with an undergrowth of shorter wool, which in the spinning process is combed out as "noils" for separate use. It is a material of enormous durability, and, owing to its remarkable elasticity, it is especially fitted for working into long piled fabrics, such as plush and imitation furs, or for use in braids and bindings, and in boot and other laces. It is largely used for making Utrecht velvet or furniture plush for the upholstering of railway carriages, &c., a trade centred at Amiens. In the making of imitation sealskins, and imitation beaver, otter, chinchilla, and other furs, and for carriage rugs generally, mohair is extensively employed. Many dress fabrics of mixed mohair and alpaca, cotton, or silk are also manufactured; but with changes in fashion such materials are constantly changing in style, composition, and name. Mohair is also used for making certain qualities of lace, and an imitation of ostrich feathers for use as trimming has been made from the fibre. The imports of mohair into the United Kingdom during 1882 amounted to 16,859,771 ℔, valued at £1,433,584, a quantity largely in excess of the imports of any previous year.

MOHAMMEDANISM

UNDER this head is given the history of Mohammed and his successors to the fall of the Eastern Caliphate, with a sketch of the institutions and civilization of the Moslem empire and an account of the Koran. The later history must be sought under the names of individual countries and dynasties. What falls to be said of the social and religious aspects of Islam in modern times will be given under the two great divisions of SUNNITES and SHÍ'ITES.

PART I.—MOHAMMED AND THE FIRST FOUR CALIPHS.

Plate VIII.

MOHAMMED[1] or MAHOMET, the founder of Islam, first appears in the full light of history with his Flight to Medina (The Hijra), A.D. 622; and this date, not that of his birth, has been fittingly chosen as the epoch of the Moslem Era. The best-attested tradition[2] places his first appearance as a prophet in Mecca some twelve years earlier (*circa* 610). He was then forty years old: the forty must be taken as a round number, but as such is doubtless trustworthy. Thus the birth of Mohammed falls about 570 A.D.: it is said to have fallen in the year when Abrahá, the Abyssinian viceroy of Yemen, made the expedition against Mecca, mentioned in the Koran, when the Arabs first saw the elephant and first suffered from smallpox.[3]

Arabia at the birth of Mohammed.

At the time of Mohammed's birth and youth nothing seemed less likely than that the Arabs should presently make their triumphal entrance into the history of the world as victors over the Greeks and Persians. Nowhere in the Peninsula was there an independent state of any considerable power and importance. At the beginning of the 6th century indeed the princes of Kinda had attempted to form a national kingdom, uniting in particular the tribes of central Arabia; but this kingdom was nothing more than an epic prelude to the true history of the Arabs, which begins with Islam. After the fall of the Kindite dynasty, the old anarchy reigned again among the nomads of the Nejd and the Ḥijáz; in all other quarters Greek or Persian influence predominated, extending from the frontier deep into the interior by the aid of two vassal states—the kingdom of the Ghassanids in the Ḥaurán under Greek suzerainty, and that of the Lakhmids in Ḥíra and Anbár under the Persian empire. The antagonism between Byzantium and Ctesiphon was reflected in the feuds of these Arab lordships; but indeed the rivalry of Greek and Persian exercised its influence even on the distant South of the Peninsula. Urged on by the Greeks, the Abyssinians had overthrown the Christian-hating realm of the Himyarites, the sunken remnant of the ancient might of the Sabæans (A.D. 526), the Persians had helped a native prince again to expel the Christians (*circa* 570), and since then the Persians had retained a footing in the land. Toward the close of the 6th century, their direct and indirect influence in Arabia greatly surpassed that of the Greeks; and since the Kindites had fallen before the kings of Ḥíra, it extended right through the Nejd into Yemen.[4]

In the Ḥijáz and western Nejd, the district from which Islam and the Arab empire took their beginning, Greeks and Persians, Ghassanids and Lakhmids, had not much influence; the nomad tribes, and the few urban commonwealths that existed there, lived free from foreign interference, after the manner of their fathers. Mohammed's city was Mecca, where the Banú Kinána had formed a settlement round the Ka'ba, the sanctuary of a number of confederate tribes (Aḥábísh) belonging to that district. The feast annually observed in the days before the full moon of the month Dhú 'l-Ḥijja at Mecca and at 'Arafa and Ḳozaḥ in the vicinity, presented strong attractions for all inhabitants of the Ḥijáz, and grew into a great fair, at which the Meccans sold to the Bedouins the goods they imported from Syria. Feast and fair gave the city the prosperity which it shared with other cities which, like Mecca, had the advantage of lying near the meeting-place of the two great natural roads to Yemen—that from the north-west along the Red Sea coast, and that from the north-east following the line of the mountains that traverse the Nejd.[5] Mecca.

By their trading journeys the Ḳoraish[6] had acquired a knowledge of the world, especially of the Græco-Syrian world: the relative superiority of their culture raised them not only above the Bedouins, but above the agricultural population of such a city as Medina; the art of reading and writing was pretty widely diffused among them. The Ḳoraish within the city were the Banú Ka'b ibn Loay, those in the surrounding country Banú 'Amir ibn Loay; the townsmen proper were again subdivided into Moṭayyabún and Aḥláf—the latter were the new citizens, who were distinguished from the old settlers by the same name in other Arabian towns, as in Ṭáif and Ḥíra. The community was a mere confederation of neighbouring septs, each occupying its own quarter; there was no magistracy, the town as such had no authority. All political action centred in the several septs and their heads; if they held together against outsiders, this was due to interest and a sense of honour, a voluntary union strengthened by the presence of public opinion. In the time of Mohammed, the most numerous and wealthy sept was that of the Banú Makhzúm; but that of the Banú 'Abdshams was the most distinguished. The Banú Omayya were the most powerful house of 'Abdshams; their head, Abú Sofyán ibn Ḥarb, exercised a decisive influence in the concerns of the whole community. Mohammed himself was of the Banú Háshim; it is affirmed that these had formerly enjoyed and claimed of right the position actually enjoyed by the Banú Omayya, but this assertion seems to have had its origin in the claims to the Caliphate which the Hashimites (the house of 'Alí and the 'Abbásids) subsequently set up against the Omayyads.[7]

---

[1] The name Mohammad means in Arabic "the praised," and it has been supposed that this epithet was conferred on the Prophet after his mission to mark him out as the promised Paraclete. This, however, is incorrect (Nöldeke, *Gesch. d. Qorans* [Gött. 1860], p. 6, note 2; Sprenger, *Leben und Lehre des M.*, i. 155 *sq.*) The name is found, although it was not common, among the heathen Arabs. Renan has shown it to occur on a Greek inscription of the early part of the 2d century of the Christian era (Boeckh, *C. I. G.*, 4500), and Mohammed ibn Maslama of Medina, a contemporary of the Prophet, bore it as his original name, as appears from the fact that his brother was called Maḥmúd, it being a favourite practice to give to brothers variations of the same name, as Anas and Múnis, Sahl and Sohail, Monabbih and Nobaih (Sprenger, i. 158, note 2). That Mohammed calls himself Aḥmad, in sur. lxi. 6, in order to adapt his name to a supposed prophecy, proves nothing; on the other hand, the men of Mecca, on occasion of a treaty with the Moslems, demanded that the Prophet should not call himself messenger of God, but Moḥammed ibn 'Abdalláh, using his old familiar name; see J. Wellhausen, *Vakidi's Kitāb al-Maghazi in verkürzter deutscher Wiedergabe* (Berl. 1882), p. 257.

[4] On the state of Arabia before Islam see Caussin de Perceval, *Essai sur l'histoire des Arabes*, vol. ii.; Muir, *Life of Mah.*, vol. i.

[5] Marr al-Ẓahrán, near Mecca, is accordingly said to have been the point at which the great emigration of tribes from Yemen parted into two streams, moving north-west and north-east respectively.

[6] The Koraish were the branch of Kinána settled in and about Mecca. They are called also Ghálib and Fihr, but the last name is particularly applied to those of the Ḳoraish who did not live within the town.

[7] Sprenger, vol. iii. p. cxx. *sq.*

Youth of the Prophet.

Mohammed's father, ʿAbdallâh b. ʿAbdalmottalib, did not live to see the son's birth, and his mother Âmina died while he was still a child. Mohammed was then cared for first by his grandfather, ʿAbdalmottalib, and after his death by his oldest paternal uncle, Abû Ṭâlib b. ʿAbdalmottalib. He was kindly treated, but shared the hardships of a numerous and very poor family; he herded sheep and gathered wild berries in the desert. This is all that we know of his youth (sur. xciii. 6), all else is legend, containing at most an occasional fragment of truth.[1]

It was, we are told, in his twenty-fifth year that Mohammed, on the recommendation of his uncle, entered the house and business of a wealthy widow named Khadîja. For her he made commercial journeys, thus learning to know part of Palestine and Syria, and perhaps receiving impressions which fructified in his soul.[2] By and by he married the widow, who was much his senior; he was a shrewd man, with prepossessing countenance, fair of skin, and black-haired. The marriage was happy, and blessed with several children. The two sons, however, died young; from the elder the father received the surname Abû 'l-Kâsim. The most famous of the daughters was Fâtima, who married her father's cousin, ʿAlî b. Abî Ṭâlib.

Arabian religion.

During his married life with Khadîja, Mohammed came in contact with a religious movement which had laid hold on some thoughtful minds in Medina, Mecca, and Ṭâif. In Mecca, as elsewhere, Arabian heathenism was a traditional form of worship, chiefly concentrated in great feasts at the holy places; it was clung to because it had come down from the fathers. The gods were many; their importance was not due to the attributes ascribed to them, but to their connection with special circles in which they were worshipped. They were the patrons of septs[3] and tribes, and symbolized, so to speak, the holy unity which united the present and past members of these. Above them all stood Allâh, the highest and universal God.[4] By him the holiest oaths were sworn; in his name (*Bismika Allâhummá*) treaties and covenants were sealed; the lower gods were not fit to be invoked in such cases, as they belonged to one party instead of standing over both. The enemy was reminded of Allâh to deter him from inhuman outrage; enemy of Allâh (ʿaduw Allâh, θεοστυγής) was the name of opprobrium for a villain. But, since Allâh ruled over all and imposed duties on all, it was not thought that one could enter into special relations with him. In worship he had the last place, those gods being preferred who represented the interests of a specific circle, and fulfilled the private desires of their worshippers.[5] Neither the fear of Allâh, however, nor reverence for the gods had much influence. The chief practical consequence of the great feasts was the observance of a truce in the holy months, and this in course of time had become mainly an affair of pure practical convenience. In general, the disposition of the heathen Arabs, if it is at all truly reflected in their poetry, was profane in an unusual degree. Wine, the chase, gaming, and love on the one side; vengeance, feuds, robbery, and glory on the other, occupy all the thoughts of the old poets. Their motives to noble deeds are honour and family feeling; they hardly name the gods, much less feel any need of them. The man sets all his trust on himself: he rides alone through the desert, his sword helps him in danger, no God stands by him, he commends his soul to no saint. His reckless egoism may expand to noble self-sacrifice for the family and the tribe; but in this heroism religious impulses have no part, there is nothing mystical in these hard, clear, and yet so passionate natures. The only vein of what can in any sense be called religious feeling appears when the volcano has burned itself out and the storm of life is over; then, it may be, a wail is heard over the vanity of all the restless activity that is now spent.[6] It is very possible that religion meant more to the sedentary Arabs than to the nomads, to whom almost all the ancient poetry belongs; but the difference cannot have been great. The ancient inhabitants of Mecca practised piety essentially as a trade, just as they do now; their trade depended on the feast, and its fair on the inviolability of the Ḥaram and on the truce of the holy months.[7]

The religion of the Arabs before Mohammed was decrepit and effete.[8] Many anecdotes and verses prove that indifference and scoffing neglect of the gods was nothing uncommon. The need for a substitute for the lost religion was not very widely felt. But there were individuals who were not content with a negation, and sought a better religion. Such were Omayya b. Abî 'l-Ṣalt in Ṭâif, Zaid b. ʿAmr in Mecca, Abû Kais b. Abî Anas, and Abû ʿÂmir in Medina.[9] They were called Ḥanîfs, probably meaning

---

[1] The tradition relates that as an infant Mohammed was entrusted to a Bedouin foster-mother, Ḥalîma, who brought him up among her people, the Banû Sa'd b. Laith. Sprenger (i. 162 *sq.*) will have it that this precise statement is also a fiction; but he is probably wrong. It can hardly be disputed that Bedouin women were accustomed to suckle the children of townsfolk for wages, and Mohammed's "milk-kinship" with the Banû Sa'd b. Laith is confirmed by what happened at and after the battle of Ḥonain. A nephew of Mohammed was also brought up among the Sa'd. Comp. *Vakidi, ut supra*, pp. 364, 377 *sq.*, 431, note 1.

[2] He saw the mute witnesses of divine judgment, the rock-dwellings of Ḥijr and the Dead Sea; perhaps, too, he was impressed by the figure of some venerable monk (Bahîra legends). Comp. Ibn Hishâm, p. 115 *sq.*; Sprenger, i. p. 178 *sqq.*

[3] *Vakidi*, p. 350: Idols were found in every house, and homage was paid to them when men went out or in to gain their blessing. Abû Bajrât made and sold them; there was a lively trade in idols with the Bedouins.

[4] The particular gods are said to have been regarded as children of Allâh (בני אלהים). From sur. liii. 21, xxxvii. 149, it appears that the Meccans called their goddesses daughters of Allâh; perhaps it was their disputes with Mohammed that forced them to this view. At first, certainly, al-Lât and al-'Ozzá were names of the wife of the supreme god; sexual dualism dominated in the oldest Arab idea of the godhead. It was Mohammed who first reduced the gods to Jinns—*i.e.* to subordinate demons and kobolds—as he did not deny their existence, but only stripped off their divinity. To say that the oldest Arabs worshipped Jinns is as unreasonable as to say that they worshipped the devil; for Islam degraded the gods to Shaitâns as well as to Jinns. Superstition certainly played its part among the Arabs, but superstition is not religion.

[5] *Vakidi*, pp. 368, note 1, 370, note 1; Sprenger, iii. 457 *sq.*, 512. Whether the feast at Mecca was celebrated in honour of Allâh before Mohammed, is very doubtful. It would seem that Hobal was worshipped in the Ka'ba (Ibn Hishâm, p. 97 *sq.*), and Kozah in Mozdalifa (*Vakidi*, p. 428); it is possible, however, that Allâh stood to Hobal among the Arabs as El to Jahwè among the Hebrews. Ritual sacrifices were generally presented to a god who had a proper name; but the trace of a religious rite which still survived in the ordinary killing of beasts for food, possibly consisted even before Mohammed in the invocation of the name of Allâh (Sprenger, ii. 478, note 1; but comp. *Vakidi*, p. 160, note 1, p. 158).

[6] "We hasten towards an unknown goal, and forget it in eating and drinking. We are sparrows and flies and worms, but more daring than famishing wolves. . . . My roots reach down to the depths of the earth; but this Death spoils me of my youth, and of my soul he spoils me and of my body, and right soon he lays me in the dust. I have urged my camel through every desert, wide-stretching and shimmering with mirage; and I have ridden in the devouring host, reaching after the honours of greedy perils, and I joined in the fray under every sky till I longed for the home-coming instead of booty. But can I, after Ḥarith's death, and after the death of Ḥojr, the noble host—can I hope for a softer lot from the change of time, which does not forget the hard mountains? I know that I must soon be transfixed by his talon and tooth as befell my father and my grandsire, not to forget him that was slain at Kolâb."—Amraalḳais, ed. Slane, No. 10, p. 33; ed. Ahlwardt, No. 5.

"penitents", men who strive to free themselves from sin.[1] They did not constitute a regular sect, and had in fact no fixed and organized views. They had, no doubt, intercourse with one another, but were not a close society; they thought more of their own souls than of propaganda; only in Medina they seem to have been more numerous. They rejected polytheism and acknowledged Alláh, but not so much on intellectual grounds as on grounds of conscience. Faith in the one God was with them identical with pious resignation (*Islám*) to his will; their monotheism was most closely allied to the sense of responsibility and of a coming judgment; it stood opposed to the worldly ideas of the idolaters, and was an impulse to upright and sin-avoiding walk. They were not theorists, but ascetics. It was the primitive ideas of Law and Gospel ("the religion of Abraham") that lived again in them. They felt on the whole less attracted towards the developed forms of the religion of revelation; they rather sought after some new form; few of them attached themselves to existing religious communities.

Mohammed, it would appear, came into connexion with these Ḥanífs through a cousin of his wife, Waraḳa b. Naufal, who was one of them. Their doctrines found a fruitful soil in his heart; he was seized with a profound sense of dependence on the omnipresent and omnipotent Lord, and of responsibility towards him. Following the example of old Zaid b. 'Amr, he now frequently withdrew for considerable periods to the solitude of the bare and desolate Mount Ḥirá, and meditated there with prayer and ascetic exercises. For years, perhaps, he went on in these purely individual exercises, without anything to distinguish him essentially from the others who held similar views. But in him the Ḥanífite ideas lodged themselves in a natural temperament which had a sickly tendency to excitement and vision, and so produced a fermentation that ended in an explosion.[2] Thus he became a prophet; he felt himself constrained to leave the silent circle of ascetics and make a propaganda for the truth. In this resolve he was unquestionably influenced by what he knew of the example of the Biblical prophets, perhaps also by the circumstance that a longing after a new founder of religion was diffused among the Ḥanífs, and found support in some dim acquaintance with the Messianic hopes of the Jews.

Jewish and Christian influence.

That Mohammed did not independently produce his own ideas is indisputable; nor is it to be doubted that he derived them from the Ḥanífs. But what was the ultimate source of these first motions towards Islam? In general they are ascribed to a Jewish source. Jews were very numerous in Ḥijáz and Yemen, and had perfectly free intercourse with the Arabs, to whom they undoubtedly imparted a quantity of Biblical and religious material. Mohammed in particular was indebted to the Jews for almost all the stories and a great part of the laws of the Koran (laws of marriage, purity, etc.), and the theological language of Islam is full of Jewish words. But the original and productive forces of Islam did not spring from Judaism, least of all the ideas of the Judgment and of the inexorable demands set before the creature by his Creator, which are so dominant in the older súras. A distinction must be drawn between the primitive impulses and the material added later; Mohammed did not get his leaven from the Jews, they only supplied him afterwards with meal. Neither in truth can Christianity be viewed as the proper source of Islam—Christianity, that is, in any of its great historical developments. The Arabs knew Greek, Syrian, and Abyssinian-Himyaritic churches; manifold influences from these doubtless reached Islam, but in none of them did the idea of Judgment still stand as the central point of religion; the living sense of divine reality ruling over the life was half extinguished by the developments of theology. But in the Syro-Babylonian desert, off the line of the church's main advance, primitive forms of Christianity, perhaps also of Essenism, still survived, which the course of church history had left untouched. To these belong on the one hand the Sabians ("Baptists," from צבע), on the other the numerous anchorets of these regions. The connection of Islam with the Sabians appears from the fact that in Mecca and Ṭáif its adherents were simply known as Sabians.[3] From them, however, were derived, it would seem, for the most part only externals, though the importance of these must on no account be undervalued. The deepest influence exercised on the Ḥanífs, and through them on the Prophet, appears to have come from the anchorite ascetics. How popular they were with the Arabs, appears from the Bedouin poetry; what power they exercised over the minds even of the heathen, is proved by various episodes in the history of Ghassán and Ḥíra; how well the Arabs knew the difference between them and the shaven clergy, is seen in the instructions of Abúbekr to the commanders in the Syrian campaigns. It was not their doctrine that proved impressive, but the genuine earnestness of their consecrated life, spent in preparation for the life to come, for the day of judgment, and forming the sharpest contrast to the profanity of heathenism. Ascesis and meditation were the chief points with the Ḥanífs also, and they are sometimes called by the same name with the Christian monks.[4] It can hardly be wrong to conclude that these nameless witnesses of the Gospel, unmentioned in church history, scattered the seed from which sprang the germ of Islam.

Mohammed's first vision.

The tradition gives a telling story of the way in which Mohammed at length came to proclaim openly what had long been living and working within him; in other words, how he became a prophet. Once, in the month of Ramadan, while he repeated his pious exercises and meditations on Mount Ḥirá, the angel Gabriel came to him by night as he slept, held a silken scroll before him and compelled him, though he could not read, to recite what stood written on it.[5] This was the first descent of a passage of the heavenly book, the source of revelation from which Moses and Jesus and all prophets had drawn; and so Mohammed was called to be a prophet. The words with which Gabriel had summoned him to read, remained graven on his heart. They were the beginning of sur. xcvi.—

[1] Sprenger (p. 38 *sq.*) connects Ḥaníf with חָנֵף, and expounds it per antiphrasin as *lucus a non lucendo*, on the ingenious fashion of A. Geiger. As *taḥannuth* = *taḥannuf* is the technical name of such solitary ascetic practices as Mohammed himself engaged in before his call, Ḥaníf may be taken to mean a *mutaḥannif* by profession. The connexion between *ḥaníf* and *taḥannuf* is certain, and it seems equally certain that *taḥannuf* as an equivalent of *taḥannuth* comes not from *ḥaníf* but from *ḥinth* (for *ḥinf*), and means not to play the Ḥaníf but to concern oneself with one's sin, to purge oneself of it.

[2] It is disputed whether Mohammed was epileptic, cataleptic, hysteric, or what not; Sprenger seems to think that the answer to this medical question is the key to the whole problem of Islam. It is certain that he had a tendency to see visions, and suffered from fits which threw him for a time into a swoon, without loss of inner consciousness.

[3] Ibn Hishám (p. 835) relates that the Banú Jadhíma announced their conversion to Islam to Khálid in the words, "We are become Sabians." Renan, *Études d'histoire rel.* (1863), p. 257, misunderstands this utterance.

[4] Abú 'Amir is as often called Ráhib as Ḥaníf. All the accounts indicate that the Ḥanífs stood nearer to Christianity than to Judaism, not only in Ṭáif but elsewhere. Interesting in the highest degree is a verse ascribed to Ṣakhr al-Ghay in the Hodhailian Poems, ed. Kosegarten 18, 11. A thundercloud is there described, the centre of which is an impenetrable mass; only on the outer fringe a restless motion is discernible. "Its fringes on the mountain-ridge (al-Malá) are like Christians celebrating a banquet when they have found a Ḥaníf (and so run to and fro in the restlessness of glad excitement)."

[5] Of course any one can read in a vision. The question discussed even by Moslems, as to whether the Prophet could read or not, has at least no place in this connexion.

"Read! in the name of thy Lord, who created, created man from a drop. Read! for thy Lord is the Most High who hath taught by the pen, hath taught to man what he knew not. Nay truly man walketh in delusion, when he deems that he suffices for himself; to thy Lord they must all return."

What is here recorded is the commencement, not of Mohammed's knowledge, but of his prophesying. That the latter was due to a vision experienced by him on a night of the month Ramadan (sur. xcvii. 1, ii. 181) is certain, and it is at least very possible that the form of the vision was governed by the traditional conception of revelation and prophecy which Mohammed had learned to accept.[1] It is, of course, uncertain whether the words in which the angel called the Prophet are really contained in sur. xcvi. Certainly this súra is very early, and its contents are, indeed, the best expression of the original ideas of Islam. Man lives on content with himself, but he must one day return to his Creator and Lord, and give account to him. This is in a sense the material principle of the oldest faith of Islam; the formal principle is the very prominent doctrine of revelation in writing copied from the heavenly book.

When the angel left him—so the tradition runs on—Mohammed came to Khadija and recounted the occurrence to her in much distress; he thought that he was possessed. She however comforted him, and confirmed him in the belief that he had received a revelation and was called as a messenger of God. Yet his doubts returned, when there ensued a break in the revelation, and they reached a distressing height. He was often on the point of seeking death by casting himself down from Mount Hirá. It is usually assumed that this state of anguish lasted from two to three years. Then the angel is said to have suddenly appeared a second time; he came to Khadija in great excitement and said: "Wrap me up! wrap me up!" This, it must be explained, was done when he fell into one of his swoons; and on this occasion, as often thereafter, the revelation came during an attack. Then was sent down súra lxxiv. beginning with the address—"O thou enveloped one!" Henceforth there was no interruption and no doubt; the revelations followed without break, and the Prophet was assured of his vocation.

The fatra.

That Mohammed did pass through many doubts and much distress before he reached this assurance, may well be believed (sur. xciii. 3); but the systematic development of the doctrine of the *fatra*, or interval of from two to three years between the first and second revelation, belongs to a later stage of tradition. It appears that it was devised to dispose of the controversy whether Mohammed lived as a prophet in Mecca for ten or for twelve years; perhaps, too, it was desired to solve another difficulty—viz., whether sur. xcvi. or sur. lxxiv. was the beginning of the revelation—in a sense that should do some justice to the rival claims of each.[2] The tradition may also have been influenced by the circumstance that Mohammed, in the first three years of his mission, did not appear as a public preacher,[3] but only sought recruits for his own cause and the cause of Alláh in private circles. First, he gained the inmates of his own house,—his wife Khadija, his freedman Zaid b. Haritha, his cousin 'Alí (of whose nurture he had relieved Abú Tálib, a poor man with many children), and finally his dearest friend Abúbekr b. Abi Kohâfa. The last named won for him several other adherents: 'Othmán b. 'Affán, Zobair b. al-'Awwám, 'Abd al-Rahmán b. 'Auf, Sa'd b. Abi Wakkás, Talha b. 'Obaid Alláh, all names of note in the subsequent history of Islam. Soon there was a little community formed, whose members united in common exercises of prayer.

To the Hanifs, especially to the family of Zaid b. 'Amr, their relation was friendly; they had the name of Moslem in common, and there was hardly any difference of principle to separate them. The personality of the prophet had given an altogether new impulse to a movement already in existence; that was all. To found a new religion was in no sense Mohammed's intention; what he sought was to secure among his people the recognition of the old and the true. He preached it to the Arabs as Moses had before him preached to the Jews, and Jesus to Christians; it was all one and the same religion as written in the heavenly book. The differences between the several religions of the book were not perceived by him till a much later period.

It is not difficult to understand why Mohammed should in the first instance have turned to those who were most readily accessible to him; but the nature of his mission did not suffer him to rest content with this; it compelled him to make public proclamation of the truth. One of his dependents, Arkam b. Abi Arkam, offered for this purpose his house, which stood close by the sanctuary, and thus the Moslems obtained a convenient meeting-place within the town, instead of, as hitherto, being compelled to resort to ravines and solitary places.[4] Here Mohammed preached, and here too it was that he received some converts to Islam. But he did not obtain any great results among the Meccans. What he had to say was already in substance familiar to them; all that was new was the enthusiasm with which he proclaimed old truth. But this enthusiasm failed to make any impression on them; they set him aside as a visionary, or as a poet, or simply as one possessed. In their eyes it was a fatal flaw that his supporters were drawn from the slave-class and the lower orders, and the ranks of the young; it would have been quite another matter if one of the rulers or elders had believed in him. This circumstance was a source of annoyance to the prophet himself; in sur. lxxx. we find him rebuked by God for having repulsed in an unkind way a blind beggar who had interrupted him as he was endeavouring to win over a man of influence—an endeavour which proved of no avail.

This indifference of the Meccans embittered the messenger of God, and led him to give to his preaching a polemical character which it had not hitherto possessed. In the oldest súras we have monotheism in its positive and practical form.[5] God is the all-powerful Lord and all-knowing Judge of man; he demands loyal self-surrender and unconditional obedience; the service he requires is a serious life, characterized in particular by prayer, almsgiving, and temperance. That the worship of other gods beside Alláh is excluded by these views, goes without saying; still it is

[1] H. Dodwell, "De Tabulis cœli," in Fabricius, *Cod. pseud. V. T.*, 2d ed., ii. 551 *sq.* Compare, in the Koran, especially sur. lxxxvii. 6, "We will cause thee so to read that thou mayest forget nothing save what God will." The *following* progress is noteworthy:—Isaiah's lips are touched to purge them of sin (Isa. vi. 7); Jeremiah's are touched by the Lord to put His word in his mouth (Jer. i. 9); Ezekiel receives the revelation as a roll of a book which he has to swallow (Ezek. iii. 2).

[2] See Sprenger in *Z.D.M.G.*, 1859, p. 173 *sq.*; Nöldeke, *op. cit.*, 67 *sq.* Ewald thinks that the vocatives at the beginning of sur. lxxiv. and lxxiii. mean simply—*O long sleeper!* This view is worthy of consideration. The Moslem exegetes thoroughly understand the art of giving to general expressions of the Koran specific reference to historical events which they have themselves invented to facilitate exegesis.

[3] Ibn Hishám, p. 166.

[4] It does not appear that Arkam's house was of the nature of an asylum to which Mohammed betook himself for refuge from the ill-treatment to which he was subjected in his own home, nor is there any evidence that he ever lived in it. It was simply the meeting-house of the oldest Islam. Prayer continued to be offered within it until the conversion of 'Omar, who was bold enough to choose the Ka'ba itself, the centre of heathenism, as the Moslem place of prayer. Comp. Muir, ii. p. 117; Sprenger, i. p. 434.

[5] What is meant by practical monotheism is most easily understood by reference to Matt. vi. 24 *sqq.*, x. 28 *sqq.*, and to Luther's exposition of the first commandment in the catechisms; it is the essence of religion. We do not, of course, mean that this practical monotheism is expressed in the Koran with as much purity and depth as in the Gospel.

noteworthy that the sharp negations of monotheism acquired prominence only by degrees. It was in his indignation against the cold mockery with which he was met that Mohammed first assumed an attitude of hostility towards the worship of polytheism, while at the same time he gave much greater prominence to his own mission, just because it was not acknowledged. He now began to threaten the infidels with the judgment of God for their contempt of His message and His messenger; he related to them the terrible punishments that in other cases had fallen on those who refused to hear the voice of their prophet, applying the old legends to the circumstances of the present with such directness that it was superfluous expressly to add the morals.

Hostility of the Meccans.

This could not fail to irritate the Meccans, especially as after all the new religion gained ground. What Mohammed attacked as ungodly and abominable were their holy things; they were jealous for their gods and their fathers. Their attachment to the traditional worship was the greater that the prosperity of their town rested upon it; for they had not yet learned that the Ka'ba was no institution of heathenism. They found, however, no other way to remove the public scandal than to approach Abú Ṭálib, the Prophet's uncle and the head of his family, asking him to impose silence on the offender, or else to withdraw from him his protection. Abú Ṭálib was not personally convinced of Mohammed's mission, but he did not choose to impose conditions on the enjoyment of his protection. At length, however, when the Meccans adopted a threatening tone and said that he must either restrain his nephew from his injurious attacks, or openly take side for Mohammed and against them, he sent for his nephew, told him how things stood, and urged him not to involve them both in ruin. Mohammed was deeply moved; he thought his uncle wished to get rid of him; yet he could not and would not withdraw from the divinely-imposed necessity which impelled him to preach his convictions. "Though they gave me the sun in my right hand," he said, "and the moon in my left, to bring me back from my undertaking, yet will I not pause till the Lord carry my cause to victory, or till I die for it." With this he burst into tears, and turned to go away. But Abú Ṭálib called him back and said: "Go in peace, son of my brother, and say what thou wilt, for, by God, I will on no condition abandon thee."

The protection of his uncle did not relieve Mohammed from all manner of petty insults which he had to endure from his enemies from day to day; but no one ventured to do him serious harm, for the family feud which this would necessarily have produced was not to be lightly incurred. Less fortunate than the Prophet, however, were such of his followers as occupied dependent positions, and had no family support; especially the converted bondmen and bondwomen, who found no consideration, and were often treated with actual cruelty. For some of these Abúbekr purchased freedom. There seem to have been no martyrs, but the situation of many Moslems became so intolerable that they fled to Abyssinia. The Abyssinian Christians were quite looked upon as their religious kinsmen.

The temporary compromise.

A breach with one's people is for the Arab a breach with God and the world; he feels it like a living death. Mohammed, who remained in Mecca, naturally made every effort to heal the breach with his townsmen, and, as naturally, the latter met him half-way. He even went so far as to take the edge from his monotheism. Once, when the heads of the Koraish were assembled at the Ka'ba, Mohammed, we are told, came to them and began to recite before them sur. liii.[1] When he came to the passage, "What think ye of al-Lát and al-'Ozzá, and of Manát the third with them?" the devil put words in his mouth which he had long wished to have by revelation from God—viz. "These are the sublime Cranes,[2] whose intercession may be hoped for." The auditors were surprised and delighted by this recognition of their goddesses, and when Mohammed closed the súra with the words, "So prostrate yourselves before Alláh and do service to him," they all with one accord complied. They then professed their satisfaction with his admissions, and declared themselves ready to recognize him. But the messenger of God went home disquieted. In the evening Gabriel came to him, and Mohammed repeated to him the súra; whereupon the angel said: "What hast thou done? thou hast spoken in the ears of the people words that I never gave to thee." Mohammed now fell into deep distress, fearing to be cast out from the sight of God. But the Lord took him back to His grace and raised him up again. He erased the diabolical verse and revealed the true reading, so that the words now ran—"What think ye of al-Lát and al-'Ozzá, and of Manát the third with them? The male [offspring] for you and the female for God? That were an unjust division!" When the new version reached the ears of the Meccans they compared it with the old, and saw that the Prophet had broken the peace again. So their enmity broke out again with fresh violence.

It is generally and justly suspected that this compromise did not rest on a momentary inspiration of Satan, but was the result of negotiations and protracted consideration. Nor was the breach so instantaneous as is represented; the peace lasted more than one day. There is no doubt as to the fact itself. Every religion must make compromises to gain the masses. But for Mohammed the moment for this had not yet arrived; later on he used the method of compromise with great effect.

The news of the peace between Mohammed and the Meccans had recalled the fugitive Moslems from Abyssinia;[3] on their return the actual state of affairs proved very different indeed from what they had been led to expect, and it was not long before a second emigration took place. By degrees as many as a hundred and one Moslems, mostly of the younger men, in little groups, had again migrated to Abyssinia, where they once more met with a friendly reception. Among them were Ja'far, the brother of 'Alí, and the Prophet's daughter Rokayya, along with her husband 'Othmán b. 'Affán.[4]

Mohammed's position was very considerably altered for the worse, both subjectively and in other respects, by his precipitate withdrawal from the compromise almost as soon as it had been made. He himself indeed, although long and salutarily humbled by the remembrance of his fall (sur. xvii. 75 *sqq.*), never abandoned faith in his vocation; his followers also did not permit themselves to be led

---

[1] The authorities for this are Ibn Sa'd, the secretary of Wákidí, to whom we owe the preservation of Wákidí's materials for the Meccan period, and especially Ṭabarí; comp. Muir, ii. 150 *sqq.* The common tradition ignores the fact itself, but knows its result, the return of the Abyssinian fugitives.

[2] "*Al-gharánik al-'olá*," fine-sounding but perhaps meaningless words—

"Herrlich, etwas dunkel zwar,
Doch es klingt recht wunderbar."

Comp. Nöldeke, *op. cit.*, p. 80. Hobal, though the chief god of the Meccans, is not mentioned in the Koran either here or elsewhere. Perhaps as God of the Ka'ba he was already identified with Alláh by the Meccans, or was so identified by Mohammed.

[3] The date assigned is the month Rajab of the fifth year of the Call, corresponding to the eighth year before the Flight (A.D. 614-615). The compromise must have been made in the interval. The chronology of this period is of course in the highest degree uncertain, and the order of the events hard to ascertain. Thus it can scarcely be determined whether the above-mentioned scene with Abú Ṭálib ought to be placed before or after the compromise.

[4] 'Othmán and Rokayya, however, members of the noble house of Omayya, soon returned, along with many others. The rest remained in exile until the seventh year of the Flight.

Tradition has it that he found comfort in the fact that at least the Jinns listened to him as by the way he chanted the Koran in the sacred grove of Nakhla.[1] In the present circumstances it was now impossible for him to return into the town, after having openly announced his intention of breaking with it and joining another community. He did not venture to do so until, after lengthened negotiations, he had assured himself of the protection of a leading citizen, Moṭ'im b. 'Adí. Notwithstanding all that had happened, he resolved, two months after the death of Khadíja, to enter upon a second marriage with Sauda bint Zam'a, the widow of an Abyssinian emigrant.

Chance soon afterwards brought to pass what forethought (on his journey to Ṭáif) had failed to accomplish. After having given up the Meccans, Mohammed was wont to seek interviews with the Arabs who came to Mecca, Majanna, Dhú 'l-Majáz, and 'Okáẓ, for the purpose of taking part in the feasts and fairs, and to preach to them.[2] On one such occasion, in the third year before the Flight (A.D. 619-620), he fell in with a small company of citizens of Medina, who to his delight did not ridicule him, as was usually the case, but showed both aptness to understand and willingness to receive his doctrines. For this they had been previously prepared, alike by their daily intercourse with the numerous Jews who lived in confederation with them in their town and neighbourhood, and by the connections which they had with the Nabatæans and Christian Arabs of the north. Ḥanífitism was remarkably widely diffused among them, and at the same time there were movements of expectation of a new religion, perhaps even of an Arabian Messiah, who should found it. Medina was the proper soil for Mohammed's activity. It is singular that he owed such a discovery to accident. He entered into closer relations with the pilgrims who had come from thence, and asked them to try to find out whether there was any likelihood of his being received in their town. They promised to do so, and to let him hear from them in the following year.

rst omage i the Akaba.

At the pilgrim feast of next year, accordingly, twelve citizens of Medina had a meeting with Mohammed,[3] and gave him their pledge to have no god but Alláh, to withhold their hands from what was not their own, to flee fornication, not to kill new-born infants, to shun slander, and to obey God's messenger as far as was fairly to be asked.[4] This is the so-called First Homage on the 'Aḳaba.[5] The twelve men now returned, as propagandists of Islam, to their homes with the injunction to let their master hear of the success of their efforts at the same place on the following year. One of the Meccan Moslems, Moṣ'ab b. 'Omair, was sent along with or after them, in order to teach the people of Medina to read the Koran, and instruct them in the doctrines and practices of Islam.

Islam spread very quickly on the new soil. It is easy to understand how his joy strengthened the Prophet's spirit to try a higher flight. As a symptom of his exalted frame we might well regard his famous night-journey to Jerusalem (sur. xvii. 1; vi. 2), if we could be sure that it belonged to this period.[6] The prophecy also of the final triumph of the Romans over the Persians (contained in sur. xxx. 1 sqq.) might very well pass for an expression of his own assurance of victory, as at that time he still had a feeling of solidarity with the Christians. But the prophecy (the only one contained in the Koran) belongs, it would appear, to a much earlier date.[7]

Second Homage.

At the Meccan festival of the last year before the Flight (in March 622) there presented themselves among the pilgrims from Medina seventy-three men and two women who had been converted to Islam. In the night after the day of the sacrifice they again had an interview with the Prophet on the 'Aḳaba; Al-'Abbás, his uncle, who after Abú Ṭálib's death had become head of the Banú Háshim, was also present. This is the so-called Second Homage on the 'Aḳaba, at which Mohammed's emigration to Medina was definitely settled. Al-'Abbás solemnly transferred his nephew from under his own protection to that of the men from Medina, after these had promised a faithful discharge of the duties this involved. They swore to the Prophet to guard him against all that they guarded their wives and children from. He, on the other hand, promised thenceforward to consider himself wholly as one of themselves, and to adhere to their society. According to the tradition this remarkable scene was brought to a close by a sudden noise.

The emigration.

The Meccans soon got wind of the affair, notwithstanding the secrecy with which it had been gone about, but Ibn Obay, the leader of the Medina pilgrim caravan, whom they questioned next morning, was able with good conscience to declare that he knew nothing at all about it, as, being still a heathen, he had not been taken into the confidence of his Moslem comrades, and he had not observed their absence over night. The Meccans did not gain certainty as to what had occurred, until the men of Medina had left. They set out after them, but by this they gained nothing. They next tried, it is said, violently to prevent their own Moslems from migrating. After a considerable pause, they renewed the persecution of the adherents of the Prophet, compelling some to apostasy, and shutting up others in prison. But the measures they adopted were in no case effective, and at best served only to precipitate the crisis. A few days after the homage on the 'Aḳaba, Mohammed issued to his followers the formal command to emigrate. In the first month of the first year of the Flight (April 622) the emigration began; within two months some 150 persons had reached Medina. Apart from slaves, only a few were kept behind in Mecca.[8]

Mohammed himself remained to the last in Mecca, in the company of Abúbekr and 'Alí. His reason for doing so is as obscure as the cause of his sudden flight. The explanation offered of the latter is a plan laid by the Meccans for his assassination, in consequence of which he secretly withdrew along with Abúbekr. For two or three days the two friends hid themselves in a cave of Mount Thaur, south from Mecca, till the pursuit should have passed over (sur. ix. 40). They then took the northward road and arrived safely in Medina on the 12th of Rabí' of the first year of the Flight.[9] Meanwhile, 'Alí remained three

[1] Sur. xlvi. 28; lxxii. 1. On the impossibility of historically fixing the date of this occurrence see Nöldeke, *op. cit.*, p. 101.

[2] Muir (ii. 181 *sq.*) assumes, with good reason, that he had already done so during the time when he was living in the Shi'b Abí Ṭálib, and assigns to this period the story that Abú Lahab followed him in this in order to counteract his preaching, and sow tares among the wheat.

[3] Sprenger (ii. 526) identifies this meeting with the first, which tradition distinguishes from it and places a year earlier. He is probably right.

[4] Afterwards this was called the women's oath. It is a noteworthy summary of the features by which Islam is distinguished from heathenism.

[5] On the 'Aḳaba compare *Wakidi*, pp. 417, 427, 429. It was a station between 'Arafa and Miná.

[6] See Muir, ii. 219 *sqq.*; Sprenger, ii. 527 *sqq.*; and on the other side, Nöldeke, *Koran*, p. 102. The *masrá* was afterwards called *mi'ráj* (ascension), and, originally represented as a vision, came to be regarded as an objective though instantaneous occurrence.

[7] See on the one hand Muir (ii. 223 *sqq.*) and Sprenger (ii. 527 *sqq.*), and on the other Nöldeke (*Qoran*, p. 102; *Tabari*, p. 298). The manner in which Sprenger seeks to make the prophecy a *vaticinium ex eventu* is unfair.

[8] Ibn Hishám, pp. 315 *sq.*, 319 *sq.*

[9] The 12th of Rabí' is, according to tradition, the Prophet's birthday, the day of his arrival in Medina, and the day of his death. It is certain that he died at mid-day on Monday the 12th of Rabí', but

Tradition has it that he found comfort in the fact that at least the Jinns listened to him as by the way he chanted the Koran in the sacred grove of Nakhla.[1] In the present circumstances it was now impossible for him to return into the town, after having openly announced his intention of breaking with it and joining another community. [9] The 12th of Rabí' is, according to tradition, the Prophet's birthday, the day of his arrival in Medina, and the day of his death. It is certain that he died at mid-day on Monday the 12th of Rabí', but

Law. Mohammed thus laid the foundations of his position in a manner precisely similar to that which Moses (Exod. xviii.) is said to have followed; and just as the Torah grew out of the decisions of Moses, so did the Sunna out of those of Mohammed. It was perhaps in judicial and regulative activity, which he continued quietly to carry on to the very end of his life, that his vocation chiefly lay. At all events his work in this direction was extremely beneficial, if only because he was the creator of law and justice where previously there had been nothing but violence, self-help, or at best voluntary arrangement. But the contents of his legislation also (if it can be called by such a name) marked a distinct advance upon what had been the previous use and wont in Arabia. In particular, he made it his special care to set a fence round the rights of property, and to protect and raise the place of woman in marriage. Blood revenge he retained indeed, but completely altered its character by reserving to himself the right of permitting it; in other words, the right of capital sentence. It need not be said that in many ways he availed himself of that which already existed, whether in the form of Arab usage or of Jewish law; he followed the latter, in particular, in his laws relating to marriage.

Religion. The new situation of affairs inevitably brought it about that religion was made a mere servant in the work of forming a commonwealth. Never has this service been better performed; never has it been utilized with greater adroitness as a means towards this end. In Mecca, Islam had originally been nothing more than the individual conviction of Mohammed; it was only after severe struggles that he went so far as to preach it, and even his preaching had no other aim than to create individual conviction in others. What he said was of the simplest description—that people ought to believe in God and in judgment to come, that men ought to live their lives seriously and not waste them in follies, that one ought not to be high-minded or covetous, and so on. A community arose, it is true, even in Mecca, and was confirmed by the persecutions. There also religious meetings were held and social prayers. But everything was still in a very fluid and rudimentary stage; religion retained its inward character. It was not until the first two years after the Flight that it gradually lost this, and became, if not exclusively, yet to a very large extent, a mere drill system for the community.[1] No god but the one God (lá iláh illa 'lláh) was the entire sum of their dogmatic, and less importance was attached to belief in it than to profession of it. It was the watchword and battle-cry. The prayers[2] took the form of military exercises; they were imitated with the greatest precision by the congregation, after the example of the Imám. The mosque was, in fact, the great exercising ground of Islam; it was there that the Moslems acquired the *esprit de corps* and rigid discipline which distinguished their armies.

Next to the monotheistic confession (tauḥíd) and to prayer (ṣalát) came almsgiving (zakát, ṣadaḳa) as a third important means by which Mohammed awakened and brought into action among his followers the feeling of fellowship. The alms by and by grew to be a sort of tithe, which afterwards became the basis of the Moslem fiscal system, and so at the same time the material foundation of the Moslem state. Religion received so practical a development that of alms nothing but the name remained, and the convenient fiction that the taxes had to be paid to God.

Increased exclusiveness. Just in proportion to the closeness of the union into which Islam brought its followers did its exclusiveness towards them that were without increase. If in Mecca Mohammed in his relations to the other monotheistic religions had observed the principle, "he that is not against me is for me," in Medina his rule was "he that is not for me is against me." As circumstances were, he had to adjust matters chiefly with the Jews. Without any intention on their part, they had helped to prepare the ground for him in Medina; he had great hopes from them, and at first treated them on no different footing from that of the Arab families which recognized him. But as his relations with the Aus and Khazraj consolidated, those which he had with the Jews became less close. The conjunction of religious with political authority, the development of civil polity out of religion, of the kingship from the prophetic function, was precisely what they objected to.[3] On the other hand, while the old polity of Medina, broken up and disorganized as it was, had no difficulty in tolerating foreign elements within its limits, the new political system created by Islam changed the situation, and rendered it necessary that these should be either assimilated or expelled.

The Jews. Mohammed's hostility to the Jews found expression, in the first instance, theoretically more than practically,[4] and especially in the care with which he now differentiated certain important religious usages which he had taken over from Judaism, so that they became distinguishing marks between Islam and Mosaism. Thus, for example, he altered the direction of prayer (Kibla), which formerly used to be towards Jerusalem, so that it now was towards Mecca; and for the fast on the 10th of Tisri ('Ashúrá) he substituted that of the month of Ramaḍan.[5] In appointing Friday as the principal day of public worship, he may also possibly have had some polemical reference to the Jewish Sabbath. Of these alterations the greatest in positive importance is the transference of the Kibla to Mecca. It symbolizes the completion of the Arabizing process which went on step by step with the change Islam underwent from being an individual to being a political religion. In substituting the Meccan Ka'ba for the sanctuary at Jerusalem, Mohammed did not merely bid farewell to Judaism and assert his independence of it; what he chiefly did was to make a concession to heathenism, and bring about a nationalization of Islam, for the purpose of welding together the Arab tribes (Kabáil) into one community. Of similar significance was the institution of the feast of sacrifice ('íd al-doḥá) on the day of the Meccan festival. The Moslems were to observe the latter as much as possible, even if they could not be actually present on the spot.

Precepts of Islam. Thus we have the five chief precepts of Islam—(1) Confession of the unity of God; (2) stated prayer; (3) almsgiving; (4) the fast of Ramaḍan; (5) observance of the festival of Mecca. Capable of having deeper meanings

[1] This is to be understood as applying to the system as a whole. Of course, there are always individuals who break through system; but the historical power of Islam rests upon the system. To the system also belongs the spiritual jargon which Mohammed introduced. It was no longer permissible to say "Good morning!" ('im ṣabáḥan), the phrase now ran, "Peace be with thee!" and on every occasion pious forms of speech were demanded. Characteristic of the puritanism of the system is the prohibition of wine and of gaming, first issued in the years immediately following the Flight, and the contempt for poetry.

[2] They were five in number—at sunrise, noon, afternoon, sunset, and late evening. Each prayer consisted originally of two, afterwards of four, prostrations. The chief weekly public service (jom'a), with sermon, was held on Friday at mid-day.

[3] While Islam had the effect of uniting the Arabs politically, uniformity of religion in the case of the Jews had no such effect; on the contrary, the mutual feuds and hatreds in which they indulged conduced greatly to the advantage of the Moslems. The Jews, of course, recognised Mohammed's supremacy as a fact, but they denied any legal title thereto as arising from his prophetic office.

[4] Compare the well-known second súra, in which a long attack is made on Judaism.

[5] A connection with the Christian fasts is usually alleged. It is possible that Christian influence may have to do with the long duration of the fasts, but it cannot have anything to do with the selection of Ramaḍan; for in the first years after the Flight, Ramaḍan fell not in Spring but in December.

Law. Mohammed thus laid the foundations of his position in a manner precisely similar to that which Moses (Exod. xviii.) is said to have followed; and just as the Torah grew out of the decisions of Moses, so did the Sunna out of those of Mohammed. It was perhaps in judicial and regulative activity, which he continued quietly to carry on to the very end of his life, that his vocation chiefly lay. At all events his work in this direction was extremely beneficial, if only because he was the creator of law and justice where previously there had been nothing but violence, self-help, or at best voluntary arrangement. But the contents of his legislation also (if it can be called by such a name) marked a distinct advance upon what had been the previous use and wont in Arabia. In particular, he made it his special care to set a fence round the rights of property, and to protect and raise the place of woman in marriage. Blood revenge he retained indeed, but completely altered its character by reserving to himself the right of permitting it; in other words, the right of capital sentence. It need not be said that in many ways he availed himself of that which already existed, whether in the form of Arab usage or of Jewish law; he followed the latter, in particular, in his laws relating to marriage.

Religion. The new situation of affairs inevitably brought it about that religion was made a mere servant in the work of forming a commonwealth. Never has this service been better performed; never has it been utilized with greater adroitness as a means towards this end. In Mecca, Islam had originally been nothing more than the individual conviction of Mohammed; it was only after severe struggles that he went so far as to preach it, and even his preaching had no other aim than to create individual conviction in others. What he said was of the simplest description—that people ought to believe in God and in judgment to come, that men ought to live their lives seriously and not waste them in follies, that one ought not to be high-minded or covetous, and so on. A community arose, it is true, even in Mecca, and was confirmed by the persecutions. There also religious meetings were held and social prayers. But everything was still in a very fluid and rudimentary stage; religion retained its inward character. It was not until the first two years after the Flight that it gradually lost this, and became, if not exclusively, yet to a very large extent, a mere drill system for the community.[1] No god but the one God (lá iláh illa 'lláh) was the entire sum of their dogmatic, and less importance was attached to belief in it than to profession of it. It was the watchword and battle-cry. The prayers[2] took the form of military exercises; they were imitated with the greatest precision by the congregation, after the example of the Imám. The mosque was, in fact, the great exercising ground of Islam; it was there that the Moslems acquired the *esprit de corps* and rigid discipline which distinguished their armies.

Next to the monotheistic confession (tauḥíd) and to prayer (ṣalát) came almsgiving (zakát, ṣadaḳa) as a third important means by which Mohammed awakened and brought into action among his followers the feeling of fellowship. The alms by and by grew to be a sort of tithe, which afterwards became the basis of the Moslem fiscal system, and so at the same time the material foundation of the Moslem state. Religion received so practical a development that of alms nothing but the name remained, and the convenient fiction that the taxes had to be paid to God.

Increased exclusiveness. Just in proportion to the closeness of the union into which Islam brought its followers did its exclusiveness towards them that were without increase. If in Mecca Mohammed in his relations to the other monotheistic religions had observed the principle, "he that is not against me is for me," in Medina his rule was "he that is not for me is against me."

The Jews. As circumstances were, he had to adjust matters chiefly with the Jews. Without any intention on their part, they had helped to prepare the ground for him in Medina; he had great hopes from them, and at first treated them on no different footing from that of the Arab families which recognized him. But as his relations with the Aus and Khazraj consolidated, those which he had with the Jews became less close. The conjunction of religious with political authority, the development of civil polity out of religion, of the kingship from the prophetic function, was precisely what they objected to.[3] On the other hand, while the old polity of Medina, broken up and disorganized as it was, had no difficulty in tolerating foreign elements within its limits, the new political system created by Islam changed the situation, and rendered it necessary that these should be either assimilated or expelled.

Mohammed's hostility to the Jews found expression, in the first instance, theoretically more than practically,[4] and especially in the care with which he now differentiated certain important religious usages which he had taken over from Judaism, so that they became distinguishing marks between Islam and Mosaism. Thus, for example, he altered the direction of prayer (Kibla), which formerly used to be towards Jerusalem, so that it now was towards Mecca; and for the fast on the 10th of Tisri ('Ashúrá) he substituted that of the month of Ramaḍan.[5] In appointing Friday as the principal day of public worship, he may also possibly have had some polemical reference to the Jewish Sabbath. Of these alterations the greatest in positive importance is the transference of the Ḳibla to Mecca. It symbolizes the completion of the Arabizing process which went on step by step with the change Islam underwent from being an individual to being a political religion. In substituting the Meccan Ka'ba for the sanctuary at Jerusalem, Mohammed did not merely bid farewell to Judaism and assert his independence of it; what he chiefly did was to make a concession to heathenism, and bring about a nationalization of Islam, for the purpose of welding together the Arab tribes (Ḳabáil) into one community. Of similar significance was the institution of the feast of sacrifice ('Id al-ḍoḥá) on the day of the Meccan festival. The Moslems were to observe the latter as much as possible, even if they could not be actually present on the spot.

Precepts of Islam. Thus we have the five chief precepts of Islam—(1) Confession of the unity of God; (2) stated prayer; (3) almsgiving; (4) the fast of Ramaḍan; (5) observance of the festival of Mecca. Capable of having deeper meanings

[1] This is to be understood as applying to the system as a whole. Of course, there are always individuals who break through system; but the historical power of Islam rests upon the system. To the system also belongs the spiritual jargon which Mohammed introduced. It was no longer permissible to say "Good morning!" ('im sabáhan), the phrase now ran, "Peace be with thee!" and on every occasion pious forms of speech were demanded. Characteristic of the puritanism of the system is the prohibition of wine and of gaming, first issued in the years immediately following the Flight, and the contempt for poetry.

[2] They were five in number—at sunrise, noon, afternoon, sunset, and late evening. Each prayer consisted originally of two, afterwards of four, prostrations. The chief weekly public service (jom'a), with sermon, was held on Friday at mid-day.

[3] While Islam had the effect of uniting the Arabs politically, uniformity of religion in the case of the Jews had no such effect; on the contrary, the mutual feuds and hatreds in which they indulged conduced greatly to the advantage of the Moslems. The Jews, of course, recognised Mohammed's supremacy as a fact, but they denied any legal title thereto as arising from his prophetic office.

[4] Compare the well-known second súra, in which a long attack is made on Judaism.

[5] A connection with the Christian fasts is usually alleged. It is possible that Christian influence may have to do with the long duration of the fasts, but it cannot have anything to do with the selection of Ramaḍan; for in the first years after the Flight, Ramaḍan fell not in Spring but in December.

by force to the rebels who showed unwillingness to accept it. More literally than Christ could Mohammed say of himself that he was come not to bring peace but a sword. Islam was a standing declaration of war against idolaters.

The holy war. The nearest object against which to direct the holy war (jihád) was presented by the Meccans. Against them first did Mohammed bring into operation the new principle, that it is faith and not blood that separates and unites. According to Arab notions it was a kind of high treason on his part to leave his native town in order to join a foreign society; on the part of the people of Medina it was an act of hostility to Mecca to receive him among them. The Meccans would have been fully justified on their side in taking arms against the Moslems, but they refrained, being too much at their ease, and shrinking besides from fratricidal war. It was the Moslems who took the initiative; aggressiveness was in their blood. Mohammed began with utilizing the favourable position of Medina, on a mountain spur near the great highway from Yemen to Syria, to intercept the Meccan caravans. Originally he sent forth only the Emigrants to take part in the expeditions, as the people of Medina had pledged themselves to defend him only in the event of his being attacked; soon, however, they also joined him. What first induced them to do so was the prospect of booty; afterwards it was impossible to separate themselves, so great was the fusion of elements which had been quietly going on within the crucible of Islam.

The first plunder was taken in the month Rajab, A.H. 2 (Autumn 623), in which circumstance was at once seen the advantage arising from the change of conscience brought about by the new religion; for in Rajab feuds and plundering raids were held to be unlawful. Relying upon the sacredness of this month a caravan of Koraish was returning from Ṭáif laden with leather, wine, and raisins. But this did not prevent Mohammed from sending out a band of Emigrants to surprise the caravan at Nakhla, between Ṭáif and Mecca; his orders to this effect were given in a document which was not to be unsealed until two days after the departure of the expedition. The plan was carried out, and the surprise was all the more successful, because the robbers gave themselves the outward semblance of pilgrims; one Meccan was killed in the struggle. But the perfidy with which in this instance Mohammed's advanced religious views enabled him to utilize for his own advantage the pious custom of the heathen roused in Medina itself such a storm of disapproval, that he found himself compelled to disavow his own tools. In Mohammedan tradition, the contents of the unambiguous document in which he ordered the surprise are usually falsified.

Battle of Bedr. The Koraish still remained quiet; another outrage had yet to come. In Ramadan A.H. 2 (December 623), the return of their great Syrian caravan was expected, and Mohammed resolved to lie in wait for it at Bedr, a favourite watering-place and camping-ground, northward from Medina. For this purpose he set out thither in person along with 308 men; but the leader of the caravan, the Omayyad Abú Sofyán, got word of the plan and sent a messenger to Mecca with a request for speedy help. Concern about their money and goods at last drove the Koraish to arms; a very short interval found them, 900 strong, on the road to Bedr. By the way they received intelligence that the caravan had made a circuit to the west of Bedr, and was already in safety. Nevertheless they resolved, at the instance of the Makhzumit Abú Jahl, for the sake of their honour, to continue their march. When the Moslems first got touch of them at Bedr, they took them for the caravan; their surprise on discovering the truth may be imagined. But, kept firm by the courage of their leader, they resolved to face the superior numbers of the enemy. On the morning of Friday, the 17th of Ramadan, the encounter took place. A number of duels were fought in the front, which were mostly decided in favour of the Moslems. The Meccans at last gave up the fight, strictly speaking for no other cause than that they did not see any reason for carrying it on. They were reluctant to shed the blood of their kinsmen; they were awestruck in presence of the gloomy determination of their adversaries, who did know what they were fighting for, and were absolutely reckless of consequences. After a number of the noblest and oldest of the Koraish, including at last Abú Jahl, had fallen, those who remained took to flight. The number of the dead is said to have been as great as that of the prisoners. Two of the latter, whom he personally hated, Mohammed caused to be put to death—'Okba b. Abí Mo'ait and al-Nadr b. al-Hárith. When the last named had perceived, from the Prophet's malignant glance, the danger in which he stood, he implored an old friend of his among the Moslems for his intercession. This request being refused, al-Nadr said: "Had the Koraish taken thee prisoner, thou hadst not been put to death as long as I had lived;" to which the apologetic reply was: "I do not doubt it, but I am differently placed from thee, for Islam has made an end of the old relations." To the remaining prisoners life was spared on payment by their kinsmen of a heavy ransom; but Mohammed is said to have afterwards reproached himself for having allowed considerations of earthly gain to keep him back from sending them all to hell as they deserved.

Effect of the battle. The battle of Bedr is not only the most celebrated of battles in the memory of Moslems; it was really also of great historical importance. It helped immensely to strengthen Mohammed's position. Thenceforward open opposition to him in Medina was impossible; families which had hitherto withdrawn themselves from his influence were so thoroughly cowed by some atrocious murders carried out in obedience to his orders, that they went over to Islam. He was now in a position to proceed to break up the autonomy of the Jews. In the first instance, he addressed himself to the weak Banú Kainoká, demanding their acceptance of Islam; on their refusal, he took the earliest opportunity that offered itself to declare war against them. After a short siege they were compelled to surrender; and they might congratulate themselves that their old ally, Ibn Obay, was able to concuss the Prophet into sparing their lives, and contenting himself with their banishment from Medina. Soon afterwards other blows were struck, in the shape of assassinations, by means of which Mohammed put out of the way several of the Jews whom he hated most, such as Ka'b b. al-Ashraf and Ibn Sonaina.[1] The state of fear to which the rest were reduced may readily be imagined; they came to the Prophet and begged him to be propitious. If in other days their dislike had found somewhat public expression in all sorts of witticisms and scornful sayings, they were now at least modest and quiet, and kept their hatred to themselves.

The Meccans also were very deeply impressed by the defeat inflicted on them by the Moslems. They saw clearly that the blow must be avenged, and they took comprehensive measures for their campaign. After a year's delay, their preparations being now complete, and their allies

[1] The murderer of Ibn Sonaina was Mohayyisa b. Mas'úd, of whose elder brother, Howaisa, he had been a sworn ally. Howaisa struck the murderer in consequence, and reproached him with his treacherous ingratitude, saying that much of the fat in his body had come from the estate of the Jew. Mohayyisa's reply was: "If he who bade me kill him were also to bid me kill thee, I should obey." The brother, amazed, asked him if he was serious, and when the other assured him that he was, Howaisa exclaimed: "By God, a religion which brings it to this is a stupendous one," and forthwith became a convert. The story (*Vakidi*, p. 98) is too characteristic to be passed over.

by force to the rebels who showed unwillingness to accept it. More literally than Christ could Mohammed say of himself that he was come not to bring peace but a sword. Islam was a standing declaration of war against idolaters.

The holy war. The nearest object against which to direct the holy war (jihád) was presented by the Meccans. Against them first did Mohammed bring into operation the new principle, that it is faith and not blood that separates and unites. According to Arab notions it was a kind of high treason on his part to leave his native town in order to join a foreign society; on the part of the people of Medina it was an act of hostility to Mecca to receive him among them. The Meccans would have been fully justified on their side in taking arms against the Moslems, but they refrained, being too much at their ease, and shrinking besides from fratricidal war. It was the Moslems who took the initiative; aggressiveness was in their blood. Mohammed began with utilizing the favourable position of Medina, on a mountain spur near the great highway from Yemen to Syria, to intercept the Meccan caravans. Originally he sent forth only the Emigrants to take part in the expeditions, as the people of Medina had pledged themselves to defend him only in the event of his being attacked; soon, however, they also joined him. What first induced them to do so was the prospect of booty; afterwards it was impossible to separate themselves, so great was the fusion of elements which had been quietly going on within the crucible of Islam.

were driven in chains to the house of Osáma b. Zaid, whence on the following morning Mohammed caused them to be brought one by one to the market-place of Medina, and there executed. This continued till late in the evening. They were six or seven hundred in number, and among them was the Nadirite Ḥoyay b. Akhṭab, the author of the War of the Fosse, who had left the Meccans to join his fortunes with those of the Ḳoraiẓa. By accepting Islám these men could have saved their lives, but they preferred death. No more magnificent martyrdom is known to history. The women and children were sold into slavery; one young woman only, Banána, suffered the penalty of death for having broken the head of a Moslem with a millstone during the siege. With joyous heart and smiling face she went to meet her death, never forgotten by 'Aísha, with whom she was when her name was called. The Prophet selected for himself the fair Raiḥána, and married her, after having caused her to become a convert to Islam.

The War of the Fosse was the last attack made by the Ḳoraish upon Medina; Mohammed now began to take the offensive towards Mecca. This he at first set about with extreme diplomacy, utilizing the festival, and the truce of God subsisting at the time of the festival, for the purpose of paying a visit to his native town. Although unsuccessful in winning to his side the neighbouring tribes of Bedouins, it was nevertheless with a considerable following (1500 men) that in Dhú 'l-ḳa'da A.H. 6 (March 628),[1] he set out on his journey. In a dream he had had the key of the Ka'ba delivered to him; on the strength of this his followers believed firmly in the success of the expedition. But the Ḳoraish were determined that the pretext of pilgrimage should not avail their adversary; they summoned their allies and formed a camp to the north of their town for the purpose of preventing the entrance of the Moslems.

Hodai-biya. Mohammed was forced to halt at Ḥodaibiya on the borders of the sacred territory, and it was in vain that by fair speeches he sought to obtain permission to make the circuit of the Ka'ba. He felt himself too weak to force his way, and accordingly preferred to treat. While the envoys were passing to and fro, there suddenly arose an alarm in the Moslem camp; they apprehended a sudden act of treachery on the part of the Meccans. It was on this occasion that the famous Homage under the Tree took place, when Mohammed pledged his followers by striking hands that they would stand by him and go to death for his sake. Some of the Ḳoraish agents witnessed the scene, and were immensely impressed by it; such an enthusiastic obedience as Mohammed received, such an ascendency over the minds of men as he exercised, they had never before conceived to be possible, and on their return they urged their people in the strongest way not to permit matters to come to extremities. The Ḳoraish accordingly judged it best to offer a bargain with Mohammed, the terms being that for this year he was to withdraw, so that the Arabs might not say that he had forced an entrance, but that on the following year he was to return and be permitted to remain three days within the sacred territory for the purpose of sacrifice. After some discussion Mohammed accepted this proposal, although zealous Moslems detected a discreditable shortcoming in matters of faith, in so far as it involved turning back within sight of the Ka'ba without being allowed to accomplish the sacred circuit. When the agreement was to be committed to writing, Mohammed dictated the words: "In the name of Alláh, the merciful Raḥmán";[2] but the Meccan plenipotentiary, Sohail b. 'Amr, declared that he knew nothing about Raḥmán, and insisted upon the customary formula—"In thy name, Allá-homma!" The Moslems murmured, but Mohammed yielded. He then went on to dictate: "This is the treaty of peace between the apostle of God." . . . Sohail anew protested; to acknowledge Mohammed as the apostle of God, would be to declare himself his follower; the designation ought to be simply Mohammed b. 'Abdalláh. The Moslems murmured louder than before, and refused to consent to the change. The heads of the two tribes of Medina, Osaid b. Ḥoḍair and Sa'd b. 'Obáda, held the hand of the scribe and declared that "Mohammed the apostle of God" must be written, or the sword must decide. The Meccan representatives whispered to one another words of amazement at the spirit displayed by these men. But Mohammed made a sign to the zealots to hold their peace, and again gave way (sur. xvii. 110). The writing which now took shape ran as follows:—

"In thy name, O God! This is the treaty of peace concluded by Mohammed b. 'Abdalláh and Sohail b. 'Amr. They have agreed to allow their arms to rest for ten years. During this time each party shall be secure, and neither shall injure the other; no secret damage shall be inflicted, but uprightness and honour prevail betwixt us. Whosoever wishes to enter into treaty and covenant with Mohammed can do so, and whosoever wishes to enter into treaty and covenant with the Koraish can do so. But if a Koraishite comes without permission of his guardian (Walí) to Mohammed, he shall be delivered up; but if, on the other hand, one of Mohammed's people comes to the Koraish he shall not be delivered up. This year Mohammed with his companions must withdraw from us,[3] but next year he may come amongst us and remain for three days, yet without other weapons than those of a traveller, the swords remaining in their sheaths." The treaty.

The first result of the treaty was that the Khozá'a declared for alliance with Mohammed; while, on the other hand, the Bekr b. Kinána joined themselves to the Ḳoraish.

To compensate his followers for the apparent resultlessness of this expedition, Mohammed immediately after their return led them out against the rich Jews of Khaibar (northwards from Medina), whither the Banú Naḍír had migrated, and from which place they had unceasingly stirred up opposition against the Prophet. Hitherto he had contented himself with putting out of the way, by means of assassination, some of their leading men who seemed to him to be particularly dangerous, such as Abú Ráfi' and Yosair b. Rázim,[4] but now he resorted to wholesale measures. In Moḥarram, A.H. 7 (May 628), he made his appearance before Khaibar with a powerful army; in the plunder only those who had taken part in the expedition of Ḥodaibiya were to share, but many others besides accompanied them. The Jews, although aware of the hostility of Mohammed's intentions, were nevertheless taken completely by surprise when one morning they saw him and his troops encamp before their strongholds. One of their leaders had given them the excellent advice not to shut themselves up by families in their quarters, but to construct a common camp in the fields, otherwise they were likely to share the fate of their coreligionists in Medina. But they replied that their strongholds were of a different sort, perched on impregnable summits, and they remained shut up within them. They had neither discipline nor order, courage nor devotion. As they were wanting in community of feeling, so also were they lacking in leaders. Their best man, Salám b. Mishkám, lay on a sick-bed; his place was by no means supplied by Kinána b. b. Abi 'l-Ḥoḳaiḳ. When they suddenly became aware that they had been completely abandoned by their Arab allies, the Ghaṭafán, their heart utterly failed them. When besieged in any of their citadels, they hardly ever waited War with Khaibar.

ites complained to the Prophet, who eagerly seized the pretext for war. In vain did the Meccans send Abú Sofyán to Medina to renew the truce; they could not move the Prophet from his purpose. In Ramadan, A.H. 8 (January 630), he moved against Mecca with an army of 10,000 men. With the Emigrants and the Defenders were mustered the Aslam, Ghifár, Mozaina, Johaina, and Ashja'; the Solaim and the Khozá'a joined them on the way. The Bedouins were drawn by the hope of booty; the Fazárite 'Oyaina was sorely vexed that he had left his Ghaṭafán at home, not knowing what was in view, for Mohammed at first kept the aim of his expedition a secret. Some of the Meccan nobles must, however, have known it; Makhrama b. Naufal, for example, and the Prophet's uncle, 'Abbás, did not await the capture of their city, but deserted to the enemy while he was still distant. Abú Sofyán, in particular, must have been in the secret; it appears that at Medina he received the promise that the holy city should be spared if it yielded pacifically, and that he pledged himself to do his best to play into the hands of the Prophet.[1] But before the populace it was necessary to keep up the appearance of a sudden surprise, an inevitable submission to an unforeseen display of force. The same comedy was repeated afterwards at Ṭáif; the headmen treated with the Prophet without consulting the Thaḳafites, and then contrived that the result of their policy should appear to be forced by the course of events. The Moslems were on the border of the holy land before the Meccans suspected their approach; then suddenly one night 10,000 fires were seen rising to heaven to the north-west of the holy city. In well-feigned surprise Abú Sofyán hastened to the hostile camp; he returned with the news that the Moslems were at the gates, that an improvised resistance could effect nothing against their force; the only wise course was a surrender—Mohammed had promised security to those who remained in their houses or threw away their weapons. The terrified Meccans had hardly any other course open to them than to follow this advice. And now the Moslems entered the city from several sides at once, meeting only at one point with an easily quelled resistance. Mohammed insisted that there should be no violence; he pledged the captains to avoid all bloodshed. Ten persons only were put to the ban, and of these one half were subsequently pardoned. He took all pains to preserve the sanctity of Mecca unimpaired, confirmed the rights and privileges therewith connected, and made it plain that the old cultus should not be less flourishing under Islam. The ceremonies were retained, save only that he abolished all idols, both the domestic gods found in every house and the images in and round the Ka'ba. But every sanctuary outside of Mecca was destroyed, except such as had a part in the celebration of the Feast, and so stood in connexion with the Ka'ba itself. Thus the Meccan worship gained a new and unique importance. Mohammed's reform did for Mecca what Josiah's did for Jerusalem.[2]

The war is renewed.

Conquest of Mecca.

The last step towards that identification of the Ka'ba with Islam, which made it the religious centre of the Moslem world, was not taken till the following year, when the famous Renunciation (Bará'a) of sur. ix. forbade the heathen to share in the Feast, which was henceforth to be a strictly Moslem ordinance, and at the same time abrogated the peace of the holy months. A year later (Dhú 'l-Ḥijja, A.H. 10, March 632) he himself celebrated the Feast for the first time in the orthodox fashion, introducing certain modifications on the traditional practice and reducing certain varieties of use to uniform rule. In all this he professed to re-establish the true ancient use, purged of heretical deviations from the example of Abraham. At the same time he remodelled the Calendar, forbidding the occasional interpolation of a month as an arbitrary and human invention, and establishing the true lunar year of twelve lunations.

We return to the capture of Mecca. The submission of the Koraish was followed by that of their nomad brethren and allies. But the neighbouring Hawázin, to whom belonged also the Thaḳafite inhabitants of Ṭáif, assembled for battle with the Moslems. They camped in Autás between Ṭáif and Mecca. Mohammed advanced against them, and battle was joined in the valley of Honain. The Moslems were broken by the first charge of the foe; for a moment the Prophet himself was in danger, till the Khazraj rallied round him, checked the onset of the Hawázin, and at length turned them to flight. A vast booty rewarded the victors; for the Hawázin had brought all their herds and non-combatants with them and placed them in the rear, that they might feel what they were fighting for.[3] Mohammed caused the prey to be conveyed to the glen of Ji'rána, outside the north-west border of the Haram, a little way off the great valley that descends from Ṭáif; he himself pressed on to Ṭáif itself. Here, however, he failed in his object; in a dream he saw a cock peck a hole in a bowl of cream that was set before him, so that the contents ran out. After fourteen days he gave up the siege and marched to Ji'rána to deal with the booty. He had deferred this task in the hope that the Hawázin would be tempted to embrace Islam in order to recover their families and cattle. But as they still sent no ambassadors, he had to yield to the pressure of the Bedouins and divide the spoil. When it was too late, the messengers of the Hawázin appeared to announce their conversion; they had now to give up their herds, and content themselves that their wives and children were restored to them, through the mediation of the Prophet with their new masters. The Bedouins received compensation for what they gave up; the Emigrants and Defenders gave up their captives freely. Altogether the men of Medina fared worst in the distribution of booty, though they had borne the brunt of the conflict; those who fared best were the nobles of Mecca, who had no share in the fight, but whom Mohammed desired to conciliate by gifts (sur. ix. 60).

War with the Hawázin.

The fall of Mecca reacted powerfully on the future development of Islam. Again the saying came true: *victa victores cepit;* the victory of the Moslems over the Koraish shaped itself into a domination of the Koraish over the Moslems. For this the Prophet himself was to blame. In making Mecca the Jerusalem of Islam, he was ostensibly moved by religious motives; but in reality Mohammed's religion had nothing to do with the heathenish usages at the Ka'ba and the Great Feast. To represent Abraham as the founder of the ritual was merely a pious fraud. What Mohammed actually sought, was to recommend Islam to Arabic prejudices by incorporating this fragment of heathenism, and at the same time he was influenced by his local patriotism. Henceforth these local feelings became quite the mainspring of his conduct; his attitude to the Koraish was determined entirely by the spirit of clannishness. Hence the extraordinary value he set on the conciliation of their chiefs; one gains the impression that he cared more for this than for the conversion of all the rest of the world. He left to them all that they already had; he gave them in addition whatever they asked, if only they would be his good friends. Abú Sofyán was a great man already, but Mohammed hastened

Aggrandizement of the Koraish.

[1] The tradition indeed is silent, but Muir (iv. 120) is justified in drawing this inference from the course of events.

[3] Among them were relatives of the Prophet's foster-mother, Halima.

ites complained to the Prophet, who eagerly seized the pretext for war. In vain did the Meccans send Abú Sofyán to Medina to renew the truce; they could not move the Prophet from his purpose. In Ramadan, A.H. 8 (January 630), he moved against Mecca with an army of 10,000 men. With the Emigrants and the Defenders were mustered the Aslam, Ghifár, Mozaina, Johaina, and Ashja'; the Solaim and the Khozá'a joined them on the way. The Bedouins were drawn by the hope of booty; the Fazárite 'Oyaina was sorely vexed that he had left his Ghatafán at home, not knowing what was in view, for Mohammed at first kept the aim of his expedition a secret. Some of the Meccan nobles must, however, have known it; Makhrama b. Naufal, for example, and the Prophet's uncle, 'Abbás, did not await the capture of their city, but deserted to the enemy while he was still distant. Abú Sofyán, in particular, must have been in the secret; it appears that at Medina he received the promise that the holy city should be spared if it yielded pacifically, and that he pledged himself to do his best to play into the hands of the Prophet.[1] But before the populace it was necessary to keep up the appearance of a sudden surprise, an inevitable submission to an unforeseen display of force. The same comedy was repeated afterwards at Táif; the headmen treated with the Prophet without consulting the Thakafites, and then contrived that the result of their policy should appear to be forced by the course of events. The Moslems were on the border of the holy land before the Meccans suspected their approach; then suddenly one night 10,000 fires were seen rising to heaven to the north-west of the holy city. In well-feigned surprise Abú Sofyán hastened to the hostile camp; he returned with the news that the Moslems were at the gates, that an improvised resistance could effect nothing against their force; the only wise course was a surrender—Mohammed had promised security to those who remained in their houses or threw away their weapons. The terrified Meccans had hardly any other course open to them than to follow this advice. And now the Moslems entered the city from several sides at once, meeting only at one point with an easily quelled resistance. Mohammed insisted that there should be no violence; he pledged the captains to avoid all bloodshed. Ten persons only were put to the ban, and of these one half were subsequently pardoned. He took all pains to preserve the sanctity of Mecca unimpaired, confirmed the rights and privileges therewith connected, and made it plain that the old cultus should not be less flourishing under Islam. The ceremonies were retained, save only that he abolished all idols, both the domestic gods found in every house and the images in and round the Ka'ba. But every sanctuary outside of Mecca was destroyed, except such as had a part in the celebration of the Feast, and so stood in connexion with the Ka'ba itself. Thus the Meccan worship gained a new and unique importance. Mohammed's reform did for Mecca what Josiah's did for Jerusalem.[2]

The war is renewed.

Conquest of Mecca.

The last step towards that identification of the Ka'ba with Islam, which made it the religious centre of the Moslem world, was not taken till the following year, when the famous Renunciation (Bará'a) of sur. ix. forbade the heathen to share in the Feast, which was henceforth to be a strictly Moslem ordinance, and at the same time abrogated the peace of the holy months. A year later (Dhú 'l-Hijja, A.H. 10, March 632) he himself celebrated the Feast for the first time in the orthodox fashion, introducing certain modifications on the traditional practice and reducing certain varieties of use to uniform rule. In all this he professed to re-establish the true ancient use, purged of heretical deviations from the example of Abraham. At the same time he remodelled the Calendar, forbidding the occasional interpolation of a month as an arbitrary and human invention, and establishing the true lunar year of twelve lunations.

We return to the capture of Mecca. The submission of the Koraish was followed by that of their nomad brethren and allies. But the neighbouring Hawázin, to whom belonged also the Thakafite inhabitants of Táif, assembled for battle with the Moslems. They camped in Autás between Táif and Mecca. and added that Mohammed's emissaries would presently appear to destroy the Rabba. The destruction took place accordingly, to the terror of the women and children, but without a *single man raising his hand.*

The pilgrimage undertaken by Mohammed in the year 10 (March 632) was like a very triumph. All Arabia, apart from the vassals of Persia and Greece, lay at his feet. The greatest success of his life had been effected by sheer moral force without a stroke of the sword. But Arabia no longer sufficed him; he had wider aims. In his last years he began to extend the holy war against the Greeks. Even on his return from Ḥodaibiya, he began to direct envoys to several foreign potentates, with letters demanding their adhesion to Islam. One of these envoys was seized and beheaded in the Belḳá (the ancient Moab). Hence sprang the first campaign against the Greeks, *i.e.* the Arabs who were subject to the Greek empire. The army directed against them was, however, entirely defeated at Mu'ta (Autumn 629); Khálid succeeded with difficulty in rallying and leading back the broken remnant of the host. Next summer the Nabatæans who visited the market of Medina spread a rumour that the Emperor Heraclius was collecting a vast force to attack the Moslems; and Mohammed set forth to meet him at the head of 30,000 men, but got no farther than Tabúk, on the southern borders of ancient Edom, when the rumour was found to be false. The expedition, however, was not altogether fruitless, as it led to the submission of several small Jewish and Christian communities in the north of the Peninsula. Mohammed equipped a new expedition against the Greeks on his return from his "farewell pilgrimage," and it was just ready to start when he died, on Monday, 8th June 632.

War with the Greeks.

Death of Mohammed.

In forming an estimate of one who has exercised so unexampled an influence on the history of the world, we shall do well to bear in mind the hint of Gibbon, that "some reverence is surely due to the fame of heroes and the religion of nations." The grounds on which Mohammed may be condemned are partly found in his private life. Although on the whole, even after he had become ruler of all Arabia, he maintained the original poverty and simplicity of his establishment, never set store by money and estate, eating and drinking and soft clothing, strictly continued to fast and watch and pray after his first fashion, and that, too, plainly out of a heartfelt need and without any ostentation, he nevertheless in one point at least used his supreme authority as prophet to make provision for the flesh. He claimed to be personally exempt from those restrictions in regard to the female sex which lay upon all other Moslems, and, as is well known, he made very extensive application of this fundamental principle. This fact is quite rightly urged against him as a reproach; even pious Moslems have been scandalised by it. At the same time, it is unnecessary to judge him on this account more harshly than we do Charlemagne, the most Christian king of the Franks; in any case we must not apply the standards of the present day to the circumstances of old Arabia. Of much weightier and indeed of crushing character is the accusation, that he did not really believe himself to be a prophet, but merely of set purpose played the part of one. For the first years of his activity indeed this charge is not now any longer maintained; it is universally granted that at that period his enthusiasm was genuine and real. But in Medina, we are told, he used his prophetic character simply as a pretext for the establishment of his power. It seems to the present writer that into this opinion there enter modern notions as to the separation between religion and the civil magistracy, which ought to be carefully kept out of sight. By any other instrumentality than that of a prophet it would hardly have been possible to found the state of Medina; religion was the soul of the community. The founding of a religion and the forming of a state were not connected in so merely external a way as is usually supposed; on the contrary, the one was the natural and necessary consequence of the other. This must certainly be conceded, that, if we are to make any distinctions at all, Islam was far less rich in religious meaning than in social forces. The Koran is Mohammed's weakest performance; the weight of his historical importance lies in his work at Medina and not in that at Mecca. And it is a fact that the politician in him outgrew the prophet more and more, and that in many cases where he assigned spiritual motives he merely did so to give a fair appearance to acts that emanated from secular regards. In this respect it appears to us particularly objectionable that he gave out as revelations of God and placed in the Koran all sorts of regulations and orders of the day, which proceeded simply from his own deliberations or even in part were suggested to him by advisers from outside. At the same time the element of self-deception is not excluded even here; he took for a message sent down from heaven everything which in his cataleptic fits passed through his mind, however close might be its agreement with his own previously cherished thoughts. It was pardonable that he went on with the idea after he had once grasped it, that he blew upon the coals when the flame threatened to die out. It is less easy to free him from the reproach of perfidy and cruel vindictiveness. The surprise of Nakhla in the month Rajab (ordered by him, though he afterwards repudiated it), the numerous assassinations which he instigated, the execution of the 600 Jews at the close of the War of the Fosse, burden the Prophet heavily, and sufficiently explain the widespread antipathy in which he is held. Yet even in this respect it is well not to forget the instance, already cited, of Charlemagne. It is precisely the man of vast aims who finds it most difficult to keep the beaten path.

After the death of Mohammed arose the question who was to be his "representative" (Khalífa, Caliph). The choice lay with the community of Medina; so much was understood; but whom were they to choose? The natives of Medina believed themselves to be now once more masters in their own house, and wished to promote one of themselves. But the Emigrants asserted their opposing claims, and with success, having brought into the town a considerable number of outside Moslems,[1] so as to terrorize the men of Medina, who besides were still divided into two parties. The Emigrants' leading spirit was 'Omar; he did not, however, cause homage to be paid to himself but to Abúbekr, the friend and father-in-law of the Prophet.

Abúbekr Caliph.

The affair would not have gone on so smoothly, had not the opportune defection of the Arabians put a stop to the inward schism which threatened. Islam suddenly found itself once more limited to the community of Medina; only Mecca and Ṭáif remained true. The Bedouins were willing enough to pray, indeed, but less willing to pay taxes; their defection, as might have been expected, was a political movement.[2] None the less was it a revolt from Islam, for here the political society and the religious are identical. A peculiar compliment to Mohammed was involved in the fact that the leaders of the rebellion in the various districts did not pose as princes and kings, but as prophets; in this the secret of Islam's success appeared to lie.

Revolt of the Arabs.

Abúbekr proved himself quite equal to the perilous situation. In the first place, he allowed the expedition against the Greeks, already arranged by Mohammed, quietly to set out, limiting himself for the time to the defence of Medina. On the return of the army he proceeded to

It was pardonable that he went on with the idea after he had once grasped it, that he blew upon the coals when the flame threatened to die out. It is less easy to free him from the reproach of perfidy and cruel vindictiveness. The surprise of Nakhla in the month Rajab (ordered by him, though he afterwards repudiated it), the numerous assassinations which he instigated, the execution of the 600 Jews at the close of the War of the Fosse, burden the Prophet heavily, and sufficiently explain the widespread antipathy in which he is held. Yet even in this respect it is well not to forget the instance, already cited, of Charlemagne. It is precisely the man of vast aims who finds it most difficult to keep the beaten path.

After the death of Mohammed arose the question who was to be his "representative" (Khalífa, Caliph). The choice lay with the community of Medina; so much was understood; but whom were they to choose? The natives of Medina believed themselves to be now once more masters in their own house, and wished to promote one of themselves. But the Emigrants asserted their opposing claims, and with success, having brought into the town a considerable number of outside Moslems,[1] so as to terrorize the men of Medina, who besides were still divided into two parties. The Emigrants' leading spirit was 'Omar; he did not, however, cause homage to be paid to himself but to Abúbekr, the friend and father-in-law of the Prophet.

Abúbekr Caliph.

The affair would not have gone on so smoothly, had not the opportune defection of the Arabians put a stop to the inward schism which threatened. Islam suddenly found itself once more limited to the community of Medina; only Mecca and Ṭáif remained true. The Bedouins were willing enough to pray, indeed, but less willing to pay taxes; their defection, as might have been expected, was a political movement.[2] None the less was it a revolt from Islam, for here the political society and the religious are identical. A peculiar compliment to Mohammed was involved in the fact that the leaders of the rebellion in the various districts did not pose as princes and kings, but as prophets; in this the secret of Islam's success appeared to lie.

Revolt of the Arabs.

Abúbekr proved himself quite equal to the perilous situation. In the first place, he allowed the expedition against the Greeks, already arranged by Mohammed, quietly to set out, limiting himself for the time to the defence of Medina. On the return of the army he proceeded to

[1] Compare Muir, iv. 263.

[2] See Nöldeke, *Beiträge zur Kenntniss der Poesie der alten Araber* (1864), p. 89 *sq.*

The fall of the Omayyads was their work, and with the Omayyads fell the Arabian empire. The course of Islam's political history during its first centuries is denoted by the removal of the capital from Damascus to Cufa, and from Cufa to Baghdád, the latter occupying, approximately, the site of the ancient Ctesiphon.

'Omar Caliph. But we must return to the period of Abúbekr. He died after a short reign, on 22d August 634, and as matter of course was succeeded by 'Omar. To 'Omar's ten years' Caliphate belong for the most part the great conquests. He himself did not take the field, but remained in Medina; he never, however, suffered the reins to slip from his grasp, so powerful was the influence of his personality and the Moslem community of feeling. His political insight is shown by the circumstance that he endeavoured to limit the indefinite extension of Moslem conquest, and to maintain and strengthen the national Arabian character of the commonwealth of Islam;[1] also by his making it his foremost task to promote law and order in its internal affairs. The saying with which he began his reign will never grow antiquated: "By God, he that is weakest among you shall be in my sight the strongest, until I have vindicated for him his rights; but him that is strongest will I treat as the weakest, until he complies with the laws." It would be impossible to give a better general definition of the function of the State. After the administration of justice he directed his organizing activity, as the circumstances demanded, chiefly towards financial questions—the incidence of taxation in the conquered territories,[2] and the application of the vast resources which poured into the treasury at Medina. It must not be brought against him as a personal reproach, that in dealing with these he acted on the principle that the Moslems were the chartered plunderers of all the rest of the world. But he had to atone by his death for the fault of his system; a workman at Cufa, driven to desperation by absurd fiscal oppressions, stabbed him in the mosque at Medina. He died in the beginning of November 644.

'Othmán Caliph. Before his death 'Omar had nominated six of the leading Emigrants who should choose the Caliph from among themselves—'Othmán, 'Alí, Zobair, Ṭalḥa, Sa'd b. Abí Waḳḳáṣ, and 'Abd al-Raḥmán b. 'Auf. The last named declined to be candidate, and decided the election in favour of 'Othmán b. 'Affán. Under this weak sovereign the government of Islam fell entirely into the hands of the Ḳoraish nobility. We have already seen that Mohammed himself prepared the way for this transference; Abúbekr and 'Omar likewise helped it; the Emigrants were unanimous among themselves in thinking that the precedence and leadership belonged to them as of right. Thanks to the energy of Omar, they were successful in appropriating to themselves the succession to the Prophet. They indeed rested the claims they put forward in the undeniable priority of their services to the faith, but they also appealed to their blood relationship with the Prophet, as a legitimation of their right to the inheritance; and the ties of blood connected them with the Ḳoraish in general. In point of fact they felt a greater solidarity with these than, for example, with the natives of Medina; nature had not been expelled by faith.[3] The supremacy of the Emigrants naturally furnished the means of transition to the supremacy of the Meccan aristocracy. 'Othmán did all in his power to press forward this development of affairs. He belonged to the foremost family of Mecca, the Omayyads, and that he should favour his relations and the Ḳoraish as a whole, in every possible way, seemed to him a matter of course. Every position of influence and emolument was assigned to them; they themselves boastingly called the important province of 'Iráḳ the garden of Ḳoraish. In truth, the entire empire had become that garden. Nor was it unreasonable that from the secularization of Islam the chief advantage should be reaped by those who best knew the world. Such were beyond all doubt the patricians of Mecca, and after them those of Ṭáif, people like Khálid b. al-Walid, 'Amr b. al-'Áṣ, 'Abdalláh b. Abí Sarh, Moghira b. Sho'ba, and, above all, old Abú Sofyán with his son Mo'áwiya, the governor of Syria.

Movement against 'Othmán. Against the rising tide of worldliness an opposition, however, now began to appear. It was led by what may be called the spiritual noblesse of Islam, which, as distinguished from the hereditary nobility of Mecca, might also be designated as the nobility of merit, consisting of the "Defenders," and especially of the Emigrants who had lent themselves to the elevation of the Ḳoraish, but by no means with the intention of allowing themselves to be thereby effaced. The opposition was headed by 'Alí, Zobair, Ṭalḥa, both as leading men among the Emigrants and as disappointed candidates for the Caliphate, who therefore were jealous of 'Othmán. Their motives were purely selfish; not God's cause but their own, not religion but power and preferment, were what they sought.[4] Their party was a mixed one. To it belonged the men of real piety, who saw with displeasure the promotion to the first places in the commonwealth of the great lords who had actually done nothing for Islam, and had joined themselves to it only at the twelfth hour, while those who had borne the burden and heat of the day were passed by. But the majority were merely a band of men without views, whose aim was not a change of system but of persons, that they themselves might fatten in the vacant places. Everywhere in the provinces there was agitation against the Caliph and his governors, except in Syria, where 'Othmán's cousin, Mo'áwiya b. Abí Sofyán, carried on a wise and strong administration. The movement was most energetic in 'Iráḳ and in Egypt. Its ultimate aim was the deposition of 'Othmán in favour of 'Alí, whose own services as well as his close relationship to the Prophet seemed to give him the best claim to the Caliphate. Even then there were enthusiasts who held him to be a sort of Messiah.

The malcontents sought to gain their end by force. In bands they came from the provinces to Medina to concuss 'Othmán into concession of their demands. From the Indus and Oxus to the Atlantic the world was trembling before the armies of the Caliph, but in Medina he had no troops at hand. He propitiated the mutineers by concessions, but as soon as they had gone, he let matters resume their old course. Thus things went on from worse to worse. In the following year (656) the leaders of the rebels came once more from Egypt and 'Iráḳ to Medina with a more numerous following; and the Caliph again tried his former plan of making promises which he did not intend to keep. But the rebels caught him in a flagrant breach of his word, and now demanded his abdication, besieging him in his own house, where he was

[1] He sought to make the whole nation a great host of God; the Arabs were to be soldiers and nothing else. They were forbidden to acquire landed estates in the conquered countries; all land was either made state property or was restored to the old owners subject to a perpetual tribute which provided pay on a splendid scale for the army.

[2] Nöldeke, *Tabari*, 246. To 'Omar also is due the establishment of the Era of the Flight.

[3] Even in the list of the slain at the battle of Honain the Emigrants are enumerated along with the Meccans and Koraish, and distinguished from the men of Medina.

[4] It was the same opposition of the spiritual to the secular nobility that afterwards showed itself in the revolt of the sacred cities against the Omayyads. The movement triumphed with the elevation of the 'Abbásids to the throne. But, that the spiritual nobility was fighting not for principle but for personal advantage was as apparent in 'Alí's hostilities against Zobair and Ṭalḥa as in that of the 'Abbásids against the followers of 'Alí.

The fall of the Omayyads was their work, and with the Omayyads fell the Arabian empire. The course of Islam's political history during its first centuries is denoted by the removal of the capital from Damascus to Cufa, and from Cufa to Baghdád, the latter occupying, approximately, the site of the ancient Ctesiphon.

'Omar Caliph. But we must return to the period of Abúbekr. He died after a short reign, on 22d August 634, and as matter of course was succeeded by 'Omar. To 'Omar's ten years' Caliphate belong for the most part the great conquests. He himself did not take the field, but remained in Medina; he never, however, suffered the reins to slip from his grasp, so powerful was the influence of his personality and the Moslem community of feeling. His political insight is shown by the circumstance that he endeavoured to limit the indefinite extension of Moslem conquest, and to maintain and strengthen the national Arabian character of the commonwealth of Islam;[1] also by his making it his foremost task to promote law and order in its internal affairs. The saying with which he began his reign will never grow antiquated: "By God, he that is weakest among you shall be in my sight the strongest, until I have vindicated for him his rights; but him that is strongest will I treat as the weakest, until he complies with the laws." It would be impossible to give a better general definition of the function of the State. After the administration of justice he directed his organizing activity, as the circumstances demanded, chiefly towards financial questions—the incidence of taxation in the conquered territories,[2] and the application of the vast resources which poured into the treasury at Medina. It must not be brought against him as a personal reproach, that in dealing with these he acted on the principle that the Moslems were the chartered plunderers of all the rest of the world. But he had to atone by his death for the fault of his system; a workman at Cufa, driven to desperation by absurd fiscal oppressions, stabbed him in the mosque at Medina. He died in the beginning of November 644.

'Othmán Caliph. Before his death 'Omar had nominated six of the leading Emigrants who should choose the Caliph from among themselves—'Othmán, 'Alí, Zobair, Ṭalḥa, Sa'd b. Abí Wakkás, and 'Abd al-Raḥmán b. 'Auf. The last named declined to be candidate, and decided the election in favour of 'Othmán b. 'Affán. Under this weak sovereign the government of Islam fell entirely into the hands of the Koraish nobility. We have already seen that Mohammed himself prepared the way for this transference; Abúbekr and 'Omar likewise helped it; the Emigrants were unanimous among themselves in thinking that the precedence and leadership belonged to them as of right. Thanks to the energy of Omar, they were successful in appropriating to themselves the succession to the Prophet. They indeed rested the claims they put forward in the undeniable priority of their services to the faith, but they also appealed to their blood relationship with the Prophet, as a legitimation of their right to the inheritance; and the ties of blood connected them with the Koraish in general. In point of fact they felt a greater solidarity with these than, for example, with the natives of Medina; nature had not been expelled by faith.[3] The supremacy of the Emigrants naturally furnished the means of transition to the supremacy of the Meccan aristocracy. 'Othmán did all in his power to press forward this development of affairs. He belonged to the foremost family of Mecca, the Omayyads, and that he should favour his relations and the Koraish as a whole, in every possible way, seemed to him a matter of course. Every position of influence and emolument was assigned to them; they themselves boastingly called the important province of 'Irák the garden of Koraish. In truth, the entire empire had become that garden. Nor was it unreasonable that from the secularization of Islam the chief advantage should be reaped by those who best knew the world. Such were beyond all doubt the patricians of Mecca, and after them those of Ṭáif, people like Khálid b. al-Walid, 'Amr b. al-'Áṣ, 'Abdalláh b. Abí Sarh, Moghira b. Sho'ba, and, above all, old Abú Sofyán with his son Mo'áwiya, the governor of Syria.

Movement against 'Othmán. Against the rising tide of worldliness an opposition, however, now began to appear. It was led by what may be called the spiritual noblesse of Islam, which, as distinguished from the hereditary nobility of Mecca, might also be designated as the nobility of merit, consisting of the "Defenders," and especially of the Emigrants who had lent themselves to the elevation of the Koraish, but by no means with the intention of allowing themselves to be thereby effaced. The opposition was headed by 'Alí, Zobair, Ṭalḥa, both as leading men among the Emigrants and as disappointed candidates for the Caliphate, who therefore were jealous of 'Othmán. Their motives were purely selfish; not God's cause but their own, not religion but power and preferment, were what they sought.[4] Their party was a mixed one. To it belonged the men of real piety, who saw with displeasure the promotion to the first places in the commonwealth of the great lords who had actually done nothing for Islam, and had joined themselves to it only at the twelfth hour, while those who had borne the burden and heat of the day were passed by. But the majority were merely a band of men without views, whose aim was not a change of system but of persons, that they themselves might fatten in the vacant places. Everywhere in the provinces there was agitation against the Caliph and his governors, except in Syria, where 'Othmán's cousin, Mo'áwiya b. Abí Sofyán, carried on a wise and strong administration. The movement was most energetic in 'Irák and in Egypt. Its ultimate aim was the deposition of 'Othmán in favour of 'Alí, whose own services as well as his close relationship to the Prophet seemed to give him the best claim to the Caliphate. Even then there were enthusiasts who held him to be a sort of Messiah.

The malcontents sought to gain their end by force. In bands they came from the provinces to Medina to concuss 'Othmán into concession of their demands. From the Indus and Oxus to the Atlantic the world was trembling before the armies of the Caliph, but in Medina he had no troops at hand. He propitiated the mutineers by concessions, but as soon as they had gone, he let matters resume their old course. Thus things went on from worse to worse. In the following year (656) the leaders of the rebels came once more from Egypt and 'Irák to Medina with a more numerous following; and the Caliph again tried his former plan of making promises which he did not intend to keep. But the rebels caught him in a flagrant breach of his word, and now demanded his abdication, besieging him in his own house, where he was

[1] He sought to make the whole nation a great host of God; the Arabs were to be soldiers and nothing else. They were forbidden to acquire landed estates in the conquered countries; all land was either made state property or was restored to the old owners subject to a perpetual tribute which provided pay on a splendid scale for the army.

[2] Nöldeke, *Tabari*, 246. To 'Omar also is due the establishment of the Era of the Flight.

[3] Even in the list of the slain at the battle of Honain the Emigrants are enumerated along with the Meccans and Koraish, and distinguished from the men of Medina.

[4] It was the same opposition of the spiritual to the secular nobility that afterwards showed itself in the revolt of the sacred cities against the Omayyads. The movement triumphed with the elevation of the 'Abbásids to the throne. But, that the spiritual nobility was fighting not for principle but for personal advantage was as apparent in 'Alí's hostilities against Zobair and Ṭalḥa as in that of the 'Abbásids against the followers of 'Alí.

The Caliph was not moved; threats prevailed over the obstinacy of the people of 'Irák, and Mo'áwiya repaired to Arabia in person, at the head of an army, to intimidate the inhabitants of Mecca and Medina. As may be supposed, the principal fomenters of the resistance in Arabia were the sons of the first Caliphs, 'Abd al-Rahmán the son of Abúbekr, 'Abdalláh the son of 'Omar, and Hosain the son of 'Alí; for, by submitting, they would have renounced all hope of being themselves chosen by the people. Another 'Abdalláh, son of that Zobair who had been among the six candidates nominated at the death of 'Omar for the choice of the Moslems, was also one of the warmest opponents of the pretensions of Mo'áwiya. All the efforts of the Caliph to win over these personages to his side having proved vain, he ordered them to be brought into the mosque at Mecca, each between two soldiers; then, having mounted the pulpit, he called on the bystanders to take the oath of allegiance to his son; adding that 'Abd al-Rahmán, Hosain, and the two 'Abdalláhs would raise no objection. They, in their terror, did not utter a word, and the assembly took the oath. Then Mo'áwiya, without concerning himself further about the malcontents, returned to Damascus.

While thus occupied at home, Mo'áwiya did not neglect foreign affairs. 'Amr b. al-'Ás, governor of Egypt, died A.H. 43 (A.D. 663-664), and was followed by several prefects in succession, under one of whom the general Mo'áwiya b. Hodaij undertook several expeditions into the province of Africa. In the year 50 (A.D. 670) he advanced as far as Camunia, now Súsa, near which city he laid the foundations of the celebrated Kairawán, and even went on to Sabaratha, a town situated near the seashore, and opposite to the island of C'rina. The emperor, Constantine IV., had sent thither thirty thousand Greeks, who were beaten and compelled to re-embark in haste. Mo'áwiya b. Hodaij returned to Egypt after his victory, and the Caliph now considered the position of the Moslems in Africa so strong, that he separated that province from Egypt, and appointed as governor of Africa 'Okba b. Náfi', who permanently established Kairawán, in a plain situated at a little distance from the first encampment of Mo'áwiya b. Hodaij. According to some historians, the new city was completed A.H. 55 (A.D. 674-675).

In the East the successes of the Moslems were still more brilliant. Ziyád, brother of Mo'áwiya, as soon as he was appointed governor of 'Irák and Persia, sent an army into Khorásán. It advanced as far as the Oxus, crossed that river, and returned loaded with booty taken from the wandering Turkish tribes of Transoxiana. Bokhárá was occupied by a son of Ziyád, and Sa'd, son of the Caliph 'Othmán, whom Mo'áwiya had made governor of Khorásán, marched against Samarkand, A.H. 56 (A.D. 675-676). Other generals penetrated as far as the Indus, and overran and conquered Múltán, Kábúlistán, Mokrán, and Sijistán.

In the North the Moslems were not less fortunate in their attacks on the Byzantine empire. Mo'áwiya, while still only governor of Syria, had gained possession of Armenia, and had sent a fleet against Cyprus, which, in conjunction with that of the governor of Egypt, had effected the conquest of that island. Encouraged by the result of this expedition, he gave the order for new incursions in the Mediterranean. His fleet of twelve hundred vessels invested the islands of Cos, Crete, and Rhodes. The famous Colossus of Rhodes was broken to pieces, and it is said that the bronze of which it was made was bought by a Jew of Emesa, and formed a load for nine hundred and eighty camels. The Arabs even dared to threaten Constantinople, which owed its safety only to the Greek fire. Yazíd, the son of Mo'áwiya, took part in these expeditions, but with no great ardour, and in the year 58 (A.D. 677-678) Mo'áwiya concluded a thirty years' peace with Constantine IV. Two years later, he died at Damascus, after a reign of nearly twenty years. He had been governor of Syria for the same length of time. Before his death, he sent for his son Yazíd, and having pointed out how he had smoothed down all difficulties for him, he advised him to spare no effort to preserve the attachment of the Syrians. He urged him also to keep a close watch on the actions of Hosain b. 'Alí, and of the other pretenders who had refused to take the oath of allegiance to him; but he added that, should they rebel, Yazíd ought to treat them with clemency, and not to forget their illustrious origin. By failing to act upon this wise advice, Yazíd rendered irreconcilable that formidable schism which, even at the present day, still divides the Moslem world, and which, at all periods, has been a source of calamity to Islam.

2. Yazíd had not his father's genius. Passionately fond of pleasure, and careless about religion, he bestowed more care on turning a pretty couplet than on consolidating the strength of his empire. During his short reign he committed three actions for which Moslems never pardoned his memory: the murder of Hosain, son of 'Alí and grandson of the Prophet; the pillage of Medina; and the taking of the Ka'ba, the venerated temple of Mecca; crimes which were not redeemed in the eyes of the people by a few fortunate expeditions on the part of his generals.[1] Yazíd I.

Immediately on ascending the throne, in the month Rajab A.H. 60 (April, A.D. 680), Yazíd sent a circular to all his prefects, with an official announcement of his father's death, and an order to administer the oath of allegiance to their respective subjects. In particular, he charged the new prefect whom he appointed to Medina, his own cousin Walíd b. 'Otba, to strike off the heads of Hosain son of 'Alí, 'Abd al-Rahmán son of Abúbekr, 'Abdalláh son of 'Omar, and 'Abdalláh son of Zobair, if they again refused to acknowledge him. Terrified at such a commission, Walíd did not dare to act with rigour against Hosain and 'Abdalláh b. Zobair, both of whom refused to take the oath, but allowed them to escape to Mecca. Yazíd immediately deprived him of his office, and appointed in his place 'Amr b. Sa'íd, already governor of Mecca. Once in the Holy City, 'Abdalláh b. Zobair thought himself in such perfect safety that he began to intrigue with the Meccans to have himself proclaimed Caliph in Arabia. At Cufa the news of the flight of Hosain produced great agitation among the partisans of the family of 'Alí, who were numerous there, and they sent several addresses to the grandson of the Prophet, inviting him to take refuge with them, and promising to have him proclaimed Caliph in 'Irák. Hosain, who knew the fickleness of the people of 'Irák, hesitated to yield to their entreaties; but Ibn Zobair, who was desirous to get rid at all costs of so formidable a rival, persuaded him that he ought to go and put himself at the head of the people of 'Irák, and enter on an open struggle with Yazíd. Hosain began by sending his cousin Moslim b. 'Akíl to Cufa, and from him he learned that many of the inhabitants of that city appeared really decided to support him. The prefect of Cufa, No'mán b. Bashír, though apprised of these proceedings, did not choose to make them known to Yazíd, as he was reluctant to act with severity against a descendant of the Prophet. Information, however, reached the Caliph, who deprived No'mán of his office, and ordered

[1] Salam b. Ziyád invaded Sogdiana, and brought back immense booty to Merv. In Africa 'Okba b. Náfi' invaded the whole coast of the Mediterranean as far as Morocco. On his return, however, he fell into an ambuscade laid by the Berbers, who killed him and took Kairawán.

The Caliph was not moved; threats prevailed over the obstinacy of the people of 'Irák, and Mo'áwiya repaired to Arabia in person, at the head of an army, to intimidate the inhabitants of Mecca and Medina. As may be supposed, the principal fomenters of the resistance in Arabia were the sons of the first Caliphs, 'Abd al-Rahmán the son of Abúbekr, 'Abdalláh the son of 'Omar, and Hosain the son of 'Alí; for, by submitting, they would have renounced all hope of being themselves chosen by the people. Another 'Abdalláh, son of that Zobair who had been among the six candidates nominated at the death of 'Omar for the choice of the Moslems, was also one of the warmest opponents of the pretensions of Mo'áwiya. All the efforts of the Caliph to win over these personages to his side having proved vain, he ordered them to be brought into the mosque at Mecca, each between two soldiers; then, having mounted the pulpit, he called on the bystanders to take the oath of allegiance to his son; adding that 'Abd al-Rahmán, Hosain, and the two 'Abdalláhs would raise no objection. They, in their terror, did not utter a word, and the assembly took the oath. Then Mo'áwiya, without concerning himself further about the malcontents, returned to Damascus.

While thus occupied at home, Mo'áwiya did not neglect foreign affairs. 'Amr b. al-'Áṣ, governor of Egypt, died A.H. 43 (A.D. 663-664), and was followed by several prefects in succession, under one of whom the general Mo'áwiya b. Hosain began by sending his cousin Moslim b. 'Akíl to Cufa, and from him he learned that many of the inhabitants of that city appeared really decided to support him. The prefect of Cufa, No'mán b. Bashír, though apprised of these proceedings, did not choose to make them known to Yazíd, as he was reluctant to act with severity against a descendant of the Prophet. Information, however, reached the Caliph, who deprived No'mán of his office, and ordered

[1] Salam b. Ziyád invaded Sogdiana, and brought back immense booty to Merv. In Africa 'Okba b. Náfi' invaded the whole coast of the Mediterranean as far as Morocco. On his return, however, he fell into an ambuscade laid by the Berbers, who killed him and took Kairawán.

Ḥosain b. Nomair immediately offered the Caliphate to Ibn Zobair, on condition that he should grant a complete amnesty to all those who had taken part in the battle of Ḥarra and in the siege of Mecca. 'Abdalláh had the folly to refuse, and Ḥosain then returned to Damascus.

Ibn Zobair proclaimed Prince of the Believers.

Thus rid of his enemy, 'Abdalláh caused the title of Prince of the True Believers (*Amír al-mo'minín*) to be conferred on him—a title which 'Omar had already received, and which was afterwards adopted by all the Caliphs. He sent one of his brothers, 'Obaid Alláh, to Medina, and chose as governor of Egypt 'Abd al-Raḥmán b. Jaḥdam, who repaired to that province, and caused the authority of Ibn Zobair to be acknowledged there. At Baṣra and at Cufa, many of the inhabitants did not hesitate to acknowledge him, and received a Zobairite governor, while the Khárijites and the Shí'ites rose in revolt—the former at Baṣra under the leadership of Náfi' b. Azraḳ, the latter at Cufa under that of Solaimán b. Ṣorad—and expelled the Omayyad governor, 'Obaid Alláh b. Ziyád, who took refuge at Damascus. Mesopotamia soon followed the example of 'Iráḳ. Even in Syria, the population seemed disposed to forsake the cause of the Omayyads. The Khárijites and Mokhtár b. Abí 'Obaid, who had supported Ibn Zobair, now repented of having laboured for the elevation of this pretender, and quitted Mecca. The son of Zobair, remaining thenceforth sole master of Mecca, occupied himself tranquilly in rebuilding the Ka'ba, which he restored on its ancient foundations.

Mo'áwiya II.

3. It was in the midst of this break-up of his party that, immediately after the death of Yazíd, his eldest son, Mo'áwiya II., was elected Caliph at Damascus at the age of only seventeen or twenty. He was a young man of weak character, and imbued, it is said, with Shí'ite opinions. He felt himself incapable of ruling, and was contemplating abdication, when he died, after a reign of but forty days, by poison, as some say; of the plague, as others assert. The Caliphate was immediately offered to 'Othmán b. 'Otba b. Abí Sofyán, cousin of Mo'áwiya II.; for Khálid, the second son of Yazíd, was only sixteen years old. 'Othmán b. 'Otba, however, having made it a condition of his election that he should not be compelled to enter on any war, or to condemn any one to death, the choice fell at Damascus on Merwán b. al-Ḥakam, a descendant of Omayya through his grandfather Abú 'l-'Áṣ, but on condition that he should marry Maisún, the widow of Yazíd, and should appoint Khálid, her son, as his successor.

Merwán I.

4. Merwán b. al-Ḥakam had been secretary to the Caliph 'Othmán, and governor of Medina under Mo'áwiya I. Yazíd, on his accession to power, had dismissed him and put Walíd b. 'Otba in his place; but Merwán had continued to live at Medina, and had been driven from it during the revolt of the year 63, and again in the following year, when 'Obaid Alláh b. Zobair had taken possession of that city in the name of his brother. It might have been thought that Merwán would cherish a deep hatred of 'Abdalláh Ibn Zobair; but he was an old man of sixty-two at the time of his election, and, dreading an unequal struggle, he was on the point of making his submission to the Meccan Caliph. The drooping courage of Merwán was revived by his son 'Abd al-Melik and by 'Obaid Alláh b. Ziyád, and he resolved to try the chances of war.

Ḍaḥḥák b. Ḳais, governor of Damascus, had declared himself on the side of Ibn Zobair, and had raised an army, principally from among the tribe of Ḳais. This tribe had taken offence because Mo'áwiya I. and Yazíd had chosen their wives from the Yemenite tribe of Kalb, and, continuing to resent their conduct, now refused to acknowledge Khálid as the heir-presumptive of Merwán. It was therefore on the Yemenites that Merwán had to depend for the suppression of Ḍaḥḥák's rebellion. The latter had an army of nearly sixty thousand horsemen, while Merwán could bring together only thirteen thousand infantry. The two armies met at Marj Ráhiṭ, a few miles from Damascus, and, after a series of combats which lasted for twenty days, Merwán's troops gained a complete victory, and Ḍaḥḥák was among the killed. The Syrian provinces hastened to acknowledge the conqueror, and Merwán was able to turn his attention to Egypt, which, as will be remembered, had submitted to the Meccan. 'Abd al-'Azíz, a son of Merwán, had already marched to Aila on the Red Sea, and was preparing to enter Egypt; Merwán joined him, and the Zobairite governor of Egypt, beaten by their united forces, was obliged to seek safety in flight. Merwán made 'Abd al-'Azíz governor of the province. At the beginning of the year 65 (A.D. 684-685) Merwán returned in haste to Syria; for, during his absence, a brother of Ibn Zobair, named Moṣ'ab, had invaded that province. Merwán triumphed over Moṣ'ab; but an army of four thousand men, which he had sent to the Ḥijáz, and in which was Ḥajjáj b. Yúsuf—then quite a young man, but who afterwards played so important a part under 'Abd al-Melik—was cut to pieces. This defeat was redeemed by a victory gained by his generals, 'Obaid Alláh b. Ziyád and Ḥosain b. Nomair, at 'Ain al-Warda over a small army of Shí'ites led by Solaimán b. Ṣorad. But while the battle was being fought in Ramadan 65 (April-May 685), Merwán died; suffocated, it is said, by his wife Maisún, because he had insulted her son Khálid, and had broken his word by nominating his own son 'Abd al-Melik as his successor. The accession of 'Abd al-Melik was attended with no difficulty, as he was acknowledged by the whole of Syria and Egypt. The Ḳaisites naturally rallied round him, because he had not a drop of Yemenite blood in his veins.

'Abd al-Melik.

5. When 'Abd al-Melik ascended the throne, there still remained much to be done before the unity of the empire could be re-established. Ibn Zobair was still master of Arabia and of 'Iráḳ, though in the latter province his authority was very much shaken by the permanent rebellion of the Shí'ites at Cufa, and of the Khárijites at Baṣra. The Zobairite general Mohallab had, it is true, succeeded in forcing back the Khárijites into Susiana and Persia; but at Cufa the Shí'ites, at the instigation of Mokhtár, continued their agitation. Mokhtár, as we have seen, had withdrawn from Mecca after the raising of the siege by Ḥosain b. Nomair. He returned to Cufa, and there fomented serious disturbances. Many of the inhabitants of that city repented bitterly of having allowed Ḥosain, the grandson of the Prophet, to be massacred. Amid the general disorder of the Moslem empire, Mokhtár hoped to make his own authority acknowledged in 'Iráḳ and Mesopotamia. He put himself forward as the avenger of the family of 'Alí, and pretended to have been commissioned by a son of 'Alí, Mohammed b. Ḥanafíya,[1] who was living at Medina, to give effect to his rights to the Caliphate. Many Shí'ites believed him, and, detesting their chief Solaimán b. Ṣorad, joined Mokhtár. On learning these intrigues, the Zobairite governor threw him into prison. Soon after the defeat of Solaimán at 'Ain al-Warda, at the request of Mokhtár's brother-in-law, who was no other than 'Abdalláh the son of 'Omar, the governor consented to set him at liberty, on his swearing to make no further attempts against him. As Solaimán had fallen on the

[1] That is to say, the son of the Ḥanafite woman. The mother of Mohammed was of the tribe of Ḥanífa. Even before Mokhtár, Mohammed had partisans who looked on him as destined to be Caliph. These sectaries received the name of Kaisánites, from a freedman of 'Alí, called Kaisán, who was the most ardent advocate of Mohammed's pretensions. After Mokhtár had declared in favour of Mohammed, his supporters received the name of Mokhtárites.

Hosain b. Nomair immediately offered the Caliphate to Ibn Zobair, on condition that he should grant a complete amnesty to all those who had taken part in the battle of Harra and in the siege of Mecca. 'Abdalláh had the folly to refuse, and Hosain then returned to Damascus.

Ibn Zobair proclaimed Prince of the Believers. Thus rid of his enemy, 'Abdalláh caused the title of Prince of the True Believers (Amír al-mo'minín) to be conferred on him—a title which 'Omar had already received, and which was afterwards adopted by all the Caliphs. He sent one of his brothers, 'Obaid Alláh, to Medina, and chose as governor of Egypt 'Abd al-Rahmán b. Jahdam, who repaired to that province, and caused the authority of Ibn Zobair to be acknowledged there. At Basra and at Cufa, many of the inhabitants did not hesitate to acknowledge him, and received a Zobairite governor, while the Khárijites and the Shí'ites rose in revolt—the former at Basra under the leadership of Náfi' b. Azrak, the latter at Cufa under that of Solaimán b. Sorad—and expelled the Omayyad governor, 'Obaid Alláh b. Ziyád, who took refuge at Damascus. Mesopotamia soon followed the example of 'Irák. Even in Syria, the population seemed disposed to forsake the cause of the Omayyads. The Khárijites and Mokhtár b. Abí 'Obaid, who had supported Ibn Zobair, now repented of having laboured for the elevation of this pretender, and quitted Mecca. The son of Zobair, remaining thenceforth sole master of Mecca, occupied himself tranquilly in rebuilding the Ka'ba, which he restored on its ancient foundations.

Mo'áwiya II. 3. It was in the midst of this break-up of his party that, immediately after the death of Yazíd, his eldest son, Mo'áwiya II., was elected Caliph at Damascus at the age of only seventeen or twenty. He was a young man of weak character, and imbued, it is said, with Shí'ite opinions. He felt himself incapable of ruling, and was contemplating abdication, when he died, after a reign of but forty days, by poison, as some say; of the plague, as others assert. The Caliphate was immediately offered to 'Othmán b. 'Otba b. Abí Sofyán, cousin of Mo'áwiya II.; for Khálid, the second son of Yazíd, was only sixteen years old. 'Othmán b. 'Otba, however, having made it a condition of his election that he should not be compelled to enter on any war, or to condemn any one to death, the choice fell at Damascus on Merwán b. al-Hakam, a descendant of Omayya through his grandfather Abú 'l-'Ás, but on condition that he should marry Maisún, the widow of Yazíd, and should appoint Khálid, her son, as his successor.

Merwán I. 4. Merwán b. al-Hakam had been secretary to the Caliph 'Othmán, and governor of Medina under Mo'áwiya I. Yazíd, on his accession to power, had dismissed him and put Walíd b. 'Otba in his place; but Merwán had continued to live at Medina, and had been driven from it during the revolt of the year 63, and again in the following year, when 'Obaid Alláh b. Zobair had taken possession of that city in the name of his brother. It might have been thought that Merwán would cherish a deep hatred of 'Abdalláh Ibn Zobair; but he was an old man of sixty-two at the time of his election, and, dreading an unequal struggle, he was on the point of making his submission to the Meccan Caliph. The drooping courage of Merwán was revived by his son 'Abd al-Melik and by 'Obaid Alláh b. Ziyád, and he resolved to try the chances of war.

Dahhák b. Kais, governor of Damascus, had declared himself on the side of Ibn Zobair, and had raised an army, principally from among the tribe of Kais. This tribe had taken offence because Mo'áwiya I. and Yazíd had chosen their wives from the Yemenite tribe of Kalb, and, continuing to resent their conduct, now refused to acknowledge Khálid as the heir-presumptive of Merwán. It was therefore on the Yemenites that Merwán had to depend for the suppression of Dahhák's rebellion. The latter had an army of nearly sixty thousand horsemen, while Merwán could bring together only thirteen thousand infantry. The two armies met at Marj Ráhit, a few miles from Damascus, and, after a series of combats which lasted for twenty days, Merwán's troops gained a complete victory, and Dahhák was among the killed. The Syrian provinces hastened to acknowledge the conqueror, and Merwán was able to turn his attention to Egypt, which, as will be remembered, had submitted to the Meccan. 'Abd al-'Azíz, a son of Merwán, had already marched to Aila on the Red Sea, and was preparing to enter Egypt; Merwán joined him, and the Zobairite governor of Egypt, beaten by their united forces, was obliged to seek safety in flight. Merwán made 'Abd al-'Azíz governor of the province. At the beginning of the year 65 (A.D. 684-685) Merwán returned in haste to Syria; for, during his absence, a brother of Ibn Zobair, named Mos'ab, had invaded that province. Merwán triumphed over Mos'ab; but an army of four thousand men, which he had sent to the Hijáz, and in which was Hajjáj b. Yúsuf—then quite a young man, but who afterwards played so important a part under 'Abd al-Melik — was cut to pieces. This defeat was redeemed by a victory gained by his generals, 'Obaid Alláh b. Ziyád and Hosain b. Nomair, at 'Ain al-Warda over a small army of Shí'ites led by Solaimán b. Sorad. But while the battle was being fought in Ramadan 65 (April-May 685), Merwán died; suffocated, it is said, by his wife Maisún, because he had insulted her son Khálid, and had broken his word by nominating his own son 'Abd al-Melik as his successor. The accession of 'Abd al-Melik was attended with no difficulty, as he was acknowledged by the whole of Syria and Egypt. The Kaisites naturally rallied round him, because he had not a drop of Yemenite blood in his veins.

'Abd al-Melik. 5. When 'Abd al-Melik ascended the throne, there still remained much to be done before the unity of the empire could be re-established. Ibn Zobair was still master of Arabia and of 'Irák, though in the latter province his authority was very much shaken by the permanent rebellion of the Shí'ites at Cufa, and of the Khárijites at Basra. The Zobairite general Mohallab had, it is true, succeeded in forcing back the Khárijites into Susiana and Persia; but at Cufa the Shí'ites, at the instigation of Mokhtár, continued their agitation. Mokhtár, as we have seen, had withdrawn from Mecca after the raising of the siege by Hosain b. Nomair. He returned to Cufa, and there fomented serious disturbances. Many of the inhabitants of that city repented bitterly of having allowed Hosain, the grandson of the Prophet, to be massacred. Amid the general disorder of the Moslem empire, Mokhtár hoped to make his own authority acknowledged in 'Irák and Mesopotamia. He put himself forward as the avenger of the family of 'Alí, and pretended to have been commissioned by a son of 'Alí, Mohammed b. Hanafíya,[1] who was living at Medina, to give effect to his rights to the Caliphate. Many Shí'ites believed him, and, detesting their chief Solaimán b. Sorad, joined Mokhtár. On learning these intrigues, the Zobairite governor threw him into prison. Soon after the defeat of Solaimán at 'Ain al-Warda, at the request of Mokhtár's brother-in-law, who was no other than 'Abdalláh the son of 'Omar, the governor consented to set him at liberty, on his swearing to make no further attempts against him. As Solaimán had fallen on the

[1] That is to say, the son of the Hanafite woman. The mother of Mohammed was of the tribe of Hanífa. Even before Mokhtár, Mohammed had partisans who looked on him as destined to be Caliph. These sectaries received the name of Kaisánites, from a freedman of 'Alí, called Kaisán, who was the most ardent advocate of Mohammed's pretensions. After Mokhtár had declared in favour of Mohammed, his supporters received the name of Mokhtárites.

for the time, for he required all his forces to dispute the empire with the son of Zobair. He consented, it is asserted, to pay the Greeks an indemnity of one thousand pieces of gold weekly. He then gave his attention to the renewal of the projected expedition against 'Irák. Moṣ'ab the Zobairite had rendered himself odious to the inhabitants of Baṣra and Cufa by his exactions, and a party favourable to 'Abd al-Melik was already forming in those cities. The Omayyad Caliph marched forth at the head of an army composed of Syrians and Egyptians, and encamped three parasangs from the plain of Dair al-Játhalík, not far from the site of Baghdád, where Moṣ'ab had established his army. Before joining battle, 'Abd al-Melik had written secretly to all the chiefs of Moṣ'ab's army, making them the most seductive promises if they would agree to desert the cause of Moṣ'ab. This step was crowned with success, and on the eve of the battle, which took place on the 13th Jomádí II., A.H. 71 (23d November 690), several of these generals passed into the camp of 'Abd al-Melik with arms and baggage. Moṣ'ab nevertheless attacked his enemy, but during the battle he found himself deserted by his troops, and, not choosing to survive his defeat, he caused himself to be slain. This victory opened the gates of Cufa to 'Abd al-Melik, and all 'Irák received him with acclamations. He remained forty days at Cufa, and then, having given the government to his brother Bishr, while Khálid b. 'Abdalláh received that of Baṣra, he returned in triumph to Damascus. Soon after, the Omayyad arms having sustained a check from the Khárijites in Fársistán, the Caliph gave Khálid orders to march against those sectaries with the support of Mohallab, who was their terror, and of the governor of Rey. Khálid succeeded completely in this expedition, and drove the Khárijites out of Ahwáz, Fársistán, and Kirmán. On his side, the Omayyad Caliph stirred up a revolt in Khorásán, a province which still remained faithful to the Zobairite cause. Its governor was treacherously assassinated by his lieutenant Bokair, who received, as the price of this service, the governorship of the province.

efeat nd eath of los'ab.

Only Arabia now remained to Ibn Zobair. In A.H. 72 'Abd al-Melik made preparations for depriving him of it. Accordingly he raised an army; but when his generals found that another siege of Mecca was in contemplation, not one of them was willing to accept such a mission. An obscure officer, Ḥajjáj b. Yúsuf, boldly offered to lead the expedition. 'Abd al-Melik had little confidence in him, and therefore at first placed only two or three thousand horsemen under his command. Ḥajjáj set out, traversed the Ḥijáz without resistance, and pitched his camp at Ṭáif, not far from Mecca. Ibn Zobair tried to dislodge him; but in the frequent encounters between his troops and those of Ḥajjáj, the latter always had the advantage. 'Abd al-Melik then decided on sending him a reinforcement of five thousand men, on receiving which Ḥajjáj invested Mecca. The blockade lasted several months, during which the city was a prey to all the horrors of siege and famine. Ḥajjáj had set up balistas on the neighbouring heights, and poured a hail of stones on the city and the Ka'ba. Famine at length triumphed over the last adherents of the son of Zobair. Ten thousand fighting men, and even several of the sons of the pretender, left the city and surrendered. Mecca being thus left without defenders, Ḥajjáj took possession of it and invested the Ka'ba. Then the son of Zobair, seeing that ruin was inevitable, went to his mother Asmá, who had reached the age of a hundred, and asked her counsel. She answered that he must die sword in hand; and when, in embracing him for the last time, she felt the cuirass which he wore, she exclaimed that such a precaution was unworthy of a man resolved to perish. 'Abdalláh took off his cuirass, and taking refuge in the Ka'ba, passed the night there in prayer. At daybreak of the 14th of Jomádí I. in the year 73 (1st October 692), the Omayyad troops made their way into the mosque. 'Abdalláh attacked them furiously, notwithstanding his advanced age, but at last fell, overwhelmed by numbers. His head was cut off, carried to Ḥajjáj, and sent by the victorious general to Damascus.[1]

econd ege of lecca.

Death of Ibn Zobair.

With Ibn Zobair perished the influence which the early companions of Mohammed had hitherto exercised over Islam. Medina and Mecca, though they continued to be the Holy Cities, had no longer the political importance which had enabled them to maintain a struggle with Damascus. Temporal interests, represented by Damascus, will henceforth have precedence over those of religion; policy will outweigh fanaticism;[2] and the centre of Islam, now permanently removed beyond the limits of Arabia, will be more easily affected by foreign influences, and assimilate more readily their civilizing elements. Damascus, Cufa, and Baṣra will attract the flower of all the Moslem provinces; and thus that great intellectual, literary, and scientific movement which is to reach its apogee under the 'Abbásid Caliphs at Baghdád, will become daily more marked.

By the death of the son of Zobair, 'Abd al-Melik remained sole Caliph; for Mohammed b. Ḥanafíya reckoned for nothing since the death of Mokhtár, whose creature he had been. The only remaining danger was from the Khárijites, who, though incessantly repulsed, as incessantly returned to the charge. Ḥajjáj had remained after his victory at Mecca, where he was occupied in rebuilding the Ka'ba, ruined for the second time by his engines of war. In the year 75, 'Abd al-Melik, alarmed at the news which reached him from Persia and 'Irák, named Ḥajjáj governor of that province, and gave him the most extensive powers for the re-establishment of order. The troops of 'Irák, who accompanied Mohallab in an expedition against the Khárijites, had abandoned their general and dispersed to their homes, and nothing could induce them to return to their duty. Ḥajjáj, arriving unexpectedly at Cufa, ascended the pulpit at the moment when the people were assembled for morning prayers, and delivered an energetic address to them, which depicts his character so well, that some passages from it may be cited:—

'Abd al-Melik sole Caliph.

Ḥajjáj in 'Irák.

"Men of Cufa, I see before me heads ripe for the harvest, and the reaper—I am he! I seem to myself already to see blood between turbans and shoulders. I am not one of those who can be frightened by an inflated bag of skin, nor need any one think to squeeze me like dried figs. I have been chosen on good grounds; and it is because I have been seen at work that I have been picked out from among others. The Prince of the Believers has spread before him the arrows of his quiver, and has tried every one of them by biting its wood. It is my wood that he has found the hardest and the bitterest, and I am the arrow which he shoots against you."

Thereupon Ḥajjáj ordered that every man capable of bearing arms should immediately join Mohallab in Susiana, and swore that all who made any delay should have their heads struck off. This threat produced its effect, and Ḥajjáj proceeded to Baṣra, where his presence was followed by the same result. Mohallab, reinforced by the army of 'Irák, at last succeeded, after a struggle of eighteen months, in subjugating the Khárijites, and was able, at the beginning of A.H. 78, to return to Ḥajjáj at Baṣra. The latter loaded him with honours and made him

[2] It is said that the Caliph 'Abd al-Melik affected great piety before his elevation. At the moment when he was first saluted with the title of Caliph, he closed a copy of the Koran which was in his hands, saying: "We must now part."

razzia there. Merwán, the father of 'Abd al-Melik, had designated as successor to the latter his other son, 'Abd al-'Azíz, governor of Egypt. 'Abd al-'Azíz having died in the year 84, 'Abd al-Melik chose as heirs of the empire, first his son Walíd, and after him his second son Solaimán.[1] He himself survived 'Abd al-'Azíz only two years, and died 14th Shawwál 86 (8th October 705), at the age of about sixty. His reign was one of the most unquiet in the annals of Islam, but also one of the most glorious. 'Abd al-Melik not only brought triumph to the cause of the Omayyads, but extended and strengthened the Moslem power externally. Amid so many grave anxieties, he yet found time for his pleasures. He was passionately fond of poetry, and his court was crowded with poets, whom he loaded with favours, even if they were Christians, like Akhtal. In his reign flourished also the two celebrated rivals of Akhtal, Jarír and Farazdaḳ.[2]

Walíd I. 6. Immediately on his accession Walíd confirmed Ḥajjáj in the government of 'Iráḳ, and appointed as governor of Medina his cousin 'Omar b. 'Abd al-'Azíz, who was received there with joy, his piety and gentle character being well known. Under his government important works were undertaken at Medina and Mecca by order of Walíd, who, having no rivals to struggle against, was able to give his attention to pacific occupations. The mosque of Medina was enlarged, wells were sunk, the streets widened, and hospitals established. At Mecca many improvements were introduced. The reputation of 'Omar attracted to the two Holy Cities a great number of the inhabitants of 'Iráḳ, who were groaning under the iron hand of Ḥajjáj. The latter, who was not a man to let his prey escape from his grasp, was so urgent with Walíd that he obtained the dismissal of 'Omar b. 'Abd al-'Azíz in the year 93, and the appointment of 'Othmán b. Ḥayyán at Medina, and of Khálid b. 'Abdalláh at Mecca. These two prefects compelled the refugees at Mecca and Medina to return to 'Iráḳ, where many of them were cruelly treated and even put to death by Ḥajjáj. It was probably his cruelty which drove so many men of 'Iráḳ to enlist in the armies of the East and the South; and this may in some degree account for the unheard-of successes of Ḳotaiba b. Moslim in Transoxiana, and of Mohammed b. Ḳásim in India. They may also be explained by the ambition of Ḥajjáj, who, it is said, cherished the project of creating a vast empire for himself to the east and south of the Moslem realm, and had secretly promised the government of China to the first of his generals who should reach that country. Be this as it may, in the course of a very few years Ḳotaiba conquered the whole of Bokharia, Khárizm, and Transoxiana or Má wará-annahr, as far as the frontiers of China. Meanwhile Mohammed b. Ḳásim invaded Mokrán, Sind, and Múltán, carried off an immense booty, and reduced the women and children to slavery. In Armenia and Asia Minor, Maslama, brother of the Caliph Walíd, and his lieutenants, also obtained numerous successes against the Greeks. In Armenia, Maslama even advanced as far as the Caucasus.

Conquest of Spain. The most important achievement, however, of Walíd's reign was the conquest of Spain. The narrative of this conquest belongs specially to the history of Spain; and we shall therefore only touch briefly on it here. We have seen that, even in the Caliphate of 'Abd al-Melik, Músá b. Noṣair had penetrated as far as Tlemcen in Africa. Under Walíd, Músá, who had been appointed governor of Africa, entered Morocco, occupied Fez and Tangier, and then returned to Kairawán, having made his lieutenant Ṭáriḳ governor of Tangier and of all the West of Africa. The town of Ceuta still held out under its governor Julian, who held it in the name of Witiza, King of Spain. Witiza having been dethroned by Roderic, Julian thought he might find the Arabs useful allies in the struggle which he proposed to carry on against the usurper[3] and entered into negotiations with Ṭáriḳ. The latter, foreseeing the possibility of conquering for the advantage of the Arabs a country which had been represented to him as a paradise, requested instructions from Músá, who referred the matter to the Caliph. Walíd gave Músá *carte blanche*, and Ṭáriḳ hastened to make alliance with Julian. He first, however, sent four ships, with five hundred men under the command of Ṭaríf, to reconnoitre the country. This expedition was successful, and Ṭáriḳ, now certain of meeting no serious opposition to his landing, passed into Spain himself, at the head of twelve thousand men, in the year 92 (A.D. 710-711), and landed at the spot which thence received the name of Jabal-Ṭáriḳ, or "Mountain of Ṭáriḳ," a name which was afterwards corrupted by the Westerns into Gibraltar. At the news of this invasion, Roderic led a numerous army against the Arabs, but was completely routed near Cadiz, and perished in the conflict. Músá, jealous of the success of his lieutenant, hastened to Spain with eighteen thousand men, and his first step on arriving was to send Ṭáriḳ orders to suspend his march. But Ṭáriḳ, far from obeying, divided his little army into three corps, and obtained possession successively of Ecija, Malaga, Elvira, Cordova, and Toledo. Músá, hopeless of arresting the victorious march of Ṭáriḳ, determined to play the part of a conqueror himself, and took Seville, Carmona, and Merida. On rejoining Ṭáriḳ at Toledo, the first step he took was to throw him into prison. The Caliph, however, gave orders that he should be set at liberty and restored to his command. The two conquerors then shared the country between them, and, in less than three years, all Spain was subdued, to the very foot of the Pyrenees. Meanwhile Walíd, fearing to see Músá declare his independence, recalled him to Damascus. He obeyed after appointing his son 'Abd al-'Azíz governor of Spain, and assigning Seville as his residence. Músá left Spain in the month of Ṣafar, A.H. 95 (October-November 713), in company with Ṭáriḳ, bringing an immense booty to Damascus, and leading in his train a great number of prisoners. His journey from Ceuta to Damascus was one long triumph. He reached Egypt in the month of Rabí' I. in the following year (Nov.-Dec. 714), and then moved on by short marches towards Damascus, where he did not arrive till two months and a half later, at the very moment when Walíd had just breathed his last, and his brother Solaimán had been saluted as Caliph. The renowned Ḥajjáj had preceded his sovereign, and had expired five days before the end of Ramadan, A.H. 95. Músá did not receive the reward due to his distinguished services. Accused of peculation by the new Caliph, he was beaten with rods, and condemned to a fine of 100,000 pieces of gold; and all his goods were confiscated. Solaimán did not stop here: he caused 'Abd al-'Azíz, the son of Músá, to be put to death in Spain, and carried his cruelty so far as to show his severed head to Músá, asking him whether he recognised it. He replied that it was the head of a man a thousand times superior to him who had ordered his death. Músá died soon after. As for Ṭáriḳ, there is no further mention of him after the beginning of the reign of Solaimán, and we must therefore suppose that he retired into private life.

[1] 'Abd al-Melik had several other sons, two of whom, Yazíd and Hishám, also reigned.

[2] See Caussin de Perceval, *Journal asiatique*, 2e série, vols. xiii. and xiv.

[3] According to Eastern chronicles, Julian's hatred of Roderic arose from the latter's having dishonoured his daughter.

razzia there. Merwán, the father of 'Abd al-Melik, had designated as successor to the latter his other son, 'Abd al-'Azíz, governor of Egypt. 'Abd al-'Azíz having died in the year 84, 'Abd al-Melik chose as heirs of the empire, first his son Walíd, and after him his second son Solaimán.[1] He himself survived 'Abd al-'Azíz only two years, and died 14th Shawwál 86 (8th October 705), at the age of about sixty. His reign was one of the most unquiet in the annals of Islam, but also one of the most glorious. 'Abd al-Melik not only brought triumph to the cause of the Omayyads, but extended and strengthened the Moslem power externally. Amid so many grave anxieties, he yet found time for his pleasures. He was passionately fond of poetry, and his court was crowded with poets, whom he loaded with favours, even if they were Christians, like Akhtal. In his reign flourished also the two celebrated rivals of Akhtal, Jarír and Farazdaḳ.[2]

Walíd I. 6. Immediately on his accession Walíd confirmed Ḥajjáj in the government of 'Iráḳ, and appointed as governor of Medina his cousin 'Omar b. 'Abd al-'Azíz, who was received there with joy, his piety and gentle character being well known. Under his government important works were undertaken at Medina and Mecca by order of Walíd, who, having no rivals to struggle against, was able to give his attention to pacific occupations. The mosque of Medina was enlarged, wells were sunk, the streets widened, and hospitals established. At Mecca many improvements were introduced. The reputation of 'Omar attracted to the two Holy Cities a great number of the inhabitants of 'Iráḳ, who were groaning under the iron hand of Ḥajjáj. The latter, who was not a man to let his prey escape from his grasp, was so urgent with Walíd that he obtained the dismissal of 'Omar b. 'Abd al-'Azíz in the year 93, and the appointment of 'Othmán b. Ḥayyán at Medina, and of Khálid b. 'Abdalláh at Mecca. These two prefects compelled the refugees at Mecca and Medina to return to 'Iráḳ, where many of them were cruelly treated and even put to death by Ḥajjáj. It was probably his cruelty which drove so many men of 'Iráḳ to enlist in the armies of the East and the South; and this may in some degree account for the unheard-of successes of Ḳotaiba b. Moslim in Transoxiana, and of Mohammed b. Ḳásim in India. They may also be explained by the ambition of Ḥajjáj, who, it is said, cherished the project of creating a vast empire for himself to the east and south of the Moslem realm, and had secretly promised the government of China to the first of his generals who should reach that country. Be this as it may, in the course of a very few years Ḳotaiba conquered the whole of Bokharia, Khárizm, and Transoxiana or Má wará-annahr, as far as the frontiers of China. Meanwhile Mohammed b. Ḳásim invaded Mokrán, Sind, and Múltán, carried off an immense booty, and reduced the women and children to slavery. In Armenia and Asia Minor, Maslama, brother of the Caliph Walíd, and his lieutenants, also obtained numerous successes against the Greeks. In Armenia, Maslama even advanced as far as the Caucasus.

Conquest of Spain. The most important achievement, however, of Walíd's reign was the conquest of Spain. The narrative of this conquest belongs specially to the history of Spain; and we shall therefore only touch briefly on it here. We have seen that, even in the Caliphate of 'Abd al-Melik, Músá b. Nosair had penetrated as far as Tlemcen in Africa. Under Walíd, Músá, who had been appointed governor of Africa, entered Morocco, occupied Fez and Tangier, and then returned to Kairawán, having made his lieutenant Ṭáriḳ governor of Tangier and of all the West of Africa. The town of Ceuta still held out under its governor Julian, who held it in the name of Witiza, King of Spain. Witiza having been dethroned by Roderic, Julian thought he might find the Arabs useful allies in the struggle which he proposed to carry on against the usurper[3] and entered into negotiations with Ṭáriḳ. The latter, foreseeing the possibility of conquering for the advantage of the Arabs a country which had been represented to him as a paradise, requested instructions from Músá, who referred the matter to the Caliph. Walíd gave Músá *carte blanche*, and Ṭáriḳ hastened to make alliance with Julian. He first, however, sent four ships, with five hundred men under the command of Ṭaríf, to reconnoitre the country. This expedition was successful, and Ṭáriḳ, now certain of meeting no serious opposition to his landing, passed into Spain himself, at the head of twelve thousand men, in the year 92 (A.D. 710-711), and landed at the spot which thence received the name of Jabal-Ṭáriḳ, or "Mountain of Ṭáriḳ," a name which was afterwards corrupted by the Westerns into Gibraltar. At the news of this invasion, Roderic led a numerous army against the Arabs, but was completely routed near Cadiz, and perished in the conflict. Músá, jealous of the success of his lieutenant, hastened to Spain with eighteen thousand men, and his first step on arriving was to send Ṭáriḳ orders to suspend his march. But Ṭáriḳ, far from obeying, divided his little army into three corps, and obtained possession successively of Ecija, Malaga, Elvira, Cordova, and Toledo. Músá, hopeless of arresting the victorious march of Ṭáriḳ, determined to play the part of a conqueror himself, and took Seville, Carmona, and Merida. On rejoining Ṭáriḳ at Toledo, the first step he took was to throw him into prison. The Caliph, however, gave orders that he should be set at liberty and restored to his command. The two conquerors then shared the country between them, and, in less than three years, all Spain was subdued, to the very foot of the Pyrenees. Meanwhile Walíd, fearing to see Músá declare his independence, recalled him to Damascus. He obeyed after appointing his son 'Abd al-'Azíz governor of Spain, and assigning Seville as his residence. Músá left Spain in the month of Ṣafar, A.H. 95 (October-November 713), in company with Ṭáriḳ, bringing an immense booty to Damascus, and leading in his train a great number of prisoners. His journey from Ceuta to Damascus was one long triumph. He reached Egypt in the month of Rabí' I. in the following year (Nov.-Dec. 714), and then moved on by short marches towards Damascus, where he did not arrive till two months and a half later, at the very moment when Walíd had just breathed his last, and his brother Solaimán had been saluted as Caliph. The renowned Ḥajjáj had preceded his sovereign, and had expired five days before the end of Ramaḍan, A.H. 95. Músá did not receive the reward due to his distinguished services. Accused of peculation by the new Caliph, he was beaten with rods, and condemned to a fine of 100,000 pieces of gold; and all his goods were confiscated. Solaimán did not stop here: he caused 'Abd al-'Azíz, the son of Músá, to be put to death in Spain, and carried his cruelty so far as to show his severed head to Músá, asking him whether he recognised it. He replied that it was the head of a man a thousand times superior to him who had ordered his death. Músá died soon after. As for Ṭáriḳ, there is no further mention of him after the beginning of the reign of Solaimán, and we must therefore suppose that he retired into private life.

[1] 'Abd al-Melik had several other sons, two of whom, Yazíd and Hishám, also reigned.

ated in the south of Syria, on the confines of Arabia. It was in this retirement that his son Mohammed conceived the design of supplanting the Omayyad dynasty. We have said that the first 'Abbásids were closely united with the family of 'Alí. Mohammed b. 'Alí, the 'Abbásid, saw clearly that it was only among the followers of 'Alí that he was likely to be able to form a party. To attain this object, he formed the plan of making it believed that a descendant of the Prophet's son-in-law had transmitted to him his rights to the Caliphate. It will be remembered that Mohammed b. Ḥanafíya had come forward as a pretender to the throne at the troublous period when Ibn Zobair and 'Abd al-Melik were disputing the Caliphate. According to the story of the 'Abbásids, Abú Háshim 'Abdalláh, the son of Ibn Ḥanafíya, had gone to Ḥomaima, to the house of Mohammed b. 'Alí, and had made on his deathbed a legal transfer of his rights to Mohammed, by appointing him his heir. Whatever may be the truth respecting this transfer,[1] Mohammed the 'Abbásid spread abroad the report of it, and chose especially for its propagation the provinces in which the family of 'Alí had the greatest number of adherents, 'Irák and Khorásán. Emissaries sent by him into these two provinces, under the caliphate of 'Omar II., began to stir up the people in secret against the reigning house. 'Omar was probably acquainted with these intrigues, but he had not time to repress them, for he died on the 20th or 25th of Rajab, A.H. 101 (5th or 10th February 720), after a reign of about two years and a half.

Yazíd II. 9. Yazíd, the son of 'Abd al-Melik, ascended the throne without resistance. His first care was to pursue Yazíd b. Mohallab, who had escaped from his prison and taken refuge in 'Irák. Besides reasons of state, Yazíd II. had personal reasons for ill-will to Yazíd b. Mohallab. One of the wives of the new Caliph, the same who gave birth to that son of Yazíd II. who afterwards reigned under the name of Walíd II., was niece to the celebrated Ḥajjáj, who, as it will be remembered, had hated and persecuted Yazíd b. Mohallab. Aware of the alliance of the new Caliph with the family of Ḥajjáj, the son of Mohallab had made every effort to escape as soon as he was informed of the illness of 'Omar II.; for he well knew that Yazíd II. would spare neither him nor his family. In fact, the Caliph sent express orders to the prefect of 'Irák to arrest all the brothers and other members of the family of Mohallab who were to be found at Baṣra; and this order was immediately carried out. But Yazíd b. Mohallab had many partisans in 'Irák. He collected a small army, and fought with such valour that in a short time he succeeded in making himself master of Baṣra, where he had himself proclaimed Caliph. The public treasury fell into his hands, and he employed it in paying his troops and in raising fresh ones, whom he sent on expeditions into Khúzistán or Ahwáz, Fársistán, Mokrán, and Sind. As this revolt threatened to spread far and wide, Yazíd II. was obliged to have recourse for its suppression to the celebrated Maslama. Early in A.H. 102, this illustrious general took the field, and completely defeated Ibn Mohallab near Baṣra. Yazíd fell in the battle, and his brothers fled beyond the Indus, but were pursued and slain by the lieutenants of Maslama.

This revolt suppressed, Yazíd II. was able to give his thoughts to the extension of the empire, an object which had been so much neglected by his predecessor. Several expeditions were directed against Farghána in Transoxiana, against the Khazars in Armenia, and against the Greeks in Asia Minor, but without any very decided results. In Africa, serious troubles had been caused by the appointment as governor of a certain Yazíd b. Abí Moslim, who had been secretary to Ḥajjáj, and who followed the example of his master's implacable harshness. The Berbers rose in insurrection, slaughtered the unfortunate governor, and chose in his place Mohammed b. Aus. The Caliph at first ratified this choice, but soon after dismissed Mohammed from his post, and replaced him by Bishr b. Ṣafwán, who sent out an expedition against Sicily.

In Europe, the Arabs obtained at first some degree of success. Under the orders of Samaḥ, then governor of Spain, they crossed the Pyrenees, and took possession of Narbonne; but, having been beaten at Toulouse, they had to retrace their steps. It was the celebrated Abderame ('Abd al-Raḥmán) who effected their retreat.

Yazíd II. died three years later of a lingering illness, caused, it is said, by his grief for the death of a favourite slave-girl. At his accession, Yazíd had designated as his successors, in the first place his son Hishám, and in the second his son Walíd. Hishám ascended the throne without opposition.

10. Hishám was a pious prince and an enemy of luxury; as rigid in his religion as 'Omar II. To this severity may in part be attributed the disturbances which broke out in the provinces during his reign. The governors were accustomed to remain loyal to the Caliphs only when the latter did not exact from them too rigorous an account. Hishám was, besides, very avaricious, a fault highly calculated to make him odious to those about him. Lastly, he favoured the Yemenites, and this alienated from him the powerful party of the Ḳaisites. All these circumstances emboldened the 'Abbásids to carry on actively their propaganda in 'Irák and Khorásán, and it succeeded beyond their hopes. The Ḳaisite tribes, offended at seeing the Caliph bestow the best posts on Yemenites, were ready to espouse with enthusiasm the cause of any one whose aim was the overthrow of the Omayyads. Rebellion had been smouldering in the provinces for thirteen years; it broke out at last at Cufa and in the whole of 'Irák, under chiefs called Moghíra and Bahlúl; and when these insurgents had been chastised, others sprung up in their place, 'Amr al-Yashkorí, Al-'Anazí, and Al-Sakhtayání. The prefect of 'Irák, Khálid b. 'Abdalláh, was accused of favouring this revolt, was degraded, and replaced by Yúsuf b. 'Omar, who threw him into prison, where he remained for eighteen months. This measure increased the discontent of the people of 'Irák, and a member of the family of 'Alí, Zaid b. 'Alí, collected round him a small body of partisans, and had himself proclaimed Caliph, A.H. 122 (A.D. 739-740). Unfortunately for Zaid, he had to do with the same Cufans whose fickleness had already been fatal to his family. In the moment of danger he was deserted by his troops, slain in an unequal conflict, and his head sent to Damascus. In Khorásán also there were very serious disturbances. In the year 106 (A.D. 724-725) there had already been a revolt at Balkh, excited by the emissaries of the 'Abbásids. The following years brought with them fresh troubles, which led to the dismissal of the governor of Khorásán, Asad, the brother of Khálid b. 'Abdalláh, who had been prefect of 'Irák. Under the successors of Asad, who were successively Ashras b. 'Abdalláh, Jonaid b. 'Abd al-Raḥmán, and 'Áṣim b. 'Abdalláh, seditions broke out in Transoxiana, which were repressed with great difficulty; and it was not until the year 120 that, by the appointment of the brave and prudent Naṣr b. Sayyár as governor of Khorásán, peace was for a time restored to that region. The 'Abbásid emissaries, nevertheless, secretly continued their propaganda.

Zaid b 'Alí.

[1] The 'Abbásid Caliph Ma'mún certainly did not believe in it, for he thought it his duty to restore the Caliphate to the family of 'Alí, by appointing as his successor 'Alí Ridá, a descendant of the Caliph 'Alí.

Mohammed had even foretold that the accession of his family would take place *in the year of the ass*,[1] through the efforts of Abú Moslim, and that one of his three sons would ascend the throne. These three sons were: Ibráhím, 'Abdalláh, called Abú 'l-'Abbás, and 'Abdalláh, called Abú Ja'far. Whatever we may think of this prediction, it is certain that under Merwán II. Abú Moslim was the principal emissary of the 'Abbásid Ibráhím, and had been able to form a vast conspiracy in Khorásán, which broke out in A.H. 128, at the very moment when it had been discovered by Naṣr b. Sayyár, the Omayyad governor of the province. Even before this, Merwán II. had had to repress disorders which had broken out in Syria, Palestine, and 'Irák; and the Caliph could now rely so little on Syria that he had thought it necessary to quit Damascus, and to fix his abode at Ḥarrán, in Mesopotamia. On learning the revolt of Abú Moslim, Merwán II. wrote to Naṣr b. Sayyár, directing him to act with vigour against the fomenters of sedition. It was easier to give such an order than to execute it, for Abú Moslim was at the head of a numerous army, absolutely devoted to the 'Abbásids. Merwán II. thought it necessary at the same time to secure the person of the 'Abbásid pretender Ibráhím, who was still living at Ḥomaima. Ibráhím was therefore arrested, conveyed to Ḥarrán, and thrown into prison. He found means, however, of communicating with his lieutenant Abú Moslim, and the latter, who had received the most extensive powers from his chief, marched direct upon Merv, the capital of Khorásán, and drove out the governor Naṣr. At the news of this the Caliph, no longer able to restrain his anger, had his captive Ibráhím put to death; an execution which, at a later period, brought upon the Omayyads the most terrible reprisals. The brother of Ibráhím, Abú 'l-'Abbás, surnamed Saffáḥ, "The Sanguinary," on account of his cruelties, having by Ibráhím's death become chief of the 'Abbásids, immediately quitted Ḥomaima with all the members of his family, and took refuge in Khorásán, that his presence there might sanction and encourage the insurrection. Abú Moslim, now master of Khorásán by the capture of Merv, had meanwhile sent an army against 'Irák, under the orders of Kaḥtaba b. Shabíb, who had beaten the Omayyad army, commanded by Yazíd b. Hobaira, governor of that province. In A.H. 132 Abú 'l-'Abbás arrived at Merv. After remaining there some time, waiting for a favourable moment, he decided on openly assuming the title of Caliph. He installed himself in the governor's palace, and thence went in state to the mosque, where he mounted the pulpit, and officiated in the capacity of successor of the Prophet. All those present took the oath of allegiance to him, and Abú 'l-'Abbás returned to the palace, over which the black flag was flying, black being the distinctive colour of the 'Abbásids.[2] But he did not remain long at Merv. Committing the government of that city to his uncle Dáwúd, he went to review his army, and divided it into several corps, which he directed against different points. After this he went to Chaldæa, and there established himself in a spot not far from Cufa, to which he gave the name of Háshimíya, or the city of Háshim, the ancestor of his own family and of that of the Prophet. Another of his uncles, 'Abdalláh b. 'Alí, whom he had sent on an expedition against the city of Shahrozúr, took possession of that place, and leaving Abú 'Aun 'Abd al-Melik b. Yazíd there as governor, rejoined his nephew and sovereign at Háshimíya. Meanwhile the Omayyad Caliph had marched against Shahrozúr. Abú 'Aun went out to meet him, and was joined by a strong reinforcement of cavalry under 'Abdalláh b. 'Alí. The 'Abbásids only numbered forty-five thousand soldiers, but these were experienced and resolute warriors. The Omayyad army, though much more numerous, was ill commanded and devoid of spirit. A battle ensued, and fortune favoured the rebels. In vain did Merwán show himself everywhere; his soldiers gave way and repassed the Záb in disorder, hurrying away in their flight the unfortunate Merwán. (Jomádí II. 11, A.H. 132, 25th January 750.) This victory cost the Omayyads their empire. Merwán attempted at first to take refuge at Mosul; but the inhabitants of that city having declared for the enemy, the prince went to his capital Ḥarrán, whence he was soon driven by the army of 'Abdalláh b. 'Alí. From Ḥarrán Merwán fled successively to Emesa, to Damascus, to Palestine, and finally to Egypt. He was pursued without intermission by Ṣáliḥ, brother of 'Abdalláh b. 'Alí, who at last came up with him at Búṣír, on the frontiers of the Delta. Merwán took refuge in a Coptic church; but the 'Abbásids pursued him into the building, and slew him at the foot of the altar. His head was cut off and sent to Cufa, where the new Caliph then was.

Al-Saffáh assumes the title of Caliph.

Triumph of the 'Abbásids.

Thus perished in the East the dynasty of the house of Omayya, which, having been founded by usurpation, had only maintained itself by shedding torrents of blood, and was destined to perish in blood. We now enter upon the history of the new dynasty, whose origin we have described, and under which the power and glory of Islam reached their highest point.

Here we give the

GENEALOGICAL TABLE OF THE OMAYYADS.

- Omayya.
  - Abú 'l-'Ás.
    - Ḥakam.
      - 4. MERWÁN I.
        - Mohammed.
          - 14. MERWÁN II.
        - 5. 'ABD AL-MELIK.
          - 6. WALÍD I.
            - 12. YAZÍD III.
            - 13. IBRÁHÍM.
          - 7. SOLAIMÁN.
          - 9. YAZÍD II.
            - 11. WALÍD II.
          - 10. HISHÁM.
        - 'Abd al-'Azíz.
          - 8. 'OMAR II.
  - Ḥarb.
    - Abú Sofyán.
      - 1. MO'ÁWIYA I.
        - 2. YAZÍD I.
          - 3. MO'ÁWIYA II.

[1] To understand this allusion we must know that Merwán II. had received the nickname of *Ḥimár*, "the ass," on account of his temperance and the strength of his constitution.

[2] Historians are divided as to the date at which black became the 'Abbásid colour. According to some, the first 'Abbásids wore a robe of black silk as early as at the battle called that of the Camel. According to others, it was only after the murder of Ibráhím by Merwán that the 'Abbásids adopted black as a sign of mourning. See Quatremère, *Mémoires historiques sur la dynastie des khalifes Abbassides.* Paris, 1837.

Mohammed had even foretold that the accession of his family would take place *in the year of the ass*,[1] through the efforts of Abú Moslim, and that one of his three sons would ascend the throne. These three sons were: Ibráhím, 'Abdalláh, called Abú 'l-'Abbás, and 'Abdalláh, called *Abú Ja'far.* Whatever we may think of this prediction, it is certain that under Merwán II. Abú Moslim was the principal emissary of the 'Abbásid Ibráhím, and had been able to form a vast conspiracy in Khorásán, which broke out in A.H. 128, at the very moment when it had been discovered by Naṣr b. Sayyár, the Omayyad governor of the province. Even before this, Merwán II. had had to repress disorders which had broken out in Syria, Palestine, and 'Irák; and the Caliph could now rely so little on Syria that he had thought it necessary to quit Damascus, and to fix his abode at Ḥarrán, in Mesopotamia. On learning the revolt of Abú Moslim, Merwán II. wrote to Naṣr b. Sayyár, directing him to act with vigour against the fomenters of sedition. It was easier to give such an order than to execute it, for Abú Moslim was at the head of a numerous army, absolutely devoted to the 'Abbásids. Merwán II. thought it necessary at the same time to secure the person of the 'Abbásid pretender Ibráhím, who was still living at Ḥomaima. Ibráhím was therefore arrested, conveyed to Ḥarrán, and thrown into prison. He found means, however, of communicating with his lieutenant Abú Moslim, and the latter, who had received the most extensive powers from his chief, marched direct upon Merv, the capital of Khorásán, and drove out the governor Naṣr. At the news of this the Caliph, no longer able to restrain his anger, had his captive Ibráhím put to death; an execution which, at a later period, brought upon the Omayyads the most terrible reprisals. The brother of Ibráhím, Abú 'l-'Abbás, surnamed Saffáḥ, "The Sanguinary," on account of his cruelties, having by Ibráhím's death become chief of the 'Abbásids, immediately quitted Ḥomaima with all the members of his family, and took refuge in Khorásán, that his presence there might sanction and encourage the insurrection. Abú Moslim, now master of Khorásán by the capture of Merv, had meanwhile sent an army against 'Irák, under the orders of Kaḥtaba b. Shabíb, who had beaten the Omayyad army, commanded by Yazíd b. Hobaira, governor of that province. In A.H. 132 Abú 'l-'Abbás arrived at Merv. After remaining there some time, waiting for a favourable moment, he decided on openly assuming the title of Caliph. He installed himself in the governor's palace, and thence went in state to the mosque, where he mounted the pulpit, and officiated in the capacity of successor of the Prophet. All those present took the oath of allegiance to him, and Abú 'l-'Abbás returned to the palace, over which the black flag was flying, black being the distinctive colour of the 'Abbásids.[2] But he did not remain long at Merv.

Al-Saffáḥ assumes the title of Caliph.

Committing the government of that city to his uncle Dáwúd, he went to review his army, and divided it into several corps, which he directed against different points. After this he went to Chaldæa, and there established himself in a spot not far from Cufa, to which he gave the name of Háshimíya, or the city of Háshim, the ancestor of his own family and of that of the Prophet. Another of his uncles, 'Abdalláh b. 'Alí, whom he had sent on an expedition against the city of Shahrozúr, took possession of that place, and leaving Abú 'Aun 'Abd al-Melik b. Yazíd there as governor, rejoined his nephew and sovereign at Háshimíya. Meanwhile the Omayyad Caliph had marched against Shahrozúr. Abú 'Aun went out to meet him, and was joined by a strong reinforcement of cavalry under 'Abdalláh b. 'Alí. The 'Abbásids only numbered forty-five thousand soldiers, but these were experienced and resolute warriors. The Omayyad army, though much more numerous, was ill commanded and devoid of spirit. A battle ensued, and fortune favoured the rebels. In vain did Merwán show himself everywhere; his soldiers gave way and repassed the Záb in disorder, hurrying away in their flight the unfortunate Merwán. (Jomádí II. 11, A.H. 132, 25th January 750.) This victory cost the Omayyads their empire. Merwán attempted at first to take refuge at Mosul; but the inhabitants of that city having declared for the enemy, the prince went to his capital Ḥarrán, whence he was soon driven by the army of 'Abdalláh b. 'Alí. From Ḥarrán Merwán fled successively to Emesa, to Damascus, to Palestine, and finally to Egypt. He was pursued without intermission by Ṣáliḥ, brother of 'Abdalláh b. 'Alí, who at last came up with him at Búṣír, on the frontiers of the Delta. Merwán took refuge in a Coptic church; but the 'Abbásids pursued him into the building, and slew him at the foot of the altar. His head was cut off and sent to Cufa, where the new Caliph then was.

Triumph of the 'Abbásids.

Thus perished in the East the dynasty of the house of Omayya, which, having been founded by usurpation, had only maintained itself by shedding torrents of blood, and was destined to perish in blood. We now enter upon the history of the new dynasty, whose origin we have described, and under which the power and glory of Islam reached their highest point.

Here we give the

GENEALOGICAL TABLE OF THE OMAYYADS.

- Omayya.
  - Abú 'l-'Áṣ.
    - Ḥakam.
      - 4. MERWÁN I.
        - Mohammed.
          - 14. MERWÁN II.
        - 5. 'ABD AL-MELIK.
          - 6. WALÍD I.
            - 12. YAZÍD III.
            - 13. IBRÁHÍM.
          - 7. SOLAIMÁN.
          - 9. YAZÍD II.
            - 11. WALÍD II.
          - 10. HISHÁM.
        - 'Abd al-'Azíz.
          - 8. 'OMAR II.
  - Ḥarb.
    - Abú Sofyán.
      - 1. MO'ÁWIYA I.
        - 2. YAZÍD I.
          - 3. MO'ÁWIYA II.

[1] To understand this allusion we must know that Merwán II. had received the nickname of *Ḥimár*, "the ass," on account of his temperance and the strength of his constitution.

[2] Historians are divided as to the date at which black became the 'Abbásid colour. According to some, the first 'Abbásids wore a robe of black silk as early as at the battle called that of the Camel. According to others, it was only after the murder of Ibráhím by Merwán that the 'Abbásids adopted black as a sign of mourning. See Quatremère, *Mémoires historiques sur la dynastie des khalifes Abbassides.* Paris, 1837.

dynasty, after having accomplished his work, which, as the historians assert, cost the lives of more than 600,000 men. Notwithstanding the defeat of 'Abdalláh b. 'Alí and the murder of Abú Moslim, the spirit of rebellion was not yet broken. Risings took place in Mesopotamia and to a still greater extent in Khorásán; and the Caliph's troops were repeatedly beaten by the rebels; but order was at last re-established by Manṣúr's generals, by Kházim b. Khozaima in Mesopotamia, and by Mohammed b. al-Ash'ath in Khorásán.

About the same time Africa and Spain escaped from the dominion of the Eastern Caliphate; the former for a season, the latter permanently. The cause of the revolt of Africa was as follows: As soon as Manṣúr ascended the throne, he wrote to 'Abd al-Raḥmán, announcing the death of Abú 'l-'Abbás, and requiring him to take the oath of allegiance. 'Abd al-Raḥmán sent in his adhesion to the new Caliph, and added a few presents of little value. The Caliph was so much dissatisfied that he replied by a threatening letter which excited the anger of 'Abd al-Raḥmán. He called the people together at the hour of prayer, mounted the pulpit, publicly cursed Manṣúr, and then declared his deposition from the Caliphate. He next caused a circular letter to be written, commanding all Maghrebins to refuse obedience to the Caliph; and this letter was circulated and read from the pulpit throughout the whole extent of the Maghrib (the West). A brother of 'Abd al-Raḥmán, Ilyás, saw in this revolt an opportunity of obtaining the government of Africa for himself. Seconded by many of the inhabitants of Ḳairawán, who had remained faithful to the cause of the 'Abbásids, he attacked his brother, slew him, and proclaimed himself governor in his stead. This revolution in favour of the 'Abbásids was, however, of no long duration. Ḥabíb, the eldest son of 'Abd al-Raḥmán, had fled on the night of his father's murder, and Ilyás caused him to be pursued, with the object of transporting him to Andalusia. Ḥabíb was captured, but the vessel which was to convey him to Spain having been detained in port by stress of weather, the partisans of independence took arms, rescued Ḥabíb, and prepared to resist Ilyás, who was marching against them at the head of an army. Under these circumstances a fortunate idea occurred to Ḥabíb. He challenged his uncle Ilyás to single combat. Ilyás hesitated, but his own soldiers compelled him to accept the challenge. He measured arms with Ḥabíb, and was laid prostrate by him with a thrust of his lance. The party of independence thus triumphed, and several years elapsed before the

The Aghlabites in Africa.

'Abbásid general, Al-Aghlab, was able to enter Ḳairawán and regain possession of Africa in the name of the Eastern Caliph. From this time forward, it must be added, Africa only nominally belonged to the 'Abbásids; for, under the Caliphate of Hárún al-Rashíd, Ibráhím, the son of Al-Aghlab, who was invested with the government of Africa, founded in that province a distinct dynasty, that of the Aghlabites.

Spanish Caliphate.

Coincidently with the revolt in Africa, the independent Caliphate of the Western Omayyads was founded in Spain. The long dissensions which had preceded the fall of that dynasty in the East, had already prepared the way for the independence of a province so distant from the centre of the empire. Every petty emir there tried to seize sovereign power for himself, and the people groaned under the consequent anarchy. Weary of these commotions, the Arabs of Spain at last came to an understanding among themselves for the election of a Caliph, and their choice fell upon the last survivor of the Omayyads, 'Abd al-Raḥmán b. Mo'áwiya, grandson of the Caliph Hishám. This prince was wandering in the deserts of Africa, pursued by his implacable enemies, but everywhere protected and concealed by the desert tribes, who pitied his misfortunes and respected his illustrious origin. A deputation from Andalusia sought him out in Africa, and offered him the Caliphate of Spain, which he accepted with joy. On 25th September, A.D. 755, 'Abd al-Raḥmán landed in the Iberian Peninsula, where he was universally welcomed, and speedily founded at Cordova the Western Omayyad Caliphate, with which this history has no further concern.

While Manṣúr was thus losing Africa and Spain, he was trying to take from the Greeks the city of Malaṭiya, which, from the importance of its situation, was looked on as the key of Asia Minor. In A.H. 139-140 (A.D. 756-757), a Moslem army of 70,000 men invested the place, and, after a vigorous siege, Malaṭiya was taken by assault. After this success the Moslems marched through Cilicia, entered Pamphylia, and cut to pieces a Greek army on the banks of the Melas. The Greeks asked and obtained a seven years' truce, which Manṣúr was the more disposed to grant because new and very serious troubles had been stirred up in his empire by certain sectaries of Khorásán, called Ráwandís. These Ráwandís, like many other Persian sectaries, admitted a number of dogmas completely foreign to Islam, such as the transmigration of souls and the incarnation of the Deity as a man. They believed, for instance, as historians assure us, that divine honours ought to be paid to the Caliph Manṣúr. They had their name from Ráwand, a city near Iṣfahán, where the sect originated. A great number of these sectaries had repaired to Háshimíya, the residence of the Caliph, and there persisted in marching in procession round his palace, as if it had been the Ka'ba. Manṣúr, refusing to receive this impious homage, caused the principal chiefs of the sect to be seized and thrown into prison. The Ráwandís immediately rose in revolt, broke open the prison doors, rescued their chiefs, and pushed their audacity so far as to besiege the Caliph in his own palace. Very fortunately for Manṣúr, the populace declared against the Ráwandís and massacred them; but from that time forward he took a dislike to the city of Háshimíya, and resolved to choose another residence. He had at first thought of fixing his place of abode at Cufa; but he remembered the fickle character of the inhabitants, and decided on founding an entirely new city on the banks of the Tigris. His choice fell upon

a spot near the ancient Ctesiphon, the capital of the Sassanids, called Baghdád. There he himself laid the first stone of the city which was to be the centre of the civilised world as long as the Caliphate lasted. A revolt, however, of some importance soon called Manṣúr's attention from the building of Baghdád. The descendants of 'Alí, who had had reason to think that the 'Abbásids were labouring for their advancement, were now cruelly undeceived. In A.H. 145 (A.D. 762-763), Mohammed Mahdí, great-grandson of Ḥosain, and surnamed Al-Nafs al-Zakíya ("the pure soul"), collected a large number of adherents at Medina, and had himself proclaimed Caliph. The governor of Cufa, 'Ísá b. Músá, received orders to march against him, and entered Arabia. The partisans of 'Alí were defeated, and Mohammed Mahdí fell in battle. But meanwhile his brother Ibráhím had gone to Baṣra, and had there succeeded in exciting a revolt, in presence of which the 'Abbásid governor had been obliged to capitulate. The adherents of 'Alí, emboldened by this success, spread themselves over 'Iráḳ, and obtained possession of several places, among which was the city of Wásiṭ. Ibráhím was already advancing towards Cufa, at the head of a strong army, when 'Ísá b. Músá, who had been hastily recalled from Arabia, threw himself in his way. A terrible conflict took place. At last Ibráhím fell, pierced by an arrow, and, in spite of the desperate efforts

At last Ibráhím fell, pierced by an arrow, and, in spite of the desperate efforts

Foundation of Baghdad.

pitched his camp on the shores of the Bosphorus. Irene took alarm, sued for peace, and obtained it, but on humiliating conditions. This brilliant success increased Mahdí's affection for Hárún to such an extent that he resolved, a few years later, to declare him his successor instead of Músá. It was necessary first to obtain from Músá a renunciation of his rights; and for this purpose his father recalled him from Jorján, where he was then engaged on an expedition against the rebels of Ṭabaristán. Músá, who had had information of his father's intentions, refused to obey this order. Mahdí determined to march in person against his rebellious son (A.H. 169), and set out, accompanied by Hárún. But, after his arrival at Másabadhán, a place in Persian 'Iráḳ or Jabal, the Caliph died suddenly, at the age of only forty-three. There are two versions of the cause of his death: some attribute it to an accident met with in hunting; others believe him to have been poisoned. If this was really the case, although we have no proofs against Músá, we may reasonably suspect him of having been privy to the sudden death of his father.

4. Mahdí having died before he could carry out his plan for assuring the throne to Hárún, the succession naturally fell to Músá, and he was proclaimed Caliph at Baghdád in the year of his father's death. He took the title of Hádí (He who directs). Hárún made no opposition to the accession of his brother, and the army which had accompanied Mahdí returned peacefully from Jabal to Baghdád.

The accession of a new Caliph doubtless appeared to the partisans of the house of 'Alí a favourable opportunity for a rising. Ḥosain b. 'Alí, a descendant of that Ḥasan who had formerly renounced his pretensions to the Caliphate through fear of Mo'áwiya I., raised an insurrection at Medina with the support of numerous adherents, and had himself proclaimed Caliph. But having unfortunately conceived the idea of going on pilgrimage to Mecca, he was attacked at Fakh by a party of 'Abbásids, and perished in the combat. His cousin Idrís b. 'Abdalláh succeeded in escaping and fled to Egypt, whence he passed into Morocco; and there, at a later period, his son founded the Idrísite dynasty.

Hádí, as may be supposed, had never been able to forget that he had narrowly escaped being supplanted by his brother. He formed a plan for excluding Hárún from the Caliphate, and transmitting the succession to his own son Ja'far. He neglected no possible means of attaining this object, and obtained the assent of his ministers, and of the principal chiefs of his army, who took the oath of allegiance to Ja'far. Only Yaḥyá b. Khálid the Barmecide, Hárún's former tutor, absolutely refused to betray the interests of his pupil. In a discussion which took place between him and the Caliph on this subject, Yaḥyá showed such firmness and boldness that Hádí resolved on his death, and Harthama b. A'yan, one of the bravest generals of the empire, had already received the order to go and take his head, when the Caliph died suddenly. One of those terrible domestic dramas had been acted of which so many were afterwards seen in the palace of the Caliphs. The mother of Hádí and Hárún was Khaizorán, a haughty and intriguing woman, whose aim it was to get the direction of affairs into her own hands, leaving Hádí only the shadow of power. Her influence over all matters of government was so well understood that her door was beset all day by a crowd of petitioners, who neglected the Caliph and preferred to address their requests to her. Hádí soon became indignant at the subordinate part which his mother wished him to play, and after a dispute on the matter, he attempted to poison her. Khaizorán, hoping to find a more submissive instrument of her will in her second son, and wishing to protect herself against fresh attempts at murder, caused Hádí to be taken unawares and smothered with cushions by two young slaves whom she had presented to him. (Rabí' I., A.H. 170, Sept. A.D. 786.)

5. We have now reached the most celebrated name among the Arabian Caliphs, celebrated not only in the East, but in the West as well, where the stories of the Thousand and One Nights have made us familiar with that world which the narrators have been pleased to represent to us in such brilliant colours. Hárún al-Rashíd.

On the unexpected death of Hádí, the generals and ministers who had declared against Hárún, perceiving that popular favour did not incline to the son of the late Caliph, hastened to rally round the son of Khaizorán; and Hárún, surnamed Al-Rashíd (The Upright), ascended the throne without opposition. His first act was to choose as prime minister his former tutor, the faithful Yaḥyá b. Khálid, and to confide important posts to the two sons of Yaḥyá, Faḍl and Ja'far, the former of whom was also his own foster-brother. The Barmecide family were endued in the highest degree with those qualities of generosity and liberality which the Arabs prized so highly. Thus the chroniclers are never wearied in their praises of the Barmecides. Loaded with all the burdens of government, Yaḥyá brought the most distinguished abilities to the exercise of his office. He put the frontiers in a state of defence, and supplied all that was wanting for their security. He filled the public treasury, and carried the splendour of the throne to the highest point. The following anecdote will show what an amount of earnest affection the Barmecide family succeeded in winning:—

After Hárún, as we shall relate farther on, had ruined the Barmecides of whose influence he was jealous, he forbade the poets to compose elegies on the disgrace of the family, and commanded that all who disobeyed this order should be punished. One day, as one of the soldiers of the Caliph's guard was passing near a ruined building, he perceived a man holding a paper in his hand, and reciting aloud, and with many tears, a lament over the ruin of the palace of the Barmecides. The soldier arrested the man and led him to the palace of the Caliph, who ordered the culprit to be brought before him, and asked him why he had infringed his orders. "Prince," replied the man, "let me relate my history to thee; when thou hast heard it, do with me as thou wilt. I was an inferior clerk under Yaḥyá b. Khálid. He said to me one day: 'Thou must invite me to thy house.' 'My lord,' I replied, 'I am quite unworthy of such an honour, and my house is not fit to receive thee.' 'No,' said Yaḥyá, 'thou must absolutely do what I require of thee.' 'In that case,' answered I, 'grant me some little delay that I may make suitable arrangements.' Yaḥyá granted me some months. As soon as I informed him that I was ready, he repaired to my abode, accompanied by his two sons, Faḍl and Ja'far, and by some of his most intimate friends. Scarcely had he dismounted from his horse when he begged me to give him something to eat. I offered him some roasted chickens. When he had eaten his fill, he went over the whole of my house, and having seen it all, he asked me to show him the buildings attached to it. 'My lord,' said I, 'thou hast seen everything.' 'No,' said he, 'thou hast another house.' In vain I assured him that I had but one; he persisted in his assertion, and, sending for a mason, ordered him to make an opening in the wall. 'My lord,' said I, 'may I venture thus to make my way into my neighbour's house?' 'It matters not,' replied he. When a doorway had been opened, he passed through it, followed by his two sons, and I went after him. We entered a delightful garden, well planted and watered by fountains. In this garden stood a beautiful house with pavilions adorned with furniture and carpets, and filled with slaves of both sexes, all of perfect beauty. 'All this is thine,' said Yaḥyá to me. I kissed his hands and poured out my thanks to him; and then I learned that on the very day when he had spoken to me of inviting him he had bought the land adjoining to my house, and had had it laid out for me without my ever suspecting it. I had certainly noticed that building was going on, but I was far from imagining that all this was intended for me. Yaḥyá next addressed himself to Ja'far and said: 'Here are certainly a house and servants, but who will provide for their support?' 'I,' replied Ja'far, 'will give him a farm and its dependencies, and will send him the deed of gift.' 'Very well,' continued Yaḥyá; 'but how is he to live until he shall receive the revenue of his property?' 'I owe him a thousand pieces of gold,' said Faḍl, 'and I will send them to his

pitched his camp on the shores of the Bosphorus. Irene took alarm, sued for peace, and obtained it, but on humiliating conditions. This brilliant success increased Mahdí's affection for Hárún to such an extent that he resolved, a few years later, to declare him his successor instead of Músá. It was necessary first to obtain from Músá a renunciation of his rights; and for this purpose his father recalled him from Jorján, where he was then engaged on an expedition against the rebels of Ṭabaristán. Músá, who had had information of his father's intentions, refused to obey this order. Mahdí determined to march in person against his rebellious son (A.H. 169), and set out, accompanied by Hárún. But, after his arrival at Másabadhán, a place in Persian 'Irák or Jabal, the Caliph died suddenly, at the age of only forty-three. There are two versions of the cause of his death: some attribute it to an accident met with in hunting; others believe him to have been poisoned. If this was really the case, although we have no proofs against Músá, we may reasonably suspect him of having been privy to the sudden death of his father.

4. Mahdí having died before he could carry out his plan for assuring the throne to Hárún, the succession naturally fell to Músá, and he was proclaimed Caliph at Baghdád in the year of his father's death. He took the title of Hádí (He who directs). Hárún made no opposition to the accession of his brother, and the army which had accompanied Mahdí returned peacefully from Jabal to Baghdád.

The accession of a new Caliph doubtless appeared to the partisans of the house of 'Alí a favourable opportunity for a rising. Hosain b. 'Alí, a descendant of that Ḥasan who had formerly renounced his pretensions to the Caliphate through fear of Mo'áwiya I., raised an insurrection at Medina with the support of numerous adherents, and had himself proclaimed Caliph. But having unfortunately conceived the idea of going on pilgrimage to Mecca, he was attacked at Fakh by a party of 'Abbásids, and perished in the combat. His cousin Idrís b. 'Abdalláh succeeded in escaping and fled to Egypt, whence he passed into Morocco; and there, at a later period, his son founded the Idrísite dynasty.

Hádí, as may be supposed, had never been able to forget that he had narrowly escaped being supplanted by his brother. He formed a plan for excluding Hárún from the Caliphate, and transmitting the succession to his own son Ja'far. He neglected no possible means of attaining this object, and obtained the assent of his ministers, and of the principal chiefs of his army, who took the oath of allegiance to Ja'far. Only Yaḥyá b. Khálid the Barmecide, Hárún's former tutor, absolutely refused to betray the interests of his pupil. In a discussion which took place between him and the Caliph on this subject, Yaḥyá showed such firmness and boldness that Hádí resolved on his death, and Harthama b. A'yan, one of the bravest generals of the empire, had already received the order to go and take his head, when the Caliph died suddenly. One of those terrible domestic dramas had been acted of which so many were afterwards seen in the palace of the Caliphs. The mother of Hádí and Hárún was Khaizorán, a haughty and intriguing woman, whose aim it was to get the direction of affairs into her own hands, leaving Hádí only the shadow of power. Her influence over all matters of government was so well understood that her door was beset all day by a crowd of petitioners, who neglected the Caliph and preferred to address their requests to her. Hádí soon became indignant at the subordinate part which his mother wished him to play, and after a dispute on the matter, he attempted to poison her. Khaizorán, hoping to find a more submissive instrument of her will in her second son, and wishing to protect herself against fresh attempts at murder, caused Hádí to be taken unawares and smothered with cushions by two young slaves whom she had presented to him. (Rabí' I., A.H. 170, Sept. A.D. 786.)

5. We have now reached the most celebrated name among the Arabian Caliphs, celebrated not only in the East, but in the West as well, where the stories of the Thousand and One Nights have made us familiar with that world which the narrators have been pleased to represent to us in such brilliant colours. Hárún al-Rashíd.

On the unexpected death of Hádí, the generals and ministers who had declared against Hárún, perceiving that popular favour did not incline to the son of the late Caliph, hastened to rally round the son of Khaizorán; and Hárún, surnamed Al-Rashíd (The Upright), ascended the throne without opposition. His first act was to choose as prime minister his former tutor, the faithful Yaḥyá b. Khálid, and to confide important posts to the two sons of Yaḥyá, Faḍl and Ja'far, the former of whom was also his own foster-brother. The Barmecide family were endued in the highest degree with those qualities of generosity and liberality which the Arabs prized so highly. Thus the chroniclers are never wearied in their praises of the Barmecides. Loaded with all the burdens of government, Yaḥyá brought the most distinguished abilities to the exercise of his office. He put the frontiers in a state of defence, and supplied all that was wanting for their security. He filled the public treasury, and carried the splendour of the throne to the highest point. The following anecdote will show what an amount of earnest affection the Barmecide family succeeded in winning:—

After Hárún, as we shall relate farther on, had ruined the Barmecides of whose influence he was jealous, he forbade the poets to compose elegies on the disgrace of the family, and commanded that all who disobeyed this order should be punished. One day, as one of the soldiers of the Caliph's guard was passing near a ruined building, he perceived a man holding a paper in his hand, and reciting aloud, and with many tears, a lament over the ruin of the palace of the Barmecides. The soldier arrested the man and led him to the palace of the Caliph, who ordered the culprit to be brought before him, and asked him why he had infringed his orders. "Prince," replied the man, "let me relate my history to thee; when thou hast heard it, do with me as thou wilt. I was an inferior clerk under Yaḥyá b. Khálid. He said to me one day: 'Thou must invite me to thy house.' 'My lord,' I replied, 'I am quite unworthy of such an honour, and my house is not fit to receive thee.' 'No,' said Yaḥyá, 'thou must absolutely do what I require of thee.' 'In that case,' answered I, 'grant me some little delay that I may make suitable arrangements.' Yaḥyá granted me some months. As soon as I informed him that I was ready, he repaired to my abode, accompanied by his two sons, Faḍl and Ja'far, and by some of his most intimate friends. Scarcely had he dismounted from his horse when he begged me to give him something to eat. I offered him some roasted chickens. When he had eaten his fill, he went over the whole of my house, and having seen it all, he asked me to show him the buildings attached to it. 'My lord,' said I, 'thou hast seen everything.' 'No,' said he, 'thou hast another house.' In vain I assured him that I had but one; he persisted in his assertion, and, sending for a mason, ordered him to make an opening in the wall. 'My lord,' said I, 'may I venture thus to make my way into my neighbour's house?' 'It matters not,' replied he. When a doorway had been opened, he passed through it, followed by his two sons, and I went after him. We entered a delightful garden, well planted and watered by fountains. In this garden stood a beautiful house with pavilions adorned with furniture and carpets, and filled with slaves of both sexes, all of perfect beauty. 'All this is thine,' said Yaḥyá to me. I kissed his hands and poured out my thanks to him; and then I learned that on the very day when he had spoken to me of inviting him he had bought the land adjoining to my house, and had had it laid out for me without my ever suspecting it. I had certainly noticed that building was going on, but I was far from imagining that all this was intended for me. Yaḥyá next addressed himself to Ja'far and said: 'Here are certainly a house and servants, but who will provide for their support?' 'I,' replied Ja'far, 'will give him a farm and its dependencies, and will send him the deed of gift.' 'Very well,' continued Yaḥyá; 'but how is he to live until he shall receive the revenue of his property?' 'I owe him a thousand pieces of gold,' said Faḍl, 'and I will send them to his

among the courtiers that every one found a thousand reasons for excusing his conduct. Hárún confirmed him in his post and returned to Baghdád, through which, however, he only passed, and went on to Raḳḳa on the Euphrates, a city which became his habitual residence. He did not long enjoy the repose which he went there to seek, for Nicephorus again broke the treaty of peace, and the Caliph was obliged to take the field anew. Once more Nicephorus was beaten, and so completely that he was obliged to submit to the very harsh conditions which the victor imposed on him.

Two years later, new disturbances broke out in Khorásán, where a certain Ráfi' b. Laith had revolted. Hárún set out again for that province, accompanied by his son Ma'mún. It was to be his last journey. He was attacked by a tumour in the abdomen, and struggled in vain against this malady, which carried him off a year after his departure, A.H. 193 (A.D. 808-809), just on his arrival at the city of Ṭús, the birthplace of the great epic poet of Persia, Firdausí. Hárún was only forty-seven years of age.

Amín. 6. On the death of Hárún, his minister Faḍl b. Rabí' hastened to call together all the troops of the late Caliph, and to lead them back to Baghdád, in order to place them in the hands of the new sovereign, Amín. He even led back the corps which was intended to occupy Khorásán, and which ought to have fallen to the share of Ma'mún, according to the testament of Hárún. Faḍl b. Rabí' thus committed a serious violation of the rights of Ma'mún; but he cared little for this, being chiefly desirous of winning the confidence of the new Caliph. He was quite aware, however, that in thus acting he was making Ma'mún his irreconcilable enemy; and he therefore purposed to use every endeavour to arouse against him the enmity of his brother Amín. He advised him to exclude Ma'mún from the succession, and the Caliph was weak enough to listen to him. Receiving the order to resign his government of Khorásán and to repair to Baghdád, Ma'mún was greatly perplexed; but his tutor and vizier, Faḍl b. Sahl, reanimated his courage, and pointed out to him that, if he obeyed the orders of the Caliph, certain death awaited him at Baghdád. Ma'mún resolved to hold out against Amín, and found pretexts for eluding the orders of his brother and remaining in Khorásán. Amín, in his anger, caused the testament of his father, which, as we have seen, was preserved in the Ka'ba, to be destroyed, declared, on his own authority, the rights of Ma'mún to the Caliphate to be forfeited, and caused the army to swear allegiance to his own son Músá, a child five years of age, on whom he bestowed the title of Náṭiḳ bil-Ḥaḳḳ, "He who speaks according to truth" (A.H. 194, A.D. 809-810). On hearing the news, Ma'mún, strong in the rightfulness of his claim, retaliated by suppressing the Caliph's name in all public acts. Amín immediately despatched to Khorásán an army of fifty thousand men, under the command of 'Alí b. 'Ísá. Ma'mún, on his side, raised troops among his faithful people of Khorásán, and entrusted their command to Ṭáhir b. Ḥosain, who displayed remarkable abilities in the war that ensued. In the following year, the two armies met under the walls of Ray, and victory declared for Ṭáhir. Ma'mún now no longer hesitated to take the title of Caliph. The year after, Amín placed in the field two new armies, commanded respectively by Aḥmed b. Mazyad and 'Abdalláh b. Ḥomaid b. Ḳaḥtaba. The skilful Ṭáhir b. Ḥosain succeeded in creating divisions among the troops of his adversaries, and obtained possession, without striking a blow, of the city of Ḥolwán, an advantage which placed him at the very gates of Baghdád. Ma'mún immediately sent Ṭáhir reinforcements under the orders of Harthama b. A'yan, which enabled him to maintain a firm hold on all the conquered territory, and to continue his victorious march to the capital. Reverses naturally lead to fresh reverses. One after the other the provinces fell away from Amín, and he soon found himself in possession of Baghdád alone, which was speedily invested by the troops of Ṭáhir and Harthama. That unfortunate capital, though blockaded on every side, made a desperate defence for two years. Ultimately the eastern part of the city fell into the hands of Ṭáhir, and Amín, deserted by his followers, was compelled to surrender. He resolved to treat with Harthama, as he hated Ṭáhir; but this step caused his ruin. Ṭáhir learned by his spies that Harthama was to receive the Caliph in person, and gave orders to a body of horsemen to arrest Amín as he issued from Baghdád under cover of the night. On the banks of the Tigris, Harthama awaited Amín with a boat, but scarcely had the Caliph set foot in it, when the agents of Ṭáhir poured on it a storm of arrows and stones. The boat sank, and the Caliph had to make his escape by swimming. But he was closely followed up, and had scarcely left the river when he fell into the hands of his enemies, who shut him up in a hut and went to inform Ṭáhir of the capture. The victorious general immediately ordered him to be put to death, and the order was carried out. The head of the unfortunate Amín was cut off and sent to Ma'mún, A.H. 198. It was presented to him by his vizier, Faḍl b. Sahl, surnamed Dhú 'l-Riyásatain, or "the man with two governments," because his master had committed to him both the ministry of war and the general administration. Ma'mún, on seeing the head, hid his joy beneath a feigned display of sorrow.

7. On the day following that on which Amín had perished so miserably, Ṭáhir caused Ma'mún to be proclaimed at Baghdád. The accession of this prince appeared likely to put an end to the evils of civil war, and to restore to the empire the order necessary for its prosperity. It was not so, however. The reign of Ma'mún—that reign on which art, science, and letters, under the patronage of the Caliph, threw so brilliant a lustre—had a very stormy beginning. Ma'mún was in no haste to remove to Baghdád, but continued to make Merv his temporary residence. In his gratitude to the two men to whom he owed his throne, he conferred on Ṭáhir the government of Mesopotamia and Syria, and chose as prime minister of the empire Faḍl b. Sahl, who had been already his vizier in the government of Khorásán. The adherents of 'Alí seized on the elevation of Ma'mún to power as a pretext for fresh revolts at Mecca, at Medina, and in 'Irák. At Cufa a certain Ibn Ṭabáṭabá also broke out into open rebellion, and placed an army in the field under one of his partisans, Abú 'l-Saráyá. Ḥasan b. Sahl, brother of Ma'mún's prime minister, who had been made governor of all the provinces conquered by Ṭáhir, immediately sent troops against Cufa. They were defeated, and Abú 'l-Saráyá, encouraged by this first success, and no longer finding a secondary part sufficient for his ambition, poisoned his chief Ibn Ṭabáṭabá, and put in his place another of the family of 'Alí, Mohammed b. Mohammed, whom, on account of his extreme youth, he hoped to govern at his will. Fresh troops sent against Abú 'l-Saráyá fared no better than the first, and several cities of 'Iráḳ, as Baṣra, Wásiṭ, and Madáin, fell into the hands of the rebels. Abú 'l-Saráyá was already marching against Baghdád, when Ḥasan b. Sahl, in great alarm, hastily recalled Harthama b. A'yan, one of the heroes of the civil war, who was already on his way back to Merv. As soon as this general had returned from Khorásán, the face of affairs changed. The adherents of 'Alí were everywhere driven back, and the whole of 'Iráḳ fell again into the hands of the 'Abbásids. Cufa was taken by assault, and both Abú 'l-Saráyá and Mohammed b. Mohammed were

among the courtiers that every one found a thousand reasons for excusing his conduct. Hárún confirmed him in his post and returned to Baghdád, through which, however, he only passed, and went on to Raḳḳa on the Euphrates, a city which became his habitual residence. He did not long enjoy the repose which he went there to seek, for Nicephorus again broke the treaty of peace, and the Caliph was obliged to take the field anew. Once more Nicephorus was beaten, and so completely that he was obliged to submit to the very harsh conditions which the victor imposed on him.

Abú 'l-Saráyá was already marching against Baghdád, when Ḥasan b. Sahl, in great alarm, hastily recalled Harthama b. A'yan, one of the heroes of the civil war, who was already on his way back to Merv. As soon as this general had returned from Khorásán, the face of affairs changed. The adherents of 'Alí were everywhere driven back, and the whole of 'Iráḳ fell again into the hands of the 'Abbásids. Cufa was taken by assault, and both Abú 'l-Saráyá and Mohammed b. Mohammed were Ma'mún.

God), he established himself with his guard at Sámarra, a small place situated a few leagues above Baghdád, and changed its name to Sorra-man-ra'a (He rejoices who sees it). This resolution of Mo'taṣim was destined to prove fatal to his dynasty; for it placed the Caliphs at the mercy of their Prætorians. In fact, from the time of Mo'taṣim, the Caliphate became the plaything of the Turkish guard, and its decline was continuous. Some glorious feats of arms, however, were still performed under Mo'taṣim. The sectary Bábak was at last taken by Afshín, a Turkish general of the Caliph, in the year 223 (A.D. 837-838). Bábak was carried to Baghdád, led through the city on the back of an elephant, and then delivered to the executioners, who cut off his arms and his legs. Afshín, however, was very ill rewarded for his services, for shortly afterwards the Caliph had him put to death on a charge of heresy.

The death of Ma'mún had for the moment suspended hostilities with Constantinople; under Mo'taṣim the war was rekindled. A valiant Greek general, Manuel, who had incurred the displeasure of the Emperor Theophilus, took refuge with the Caliph, who eagerly welcomed him and gave him a command. Manuel began by reducing Khorásán, which had risen in revolt, and Mo'taṣim was so well satisfied with him that he thought of employing him against his own countrymen. This was precisely what Theophilus dreaded, and he took measures accordingly to bring back the banished general to his side. He sent an ambassador to Mo'taṣim, under pretence of ransoming some Greek prisoners; but the real object of his mission, which he contrived to communicate to Manuel, was the recall of that general. Manuel, feigning great animosity against his country, himself asked to be allowed to lead a Moslem army into Cappadocia. The Caliph granted his request, and sent with him his own son Wáthiḳ billáh. But, as soon as they reached the frontiers of Cappadocia, Manuel confessed to the young prince that his intention was to return to Constantinople, and quitted the army. Theophilus, taking advantage of the confusion into which the departure of Manuel had thrown the Moslems, made an incursion into Syria, laid waste that province as far as Zabaṭra, and returned loaded with booty. At the news of this disaster, Mo'taṣim assembled a formidable army, estimated at more than two hundred thousand men, penetrated into Asia Minor, beat the Greeks, and took the city of Amorium, which he ordered to be razed to the ground. A revolt which broke out at Baghdád in favour of his nephew 'Abbás, the son of Ma'mún, compelled the Caliph to turn back. Mo'taṣim had the unfortunate 'Abbás arrested, and he was soon after found dead in his prison. Mo'taṣim survived him only four years. He died at Sorra-man-ra'a, in A.H. 227 (A.D. 841-842).

Wáthiḳ. 9. His son Wáthiḳ, who succeeded him, showed himself no less intolerant on the doctrinal question of the uncreated Koran. He carried his zeal to such a point that, on the occasion of an exchange of Greek against Moslem prisoners, in the year 231 (A.D. 845-846), he ordered that all the Moslem captives who would not declare their belief that the Koran was a human work, should be left in the hands of the enemy. The reign of Wáthiḳ billáh was not otherwise marked by any very striking events. He died in 232 (A.D. 846-847), after a reign of five years. As he had appointed no successor before his death, the principal personages of the state at first cast their eyes on his son Mohammed; but they had scarcely saluted him with the title of Caliph, when they changed their purpose, and offered the supreme power to Motawakkil 'ala 'lláh (He who trusts to God), brother of Wáthiḳ. This prince was therefore elected in the same year in which Wáthiḳ died.

10. The first act of Motawakkil was an atrocious cruelty. He seized Mohammed b. 'Abd al-Melik, his brother's vizier, who had always been his enemy, and ordered him to be placed in a furnace bristling within with iron points, which was then raised to a red heat. The Caliph looked on at the agonies of his victim, incessantly repeating: "Pity is a weakness." This had been the favourite maxim of the unfortunate vizier. An impostor named Mohammed b. Faraj had set himself up as a prophet, giving out that he was Moses risen from the dead. By means of this gross fabrication, he had contrived to attract twenty-seven followers. The Caliph had him seized, and condemned him to perpetual imprisonment; but first he compelled each of the followers of Mohammed to give the pretended prophet ten blows on the head with his fist; and the poor wretch expired under the hands of his own disciples. (A.H. 235, A.D. 849-850.) Motawakkil.

In the year of his elevation to the Caliphate, Motawakkil had regulated the succession to the empire in his own family, by designating as future Caliphs his three sons, Montaṣir billáh (He who seeks help in God), Mo'tazz billáh (Strong through God), and Mowayyad billáh (Assisted by God). In acting thus, his object was to protest against the tendency of his predecessors to favour the house of 'Alí, and to guard against the attainment of the Caliphate by any member of that house. Motawakkil displayed the most extreme hatred for the descendants of the Prophet. He even went so far as to destroy the chapel erected over the tomb of Ḥosain at Kerbelá, and forbade the Shí'ites to visit the spot. Not content with attacking the liberty and the property of the descendants of 'Alí, he insulted their belief, by taking buffoons into his pay, whose business it was to turn the person of 'Alí into mockery. He also persecuted the Christians and the Jews; excluding them from all public employments, and obliging them to send their children to Moslem schools. In the year 237, a revolt broke out in Armenia. The Caliph sent the Turk Bugha against the rebels; but they met him with a vigorous resistance, and it was four years before peace was restored to the province. During that time the Greeks effected a descent on Egypt, and Damietta was taken and burned. Motawakkil caused Damietta to be fortified, and transferred his own residence to Damascus, doubtless that he might be able to keep a closer watch on the proceedings of the Byzantines. He soon thought himself strong enough to take the offensive, and poured his Turkish soldiery into Asia Minor, where they encountered the same Manuel who had been formerly received at the court of Mo'taṣim. After an alternation of successes and reverses, both Moslems and Greeks retired from the conflict. Motawakkil then returned to his residence at Sorra-man-ra'a, and there caused a magnificent quarter to be built, which he called Ja'fariyya.[1] There he gave himself up to debaucheries; till at last, during one of his orgies, he was murdered by a Turkish soldier named Waṣíf, who had been bribed to the deed by his own son Montaṣir billáh (A.H. 247, A.D. 861-862).

11. On the very night of his father's assassination Montaṣir had himself proclaimed Caliph. The conspirators among the Turkish soldiery compelled him to deprive his two brothers, Mo'tazz and Mowayyad, who were not agreeable to them, of their rights of succession. Montaṣir did not long enjoy the fruits of his crime. He died five months after, by poison, it is said. Montaṣir.

12. The Turkish soldiery, which now arrogated to itself the mastery over the Caliphate, chose in succession to Montaṣir his cousin Aḥmed, who took the title of Mosta'ín Mosta'ín

[1] That is, "City of Ja'far." Ja'far was Motawakkil's own proper name.

God), he established himself with his guard at Sámarra, a small place situated a few leagues above Baghdád, and changed its name to Sorra-man-ra'a (He rejoices who sees it). This resolution of Mo'taṣim was destined to prove fatal to his dynasty; for it placed the Caliphs at the mercy of their Prætorians. In fact, from the time of Mo'taṣim, the Caliphate became the plaything of the Turkish guard, and its decline was continuous. Some glorious feats of arms, however, were still performed under Mo'taṣim. The sectary Bábak was at last taken by Afshín, a Turkish general of the Caliph, in the year 223 (A.D. 837-838). Bábak was carried to Baghdád, led through the city on the back of an elephant, and then delivered to the executioners, who cut off his arms and his legs. Afshín, however, was very ill rewarded for his services, for shortly afterwards the Caliph had him put to death on a charge of heresy.

The death of Ma'mún had for the moment suspended hostilities with Constantinople; under Mo'taṣim the war was rekindled. A valiant Greek general, Manuel, who had incurred the displeasure of the Emperor Theophilus, took refuge with the Caliph, who eagerly welcomed him and gave him a command. Manuel began by reducing Khorásán, which had risen in revolt, and Mo'taṣim was so well satisfied with him that he thought of employing him against his own countrymen. This was precisely what Theophilus dreaded, and he took measures accordingly to bring back the banished general to his side. He sent an ambassador to Mo'taṣim, under pretence of ransoming some Greek prisoners; but the real object of his mission, which he contrived to communicate to Manuel, was the recall of that general. Manuel, feigning great animosity against his country, himself asked to be allowed to lead a Moslem army into Cappadocia. The Caliph granted his request, and sent with him his own son Wáthiḳ billáh. But, as soon as they reached the frontiers of Cappadocia, Manuel confessed to the young prince that his intention was to return to Constantinople, and quitted the army. Theophilus, taking advantage of the confusion into which the departure of Manuel had thrown the Moslems, made an incursion into Syria, laid waste that province as far as Zabaṭra, and returned loaded with booty. At the news of this disaster, Mo'taṣim assembled a formidable army, estimated at more than two hundred thousand men, penetrated into Asia Minor, beat the Greeks, and took the city of Amorium, which he ordered to be razed to the ground. A revolt which broke out at Baghdád in favour of his nephew 'Abbás, the son of Ma'mún, compelled the Caliph to turn back. Mo'taṣim had the unfortunate 'Abbás arrested, and he was soon after found dead in his prison. Mo'taṣim survived him only four years. He died at Sorra-man-ra'a, in A.H. 227 (A.D. 841-842).

Wáthiḳ. 9. His son Wáthiḳ, who succeeded him, showed himself no less intolerant on the doctrinal question of the uncreated Koran. He carried his zeal to such a point that, on the occasion of an exchange of Greek against Moslem prisoners, in the year 231 (A.D. 845-846), he ordered that all the Moslem captives who would not declare their belief that the Koran was a human work, should be left in the hands of the enemy. The reign of Wáthiḳ billáh was not otherwise marked by any very striking events. He died in 232 (A.D. 846-847), after a reign of five years. As he had appointed no successor before his death, the principal personages of the state at first cast their eyes on his son Mohammed; but they had scarcely saluted him with the title of Caliph, when they changed their purpose, and offered the supreme power to Motawakkil 'ala 'lláh (He who trusts to God), brother of Wáthiḳ. This prince was therefore elected in the same year in which Wáthiḳ died.

10. The first act of Motawakkil was an atrocious cruelty. He seized Mohammed b. 'Abd al-Melik, his brother's vizier, who had always been his enemy, and ordered him to be placed in a furnace bristling within with iron points, which was then raised to a red heat. The Caliph looked on at the agonies of his victim, incessantly repeating: "Pity is a weakness." This had been the favourite maxim of the unfortunate vizier. An impostor named Mohammed b. Faraj had set himself up as a prophet, giving out that he was Moses risen from the dead. By means of this gross fabrication, he had contrived to attract twenty-seven followers. The Caliph had him seized, and condemned him to perpetual imprisonment; but first he compelled each of the followers of Mohammed to give the pretended prophet ten blows on the head with his fist; and the poor wretch expired under the hands of his own disciples. (A.H. 235, A.D. 849-850.) Motawakkil.

In the year of his elevation to the Caliphate, Motawakkil had regulated the succession to the empire in his own family, by designating as future Caliphs his three sons, Montaṣir billáh (He who seeks help in God), Mo'tazz billáh (Strong through God), and Mowayyad billáh (Assisted by God). In acting thus, his object was to protest against the tendency of his predecessors to favour the house of 'Alí, and to guard against the attainment of the Caliphate by any member of that house. Motawakkil displayed the most extreme hatred for the descendants of the Prophet. He even went so far as to destroy the chapel erected over the tomb of Ḥosain at Kerbelá, and forbade the Shí'ites to visit the spot. Not content with attacking the liberty and the property of the descendants of 'Alí, he insulted their belief, by taking buffoons into his pay, whose business it was to turn the person of 'Alí into mockery. He also persecuted the Christians and the Jews; excluding them from all public employments, and obliging them to send their children to Moslem schools. In the year 237, a revolt broke out in Armenia. The Caliph sent the Turk Bugha against the rebels; but they met him with a vigorous resistance, and it was four years before peace was restored to the province. During that time the Greeks effected a descent on Egypt, and Damietta was taken and burned. Motawakkil caused Damietta to be fortified, and transferred his own residence to Damascus, doubtless that he might be able to keep a closer watch on the proceedings of the Byzantines. He soon thought himself strong enough to take the offensive, and poured his Turkish soldiery into Asia Minor, where they encountered the same Manuel who had been formerly received at the court of Mo'taṣim. After an alternation of successes and reverses, both Moslems and Greeks retired from the conflict. Motawakkil then returned to his residence at Sorra-man-ra'a, and there caused a magnificent quarter to be built, which he called Ja'fariyya.[1] There he gave himself up to debaucheries; till at last, during one of his orgies, he was murdered by a Turkish soldier named Waṣíf, who had been bribed to the deed by his own son Montaṣir billáh (A.H. 247, A.D. 861-862).

11. On the very night of his father's assassination Montaṣir had himself proclaimed Caliph. The conspirators among the Turkish soldiery compelled him to deprive his two brothers, Mo'tazz and Mowayyad, who were not agreeable to them, of their rights of succession. Montaṣir did not long enjoy the fruits of his crime. He died five months after, by poison, it is said. Montaṣir.

12. The Turkish soldiery, which now arrogated to itself the mastery over the Caliphate, chose in succession to Montaṣir his cousin Aḥmed, who took the title of Mosta'ín Mosta'ín.

[1] That is, "City of Ja'far." Ja'far was Motawakkil's own proper name.

party of Moḳtadir prevailed, and his rival was put to death. Moḳtadir, however, was too young to exercise any real power; he was governed by his eunuchs. He was, besides, a man of feeble character, and looked on helplessly at the death-struggle of the empire, upon which calamities of every kind now poured in. The Greeks invaded Mesopotamia. A truce was concluded with them; but the Carmathians then recommenced their disorders in Syria. The indolence of the Caliph, and his inaction in the face of this danger, alienated all hearts from him; and the eunuch Múnis, the principal chief of his party, took the lead in deposing him and proclaiming in his stead his brother Ḳáhir billáh (Victorious through God), in the year 317 (A.D. 929-930). Ḳáhir, however, having refused to distribute a donative to the army on the occasion of his accession, a counter-revolution took place, and Moḳtadir, who had been imprisoned, was taken from his dungeon and replaced on the throne, only three days after his deposition. Favoured by these disturbances, the governor of Mosul, Náṣir al-Daula, declared himself independent, and founded definitively the dynasty of the Ḥamdánites; thus causing an additional dismemberment of the empire. The Carmathians in their turn, under the guidance of a new chief, Abú Ṭáhir, obtained possession of Mecca, and carried off the celebrated black stone of the Ka'ba, which they did not restore till very long afterwards. Meanwhile the eunuch Múnis had been disgraced. He withdrew at first to Mosul, to the court of Náṣir al-Daula; but it was to raise an army and march upon Baghdád, where the Caliph had again fixed his abode. The object of Múnis was not to attack the Caliph, but only to take vengeance on his personal enemies. Moḳtadir was induced by evil counsellors to make a sally against Múnis. His troops were put to the rout, and he himself fell on the field of battle, in the year 320 (A.D. 932).

The Fátimites.

With the reign of Moḳtadir is connected one of the greatest events in the history of the Caliphate, the foundation of the Fátimite dynasty, which reigned, first in the Maghrib and then in Egypt, for nearly three centuries. The first of this family who put forward any pretensions to the Caliphate was 'Obaid Alláh, surnamed the Mahdí, or Messiah of the followers of 'Alí, who gave himself out as a direct descendant of 'Alí, through his wife Fáṭima, the daughter of Mohammed, whence the name of Fátimite. It seems to be proved that 'Obaid Alláh was really descended from a certain 'Abdalláh b. Maimún el-Ḳaddáḥ, the founder of the Ismailian sect, of which the Carmathians were only a branch. This 'Obaid Alláh had himself become pontiff of the Ismailians. As early as the Caliphate of Moktafí, one of 'Obaid Alláh's missionaries, named Abú 'Abdalláh, had succeeded in gaining numerous partisans in the province of Africa, then subject to the Aghlabites, and the victories of this missionary had wrested Eastern Africa from the family of Aghlab when Moḳtadir ascended the throne. 'Obaid Alláh then repaired to his new realm (A.H. 303), and founded the city of Mahdíya, which he made his capital. He tried also, but without success, to seize Egypt; the conquest of that country was reserved for one of his successors, Mo'izz li-dín-illáh. 'Obaid Alláh died two years after Moḳtadir, leaving to his son Ḳáim an empire already sufficiently powerful to cause uneasiness to the 'Abbásids, to the Omayyads of Spain, and to all the Christian princes whose states bordered on the Mediterranean.

The last 'Abbásids. Ḳáhir.

19. Ḳáhir billáh, on being raised anew to the throne after the death of his brother Moḳtadir, still bore ill-will to his patrons, and tried to free himself from their guardianship. The emirs of his court dethroned him a second time and put out his eyes. One of his nephews was then proclaimed Caliph under the name of Rádí

Rádí.

billáh (Content through God). This prince, who was entirely governed by those about his person, created, in favour of a certain Abúbekr Mohammed b. Ráiḳ, the office of Amír al-Omará, or Emir of the Emirs, which nearly corresponds to that of Mayor of the Palace among the Franks.[1] The Amír al-Omará was charged with the administration of civil and military affairs. He also acted as the Caliph's deputy in sacerdotal functions, and was named next after him in the public prayers. Thenceforth the Caliphate was no longer anything but an empty shadow. During the reigns of Ḳáhir and Rádí, the Carmathians became more audacious than ever. The Amír al-Omará was obliged to purchase from them the freedom of pilgrimage to Mecca at the price of a disgraceful treaty. Thus the Caliphate found itself almost reduced to the province of Baghdád. Khorásán, Transoxiana, Kirmán, and Persia were in the hands of independent sovereigns, the Sámánids, the Búyids, and a prince named Washimgír. The Ḥamdánites possessed Mesopotamia; the Sájites, Armenia; Egypt was under the rule of the Ikhshídites; Arabia was held by the Carmathians; Africa, as we have seen, had become the prey of the Fáṭimites. The single transient success obtained by Rádí was the capture of Mosul in A.H. 328 (A.D. 939-40); and even this success he owed to the Turk Bejkem, who had succeeded Mohammed b. Ráiḳ as Amír al-Omará.

Rádí died in the following year, and was succeeded by Mottaḳí lilláh (He who fears God). From his very accession, this prince saw himself exposed to the attacks of a certain Al-Barídí, who had carved out for himself a principality in Chaldæa, and who now laid siege to Baghdád. Náṣir al-Daula, prince of Mosul, who had been reinstated in his government, offered an asylum to Mottaḳí; put his troops at his disposal, and succeeded in repelling Al-Barídí. In return he obtained the office of Amír al-Omará. But there were other competitors for that post. Turun, a former lieutenant of Bejkem, protested sword in hand against the choice of the Caliph, and threatened Baghdád. Ikhshíd, sovereign of Egypt, offered Mottaḳí a refuge in his states; but Turun, fearing to see the Caliph obtain such powerful support, found means to entice him to his tent, and had his eyes put out, A.H. 333 (A.D. 944-945). Mottaḳí.

As successor to Mottaḳí, Turun chose Mostakfí billáh (He who places his whole trust in God). This prince, like his predecessors, was a mere puppet in the hands of his ministers. A new Amír al-Omará, Zírak b. Shírzád, made himself so hateful to the people of Baghdád by his deeds of violence and rapacity that they besought the help of the Búyids. Aḥmed, the third prince of that dynasty, entered Baghdád, overthrew Zírak, and took his place under the title of Mo'izz al-Daula. Mostakfí soon had enough of this new master, and ventured to conspire against him. The plot was discovered, and Mo'izz al-Daula had the eyes of the Caliph put out. There were now at Baghdád three Caliphs who had been dethroned and blinded—Ḳáhir, Mottaḳí, and Mostakfí. Mo'izz al-Daula thought for a moment of restoring the illusory title of Caliph to the descendants of 'Alí. He feared, however, lest this should lead to the recovery by the Caliphs of their former supremacy, and his choice fell on a son of Moḳtadir under the name of Motí' lilláh (He who obeys God). Reserving to himself all the powers and revenues of the Caliph, he allowed Motí' merely a secretary and a moderate pension. The prince of Mosul, who began to think his possessions threatened by the neighbourhood of Mo'izz, entered on a struggle with him and tried to wrest Baghdád from him; but he failed, and was obliged to Mostakfí. Motí'.

SECT. III.—SKETCH OF THE INSTITUTIONS AND CIVILIZATION OF THE EASTERN CALIPHATE.

Mohammed had begun to bestow political unity on Arabia; but he had done still more: he had given her the Koran, as the starting-point and base of the future civilization of Islam. It was for the preservation and the better understanding of the sacred text that the first believers were led to create grammar and lexicography, and to make collections of the poems of their own and former times, those "witnesses of the meaning of words," as the Arabs call them. To elucidate questions of dogma they created theology. Jurisprudence, in like manner, issued from the Koran, and the historical sciences at first gathered around it. As early as the first century of the Flight, schools were founded in 'Irák, at Basra and at Cufa, in which all the questions to which the study of the Koran gave rise were stated, and answered in different ways. Natural science and mathematics were less directly concerned with the sacred book, and were consequently neglected during the whole period of the Omayyad dynasty. They only began to be cultivated when, under the 'Abbásids, the study of philosophy led to the use of translations from the Greek. The institutions of Islam were developed, no doubt, as new wants made themselves felt, in proportion to the extension of the empire; but they were nevertheless founded on the first arrangements made by the Prophet, and handed down by him in the Koran.

Political and social institutions.

Under the first four Caliphs these institutions continued in a rudimentary state. The Caliph (*Khalífa*, substitute or successor) was elected by the Moslem community; and, after receiving from all its members the oath of fidelity (*Bai'a*) which they were bound to take, united the temporal and spiritual powers in his own hands. He was at the same time high priest, ruler, and judge. He was compelled, however, by the very extent of the empire to delegate his powers to those agents (*'Ámil*, plural *'Ommál*) whom he commissioned to represent him in the provinces. The State revenues, which entered the public treasury (*Bait al-mál*), were composed—(1) of the tithe, or tax for the poor (*Zakát*), which every Moslem was bound to pay; (2) of the fifth, raised on all booty taken in war, the rest being divided among the warriors; (3) of the poll-tax (*Jizya*) and the land-tax (*Kharáj*), which only affected non-Moslem subjects. The Caliph administered the revenues of the State at his own pleasure, applying them to the necessities of war, to public works, to the payment of officials, to the support of the poor, and to the distribution of the annual pensions, in which every Moslem had originally a right to share. The State could possess landed property. Under 'Omar I. we find that the pasture land belonging to the State supported not less than forty thousand camels and horses. To 'Omar I. was due the regulation of the poll-tax by a fixed scale. The rich, whether Christians or Jews, paid four dínárs (about thirty-two shillings) yearly; people of the middle class, two dínárs; the poor, one dínár. Besides this payment in money, the subject-races had to make contributions in kind, intended for the support of the troops. The land-tax consisted of a general rent in proportion to the extent, character, and fertility of the lands possessed by the conquered.

The Díwán.

As the sums produced by these different imposts were often very considerable, it became necessary, as early as the Caliphate of 'Omar I., to create a special office, charged with the accounts of their expenditure. Its organization was borrowed by 'Omar from the Persians, and it retained its Persian name of Díwán, a term afterwards applied to all government offices. The Arabs at that time being too illiterate for such employment, the task of keeping the registers of the Díwán was entrusted to Greeks, Copts, and Persians. 'Omar also gave his attention to the apportionment of the individual pensions of the Faithful. Every one received a larger or smaller sum according to the greater or less nearness of his connexion with the family, or the tribe, of the Prophet. Thus 'Áisha, who had been the favourite wife of Mohammed, received a yearly pension of twelve thousand dirhems;[1] the other widows of the Prophet only received ten thousand. The Háshimites and Mottalibites, that is, the members of the Prophet's family, also received ten thousand dirhems. The Emigrants and the Defenders, or those citizens of Mecca and Medina who had been the first to embrace Islam, had five thousand dirhems; and that was the sum which 'Omar I. allotted to himself.[2] For every other Moslem of full age, the pension varied from 4000 to 300 dirhems. We can easily understand what an influence the hope of this pension must have exerted on the conquered races, and how much it must

[1] The dirhem was equivalent to one franc.

[2] His moderation was not imitated by his successor 'Othmán, who made it his principal object to enrich all the members of his own family at the expense of the rest of the Moslems.

Sect. III.—Sketch of the Institutions and Civilization of the Eastern Caliphate.

Mohammed had begun to bestow political unity on Arabia; but he had done still more: he had given her the Koran, as the starting-point and base of the future civilization of Islam. It was for the preservation and the better understanding of the sacred text that the first believers were led to create grammar and lexicography, and to make collections of the poems of their own and former times, those "witnesses of the meaning of words," as the Arabs call them. To elucidate questions of dogma they created theology. Jurisprudence, in like manner, issued from the Koran, and the historical sciences at first gathered around it. As early as the first century of the Flight, schools were founded in 'Iráḳ, at Baṣra and at Cufa, in which all the questions to which the study of the Koran gave rise were stated, and answered in different ways. Natural science and mathematics were less directly concerned with the sacred book, and were consequently neglected during the whole period of the Omayyad dynasty. They only began to be cultivated when, under the 'Abbásids, the study of philosophy led to the use of translations from the Greek. The institutions of Islam were developed, no doubt, as new wants made themselves felt, in proportion to the extension of the empire; but they were nevertheless founded on the first arrangements made by the Prophet, and handed down by him in the Koran.

Political and social institutions.

Under the first four Caliphs these institutions continued in a rudimentary state. The Caliph (*Khalífa*, substitute or successor) was elected by the Moslem community; and, after receiving from all its members the oath of fidelity (*Bai'a*) which they were bound to take, united the temporal and spiritual powers in his own hands. He was at the same time high priest, ruler, and judge. He was compelled, however, by the very extent of the empire to delegate his powers to those agents (*'Ámil*, plural *'Ommál*) whom he commissioned to represent him in the provinces. The State revenues, which entered the public treasury (*Bait al-mál*), were composed—(1) of the tithe, or tax for the poor (*Zakát*), which every Moslem was bound to pay; (2) of the fifth, raised on all booty taken in war, the rest being divided among the warriors; (3) of the poll-tax (*Jizya*) and the land-tax (*Kharáj*), which only affected non-Moslem subjects. The Caliph administered the revenues of the State at his own pleasure, applying them to the necessities of war, to public works, to the payment of officials, to the support of the poor, and to the distribution of the annual pensions, in which every Moslem had originally a right to share. The State could possess landed property. Under 'Omar I. we find that the pasture land belonging to the State supported not less than forty thousand camels and horses. To 'Omar I. was due the regulation of the poll-tax by a fixed scale. The rich, whether Christians or Jews, paid four dínárs (about thirty-two shillings) yearly; people of the middle class, two dínárs; the poor, one dínár. Besides this payment in money, the subject-races had to make contributions in kind, intended for the support of the troops. The land-tax consisted of a general rent in proportion to the extent, character, and fertility of the lands possessed by the conquered.

The Díwán.

As the sums produced by these different imposts were often very considerable, it became necessary, as early as the Caliphate of 'Omar I., to create a special office, charged with the accounts of their expenditure. Its organization was borrowed by 'Omar from the Persians, and it retained its Persian name of Díwán, a term afterwards applied to all government offices. The Arabs at that time being too illiterate for such employment, the task of keeping the registers of the Díwán was entrusted to Greeks, Copts, and Persians. 'Omar also gave his attention to the apportionment of the individual pensions of the Faithful. Every one received a larger or smaller sum according to the greater or less nearness of his connexion with the family, or the tribe, of the Prophet. Thus 'Áisha, who had been the favourite wife of Mohammed, received a yearly pension of twelve thousand dirhems;[1] the other widows of the Prophet only received ten thousand. The Háshimites and Mottalibites, that is, the members of the Prophet's family, also received ten thousand dirhems. The Emigrants and the Defenders, or those citizens of Mecca and Medina who had been the first to embrace Islam, had five thousand dirhems; and that was the sum which 'Omar I. allotted to himself.[2] For every other Moslem of full age, the pension varied from 4000 to 300 dirhems. We can easily understand what an influence the hope of this pension must have exerted on the conquered races, and how much it must

[1] The dirhem was equivalent to one franc.
[2] His moderation was not imitated by his successor 'Othmán, who made it his principal object to enrich all the members of his own family at the expense of the rest of the Moslems.

Simultaneously with the accession of the 'Abbásids, Persian influence began to preponderate. The Persian, Khálid b. Barmak, was entrusted with the administration of the finances (*Díwán al-Kharáj*) by As-Saffáh, who was also the first Caliph who transferred the burden of public affairs from himself to a Prime Minister (*Wazír*, whence, in European languages, the term *Vizier*). The title of Wazír was unknown to the Omayyads. The office of Prime Minister was of Persian origin. It existed till the time of the Caliph Rádí, when that of Amír al-Omará was substituted for it. When the Caliphs had fallen under the tutelage of the Búyids, it was the latter who chose Viziers, leaving to the Caliphs only Secretaries (*Rayís al-Ruwasá*). Under the Seljúk Sultans the Caliphs were again permitted to choose their own Viziers.

Prime Minister.

The institution of the office of Vizier was not the least among the causes of the decadence of the Eastern Caliphate. The 'Abbásids gradually became unaccustomed to the exercise of power and the management of affairs, and thus lost all direct influence over their subjects. Besides the Minister of Finance and the Vizier, the 'Abbásids created another important office, that of Postmaster-General (*Sáhib al-Baríd*), whose duty it was to collect at a central office all the information which arrived from the provinces, and to transmit it to the Prime Minister. Thus the administrative services were greatly extended under the 'Abbásids. They were subdivided as follows:—1. *Díwán al-Kharáj*, or Ministry of Finance; 2. *Díwán al-Diyá'*, or Bureau of State property; 3. *Díwán al-Zimám*, Registry Office or Exchequer Office; 4. *Díwán al-Jond*, or Ministry of War; 5. *Nazar al-Mazálim*, or Court of Appeal; 6. *Díwán al-Mawálí wal-Ghilmán*, or Bureau of the freedmen and slaves of the Caliphs; 7. *Díwán Zimám al-Nafakát*, or Office of Expenditure; 8. *Díwán al-Baríd*, or Office of the Posts; 9. *Díwán al-Rasáil*, or Office of Correspondence; 10. *Díwán al-Taukí'*, or Office of the Imperial Seal, and of the registration of official documents. There were also offices for the despatch and reception of official documents, and for the inspection of weights and measures.

Administrative services.

Organization of the State.

We cannot better conclude this brief summary of the institutions of the Caliphate than by giving a sketch of the organization of the State, according to the Moslem authors themselves.

Caliph.

The supreme chief received the title of Caliph, or of Commander of the Faithful (Amír al-Mo'minín). He united in his own person all the powers of the State; his Ministers and all public functionaries acted only by virtue of a commission from him. They, like all other Moslems, were at the mercy of the Caliph, who had power of life and death over them. As spiritual chief, the Caliph was also the supreme judge in questions of dogma. In theory he held his powers by the free choice of the majority of Moslems; but, when he had once received their oath of allegiance, he became their absolute master. The first condition of eligibility to the Caliphate was to belong to the tribe of Koraish. In Moslem belief, the subjects of the Caliph owed him obedience and aid so long as he should fulfil his duties with exactness. These consisted in maintaining the principles of religion, in administering justice scrupulously, in defending the territory and assuring its safety, in carrying on war for the subjugation of the infidels, and in spending the public revenue in conformity to the law. If the Caliph failed in the performance of his duty, rebellion against him became lawful.

Ministers.

The Ministers might be absolute or dependent. If dependent, they simply executed the orders of their sovereign. If absolute, they took his place, and exercised all the powers of a Caliph except that they could not, at least in theory, designate any successor to the reigning Caliph. It was only to the Caliph himself that they were responsible for their actions.

Prefects.

The Prefects, when once appointed, whether by the Caliph or the Vizier, became so many petty sovereigns, and, legally, owed an account of their actions only to the Caliph, or to his Prime Minister, when the latter was absolute.

Generals.

The Generals were appointed either by the Caliph or by the Vizier, or lastly by the Prefect, when only a local war was in question. They were sometimes invested with very extensive powers, such as those of concluding treaties of peace, of administering justice, and of dividing the booty. The General, in his turn, appointed the officers (*Nakíbs*) and under-officers (*'Arífs*). It was a general order that infidels, before hostilities against them were opened, should be summoned to embrace the faith, or to submit by capitulation. The conversion of infidels was valid, even when effected sword in hand, on the field of battle, and the new convert became inviolable in person and property. On the other hand, every infidel taken prisoner was sold as a slave, with his wife and children. He might even be put to death. Apostates were never to be spared; they were put to death, and their property confiscated.

Cadis.

Justice was administered by Cadis, appointed either by the Caliph, by the Vizier, or by the Prefect. To be eligible as a Cadi (*Kádi*), it was requisite that a man should be—1. A male and of respectable age; 2. In full possession of his mental and physical faculties; 3. A free man; 4. A Moslem; 5. Of good moral character; 6. Acquainted with the principles of the law and their application. The duties of the Cadi were to examine into the disputes and lawsuits brought before him; to enforce the execution of his judgments; to name judicial councils for the administration of the goods of minors, madmen, etc.; to administer the mortmain property of mosques and schools (*wakf*, plural *wokúf*); to watch over the execution of wills; to inflict due legal penalties on those guilty of crimes or misdemeanours;[1] and to inspect the highways and public buildings. When any locality possessed no Imám, or public officiator at the mosque, it was the Cadi who performed this duty. The assistants of the Cadi were Notaries (*Shohúd*), Secretaries (*Omaná*), and Deputies (*Náyibín*). If the Cadi died, his subordinates lost their offices *ipso facto*. On the other hand, the death of a Caliph did not nullify the powers of the Cadi; but it was necessary that he should be confirmed by the new sovereign.

Court of Appeal.

The Court of Appeal (*Nazar al-Mazálim*) was instituted to take cognizance of those causes in which the parties concerned appealed from the judgment of the Cadi. The sittings of this court were presided over by the Caliph in person. It was established by the Omayyad 'Abd al-Melik. The last Caliph who sat in public to examine appeal cases was Mohtadí. After him a special judge was appointed to the function of president of the Court of Appeal.

Inspectors.

Besides the Judges there were Inspectors (*Mohtasib*), charged with the police of the markets and the care of morals. The Mohtasib's duty was to take care that weights and measures were not falsified, and that buyers were not deceived as to the quality of the goods sold. He had the power of inflicting summary punishment on delinquents, but only in the case of flagrant offences. If the person charged denied the facts, he was to be brought before the Cadi. As regards morals, the Mohtasib took care that widows and divorced women should not remarry before the expiration of the legal period prescribed by the

[1] The principal offences were—apostasy, neglect of religious duties, refusal to pay taxes, theft, adultery, outrages, and murder. The penalties were imprisonment, fines, corporal punishment, and death.

Simultaneously with the accession of the 'Abbásids, Persian influence began to preponderate. The Persian, Khálid b. Barmak, was entrusted with the administration of the finances (*Díwán al-Kharáj*) by As-Saffáh, who was also the first Caliph who transferred the burden of public affairs from himself to a Prime Minister (*Wazír*, whence, in European languages, the term *Vizier*). The title of Wazír was unknown to the Omayyads. The office of Prime Minister was of Persian origin. It existed till the time of the Caliph Rádí, when that of Amír al-Omará was substituted for it. When the Caliphs had fallen under the tutelage of the Búyids, it was the latter who chose Viziers, leaving to the Caliphs only Secretaries (*Rayís al-Ruwasá*). Under the Seljúk Sultans the Caliphs were again permitted to choose their own Viziers.

Prime Minister.

The institution of the office of Vizier was not the least among the causes of the decadence of the Eastern Caliphate. The 'Abbásids gradually became unaccustomed to the exercise of power and the management of affairs, and thus lost all direct influence over their subjects. Besides the Minister of Finance and the Vizier, the 'Abbásids created another important office, that of Postmaster-General (*Ṣáḥib al-Baríd*), whose duty it was to collect at a central office all the information which arrived from the provinces, and to transmit it to the Prime Minister. Thus the administrative services were greatly extended under the 'Abbásids. They were subdivided as follows:—1. *Díwán al-Kharáj*, or Ministry of Finance; 2. *Díwán al-Ḍiyá'*, or Bureau of State property; 3. *Díwán al-Zimám*, Registry Office or Exchequer Office; 4. *Díwán al-Jond*, or Ministry of War; 5. *Nazar al-Mazálim*, or Court of Appeal; 6. *Díwán al-Mawálí wal-Ghilmán*, or Bureau of the freedmen and slaves of the Caliphs; 7. *Díwán Zimám al-Nafakát*, or Office of Expenditure; 8. *Díwán al-Baríd*, or Office of the Posts; 9. *Díwán al-Rasáil*, or Office of Correspondence; 10. *Díwán al-Taukí'*, or Office of the Imperial Seal, and of the registration of official documents. Organization of the State.

We cannot better conclude this brief summary of the institutions of the Caliphate than by giving a sketch of the organization of the State, according to the Moslem authors themselves.

Caliph.

The supreme chief received the title of Caliph, or of Commander of the Faithful (Amír al-Mo'minín). He united in his own person all the powers of the State; his Ministers and all public functionaries acted only by virtue of a commission from him. They, like all other Moslems, were at the mercy of the Caliph, who had power of life and death over them. As spiritual chief, the Caliph was also the supreme judge in questions of dogma. In theory he held his powers by the free choice of the majority of Moslems; but, when he had once received their oath of allegiance, he became their absolute master. The first condition of eligibility to the Caliphate was to belong to the tribe of Koraish. In Moslem belief, the subjects of the Caliph owed him obedience and aid so long as he should fulfil his duties with exactness. These consisted in maintaining the principles of religion, in administering justice scrupulously, in defending the territory and assuring its safety, in carrying on war for the subjugation of the infidels, and in spending the public revenue in conformity to the law. If the Caliph failed in the performance of his duty, rebellion against him became lawful.

Ministers.

The Ministers might be absolute or dependent. If dependent, they simply executed the orders of their sovereign. If absolute, they took his place, and exercised all the powers of a Caliph except that they could not, at least in theory, designate any successor to the reigning Caliph. It was only to the Caliph himself that they were responsible for their actions.

Prefects.

The Prefects, when once appointed, whether by the Caliph or the Vizier, became so many petty sovereigns, and, legally, owed an account of their actions only to the Caliph, or to his Prime Minister, when the latter was absolute.

Generals.

The Generals were appointed either by the Caliph or by the Vizier, or lastly by the Prefect, when only a local war was in question. They were sometimes invested with very extensive powers, such as those of concluding treaties of peace, of administering justice, and of dividing the booty. The General, in his turn, appointed the officers (*Nakíbs*) and under-officers (*'Arífs*). It was a general order that infidels, before hostilities against them were opened, should be summoned to embrace the faith, or to submit by capitulation. The conversion of infidels was valid, even when effected sword in hand, on the field of battle, and the new convert became inviolable in person and property. On the other hand, every infidel taken prisoner was sold as a slave, with his wife and children. He might even be put to death. Apostates were never to be spared; they were put to death, and their property confiscated.

Cadis.

Justice was administered by Cadis, appointed either by the Caliph, by the Vizier, or by the Prefect. To be eligible as a Cadi (*Ḳáḍí*), it was requisite that a man should be—1. A male and of respectable age; 2. In full possession of his mental and physical faculties; 3. A free man; 4. A Moslem; 5. Of good moral character; 6. Acquainted with the principles of the law and their application. The duties of the Cadi were to examine into the disputes and lawsuits brought before him; to enforce the execution of his judgments; to name judicial councils for the administration of the goods of minors, madmen, etc.; to administer the mortmain property of mosques and schools (*wakf*, plural *wokúf*); to watch over the execution of wills; to inflict due legal penalties on those guilty of crimes or misdemeanours;[1] and to inspect the highways and public buildings. When any locality possessed no Imám, or public officiator at the mosque, it was the Cadi who performed this duty. The assistants of the Cadi were Notaries (*Shohúd*), Secretaries (*Omaná*), and Deputies (*Náyibín*). If the Cadi died, his subordinates lost their offices *ipso facto*. On the other hand, the death of a Caliph did not nullify the powers of the Cadi; but it was necessary that he should be confirmed by the new sovereign.

Court of Appeal.

The Court of Appeal (*Nazar al-Mazálim*) was instituted to take cognizance of those causes in which the parties concerned appealed from the judgment of the Cadi. The sittings of this court were presided over by the Caliph in person. It was established by the Omayyad 'Abd al-Melik. The last Caliph who sat in public to examine appeal cases was Mohtadí. After him a special judge was appointed to the function of president of the Court of Appeal.

Inspectors.

Besides the Judges there were Inspectors (*Mohtasib*), charged with the police of the markets and the care of morals. The Mohtasib's duty was to take care that weights and measures were not falsified, and that buyers were not deceived as to the quality of the goods sold. He had the power of inflicting summary punishment on delinquents, but only in the case of flagrant offences. If the person charged denied the facts, he was to be brought before the Cadi. As regards morals, the Mohtasib took care that widows and divorced women should not remarry before the expiration of the legal period prescribed by the

[1] The principal offences were—apostasy, neglect of religious duties, refusal to pay taxes, theft, adultery, outrages, and murder. The penalties were imprisonment, fines, corporal punishment, and death.

the eyes of their respective partisans. A further distinction between the Shí'ites and other sects is, that they introduced the practice of giving the Koran an allegorical interpretation. This system permitted them to see in the sacred book whatever meaning they chose, and was carried out at a later date, as we shall see, by the founder of the Ismailian sect.

Under the 'Abbásids it seemed for a moment that the Shí'ite doctrines were about to triumph. We know, in fact, that the founder of that dynasty gave himself out as the heir of the house of 'Alí. But reasons of State prevailed, and the 'Abbásids, false to their first professions, on the whole supported orthodoxy. Under their reign were established the four orthodox sects—Málikite, Hanafite, Sháfi'ite, and Hanbalite, which even at this day divide between them the whole Moslem world. They are named after their founders—Málik, Abú Hanífa, Sháfi'í, and Ibn Hanbal. These sects only differ from each other on a few points of civil and religious jurisprudence. They agree on questions of dogma. It was not, however, without difficulty that orthodoxy succeeded in obtaining the victory. Under Ma'mún and other Caliphs several doctors, as we have seen, were persecuted for believing that the Koran was the uncreated word of God. From the time of Motawakkil, however, orthodoxy regained the upper hand. Still, this reaction would not have lasted long, in face of the advance in science which marked the accession of Ma'mún to power, if the orthodox had had no other defensive weapons than material force and the assent of the majority. As philosophy made its way in Islam, thanks to the translations from Greek authors, which were made principally during the Caliphate of Ma'mún, it called forth in men's minds a movement of scientific curiosity which might have been fatal to orthodoxy. In the tenth century of our era a society of encyclopedists was formed at Basra, who, under the name of Ikhwán al-Safá, or Brothers of Purity, put forth a number of very curious treatises, in which all sorts of physical and metaphysical questions were discussed and resolved in a scientific manner.[1] There is no doubt that these lucid and attractive writings would have led to a great religious revolution, if the orthodox had not understood the danger of their position, and applied themselves also to the study of philosophy, for the purpose of employing it in the service of the faith. It was thus that, towards the middle of the tenth century, a certain Abú 'l-Hasan al-Ash'arí, a descendant of that Abú Músá al-Ash'arí who had formerly acted the part of arbitrator in the dispute between Mo'áwiya and 'Alí, struck out a system in which religion appeared to be reconciled with philosophy; a system which was naturally sure to attract all commonplace minds—that is to say, the greater number. Ash'arism, or philosophic theology (Kalám), was adopted with enthusiasm by the triumphant orthodox doctors, and thenceforth pure philosophy and the heterodox sects ceased to extend their influence.[2]

The orthodox sects.

Ash'arí.

The creation, however, of this philosophical theology had not done away with all dangers for orthodoxy. We have seen above that the Shí'a were divided into several sects, each holding for one of the direct descendants of 'Alí, and paying him the reverence due to a deity. One of these sects, called the Ismailian, because it acknowledged Ismá'íl, the seventh Imám or Pontiff of the posterity of 'Alí, as its chief, was the source of the greatest disorders in the Moslem empire, and was not far from being triumphant in Asia, as it was for a long time in Egypt. The Ismailians, like all the other Shí'ites, believed in the coming of a Messiah, whom they called the Mahdí, and who, according to them, was one day to appear on earth, in order to establish the reign of justice and equity, and to take vengeance on the oppressors of the family of 'Alí. They also believed in a God of far more elevated character than the God of the Koran, one who was unapproachable by human reason, and who had created the universe, not directly, but by the intermediate action of a sublime being, the Universal Reason, produced by an act of God's will. The Universal Reason, in its turn, had produced the Universal Soul, which, on its part, had given birth to primitive Matter, to Space, and to Time. These five principles were the causes of the universe. Man, emanating from them, had a tendency to reascend towards his source. The chief end of his being was to attain to perfect union with the Universal Reason.[3] But, left to himself, man would have been powerless to attain this end. The Universal Reason and the Universal Soul therefore became incarnate among men, in order to guide them towards the light. These incarnations were no other than the prophets in all ages, and, in the last period, the Imáms of the posterity of 'Alí. In the second half of the ninth century, a Persian, born in Susiana and named 'Abdalláh b. Maimún al-Kaddáh, nourished the dream of destroying Islam, and thought these doctrines, suitably modified, likely to be highly useful in carrying out his purpose. He devised a system at once religious, philosophical, political, and social, in which, as he thought, all beliefs were to meet and mingle, but—and in this consisted its originality—a system so graduated to suit different degrees of intelligence, that the whole world should become one vast Masonic association. The chief of the Ismailians, the Imám Ismá'íl, having died, 'Abdalláh asserted that his son Mohammed b. Ismá'íl was to succeed him as the founder of this new religion, which it was 'Abdalláh's mission to announce to the world. Since the creation of the world, as 'Abdalláh asserted, there had been six religious periods, each marked by an incarnation of the Universal Reason in the person of a prophet. Adam, Noah, Abraham, Moses, Jesus, and Mohammed had been the prophets of these periods. Their mission had been to invite men to accept more and more perfect forms of religion. The seventh and last religion, and the most perfect of all, was that of Mohammed b. Ismá'íl, the true Messiah. The Ismailians, as may be imagined, readily embraced the theories of 'Abdalláh. In addressing other sects and religions, 'Abdalláh used special arguments with each. With the philosophers he dwelt on the philosophical principles of his doctrine. The conversion of Christians, Moslems, or Jews, was a more difficult task. 'Abdalláh had established several degrees of initiation, and it was only by slow degrees, and with the most minute precautions, that he gained a mastery over the mind of the future proselyte. His curiosity was first aroused by allegorical interpretations of the Old Testament, the Gospels, and the Koran, and by proposing to him religious problems which could not be solved by any of the existing religions. The solution of these problems was not to be given to him till he should have signed a compact, and sworn never to reveal the mysteries with which he was made acquainted. If he took this pledge, he thenceforward belonged, body and soul, to the sect; and woe to him if he made any attempt to withdraw himself from the authority of his chiefs! The compact signed, the newly-initiated disciple had to make a certain payment, which went to swell the treasury of the sect. The secret society

Ismailians.

[3] It need hardly be said that all these doctrines were borrowed from Gnosticism and from Neo-Platonism. See on the Ismailian sect Guyard, *Fragments relatifs à la doctrine des Ismaéliens*, and *Un grand-maître des Assassins au temps de Saladin*.

the eyes of their respective partisans. A further distinction between the Shí'ites and other sects is, that they introduced the practice of giving the Koran an allegorical interpretation. This system permitted them to see in the sacred book whatever meaning they chose, and was carried out at a later date, as we shall see, by the founder of the Ismailian sect.

Under the 'Abbásids it seemed for a moment that the Shí'ite doctrines were about to triumph. We know, in fact, that the founder of that dynasty gave himself out as the heir of the house of 'Alí. But reasons of State prevailed, and the 'Abbásids, false to their first professions, on the whole supported orthodoxy. Under their reign were established the four orthodox sects—Málikite, Ḥanafite, Sháfi'ite, and Ḥanbalite, which even at this day divide between them the whole Moslem world. They are named after their founders—Málik, Abú Ḥanífa, Sháfi'í, and Ibn Ḥanbal. These sects only differ from each other on a few points of civil and religious jurisprudence. They agree on questions of dogma. It was not, however, without difficulty that orthodoxy succeeded in obtaining the victory. Under Ma'mún and other Caliphs several doctors, as we have seen, were persecuted for believing that the Koran was the uncreated word of God. From the time of Motawakkil, however, orthodoxy regained the upper hand. Still, this reaction would not have lasted long, in face of the advance in science which marked the accession of Ma'mún to power, if the orthodox had had no other defensive weapons than material force and the assent of the majority. As philosophy made its way in Islam, thanks to the translations from Greek authors, which were made principally during the Caliphate of Ma'mún, it called forth in men's minds a movement of scientific curiosity which might have been fatal to orthodoxy. In the tenth century of our era a society of encyclopedists was formed at Baṣra, who, under the name of Ikhwán al-Ṣafá, or Brothers of Purity, put forth a number of very curious treatises, in which all sorts of physical and metaphysical questions were discussed and resolved in a scientific manner.[1] There is no doubt that these lucid and attractive writings would have led to a great religious revolution, if the orthodox had not understood the danger of their position, and applied themselves also to the study of philosophy, for the purpose of employing it in the service of the faith. It was thus that, towards the middle of the tenth century, a certain Abú 'l-Ḥasan al-Ash'arí, a descendant of that Abú Músá al-Ash'arí who had formerly acted the part of arbitrator in the dispute between Mo'áwiya and 'Alí, struck out a system in which religion appeared to be reconciled with philosophy; a system which was naturally sure to attract all commonplace minds—that is to say, the greater number. Ash'arism, or philosophic theology (Kalám), was adopted with enthusiasm by the triumphant orthodox doctors, and thenceforth pure philosophy and the heterodox sects ceased to extend their influence.[2]

The orthodox sects.

Ash'ari.

The creation, however, of this philosophical theology had not done away with all dangers for orthodoxy. We have seen above that the Shí'a were divided into several sects, each holding for one of the direct descendants of 'Alí, and paying him the reverence due to a deity. One of these sects, called the Ismailian, because it acknowledged Ismá'íl, the seventh Imám or Pontiff of the posterity of 'Alí, as its chief, was the source of the greatest disorders in the Moslem empire, and was not far from being triumphant in Asia, as it was for a long time in Egypt. The Ismailians, like all the other Shí'ites, believed in the coming of a Messiah, whom they called the Mahdí, and who, according to them, was one day to appear on earth, in order to establish the reign of justice and equity, and to take vengeance on the oppressors of the family of 'Alí. They also believed in a God of far more elevated character than the God of the Koran, one who was unapproachable by human reason, and who had created the universe, not directly, but by the intermediate action of a sublime being, the Universal Reason, produced by an act of God's will. The Universal Reason, in its turn, had produced the Universal Soul, which, on its part, had given birth to primitive Matter, to Space, and to Time. These five principles were the causes of the universe. Man, emanating from them, had a tendency to reascend towards his source. The chief end of his being was to attain to perfect union with the Universal Reason.[3] But, left to himself, man would have been powerless to attain this end. The Universal Reason and the Universal Soul therefore became incarnate among men, in order to guide them towards the light. These incarnations were no other than the prophets in all ages, and, in the last period, the Imáms of the posterity of 'Alí. In the second half of the ninth century, a Persian, born in Susiana and named 'Abdalláh b. Maimún al-Ḳaddáḥ, nourished the dream of destroying Islam, and thought these doctrines, suitably modified, likely to be highly useful in carrying out his purpose. He devised a system at once religious, philosophical, political, and social, in which, as he thought, all beliefs were to meet and mingle, but—and in this consisted its originality—a system so graduated to suit different degrees of intelligence, that the whole world should become one vast Masonic association. The chief of the Ismailians, the Imám Ismá'íl, having died, 'Abdalláh asserted that his son Mohammed b. Ismá'íl was to succeed him as the founder of this new religion, which it was 'Abdalláh's mission to announce to the world. Since the creation of the world, as 'Abdalláh asserted, there had been six religious periods, each marked by an incarnation of the Universal Reason in the person of a prophet. Adam, Noah, Abraham, Moses, Jesus, and Mohammed had been the prophets of these periods. Their mission had been to invite men to accept more and more perfect forms of religion. The seventh and last religion, and the most perfect of all, was that of Mohammed b. Ismá'íl, the true Messiah. The Ismailians, as may be imagined, readily embraced the theories of 'Abdalláh. In addressing other sects and religions, 'Abdalláh used special arguments with each. With the philosophers he dwelt on the philosophical principles of his doctrine. The conversion of Christians, Moslems, or Jews, was a more difficult task. 'Abdalláh had established several degrees of initiation, and it was only by slow degrees, and with the most minute precautions, that he gained a mastery over the mind of the future proselyte. His curiosity was first aroused by allegorical interpretations of the Old Testament, the Gospels, and the Koran, and by proposing to him religious problems which could not be solved by any of the existing religions. The solution of these problems was not to be given to him till he should have signed a compact, and sworn never to reveal the mysteries with which he was made acquainted. If he took this pledge, he thenceforward belonged, body and soul, to the sect; and woe to him if he made any attempt to withdraw himself from the authority of his chiefs! The compact signed, the newly-initiated disciple had to make a certain payment, which went to swell the treasury of the sect. The secret society

Ismailians.

[3] It need hardly be said that all these doctrines were borrowed from Gnosticism and from Neo-Platonism. See on the Ismailian sect Guyard, *Fragments relatifs à la doctrine des Ismaéliens*, and *Un grand-maître des Assassins au temps de Saladin.*

School of 'Irák.

In 'Irák another school of law was formed, which is distinguished from that of Medina by a greater degree of independence. While the lawyers of Medina held strictly to the Koran, the traditions of the Prophet, and the 'Áthár, those of 'Irák admitted, in addition to these, the deductive or analogical method (*Kiyás*), according to which it was lawful to create precedents, provided there was no departure from the spirit of the sacred book, from the traditions of the Prophet, or from the corresponding decisions of the first four Caliphs. Ibn Abí Laila, who filled the office of judge in 'Irák under the caliphate of Manṣúr, was one of the first to apply this system. His renown, however, was eclipsed by that of his contemporary Abú Ḥaníſa, who worked out a complete system of jurisprudence, with which his name has continued to be connected (Hanifite law). Fifty years after the death of Abú Ḥaníſa, Sháfi'í, a pupil of Málik, appeared at Baghdád, and founded in his turn an intermediate system, in which he endeavoured to hold an equal balance between the purely traditional and the deductive methods. The fourth system reputed orthodox is that of Ibn Ḥanbal, a pupil of Sháfi'í. Ibn Ḥanbal strove above all things to bring back religious observances to their primitive purity. His doctrine was a kind of puritanism. As may be supposed, each of these systems has been subsequently developed and commented on in a multitude of works, even the names of which it is impossible to enumerate. In order, however, to give some idea of what a Moslem treatise on jurisprudence is, we shall point out the principal subjects contained in it. It treats successively—1. Of Purification (ablutions commanded by the law, purification of women, circumcision, etc.); 2. Of Prayer as commanded by the law; 3. Of Funerals; 4. Of Tithe and Almsgiving; 5. Of the legal Fast; 6. Of the Pilgrimage to Mecca; 7. Of Commercial and other transactions; 8. Of Inheritance; 9. Of Marriage and Divorce; 10. Of the Faith; 11. Of Crimes and Misdemeanours; 12. Of Justice; 13. Of the Imámate or spiritual power, and of the Caliphate or temporal power. It is thus a complete code, religious, civil, penal, and governmental, that Moslem treatises on jurisprudence set before us; a code which embraces and foresees all the circumstances both of public and private life.

Science and letters.

The development of science and literature runs parallel with the development of law. Before the time of Mohammed the Arabs had been distinguished only by a rare poetical talent. Islam was the signal for the springing up of all the sciences and of literature. While the study of the dogmas and ordinances of the Koran was producing theology and jurisprudence, the necessity of preserving the exact text of the sacred book, and of teaching the new converts the language of the Prophet, was giving birth to grammar and lexicography. The first school of grammar was established at Baṣra. The first attempts at grammar are generally attributed to a certain Abú 'l-Aswad al-Do'alí, who was tutor to the children of Ziyád, the brother of Mo'áwiya. According, however, to some authors, the honour of having discovered the first elements of grammar ought to be attributed to a Persian, named 'Abd al-Raḥmán b. Hormúz. Be this as it may, a foreign influence must be recognized at the very commencement of this science. The vowel marks, for instance, were imitated from those of the Syriac. The division of the parts of speech into nouns, verbs, and particles was indirectly borrowed from Greek grammar. Yet the Moslems, once in possession of the principles of grammar, knew how to develop and apply them in an admirable manner. A perfect galaxy of grammarians arose in the track of Abú 'l-Aswad; a rival school to that of Baṣra was established at Cufa, and grammar attained its highest degree of perfection under the first 'Abbásids; as is shown by the voluminous treatise of Síbawaihi, known under the name of *Kitáb*,[1] or the Book *par excellence*.

Grammar.

Lexicography.

In lexicography, the Arabs were at first content to explain the rarer words of the Koran, of the traditions, and of the ancient poems; and to collect lists of terms applying to the same object, as the camel, the horse, the sword, etc. Thus small collections were formed, which served afterwards for the composition of dictionaries. The first dictionary properly so called, composed in Arabic, appears to have been the *Kitáb al-'Ain* of Khalíl b. Aḥmed al-Faráhidí, a contemporary of Hárún al-Rashíd. After him came Jauharí, whose *Ṣaḥáḥ* may still be consulted with profit. The celebrated Zamakhsharí composed a dictionary of metaphors under the title of *Asás al-Balágha*. Lastly, Tha'álibí, in the 11th century of our era, drew up his *Fikh al-Logha*,[2] a work specially devoted to synonyms. The accessory branches of philology gave occasion to some important works. The ancient poems and proverbs were collected and commented on. Thus Abú Tammám formed his Anthology, called Ḥamása (*q.v.*), and Maidání his collection of proverbs (*Kitáb amthál al-'Arab*).[3] The study of poetry, with special regard to its rhythm, led Khalíl b. Aḥmed, already mentioned as a grammarian and lexicographer, to the conception of prosody. He wrote the first treatise on that science, which served as a model to all subsequent writers on metre.[4] Pure literature remained confined to poetry. It was not that the Arabs were without any conception of the romance, the tale, or the novel. The adventures of Antar, the romances of Dhú 'l-Himma and of Saif al-Yazan, the Thousand and one Nights, and various collections of stories and novels, such as the *Faraj ba'da 'l-Shidda* and the compilation of Biḳá'í, well known by the extracts which Kosegarten has given in his Chrestomathy;—all these show clearly that the Arabs were not devoid of imagination, at least if, as we believe, these tales and romances were not pure and simple imitations from the Persian. It must be acknowledged, however, that these few productions do not, any more than the *Maḳámát* of Hamadhání and of Ḥarírí, constitute a very important literature. The drama, the epic, the romance of character, were absolutely unknown to the Arabs. Poetry, on the other hand, an endowment of the ancient Arabs, continued to live and flourish as long as the Eastern Caliphate lasted. We may count poets by the hundred, eminent in every department of that art: in descriptive, erotic, martial, and philosophic poetry; in odes, in satires, etc. The great collection entitled *Kitáb al-Aghání*,[5] compiled by Iṣfahání, contains a choice of the finest poems, accompanied by very instructive notices of the poets, and of the circumstances under which they composed such and such pieces. Besides this, many Díwáns, or complete editions of the works of poets, have come down to us. They bear the celebrated names of Nábigha, of 'Antara, of Ṭarafa, of Zohair, of 'Alḳama, of Amraalḳais, of Shanfara, of Labíd, in the pre-Islamic period (see Mo'allakát); of Jarír, Akhtal, and Farazdaḳ,[6] in the Omayyad period; and of Abú Nowás,[7] Abú 'l-'Atáhiya, Moslim,[8] Motanabbi' (*q.v.*), and Abú 'l-'Alá,[9] in the period of the 'Abbásids. And this list contains only the most illustrious names.

Poetry and romance.

own prescriptions, which they pretended to have received from the Prophet, those of the Greek physicians. The works of Avicenna prove this; and Ibn al-Baiṭâr's treatise on the pharmacopœia also shows how small a part observation played in Arabian medicine.[1] Zoology, botany, and mineralogy made no greater progress; but they were at least among the subjects which attracted the attention of learned Moslems. The great treatise by Damîrî, entitled *Hayât al-Haiwân*, or *Life of Animals*, is of interest mainly from the legends it contains;[2] and the treatise on mineralogy by Taifashi interests us principally by the details it gives on the origin of precious stones and the art of cutting them. It would be unjust to conclude this sketch without adding that the Moslems possess also a great number of technical treatises on the art of war, on military engines, and the Greek fire, on falconry and hunting, and on certain industries, such as those of glass, pottery, and metals. They have also written on magic, on the interpretation of dreams, and on sleight of hand. These works have as yet been very little investigated. We shall no doubt find in them interesting revelations on the history of the industrial arts, and on the history of superstitions.

Commerce. With an empire so vast as that of the Moslems, we may easily conceive how extensive their commerce and industry must have been. Commerce had at all times been held in honour by the Arabs. Long before the days of Mohammed, the Koraish annually sent caravans, laden with all the products of Yemen, into Syria. Maritime commerce also was already flourishing in Chaldæa in the 5th century of our era. The city of Hîra was frequented by ships coming from the Red Sea, from India, and even from China. Obolla was the emporium for the merchandise of India. It was principally thither that teakwood was brought, which served for the construction of ships and houses. Thus the Arabs, when they conquered Chaldæa, found maritime commerce in full activity there, and took advantage of it. Under the 'Abbâsids Basra supplanted Hira and Obolla, and became the principal port. The history of Sindibâd (Sinbad the Sailor) shows how active foreign commerce was under the 'Abbâsids, and with what courage the Arab sailors confronted danger. Moslem colonies were established all along the coasts of Persia and India, and Moslem voyagers did not fear to venture as far as the China Seas. On the West, the commercial movement was not less active. Caravans laden with the products of Spain left Tangier, traversed the whole of Northern Africa, and reached Syria, Arabia, and Mesopotamia. Others passed through Asia Minor, Armenia, Persia, Khorâsân, and Turkestân, as far as the frontiers of China, while the route of others again was along the eastern coast of Africa, whence they brought back ivory and black slaves. Thus the silks of China, and the spices, camphor, steel, and precious woods of India, were poured into the empire, while the Moslems exported their glass, their dates, their cotton stuffs, their refined sugar, and their wrought tools, to those countries. The manufacture of glass was an industry of old standing among them. The glass of Syria was celebrated, and we know that flint-glass and enamels were also made at Baghdâd. Dates were cultivated principally in the neighbourhood of Basra, and also in Persia and Khûzistân. Refined sugar also came from the coast of Persia. As regards steel, the manufacture of armour and weapons was the speciality of the people of 'Irâk, of Bahrain, of 'Omân, and of Yemen. The Syrians had the credit of forging excellent sword-blades. In Syria too were made mirrors of polished steel. The weaving of various stuffs formed an important branch of industry. The striped stuffs of Yemen, and the tissues of Baghdâd, Herât, Tawwaj, and Fasá, enjoyed a high repute. Damascus was renowned for the silk fabrics which have taken their name from that city. The silks of Yemen, of Egypt, and of Cufa, had also a high reputation. Tunis produced gauze and muslin figured with gold. Egypt manufactured brocade, Armenia supplied satin. The carpet manufacture under the Caliphs had already reached the excellence which it has maintained to our own days. At that time the carpets most valued came from Fársistán and Ṭabaristán. Jewellery and trinkets found numerous outlets, as may be supposed. This traffic was principally carried on in the East by the Jews.

Manufactures.

Art. We know that the religion of the Prophet forbade any representation of the human figure. This prohibition does not appear to have been long observed, for we find that the walls of palaces and of the houses of the rich were covered with paintings. There was a school of painting at Basra, and a historian gives us the names of two painters of high celebrity in their art—Ibn 'Azîz and Koṣair.

The manufacture of paper was carried on very extensively, a fact which is easily explained when we think of the literary activity of the Moslems. The Arabs originally used parchment. For this, after the conquest of Egypt, they substituted papyrus, which was itself supplanted by paper, when the Arabs had opened communications with China. Paper mills were established in several of the provinces, and at Baghdâd itself. Simultaneously with the appearance of this precious substance, the art of binding became one of the most flourishing industries, as did also the trades of the shoemaker, the saddler, and the dyer, etc. etc. Retail commerce, lastly, undertook the distribution of the products of agriculture and industry. In almost all the cities of the empire markets were held, where the fruiterer and grocer (*Bakkâl*), the butcher (*Jazâr*), the armourer (*Saikal*), the bookseller (*Warrâk*), and the druggist and perfumer (*'Aṭṭâr*), offered their wares for sale.[3] (ST. G.)

PART III.—THE KORAN.

THE Koran (Ko'rân) is the foundation of Islam. It is the sacred book of more than a hundred millions of men, some of them nations of immemorial civilization, by all whom it is regarded as the immediate word of God. And since the use of the Koran in public worship, in schools and otherwise, is much more extensive than, for example, the reading of the Bible in most Christian countries, it has been truly described as the most widely-read book in existence. This circumstance alone is sufficient to give it an urgent claim on our attention, whether it suit our taste and fall in with our religious and philosophical views or not. Besides, it is the work of Mohammed, and as such is fitted to afford a clue to the spiritual development of that most successful of all prophets and religious personalities. It must be owned that the first perusal leaves on a European an impression of chaotic confusion,—not that the book is so very extensive, for it is not quite so large as the New Testament. This impression can in some degree be modified only by the application of a critical analysis with the assistance of Arabian tradition.

To the faith of the Moslems, as has been said, the Koran is the word of God, and such also is the claim which the book itself advances. For except in sur. i.—which is

[1] The treatise has been translated into French by Dr. Leclerc.

[2] Printed at Bûlâk, A.H. 1292.

Besides, it is the work of Mohammed, and as such is fitted to afford a clue to the spiritual development of that most successful of all prophets and religious personalities. It must be owned that the first perusal leaves on a European an impression of chaotic confusion,—not that the book is so very extensive, for it is not quite so large as the New Testament. This impression can in some degree be modified only by the application of a critical analysis with the assistance of Arabian tradition.

To the faith of the Moslems, as has been said, the Koran is the word of God, and such also is the claim which the book itself advances. For except in sur. i.—which is

[1] The treatise has been translated into French by Dr. Leclerc.

convenient to employ some one else whenever he had anything to write. After the flight to Medina (A.D. 622) we are told that short pieces—chiefly legal decisions—were taken down immediately after they were revealed, by an adherent whom he summoned for the purpose; so that nothing stood in the way of their publication. Hence it is probable that in Mecca, where the art of writing was commoner than in Medina, he had already begun to have his oracles committed to writing. That even long portions of the Koran existed in written form from an early date may be pretty safely inferred from various indications; especially from the fact that in Mecca the Prophet had caused insertions to be made, and pieces to be erased in his previous revelations. For we cannot suppose that he knew the longer súras by heart so perfectly that he was able after a time to lay his finger upon any particular passage. In some instances, indeed, he may have relied too much on his memory. For example, he seems to have occasionally dictated the same súra to different persons in slightly different terms. In such cases, no doubt, he may have partly intended to introduce improvements; and so long as the difference was merely in expression, without affecting the sense, it could occasion no perplexity to his followers. None of them had literary pedantry enough to question the consistency of the divine revelation on that ground. In particular instances, however, the difference of reading was too important to be overlooked. Thus the Koran itself confesses that the unbelievers cast it up as a reproach to the Prophet that God sometimes substituted one verse for another (xvi. 103). On one occasion, when a dispute arose between two of his own followers as to the true reading of a passage which both had received from the Prophet himself, Mohammed is said to have explained that the Koran was revealed in seven forms. In this apparently genuine dictum seven stands, of course, as in many other cases, for an indefinite but limited number. But one may imagine what a world of trouble it has cost the Moslem theologians to explain the saying in accordance with their dogmatic beliefs. A great number of explanations are current, some of which claim the authority of the Prophet himself; as, indeed, fictitious utterances of Mohammed play throughout a conspicuous part in the exegesis of the Koran. One very favourite, but utterly untenable interpretation is that the "seven forms" are seven different Arabic dialects.

Abrogated readings.

When such discrepancies came to the cognisance of Mohammed it was doubtless his desire that only one of the conflicting texts should be considered authentic; only he never gave himself much trouble to have his wish carried into effect. Although in theory he was an upholder of verbal inspiration, he did not push the doctrine to its extreme consequences; his practical good sense did not take these things so strictly as the theologians of later centuries. Sometimes, however, he did suppress whole sections or verses, enjoining his followers to efface or forget them, and declaring them to be "abrogated." A very remarkable case is that of the two verses in liii., when he had recognised three heathen goddesses as exalted beings, possessing influence with God. (*Supra*, p. 549.)

Abrogated laws.

So much for abrogated readings; the case is somewhat different when we come to the abrogation of laws and directions to the Moslems, which often occurs in the Koran. There is nothing in this at variance with Mohammed's idea of God. God is to him an absolute despot, who declares a thing right or wrong from no inherent necessity but by his arbitrary fiat. This God varies his commands at pleasure, prescribes one law for the Christians, another for the Jews, and a third for the Moslems; nay, he even changes his instructions to the Moslems when it pleases him. Thus, for example, the Koran contains very different directions, suited to varying circumstances, as to the treatment which idolaters are to receive at the hands of believers. But Mohammed showed no anxiety to have these superseded enactments destroyed. Believers could be in no uncertainty as to which of two contradictory passages remained in force; and they might still find edification in that which had become obsolete. That later generations might not so easily distinguish the "abrogated" from the "abrogating" did not occur to Mohammed, whose vision, naturally enough, seldom extended to the future of his religious community. Current events were invariably kept in view in the revelations. In Medina it called forth the admiration of the Faithful to observe how often God gave them the answer to a question whose settlement was urgently required at the moment. The same naïveté appears in a remark of the Caliph 'Othmán about a doubtful case: 'If the Apostle of God were still alive, methinks there had been a Koran passage revealed on this point." Not unfrequently the divine word was found to coincide with the advice which Mohammed had received from his most intimate disciples. "Omar was many a time of a certain opinion," says one tradition, "and the Koran was then revealed accordingly."

Contents of the Koran.

The contents of the different parts of the Koran are extremely varied. Many passages consist of theological or moral reflections. We are reminded of the greatness, the goodness, the righteousness of God as manifested in Nature, in history, and in revelation through the prophets, especially through Mohammed. God is magnified as the One, the All-powerful. Idolatry and all deification of created beings, such as the worship of Christ as the Son of God, are unsparingly condemned. The joys of heaven and the pains of hell are depicted in vivid sensuous imagery, as is also the terror of the whole creation at the advent of the last day and the judgment of the world. Believers receive general moral instruction, as well as directions for special circumstances. The lukewarm are rebuked, the enemies threatened with terrible punishment, both temporal and eternal. To the sceptical the truth of Islam is held forth; and a certain, not very cogent, method of demonstration predominates. In many passages the sacred book falls into a diffuse preaching style, others seem more like proclamations or general orders. A great number contain ceremonial or civil laws, or even special commands to individuals down to such matters as the regulation of Mohammed's harem. In not a few, definite questions are answered which had actually been propounded to the Prophet by believers or infidels. Mohammed himself, too, repeatedly receives direct injunctions, and does not escape an occasional rebuke. One súra (i.) is a prayer, two (cxiii., cxiv.) are magical formulas. Many súras treat of a single topic, others embrace several.

Narratives.

From the mass of material comprised in the Koran—and the account we have given is far from exhaustive—we should select the histories of the ancient prophets and saints as possessing a peculiar interest. The purpose of Mohammed is to show from these histories how God in former times had rewarded the righteous and punished their enemies. For the most part the old prophets only serve to introduce a little variety in point of form, for they are almost in every case facsimiles of Mohammed himself. They preach exactly like him, they have to bring the very same charges against their opponents, who on their part behave exactly as the unbelieving inhabitants of Mecca. The Koran even goes so far as to make Noah contend against the worship of certain false gods, mentioned by name, who were worshipped by the Arabs of Mohammed's time. In an address which is put in the mouth of Abraham (xxvi. 75 *sqq.*) the reader quite forgets that it is Abraham, and not Mohammed (or God himself) who is

Many súras treat of a single topic, others embrace several.

Narratives.

From the mass of material comprised in the Koran—and the account we have given is far from exhaustive—we should select the histories of the ancient prophets and saints as possessing a peculiar interest. The purpose of Mohammed is to show from these histories how God in former times had rewarded the righteous and punished their enemies. For the most part the old prophets only serve to introduce a little variety in point of form, for they are almost in every case facsimiles of Mohammed himself. They preach exactly like him, they have to bring the very same charges against their opponents, who on their part behave exactly as the unbelieving inhabitants of Mecca. The Koran even goes so far as to make Noah contend against the worship of certain false gods, mentioned by name, who were worshipped by the Arabs of Mohammed's time. In an address which is put in the mouth of Abraham (xxvi. 75 *sqq.*) the reader quite forgets that it is Abraham, and not Mohammed (or God himself) who is

Ilyás (vi. 85; xxxvii. 123). The substance even is modified to suit exigencies of rhyme. Thus the Prophet would scarcely have fixed on the unusual number of *eight* angels round the throne of God (lxix. 17) if the word *thamániyah*, "eight," had not happened to fall in so well with the rhyme. And when lv. speaks of *two* heavenly gardens, each with *two* fountains and *two* kinds of fruit, and again of *two* similar gardens, all this is simply because the dual termination (*án*) corresponds to the syllable that controls the rhyme in that whole súra. In the later pieces, Mohammed often inserts edifying remarks, entirely out of keeping with the context, merely to complete his rhyme. In Arabic it is such an easy thing to accumulate masses of words with the same termination, that the gross negligence of the rhyme in the Koran is doubly remarkable. One may say that this is another mark of the Prophet's want of mental training, and incapacity for introspective criticism.

Stylistic weaknesses.

On the whole, while many parts of the Koran undoubtedly have considerable rhetorical power, even over an unbelieving reader, the book, æsthetically considered, is by no means a first-rate performance. To begin with what we are most competent to criticize, let us look at some of the more extended narratives. It has already been noticed how vehement and abrupt they are where they ought to be characterized by epic repose. Indispensable links, both in expression and in the sequence of events, are often omitted, so that to understand these histories is sometimes far easier for us than for those who heard them first, because we know most of them from better sources. Along with this, there is a great deal of superfluous verbiage; and nowhere do we find a steady advance in the narration. Contrast in these respects the history of Joseph (xii.) and its glaring improprieties, with the admirably-conceived and admirably-executed story in Genesis. Similar faults are found in the non-narrative portions of the Koran. The connexion of ideas is extremely loose, and even the syntax betrays great awkwardness. Anacolutha are of frequent occurrence, and cannot be explained as conscious literary devices. Many sentences begin with a "when" or "on the day when" which seems to hover in the air, so that the commentators are driven to supply a "think of this" or some such ellipsis. Again, there is no great literary skill evinced in the frequent and needless harping on the same words and phrases; in xviii., for example, "till that" (*hattá idhá*) occurs no fewer than eight times. Mohammed, in short, is not in any sense a master of style. This opinion will be endorsed by any European who reads through the book with an impartial spirit and some knowledge of the language, without taking into account the tiresome effect of its endless iterations. But in the ears of every pious Moslem such a judgment will sound almost as shocking as downright atheism or polytheism.

gma he istic ec- of an.

Among the Moslems, the Koran has always been looked on as the most perfect model of style and language. This feature of it is in their dogmatic the greatest of all miracles, the incontestable proof of its divine origin. Such a view on the part of men who knew Arabic infinitely better than the most accomplished European Arabist will ever do, may well startle us. In fact, the Koran boldly challenged its opponents to produce ten súras, or even a single one, like those of the sacred book, and they never did so. That, to be sure, on calm reflexion, is not so very surprising. Revelations of the kind which Mohammed uttered, no unbeliever could produce without making himself a laughing-stock. However little real originality there is in Mohammed's doctrines, as against his own countrymen he was thoroughly original, even in the form of his oracles. To compose such revelations at will was beyond the power of the most expert literary artist; it would have required either a prophet, or a shameless impostor. And if such a character appeared *after* Mohammed, still he could never be anything but an imitator, like the false prophets who arose about the time of his death and afterwards. That the adversaries should produce any sample whatsoever of poetry or rhetoric equal to the Koran is not at all what the Prophet demands. In that case he would have been put to shame, even in the eyes of many of his own followers, by the first poem that came to hand. Nevertheless, it is on a false interpretation of this challenge that the dogma of the incomparable excellence of the style and diction of the Koran is based. The rest has been accomplished by dogmatic prejudice, which is quite capable of working other miracles besides turning a defective literary production into an unrivalled masterpiece in the eyes of believers. This view once accepted, the next step was to find everywhere evidence of the perfection of the style and language. And if here and there, as one can scarcely doubt, there was among the old Moslems a lover of poetry who had his difficulties about this dogma, he had to beware of uttering an opinion which might have cost him his head. We know of at least one rationalistic theologian who defined the dogma in such a way that we can see he did not believe it (Shahrastání, p. 39). The truth is, it would have been a miracle indeed if the style of the Koran had been perfect. For although there was at that time a recognized poetical style, already degenerating to mannerism, a prose style did not exist. All beginnings are difficult; and it can never be esteemed a serious charge against Mohammed that his book, the first prose work of a high order in the language, testifies to the awkwardness of the beginner. And further, we must always remember that entertainment and æsthetic effect were at most subsidiary objects. The great aim was persuasion and conversion; and, say what we will, that aim has been realized on the most imposing scale.

Foreign words.

Mohammed repeatedly calls attention to the fact that the Koran is not written, like other sacred books, in a strange language, but in Arabic, and therefore is intelligible to all. At that time, along with foreign ideas, many foreign words had crept into the language; especially Aramaic terms for religious conceptions of Jewish or Christian origin. Some of these had already passed into general use, while others were confined to a more limited circle. Mohammed, who could not fully express his new ideas in the common language of his countrymen, but had frequently to find out new terms for himself, made free use of such Jewish and Christian words, as was done, though perhaps to a smaller extent, by certain thinkers and poets of that age who had more or less risen above the level of heathenism. In Mohammed's case this is the less wonderful, because he was indebted to the instruction of Jews and Christians whose Arabic—as the Koran pretty clearly intimates with regard to one of them—was very defective. Nor is it very surprising to find that his use of these words is sometimes as much at fault as his comprehension of the histories which he learned from the same people—that he applies Aramaic expressions as incorrectly as many uneducated persons now employ words derived from the French. Thus, *forkán* means really "redemption," but Mohammed (misled by the Arabic meaning of the root فرق "sever," "decide") uses it for "revelation." *Milla* is properly "Word," but in the Koran "religion." *Illiyún* (lxxxiii. 18, 19) is apparently the Hebrew name of God, *Elyón*, "the Most High"; Mohammed uses it of a heavenly book (see S. Fraenkel, *De vocabulis in antiquis Arabum carminibus et in Corano peregrinis*, Leyden, 1880, p. 23). So again the word *mathání* is, as Geiger has conjectured, the

Ilyás (vi. 85; xxxvii. 123). The substance even is modified to suit exigencies of rhyme. Thus the Prophet would scarcely have fixed on the unusual number of *eight* angels round the throne of God (lxix. 17) if the word *thamániyah*, "eight," had not happened to fall in so well with the rhyme. And when lv. speaks of *two* heavenly gardens, each with *two* fountains and *two* kinds of fruit, and again of *two* similar gardens, all this is simply because the dual termination (*án*) corresponds to the syllable that controls the rhyme in that whole súra. Foreign words.

Mohammed repeatedly calls attention to the fact that the Koran is not written, like other sacred books, in a strange language, but in Arabic, and therefore is intelligible to all. At that time, along with foreign ideas, many foreign words had crept into the language; especially Aramaic terms for religious conceptions of Jewish or Christian origin. Some of these had already passed into general use, while others were confined to a more limited circle. Mohammed, who could not fully express his new ideas in the common language of his countrymen, but had frequently to find out new terms for himself, made free use of such Jewish and Christian words, as was done, though perhaps to a smaller extent, by certain thinkers and poets of that age who had more or less risen above the level of heathenism. In Mohammed's case this is the less wonderful, because he was indebted to the instruction of Jews and Christians whose Arabic—as the Koran pretty clearly intimates with regard to one of them—was very defective. Nor is it very surprising to find that his use of these words is sometimes as much at fault as his comprehension of the histories which he learned from the same people—that he applies Aramaic expressions as incorrectly as many uneducated persons now employ words derived from the French. Thus, *forkán* means really "redemption," but Mohammed (misled by the Arabic meaning of the root فرق "sever," "decide") uses it for "revelation." *Milla* is properly "Word," but in the Koran "religion." *Illiyún* (lxxxiii. 18, 19) is apparently the Hebrew name of God, *Elyón*, "the Most High"; Mohammed uses it of a heavenly book (see S. Fraenkel, *De vocabulis in antiquis Arabum carminibus et in Corano peregrinis*, Leyden, 1880, p. 23). So again the word *mathání* is, as Geiger has conjectured, the

short sentences with tolerably pure but rapidly-changing rhymes. The oaths, too, with which many of them begin, were largely used by the soothsayers. Some of these oaths are very uncouth and hard to understand, some of them perhaps were not meant to be understood, for indeed all sorts of strange things are met with in these chapters. Here and there Mohammed speaks of visions, and appears even to see angels before him in bodily form. There are some intensely vivid descriptions of the resurrection and the last day which must have exercised a demonic power over men who were quite unfamiliar with such pictures. Other pieces paint in glowing colours the joys of heaven and the pains of hell. However, the súras of this period are not all so wild as these; and those which are conceived in a calmer mood appear to be the oldest. Yet, one must repeat, it is exceedingly difficult to make out any strict chronological sequence. For instance, it is by no means certain whether the beginning of xcvi. is really, what a widely-circulated tradition calls it, the oldest part of the whole Koran. That tradition goes back to the Prophet's favourite wife 'Áisha; but as she was not born at the time when the revelation is said to have been made, it can only contain at the best what Mohammed told her years afterwards, from his own not very clear recollection, with or without fictitious additions. And, moreover, there are other pieces mentioned by others as the oldest. In any case xcvi. 1 *sqq.* is certainly very early. According to the traditional view, which appears to be correct, it treats of a vision in which the Prophet receives an injunction to recite a revelation conveyed to him by the angel. It is interesting to observe that here already two things are brought forward as proofs of the omnipotence and care of God: one is the creation of man out of a seminal drop—an idea to which Mohammed often recurs; the other is the then recently introduced art of writing, which the Prophet instinctively seizes on as a means of propagating his doctrines. It was only after Mohammed encountered obstinate resistance that the tone of the revelations became thoroughly passionate. In such cases he was not slow to utter terrible threats against those who ridiculed the preaching of the unity of God, of the resurrection, and of the judgment. His own uncle Abú Lahab had rudely repelled him, and in a brief special súra (cxi.) he and his wife are consigned to hell. The súras of this period form almost exclusively the concluding portions of the present text. One is disposed to assume, however, that they were at one time more numerous, and that many of them were lost at an early period.

Since Mohammed's strength lay in his enthusiastic and fiery imagination rather than in the wealth of ideas and clearness of abstract thought on which exact reasoning depends, it follows that the older súras, in which the former qualities have free scope, must be more attractive to us than the later. In the súras of the second period the imaginative glow perceptibly diminishes; there is still fire and animation, but the tone becomes gradually more prosaic. As the feverish restlessness subsides, the periods are drawn out, and the revelations as a whole become longer. The truth of the new doctrine is proved by accumulated instances of God's working in nature and in history; the objections of opponents, whether advanced in good faith or in jest, are controverted by arguments; but the demonstration is often confused or even weak. The histories of the earlier prophets, which had occasionally been briefly touched on in the first period, are now related, sometimes at great length. On the whole, the charm of the style is passing away.

The Fátiha.

There is one piece of the Koran, belonging to the beginning of this period, if not to the close of the former, which claims particular notice. This is i., the Lord's Prayer of the Moslems, and beyond dispute the gem of the Koran. The words of this súra, which is known as *al-fátiha* ("the opening one") are as follows:—

(1) In the name of God, the compassionate compassioner. (2) Praise be [literally "is"] to God, the Lord of the worlds, (3) the compassionate compassioner, (4) the Sovereign of the day of judgment. (5) Thee do we worship and of Thee do we beg assistance. (6) Direct us in the right way; (7) in the way of those to whom Thou hast been gracious, on whom there is no wrath, and who go not astray.

The thoughts are so simple as to need no explanation; and yet the prayer is full of meaning. It is true that there is not a single original idea of Mohammed's in it. Several words and turns of expression are borrowed directly from the Jews, in particular the designation of God as the "Compassioner," *Raḥmán*. This is simply the Jewish *Raḥmáná*, which was a favourite name for God in the Talmudic period. Mohammed seems for a while to have entertained the thought of adopting *al-Raḥmán* as a proper name of God, in place of *Alláh*, which was already used by the heathens.[1] This purpose he ultimately relinquished, but it is just in the súras of the second period that the use of *Raḥmán* is specially frequent. It was probably in the first súra also that Mohammed first introduced the formula, "In the name of God," etc. It is to be regretted that this prayer must lose its effect through too frequent use, for every Moslem who says his five prayers regularly—as the most of them do—repeats it not less than twenty times a day.

Raḥmán.

Latest Meccan súras.

The súras of the third Meccan period, which form a pretty large part of our present Koran, are almost entirely prosaic. Some of the revelations are of considerable extent, and the single verses also are much longer than in the older súras. Only now and then a gleam of poetic power flashes out. A sermonizing tone predominates. The súras are very edifying for one who is already reconciled to their import, but to us at least they do not seem very well fitted to carry conviction to the minds of unbelievers. That impression, however, is not correct, for in reality the demonstrations of these longer Meccan súras appear to have been peculiarly influential for the propagation of Islam. Mohammed's mission was not to Europeans, but to a people who, though quick-witted and receptive, were not accustomed to logical thinking, while they had outgrown their ancient religion.

Medina súras.

When we reach the Medina period it becomes, as has been indicated, much easier to understand the revelations in their historical relations, since our knowledge of the history of Mohammed in Medina is tolerably complete. In many cases the historical occasion is perfectly clear, in others we can at least recognize the general situation from which they arose, and thus approximately fix their time. There still remains, however, a remnant, of which we can only say that it belongs to Medina.

The style of this period bears a pretty close resemblance to that of the latest Meccan period. It is for the most part pure prose, enriched by occasional rhetorical embellishments. Yet even here there are many bright and impressive passages, especially in those sections which may be regarded as proclamations to the army of the faithful. For the Moslems, Mohammed has many different messages. At one time it is a summons to do battle for the faith; at another, a series of reflexions on recently experienced success or misfortune, or a rebuke for their weak faith; or an exhortation to virtue, and so on. He often addresses himself to the "doubters," some of whom vacillate between faith and unbelief, others make a pretence of faith, while others

[1] Since in Arabic also the root رحم signifies "to have pity," the Arabs must have at once perceived the force of the new name.

short sentences with tolerably pure but rapidly-changing rhymes. The oaths, too, with which many of them begin, were largely used by the soothsayers. Some of these oaths are very uncouth and hard to understand, some of them perhaps were not meant to be understood, for indeed all sorts of strange things are met with in these chapters. Here and there Mohammed speaks of visions, and appears even to see angels before him in bodily form. There are some intensely vivid descriptions of the resurrection and the last day which must have exercised a demonic power over men who were quite unfamiliar with such pictures. Other pieces paint in glowing colours the joys of heaven and the pains of hell. However, the súras of this period are not all so wild as these; and those which are conceived in a calmer mood appear to be the oldest. Yet, one must repeat, it is exceedingly difficult to make out any strict chronological sequence. For instance, it is by no means certain whether the beginning of xcvi. is really, what a widely-circulated tradition calls it, the oldest part of the whole Koran. That tradition goes back to the Prophet's favourite wife 'Áisha; but as she was not born at the time when the revelation is said to have been made, it can only contain at the best what Mohammed told her years afterwards, from his own not very clear recollection, with or without fictitious additions. And, moreover, there are other pieces mentioned by others as the oldest. In any case xcvi. 1 *sqq.* is certainly very early. According to the traditional view, which appears to be correct, it treats of a vision in which the Prophet receives an injunction to recite a revelation conveyed to him by the angel. It is interesting to observe that here already two things are brought forward as proofs of the omnipotence and care of God: one is the creation of man out of a seminal drop—an idea to which Mohammed often recurs; the other is the then recently introduced art of writing, which the Prophet instinctively seizes on as a means of propagating his doctrines. It was only after Mohammed encountered obstinate resistance that the tone of the revelations became thoroughly passionate. In such cases he was not slow to utter terrible threats against those who ridiculed the preaching of the unity of God, of the resurrection, and of the judgment. His own uncle Abú Lahab had rudely repelled him, and in a brief special súra (cxi.) he and his wife are consigned to hell. The súras of this period form almost exclusively the concluding portions of the present text. One is disposed to assume, however, that they were at one time more numerous, and that many of them were lost at an early period.

Since Mohammed's strength lay in his enthusiastic and fiery imagination rather than in the wealth of ideas and clearness of abstract thought on which exact reasoning depends, it follows that the older súras, in which the former qualities have free scope, must be more attractive to us than the later. In the súras of the second period the imaginative glow perceptibly diminishes; there is still fire and animation, but the tone becomes gradually more prosaic. As the feverish restlessness subsides, the periods are drawn out, and the revelations as a whole become longer. The truth of the new doctrine is proved by accumulated instances of God's working in nature and in history; the objections of opponents, whether advanced in good faith or in jest, are controverted by arguments; but the demonstration is often confused or even weak. The histories of the earlier prophets, which had occasionally been briefly touched on in the first period, are now related, sometimes at great length. On the whole, the charm of the style is passing away.

The Fátiha.

There is one piece of the Koran, belonging to the beginning of this period, if not to the close of the former, which claims particular notice. This is i., the Lord's Prayer of the Moslems, and beyond dispute the gem of the Koran. The words of this súra, which is known as *al-fátiha* ("the opening one") are as follows:—

(1) In the name of God, the compassionate compassioner. (2) Praise be [literally "is"] to God, the Lord of the worlds, (3) the compassionate compassioner, (4) the Sovereign of the day of judgment. (5) Thee do we worship and of Thee do we beg assistance. (6) Direct us in the right way; (7) in the way of those to whom Thou hast been gracious, on whom there is no wrath, and who go not astray.

The thoughts are so simple as to need no explanation; and yet the prayer is full of meaning. It is true that there is not a single original idea of Mohammed's in it. Several words and turns of expression are borrowed directly from the Jews, in particular the designation of God as the "Compassioner," *Rahmán*. This is simply the Jewish *Rahmáná*, which was a favourite name for God in the Talmudic period. Mohammed seems for a while to have entertained the thought of adopting *al-Rahmán* as a proper name of God, in place of *Alláh*, which was already used by the heathens.[1] This purpose he ultimately relinquished, but it is just in the súras of the second period that the use of *Rahmán* is specially frequent. It was probably in the first súra also that Mohammed first introduced the formula, "In the name of God," etc. It is to be regretted that this prayer must lose its effect through too frequent use, for every Moslem who says his five prayers regularly—as the most of them do—repeats it not less than twenty times a day.

[1] Since in Arabic also the root رحم signifies "to have pity," the Arabs must have at once perceived the force of the new name.

Hafṣa, which, however, was soon afterwards destroyed by Merwán, the governor of Medina. The destruction of the earlier codices was an irreparable loss to criticism; but, for the essentially political object of putting an end to controversies by admitting only one form of the common book of religion and of law, this measure was necessary.

The result of these labours is in our hands; as to how they were conducted we have no trustworthy information, tradition being here too much under the influence of dogmatic presuppositions. The critical methods of a modern scientific commission will not be expected of an age when the highest literary education for an Arab consisted in ability to read and write. It now seems to me highly probable that this second redaction took this simple form: Zaid read off from the codex which he had previously written, and his associates, simultaneously or successively, wrote one copy each to his dictation. It certainly cannot have been by chance that, according to sure tradition, they wrote exactly four copies. Be that as it may, it is impossible now to distinguish in the present form of the book what belongs to the first redaction from what is due to the second.

In the arrangement of the separate sections, a classification according to contents was impracticable because of the variety of subjects often dealt with in one súra. A chronological arrangement was out of the question, because the chronology of the older pieces must have been imperfectly known, and because in some cases passages of different dates had been joined together. Indeed, systematic principles of this kind were altogether disregarded at that period. The pieces were accordingly arranged in indiscriminate order, the only rule observed being to place the long súras first and the shorter towards the end, and even that was far from strictly adhered to. The short opening súra is so placed on account of its superiority to the rest, and two magical formulæ are kept for a sort of protection at the end; these are the only special traces of design. The combination of pieces of different origin may proceed partly from the possessors of the codices from which Zaid compiled his first complete copy, partly from Zaid himself. The individual súras are separated simply by the superscription—"In the name of God, the compassionate Compassioner," which is wanting only in the ninth. The additional headings found in our texts (the name of the súra, the number of verses, etc.) were not in the original codices, and form no integral part of the Koran.

It is said that 'Othmán directed Zaid and his associates, in cases of disagreement, to follow the Koraish dialect; but, though well attested, this account can scarcely be correct. The extremely primitive writing of those days was quite incapable of rendering such minute differences as can have existed between the pronunciation of Mecca and that of Medina.

The Koran not complete.

'Othmán's Koran was not complete. Some passages are evidently fragmentary; and a few detached pieces are still extant which were originally parts of the Koran, although they have been omitted by Zaid. Amongst these are some which there is no reason to suppose Mohammed desired to suppress. Zaid may easily have overlooked a few stray fragments, but that he purposely omitted anything which he believed to belong to the Koran is very unlikely. It has been conjectured that in deference to his superiors he kept out of the book the names of Mohammed's enemies, if they or their families came afterwards to be respected. But it must be remembered that it was never Mohammed's practice to refer explicitly to contemporary persons and affairs in the Koran. Only a single friend, his adopted son Zaid (xxxiii. 37), and a single enemy, his uncle Abú Lahab (cxi.)—and these for very special reasons—are mentioned by name; and the name of the latter has been left in the Koran with a fearful curse annexed to it, although his son had embraced Islam before the death of Mohammed. So, on the other hand, there is no single verse or clause which can be plausibly made out to be an interpolation by Zaid at the instance of Abúbekr, 'Omar, or 'Othmán. Slight clerical errors there may have been, but the Koran of 'Othmán contains none but genuine elements,—though sometimes in very strange order.

Of the four exemplars of 'Othmán's Koran, one was kept in Medina, and one was sent to each of the three metropolitan cities, Cufa, Baṣra, and Damascus. It can still be pretty clearly shown in detail that these four codices deviated from one another in points of orthography, in the insertion or omission of a *wa* ("and"), and such-like minutiæ; but these variations nowhere affect the sense. All later manuscripts are derived from these four originals.

Other ...

At the same time, the other forms of the Koran did not at once become extinct. In particular we have some information about the codex of Obay. If the list which gives the order of its súras is correct, it must have contained substantially the same materials as our text; in that case Obay must have used the original collection of Zaid. The same is true of the codex of Ibn Mas'úd, of which we have also a catalogue. It appears that the principle of putting the longer súras before the shorter was more consistently carried out by him than by Zaid. He omits i. and the magical formulæ of cxiii. cxiv. Obay, on the other hand, had embodied two additional short prayers, which we may regard as Mohammed's. One can easily understand that differences of opinion may have existed as to whether and how far formularies of this kind belonged to the Koran. Some of the divergent readings of both these texts have been preserved, as well as a considerable number of other ancient variants. Most of them are decidedly inferior to the received readings, but some are quite as good, and a few deserve preference.

Ibn Mas'...

The only man who appears to have seriously opposed the general introduction of 'Othmán's text is Ibn Mas'úd. He was one of the oldest disciples of the Prophet, and had often rendered him personal service; but he was a man of contracted views, although he is one of the pillars of Moslem theology. His opposition had no effect. Now when we consider that at that time there were many Moslems who had heard the Koran from the mouth of the Prophet, that other measures of the imbecile 'Othmán met with the most vehement resistance on the part of the bigoted champions of the faith, that these were still further incited against him by some of his ambitious old comrades until at last they murdered him, and finally that in the civil wars after his death the several parties were glad of any pretext for branding their opponents as infidels;—when we consider all this, we must regard it as a strong testimony in favour of 'Othmán's Koran that no party, not even that of 'Alí, found fault with his conduct in this matter, or repudiated the text formed by Zaid, who was one of the most devoted adherents of 'Othmán and his family.

T... hist... of t... text

But this redaction is not the close of the textual history of the Koran. The ancient Arabic alphabet was very imperfect; it not only wanted marks for the short, and in part even for the long vowels, but it often expressed several consonants by the same sign. Hence there were many words which could be read in very different ways. This variety of possible readings was at first very great, and many readers seem to have actually made it their object to discover pronunciations which were new, provided they were at all appropriate to the ambiguous text. There was also a dialectic license in grammatical forms, which had not as yet been greatly restricted. An effort was made by many to establish a more refined pronunciation for the Koran than was usual in common life or in secular literature. The various schools of "readers" differed very widely from one another; although for the most part there was no important divergence as to the sense of words. A few of them gradu-

MOHL, JULES (1800-1876), Orientalist, was born at Stuttgart 25th October 1800, and educated for the Lutheran Church at Tübingen; but his inclinations carried him from theology through Hebrew to Oriental studies, and in 1823 he betook himself to Paris, at that time under De Sacy the great European school of Eastern letters. He soon acquired reputation, and from 1826 to 1833 was nominally professor at Tübingen, with permission to continue his studies in France, but he never entered on the duties of this office, Paris having become his second home. In 1826 he was charged by the French Government with the preparation of an edition of the *Sháh Námeh*, the first volume of which appeared in 1838, while the seventh and last was left unfinished at his death; in 1844 he was nominated to the Institut, and in 1847 he became professor of Persian at the Collége de France. But his knowledge and interest extended to all departments of Oriental learning, and this catholicity of taste, united to a singular impartiality of judgment and breadth of view, gave him a quite remarkable personal influence on the course of Eastern learning in France. The chief sphere of this influence was the Société Asiatique, which he served for many years as secretary-adjunct, as secretary, and finally as president. His annual reports on Oriental science, presented to the society from 1840 to 1867, and collected after his death (4th January 1876, at Paris) under the title *Vingt-sept Ans des Études Orientales* (Paris, 1879), are an admirable history of the progress of Eastern learning during these years, and justify the high esteem in which he was held by scholars.

MÖHLER, JOHANN ADAM (1796-1838), Roman Catholic theologian, was born at the village of Igersheim in Würtemberg on 6th May 1796, and, after studying philosophy and theology in the Lyceum at Ellwangen, entered the Wilhelmstift in the university of Tübingen in 1817. Ordained to the priesthood in 1819, he was appointed to a curacy at Riedlingen, but speedily returned as "repetent" to Tübingen, where he became privat-docent in 1822, extraordinary professor of theology in 1826, and ordinary in 1828. The controversies excited by his *Symbolik* (1832) proved so unpleasant that in 1835 he accepted a call to the university of Munich. In 1838 he was appointed to the deanery of Würzburg, but died shortly afterwards (12th April 1838).

Möhler wrote *Die Einheit in der Kirche* (Tübingen, 1825); *Athanasius der Grosse u. d. Kirche seiner Zeit im Kampfe m. d. Arianismus* (2 vols., Mainz, 1827); *Symbolik, oder Darstellung der dogmatischen Gegensätze der Katholiken u. Protestanten nach ihren öffentlichen Bekenntnissschriften* (Mainz, 1832; 8th ed., 1871-72; Eng. transl. by J. B. Robertson, 1843); and *Neue Untersuchungen der Lehrgegensätze zwischen den Katholiken u. Protestanten* (1834). His *Gesammelte Schriften u. Aufsätze* were edited by Döllinger in 1839; his *Patrologie* by Reithmayr, also in 1839; and a *Biographie* by Wörner was published at Ratisbon in 1866. It is with the *Symbolik* that his name is chiefly associated; the interest excited by it in Protestant circles is shown by the fact that within two years of its appearance it had elicited three replies of considerable importance, those namely of Baur, Marheineke, and Nitzsch. But, although characterized by abundant learning and acuteness, as well as by considerable breadth of spiritual sympathy, and thus a stimulative and suggestive work, it cannot be said to have been accepted by Catholics themselves as embodying an accurate objective view of the actual doctrine of their church. The liberal school of thought of which Möhler was a prominent exponent was discouraged in official circles, while Protestants, on the other hand, complain that the author has failed to grasp the vast significance of the Reformation as a great movement in the spiritual history of mankind, while expending needless pains on an exposition of the doctrinal shortcomings, inconsistencies, and contradictions of the individuals who were its leaders.

MOHR, KARL FRIEDRICH (1806-1879), a philosopher whose greatest claims to scientific distinction are as yet, though indubitable, only partially admitted, was the son of a well-to-do druggist in Coblentz, and was born 4th November 1806. Being a delicate child, he received much of his early education at home, in great part in his father's laboratory. To this may be traced much of the skill he showed in devising instruments and methods of analysis which are still in common use in chemical and pharmaceutical laboratories. At the age of 21 he studied chemistry under Gmelin, and, after five years spent in Heidelberg, Berlin, and Bonn, returned with the degree of Ph.D. to join his father's establishment. On the death of his father in 1840 he succeeded to the business, retiring from it for scientific leisure in 1857. Serious pecuniary losses led him at the age of 57 to become a privat-docent in Bonn, where he was soon after appointed, by the direct influence of the emperor, extraordinary professor of pharmacy. In private and domestic life he was a man of singularly winning manners, intensely fond of music and poetry, for the latter of which he showed wonderful memory. But his uncompromising spirit—perhaps we might even in some cases say his wrongheadedness—in matters of scientific and theological authority had raised such a host of enemies that even royal influence could not secure his further advancement. Although he stood at the very head of the scientific pharmacists of Germany, his name was deliberately omitted from the list of the commission entrusted with the preparation of the *Pharmacopœia Germanica*. Yet in that work many of his ideas and processes were incorporated by the very men who had previously denounced them. He died in October 1879.

Mohr's best-known work is his *Lehrbuch der chemisch-analytischen Titrirmethode* (1855), which has already run through many editions, and which was specially commended by Liebig. His improvements in methods of chemical analysis occupy a long series of papers extending over some fifty years. He also published a number of physical papers on subjects such as Hail, St. Elmo's Fire, Ground-ice, &c., and a curious notice of the earliest mention of Ozone. He shows that Homer, on four different occasions, mentions the sulphurous smell produced by lightning, and employs the very word from which the name of Ozone was long afterwards coined. In 1866 appeared his *Geschichte der Erde, eine Geologie auf neuer Grundlage*, which has obtained a wide circulation.

But he will be remembered in future times mainly on account of a paper, *Ueber die Natur der Wärme*, published in 1837, which unfortunately has not yet appeared in full in an English translation. The history of this paper is remarkable. It was refused admission into *Poggendorff's Annalen*, and was then sent to Baumgartner of Vienna, in whose *Zeitschrift für Physik*, &c., it was at once published. As no proof-sheets reached Mohr, he concluded that his paper had been lost or rejected, and contented himself with publishing a short analysis in the *Annalen der Pharmacie*, of which he was an editor. This analysis, it is only fair to say, though probably prepared by the author himself, gives a very inadequate idea of the scope and merit of the paper. In 1864 Dr. Akin unearthed the paper from the forgotten pages of the *Zeitschrift*, and the author was enabled to reprint it, with notes, while the recent discussions as to the history of Conservation of Energy were still being carried on. Along with it he issued a number of other papers of greatly inferior merit.

Unless some still earlier author should be discovered, there can be no doubt that Mohr is to be recognized as the first to enunciate in its generality what we now call "conservation of energy." The thesis of his paper must be stated in his own words,—"Besides the 54 known chemical elements, there is in the physical world one agent only, and this is called Kraft (energy).[1] It may appear, according to circumstances, as motion, chemical affinity, cohesion, electricity, light, and magnetism; and from any one of these forms it can be transformed into any of the others." Even now, after nearly half a century of rapid advance in science, it would be difficult to improve this statement except by inserting, as regards transformation of energy, some such guarding expression as "in whole or in part." But if Mohr had inserted this, he might have had claims to the "dissipation of energy" also. Mohr's starting-point appears to have been the discovery (by Forbes) of the polarization of radiant heat. He goes through the whole of the then range of physics, pointing out the explanation of each experimental result as a transformation of energy, mentioning even the electric currents produced by electro-magnetic induction as a transformation of the energy required to draw the coil from the magnet—one of the earlier methods used by Joule for quantitative determinations. His numerical results, based on data quoted from various books, are, it is

[1] It is to be remembered that even the most accurate authorities in Germany—as, for instance, Von Helmholtz in his *Essay* of 1847—used till quite recently the word Kraft in the sense of Energy.

MOHL, JULES (1800-1876), Orientalist, was born at Stuttgart 25th October 1800, and educated for the Lutheran Church at Tübingen; but his inclinations carried him from theology through Hebrew to Oriental studies, and in 1823 he betook himself to Paris, at that time under De Sacy the great European school of Eastern letters. He soon acquired reputation, and from 1826 to 1833 was nominally professor at Tübingen, with permission to continue his studies in France, but he never entered on the duties of this office, Paris having become his second home. In 1826 he was charged by the French Government with the preparation of an edition of the *Sháh Námeh*, the first volume of which appeared in 1838, while the seventh and last was left unfinished at his death; in 1844 he was nominated to the Institut, and in 1847 he became professor of Persian at the Collége de France. But his knowledge and interest extended to all departments of Oriental learning, and this catholicity of taste, united to a singular impartiality of judgment and breadth of view, gave him a quite remarkable personal influence on the course of Eastern learning in France. The chief sphere of this influence was the Société Asiatique, which he served for many years as secretary-adjunct, as secretary, and finally as president. His annual reports on Oriental science, presented to the society from 1840 to 1867, and collected after his death (4th January 1876, at Paris) under the title *Vingt-sept Ans des Études Orientales* (Paris, 1879), are an admirable history of the progress of Eastern learning during these years, and justify the high esteem in which he was held by scholars.

MÖHLER, JOHANN ADAM (1796-1838), Roman Catholic theologian, was born at the village of Igersheim in Würtemberg on 6th May 1796, and, after studying philosophy and theology in the Lyceum at Ellwangen, entered the Wilhelmstift in the university of Tübingen in 1817. Ordained to the priesthood in 1819, he was appointed to a curacy at Riedlingen, but speedily returned as "repetent" to Tübingen, where he became privat-docent in 1822, extraordinary professor of theology in 1826, and ordinary in 1828. The controversies excited by his *Symbolik* (1832) proved so unpleasant that in 1835 he accepted a call to the university of Munich. In 1838 he was appointed to the deanery of Würzburg, but died shortly afterwards (12th April 1838).

Möhler wrote *Die Einheit in der Kirche* (Tübingen, 1825); *Athanasius der Grosse u. d. Kirche seiner Zeit im Kampfe m. d. Arianismus* (2 vols., Mainz, 1827); *Symbolik, oder Darstellung der dogmatischen Gegensätze der Katholiken u. Protestanten nach ihren öffentlichen Bekenntnissschriften* (Mainz, 1832; 8th ed., 1871-72; Eng. transl. by J. B. Robertson, 1843); and *Neue Untersuchungen der Lehrgegensätze zwischen den Katholiken u. Protestanten* (1834). His *Gesammelte Schriften u. Aufsätze* were edited by Dollinger in 1839; his *Patrologie* by Reithmayr, also in 1839; and a *Biographie* by Wörner was published at Ratisbon in 1866. It is with the *Symbolik* that his name is chiefly associated; the interest excited by it in Protestant circles is shown by the fact that within two years of its appearance it had elicited three replies of considerable importance, those namely of Baur, Marheineke, and Nitzsch. But, although characterized by abundant learning and acuteness, as well as by considerable breadth of spiritual sympathy, and thus a stimulative and suggestive work, it cannot be said to have been accepted by Catholics themselves as embodying an accurate objective view of the actual doctrine of their church. The liberal school of thought of which Mohler was a prominent exponent was discouraged in official circles, while Protestants, on the other hand, complain that the author has failed to grasp the vast significance of the Reformation as a great movement in the spiritual history of mankind, while expending needless pains on an exposition of the doctrinal shortcomings, inconsistencies, and contradictions of the individuals who were its leaders.

MOHR, KARL FRIEDRICH (1806-1879), a philosopher whose greatest claims to scientific distinction are as yet, though indubitable, only partially admitted, was the son of a well-to-do druggist in Coblentz, and was born 4th November 1806. Being a delicate child, he received much of his early education at home, in great part in his father's laboratory. To this may be traced much of the skill he showed in devising instruments and methods of analysis which are still in common use in chemical and pharmaceutical laboratories. At the age of 21 he studied chemistry under Gmelin, and, after five years spent in Heidelberg, Berlin, and Bonn, returned with the degree of Ph.D. to join his father's establishment. On the death of his father in 1840 he succeeded to the business, retiring from it for scientific leisure in 1857. Serious pecuniary losses led him at the age of 57 to become a privat-docent in Bonn, where he was soon after appointed, by the direct influence of the emperor, extraordinary professor of pharmacy. In private and domestic life he was a man of singularly winning manners, intensely fond of music and poetry, for the latter of which he showed wonderful memory. But his uncompromising spirit—perhaps we might even in some cases say his wrongheadedness—in matters of scientific and theological authority had raised such a host of enemies that even royal influence could not secure his further advancement. Although he stood at the very head of the scientific pharmacists of Germany, his name was deliberately omitted from the list of the commission entrusted with the preparation of the *Pharmacopœia Germanica*. Yet in that work many of his ideas and processes were incorporated by the very men who had previously denounced them. He died in October 1879.

Mohr's best-known work is his *Lehrbuch der chemisch-analytischen Titrirmethode* (1855), which has already run through many editions, and which was specially commended by Liebig. His improvements in methods of chemical analysis occupy a long series of papers extending over some fifty years. He also published a number of physical papers on subjects such as Hail, St. Elmo's Fire, Ground-ice, &c., and a curious notice of the earliest mention of Ozone. He shows that Homer, on four different occasions, mentions the sulphurous smell produced by lightning, and employs the very word from which the name of Ozone was long afterwards coined. In 1866 appeared his *Geschichte der Erde, eine Geologie auf neuer Grundlage*, which has obtained a wide circulation.

But he will be remembered in future times mainly on account of a paper, *Ueber die Natur der Warme*, published in 1837, which unfortunately has not yet appeared in full in an English translation. The history of this paper is remarkable. It was refused admission into *Poggendorff's Annalen*, and was then sent to Baumgartner of Vienna, in whose *Zeitschrift fur Physik*, &c., it was at once published. As no proof-sheets reached Mohr, he concluded that his paper had been lost or rejected, and contented himself with publishing a short analysis in the *Annalen der Pharmacie*, of which he was an editor. This analysis, it is only fair to say, though probably prepared by the author himself, gives a very inadequate idea of the scope and merit of the paper. In 1864 Dr. Akin unearthed the paper from the forgotten pages of the *Zeitschrift*, and the author was enabled to reprint it, with notes, while the recent discussions as to the history of Conservation of Energy were still being carried on. Along with it he issued a number of other papers of greatly inferior merit.

Unless some still earlier author should be discovered, there can be no doubt that Mohr is to be recognized as the first to enunciate in its generality what we now call "conservation of energy." The thesis of his paper must be stated in his own words,—"Besides the 54 known chemical elements, there is in the physical world one agent only, and this is called Kraft (energy).[1] It may appear, according to circumstances, as motion, chemical affinity, cohesion, electricity, light, and magnetism; and from any one of these forms it can be transformed into any of the others." Even now, after nearly half a century of rapid advance in science, it would be difficult to improve this statement except by inserting, as regards transformation of energy, some such guarding expression as "in whole or in part." But if Mohr had inserted this, he might have had claims to the "dissipation of energy" also. Mohr's starting-point appears to have been the discovery (by Forbes) of the polarization of radiant heat. He goes through the whole of the then range of physics, pointing out the explanation of each experimental result as a transformation of energy, mentioning even the electric currents produced by electro-magnetic induction as a transformation of the energy required to draw the coil from the magnet—one of the earlier methods used by Joule for quantitative determinations. His numerical results, based on data quoted from various books, are, it is

[1] It is to be remembered that even the most accurate authorities in Germany—as, for instance, Von Helmholtz in his *Essay* of 1847—used till quite recently the word Kraft in the sense of Energy.

composed of these distinct portions of matter separated, or capable of being separated, by empty space from other portions. But the *molecular* hypothesis of the constitution of different kinds of substances aims at analysing this process by which such substances are built up out of their constituent atoms. The *molecule* of any substance is, by some chemists, defined as being the smallest portion of that substance to which can be attributed all the chemical properties of the substance; by others, as the smallest portion which, so long as the substance is chemically unchanged, keeps together without complete separation of its parts. In the language of Clausius's theorem, if the parts of the molecule have internal motion, the kinetic energy of such internal motion is equal to the virial of the mutual attractive forces of the parts. Thus the formation of the molecule of each particular substance is viewed as an essential step in the process of building up that substance out of its constituent atoms. The molecule is first built up out of atoms arranged in its formation according to a definite type, and then the substance itself is constituted of these molecules. Of course molecules may be, and in fact in many particular substances are, supposed to be monatomic; that is to say, the intermediate step of building up the molecule out of the atoms has, in these particular substances, been omitted, the atoms and molecules becoming then identical. The particular arrangement of the formed molecules in the building up of the substance determines the physical state of that substance,—that is, its fluid, solid, gaseous, crystalline, or amorphous state; but the chemical properties of the substance depend upon the constitution of the molecule. As the investigations and theories of chemistry appear to indicate irresistibly the existence of permanent atoms, so do they also lead almost as necessarily to the conception of the molecule as an entity which bears the same relation to special substances that the atoms bear to matter generally. So long as the molecule endures, the substance of which it is the molecule retains its chemical properties; with the dissolution of the molecule, the substance, as that special substance, perishes; the atoms alone continue, and are free to enter into other combinations. The permanence of the molecule is relative, that of the atom absolute. This conception of the molecular constitution of substances suggests physical questions of great interest, such as the shape, volume, and mass of the constituent molecules, and the relative motions of which their parts are susceptible; and the answers to these questions cannot fail to be of great value in chemical and chemico-physical investigations, as well as in the theories of light and electricity.

Now, whatever differences may exist between the properties of different substances in the solid and liquid states, there are certain properties which, in the gaseous state, manifest themselves with no variation whatever in all substances alike. Hence the explanation of these common properties—or gaseous laws, as they are called—has long possessed a peculiar fascination for physicists. The tendency to expand or fill all accessible space, manifested by all gases, proves that on the molecular hypothesis their compound atoms or molecules must be continually tending to fly apart. We must conceive gases as constituted of molecules, not only separable but actually separated by space void of the matter of which these gases consist; and it may be most reasonably expected, therefore, that any general laws to which substances in this state conform may afford us a valuable insight into the constitution of these separate molecules.

Now the general laws to which all gases conform are: (1) *Boyle's law*—that, in a given mass of any gas kept at constant temperature, the pressure per unit of area upon the containing surface increases in the same proportion as the volume occupied by the gas is diminished, or at least with very slight deviation from exact proportionality; (2) *Charles's law*—that, if the temperature be varied while the pressure upon the gas remains the same, the gas increases by $\frac{1}{273}$d of its volume at zero centigrade for every degree of centigrade added to the temperature, or, which in combination with Boyle's law is the same thing, that if the density be constant, the pressure is directly proportional to the temperature measured from the point -273° centigrade, this point being called the zero of absolute temperature; (3) *Avogadro's law*—which asserts that all gases at the same temperature and pressure contain the same number of molecules in the same volume; and (4) *Dalton's law*—that in a mixture of different gases, when there is equilibrium, each gas behaves as a vacuum to all the rest.

It was at one time considered that these phenomena might be explained on the hypothesis of mutual repulsive forces between the parts of which the gas is composed, whether they were regarded as constituted of molecules or of infinitely divisible continuous matter,[1] but it has been shown in the article ATOM (vol. iii. p. 39 *sq.*) that there are at least two absolutely conclusive reasons why this explanation cannot be accepted. These objections, together with the experimental fact proved by Joule that gases, or at any rate atmospheric air, expand into vacuum with scarcely any appreciable change of temperature, must be considered fatal to any mutual-force theory of gaseous action, and, accordingly, physicists have been driven to seek for other methods of explaining these laws. The explanation which has been more developed than any other is that known as the kinetic theory of gases, which regards the intrinsic energy of a gaseous mass as residing, not in the potential energy of intermolecular forces, but mainly in the kinetic energy of the molecules themselves, which are assumed to be in a state of continual relative velocity, admitting at the same time a possible small intermolecular potential energy, and it may be also an interatomic energy, between the atoms of the individual molecules. That some such persistent relative motion does exist in every gaseous mass is evident from the rapidity with which odours penetrate the stillest air where no breath of wind—that is, of absolute motion of translation of the mass as a whole or any portion of finite size—is perceptible. It becomes an interesting question whether the laws of mechanics admit of a mass thus constituted ever arriving at a state of permanence; that is to say, whether, consistently with the hypothesis of infinite irregularities in the directions and magnitudes of velocities of individual molecules, there may be found any properties of the mass in the aggregate which remain

[1] An argument in favour of the molecular constitution of gases, to which attention was first called by Professor Osborne Reynolds (Memoir "On some Dimensional Properties of Matter in the Gaseous State," *Phil. Trans.*, 1879), is derived from certain phenomena observed in highly-rarefied gases, and in the transpiration of gases through porous plates. If, according to this argument, we had in a gas to do with a continuous plenum, such that every portion must possess the same properties, then these properties must exist independently of the amount of gas contained in any space, although their sensible effects might be increased or diminished by a variation in that amount. If, then, we can find properties of a gas depending on the size of the space in which it is enclosed, and on the quantity of gas enclosed in this space, we have proof that gas is not continuous —in other words, possesses dimensional structure. Such properties we do find in highly-rarefied gases, as, for instance, in the phenomena of Crooke's radiometer. The motion of the vanes when one side is heated by incident rays appears to depend on the distance between the vane and the containing walls of the vessel bearing some not very high ratio to the distance between the particles or molecules of the gas. At least no satisfactory explanation of the phenomena consistent with the gas being continuous has yet been suggested.

Again, Professor O. Reynolds, from his experiments on the transpiration of gases through a porous plate, finds a relation between the gas and the coarseness or fineness of the plate, which would not exist were the gas continuous.

composed of these distinct portions of matter separated, or capable of being separated, by empty space from other portions. But the *molecular* hypothesis of the constitution of different kinds of substances aims at analysing this process by which such substances are built up out of their constituent atoms. The *molecule* of any substance is, by some chemists, defined as being the smallest portion of that substance to which can be attributed all the chemical properties of the substance; by others, as the smallest portion which, so long as the substance is chemically unchanged, keeps together without complete separation of its parts. In the language of Clausius's theorem, if the parts of the molecule have internal motion, the kinetic energy of such internal motion is equal to the virial of the mutual attractive forces of the parts. Thus the formation of the molecule of each particular substance is viewed as an essential step in the process of building up that substance out of its constituent atoms. The molecule is first built up out of atoms arranged in its formation according to a definite type, and then the substance itself is constituted of these molecules. Of course molecules may be, and in fact in many particular substances are, supposed to be monatomic; that is to say, the intermediate step of building up the molecule out of the atoms has, in these particular substances, been omitted, the atoms and molecules becoming then identical. The particular arrangement of the formed molecules in the building up of the substance determines the physical state of that substance,—that is, its fluid, solid, gaseous, crystalline, or amorphous state; but the chemical properties of the substance depend upon the constitution of the molecule. As the investigations and theories of chemistry appear to indicate irresistibly the existence of permanent atoms, so do they also lead almost as necessarily to the conception of the molecule as an entity which bears the same relation to special substances that the atoms bear to matter generally. [1] An argument in favour of the molecular constitution of gases, to which attention was first called by Professor Osborne Reynolds (Memoir "On some Dimensional Properties of Matter in the Gaseous State," *Phil. Trans.*, 1879), is derived from certain phenomena observed in highly-rarefied gases, and in the transpiration of gases through porous plates. If, according to this argument, we had in a gas to do with a continuous plenum, such that every portion must possess the same properties, then these properties must exist independently of the amount of gas contained in any space, although their sensible effects might be increased or diminished by a variation in that amount. If, then, we can find properties of a gas depending on the size of the space in which it is enclosed, and on the quantity of gas enclosed in this space, we have proof that gas is not continuous —in other words, possesses dimensional structure. Such properties we do find in highly-rarefied gases, as, for instance, in the phenomena of Crooke's radiometer. The motion of the vanes when one side is heated by incident rays appears to depend on the distance between the vane and the containing walls of the vessel bearing some not very high ratio to the distance between the particles or molecules of the gas. At least no satisfactory explanation of the phenomena consistent with the gas being continuous has yet been suggested.

Again, Professor O. Reynolds, from his experiments on the transpiration of gases through a porous plate, finds a relation between the gas and the coarseness or fineness of the plate, which would not exist were the gas continuous.

x and $x+dx$, y and $y+dy$, z and $z+dz$, and component velocities intermediate between u and $u+du$, v and $v+dv$, w and $w+dw$, is

$$\psi(x, y, z, u, v, w)\, dx\, dy\, dz\, du\, dv\, dw.$$

In the state of permanence the form of ψ must be independent of the time (t), so long as the sphere is moving free from collisions with any other.

From the last-mentioned condition it must follow that, if $\phi_1=a_1$, $\phi_2=a_2$, &c., be any equations among the variables determining the position and motion of any sphere obtained by the elimination of t from the equations of motion of that sphere, then ψ must be of the form $\psi(\phi_1, \phi_2, \text{\&c.})$. With the assumption, then, that the number of spheres of the given set with variables between the above-mentioned limits is

$$\psi(\phi_1, \phi_2 \ldots)\, dx \ldots dw,$$

we find for the form of ψ, by reasoning like the foregoing, $Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}$, where χ is the potential energy of the sphere in the position x, y, z, and $c^2=u^2+v^2+w^2$, and h is a constant, the same for all the sets.

If we integrate the expression $Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}dx\, dy\, dz\, du\, dv\, dw$ for all values of x, y, z within the given region, we find for the number of spheres of any set with component velocities between u and $u+du$, v and $v+dv$, w and $w+dw$,

$$Be^{-\frac{hmc^2}{2}} du\, dv\, dw,$$

whence we easily see that the chances of velocities in all directions are the same, and that the mean velocity and mean square velocity of any sphere of this set are $\frac{2\sqrt{2\pi}}{\sqrt{mh}}$ and $\frac{3}{mh}$ respectively, and the mean kinetic energy of any such sphere is $\frac{3}{2h}$, and therefore the same for all the sets.

Furthermore, if we integrate the expression

$$Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}dx\, dy\, dz\, du\, dv\, dw$$

for all values of u, v, and w from $-\infty$ to $+\infty$ respectively, we obtain a result of the form $Ce^{-h\chi}\, dx\, dy\, dz$, and therefore the number of spheres of the set in question with centres within the elementary volume $dx\, dy\, dz$, or, what is the same thing with the exception of a constant factor, the chance of the centre of any sphere of that set being within that elementary volume, is $Ce^{-h\chi}\, dx\, dy\, dz$, so that the *density of the N set of matter in the neighbourhood of the point* x, y, z is $mCe^{-h\chi}$.

We are now in a position to compare the physical properties of a medium composed of monatomic molecules in motion, and free from any intermolecular or interatomic forces with those of ordinary gases, so long at least as the atoms are spherical.

Consider two contiguous portions of such a medium separated by any plane parallel to that of yz, and, since the distribution and motion of each set of spheres is independent of all the other sets, let us confine our attention to the spheres of the N set. Suppose that there are N such spheres per unit volume in the neighbourhood of the point x, y, z, whose component velocities parallel to the axis of x are between u and $u+du$. The number of these spheres which cross the elementary area $dy\, dz$ in time dt will be the same as the number of the dN spheres whose centres are situated within the elementary parallelepiped $dx\, dy\, dz$, in which dx is equal to udt, and this number is

$$Nu\, dy\, dz\, dt.$$

Each of these spheres carries across with it a momentum parallel to x equal to mu; the total momentum parallel to x transferred across $dy\, dz$ in time dt is therefore

$$mNu^2\, dy\, dz\, dt.$$

If u be positive, this is positive momentum transferred from the negative to the positive side of the plane yz; and if u be negative, this is negative momentum similarly transferred from the positive to the negative side of that plane. In either case it follows that by the mere motion of these spheres across the area $dy\, dz$ the positive momentum parallel to the axis of x is diminished by the quantity $mNu^2\, dy\, dz\, dt$ on the negative side of the plane y z, and increased by the same quantity on the positive side of that plane in the time dt; m being, as before, the mass of each sphere. Hence, on the whole, there is a transference of positive x momentum in the time dt across the area $dy\, dz$ equal to $mdy\, dz\, dt\, \Sigma_{-\infty}^{\infty} u^2N$; that is, equal to

$$dy\, dz\, dt\, \rho\overline{u^2},$$

where ρ is the density of the N matter at the point x, y, z, and $\overline{u^2}$ is the mean square of the x velocities.

But either by integration or general reasoning it is easily seen that $\overline{u^2}=\frac{\overline{v^2}}{3}$, where $\overline{v^2}$ is the mean square of the resultant velocities of the N spheres, and is equal, as we have proved, to

$$\frac{3}{mh}.$$

Therefore, there is a transference of positive momentum from the negative to the positive side of the plane yz across the area $dy\, dz$ in time dt equal to

$$\frac{\rho\, dy\, dz\, dt}{mh}.$$

Each separate sphere whose component velocities are u, v, and w carries across the same area y and z momenta equal to mv and mw respectively, so that in the time dt there are carried across the area $dy\, dz\, y$ and z momenta equal to $\Sigma muv\, dy\, dz\, dt$ and $\Sigma muw\, dy\, dz\, dt$, respectively. By symmetry it is clear that Σmuv and Σmuw are separately zero. Therefore, the resultant mutual actions of the two portions of the medium under consideration in the time dt is the transference across the elementary area $dy\, dz$ of a quantity of x momentum equal to $\rho dy\, dz\, dt\, \frac{\overline{v^2}}{3}$ from the negative to the positive *side of the bounding plane. If this mutual action, or, as it is generally called,* "pressure" when referred to unit of surface, be denoted by the symbol p, we get the equation

$$p\, dy\, dz\, dt=\rho\, dy\, dz\, dt\frac{\overline{v^2}}{3},$$

or

$$p=\rho\,\frac{\overline{v^2}}{3}=\frac{\rho}{mh}.$$

Since the momenta parallel to y and z remain unaltered, it follows that the mutual action or pressure between contiguous portions of the medium in the neighbourhood of any point is normal to the bounding surface at that point. Since also the expression for p or $\frac{\rho}{mh}$ is independent of the direction of the x axis, it follows that the pressure at any point of the medium is the same in all directions.

If the contiguous portions of the medium be separated by a material instead of an ideal plane, it will be necessary for the maintenance of equilibrium that there should be an action between this plane and the adjacent medium, equivalent to the transference of momentum estimated above; but action measured by the rate per unit of time at which momentum is generated constitutes moving force or statical pressure. Hence the force or pressure between the plane and medium is normal to the plane, independent of the direction of the plane through the point, and equal to the value of $\frac{\rho}{mh}$ at the point.

When several sets of spheres are present together in the region under consideration, the distribution of the centres and of the velocities of each set is, as we have seen, independent of the coexistence of the other sets. If therefore ρ_1, ρ_2, &c., be the densities of the matter of the different sets in the neighbourhood of the point x, y, z, and if p_1, p_2, &c., be the pressures at that point defined as above, and if m_1, m_2, &c., be the masses of the spheres of each of the sets, and p the total pressure, we get

$$p=p_1+p_2+\text{\&c.}$$
$$=\frac{\rho_1}{m_1h}+\frac{\rho_2}{m_2h}+\text{\&c.}$$

Hence we arrive at the following conclusions:—(1) there is one physical quantity having the same value for every set of spheres—namely, the mean kinetic energy of each sphere, or $\frac{3}{2h}$; let this quantity be called τ; (2) the distribution of the positions and velocities of the spheres of each set is independent of the coexistence of the remaining sets, and is in all respects the same as if that particular set existed alone in the region considered; (3) the pressure at any point referred to unit of surface at any point of the medium arising from the action of any one of the sets is $\frac{2}{3m}\rho\tau$, where ρ is the density of that particular set at the point in question, and τ is the physical quantity above referred to as common to all the sets.

This third inference may be expanded into the following three laws:—(α) if τ be kept constant, then the pressure arising from each set varies as the density of that set; (β) if ρ be kept constant, then the pressure from each set varies as τ; (γ) if the pressures for all the sets be the same, then $\frac{\rho}{m}$ *is also the same, or the number* of spheres per unit volume is the same.

Now suppose there is a mixture of any number of gases in any region; when there is equilibrium there is one physical quantity, namely, temperature, which is the same for all; the intrinsic

x and $x+dx$, y and $y+dy$, z and $z+dz$, and component velocities intermediate between u and $u+du$, v and $v+dv$, w and $w+dw$, is

$$\psi (x, y, z, u, v, w)\, dx\, dy\, dz\, du\, dv\, dw.$$

In the state of permanence the form of ψ must be independent of the time (t), so long as the sphere is moving free from collisions with any other.

From the last-mentioned condition it must follow that, if $\phi_1=a_1$, $\phi_2=a_2$, &c., be any equations among the variables determining the position and motion of any sphere obtained by the elimination of t from the equations of motion of that sphere, then ψ must be of the form $\psi (\phi_1, \phi_2$, &c.). With the assumption, then, that the number of spheres of the given set with variables between the above-mentioned limits is

$$\psi (\phi_1, \phi_2 \ldots)\, dx \ldots dw,$$

we find for the form of ψ, by reasoning like the foregoing, $Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}$, where χ is the potential energy of the sphere in the position x, y, z, and $c^2=u^2+v^2+w^2$, and h is a constant, the same for all the sets.

If we integrate the expression $Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}dx\, dy\, dz\, du\, dv\, dw$ for all values of x, y, z within the given region, we find for the number of spheres of any set with component velocities between u and $u+du$, v and $v+dv$, w and $w+dw$,

$$Be^{-\frac{hmc^2}{2}}du\, dv\, dw,$$

whence we easily see that the chances of velocities in all directions are the same, and that the mean velocity and mean square velocity of any sphere of this set are $\frac{2\sqrt{2\pi}}{\sqrt{mh}}$ and $\frac{3}{mh}$ respectively, and the mean kinetic energy of any such sphere is $\frac{3}{2h}$, and therefore the same for all the sets.

Furthermore, if we integrate the expression

$$Ae^{-h\left(\chi+\frac{mc^2}{2}\right)}dx\, dy\, dz\, du\, dv\, dw$$

for all values of u, v, and w from $-\infty$ to $+\infty$ respectively, we obtain a result of the form $Ce^{-h\chi}\, dx\, dy\, dz$, and therefore the number of spheres of the set in question with centres within the elementary volume $dx\, dy\, dz$, or, what is the same thing with the exception of a constant factor, the chance of the centre of any sphere of that set being within that elementary volume, is $Ce^{-h\chi}\, dx\, dy\, dz$, so that the *density of the N set of matter in the neighbourhood of the point x, y, z is $mCe^{-h\chi}$.*

We are now in a position to compare the physical properties of a medium composed of monatomic molecules in motion, and free from any intermolecular or interatomic forces with those of ordinary gases, so long at least as the atoms are spherical.

Consider two contiguous portions of such a medium separated by any plane parallel to that of yz, and, since the distribution and motion of each set of spheres is independent of all the other sets, let us confine our attention to the spheres of the N set. Suppose that there are N such spheres per unit volume in the neighbourhood of the point x, y, z, whose component velocities parallel to the axis of x are between u and $u+du$. The number of these spheres which cross the elementary area $dy\, dz$ in time dt will be the same as the number of the dN spheres whose centres are situated within the elementary parallelepiped $dx\, dy\, dz$, in which dx is equal to udt, and this number is

$$Nu\, dy\, dz\, dt.$$

Each of these spheres carries across with it a momentum parallel to x equal to mu; the total momentum parallel to x transferred across $dy\, dz$ in time dt is therefore

$$mNu^2\, dy\, dz\, dt.$$

If u be positive, this is positive momentum transferred from the negative to the positive side of the plane $y\, z$; and if u be negative, this is negative momentum similarly transferred from the positive to the negative side of that plane. In either case it follows that by the mere motion of these spheres across the area $dy\, dz$ the positive momentum parallel to the axis of x is diminished by the quantity $mNu^2\, dy\, dz\, dt$ on the negative side of the plane $y\, z$, and increased by the same quantity on the positive side of that plane in the time dt; m being, as before, the mass of each sphere. Hence, on the whole, there is a transference of positive x momentum in the time dt across the area $dy\, dz$ equal to $mdy\, dz\, dt\, \Sigma_{-\infty}^{\infty} u^2N$; that is, equal to

$$dy\, dz\, dt\, \rho\overline{u^2},$$

where ρ is the density of the N matter at the point x, y, z, and $\overline{u^2}$ is the mean square of the x velocities.

But either by integration or general reasoning it is easily seen that $\overline{u^2}=\frac{\overline{v^2}}{3}$, where $\overline{v^2}$ is the mean square of the resultant velocities of the N spheres, and is equal, as we have proved, to

$$\frac{3}{mh}.$$

Therefore, there is a transference of positive momentum from the negative to the positive side of the plane $y\, z$ across the area $dy\, dz$ in time dt equal to

$$\frac{\rho\, dy\, dz\, dt}{mh}.$$

Each separate sphere whose component velocities are u, v, and w carries across the same area y and z momenta equal to mv and mw respectively, so that in the time dt there are carried across the area $dy\, dz\, y$ and z momenta equal to $\Sigma muv\, dy\, dz\, dt$ and $\Sigma muw\, dy\, dz\, dt$, respectively. By symmetry it is clear that Σmuv and Σmuw are separately zero. Therefore, the resultant mutual actions of the two portions of the medium under consideration in the time dt is the transference across the elementary area $dy\, dz$ of a quantity of x momentum equal to $\rho dy\, dz\, dt\, \frac{\overline{v^2}}{3}$ from the negative to the positive side of the bounding plane. If this mutual action, or, as it is generally called, "pressure" when referred to unit of surface, be denoted by *the symbol p, we get the equation*

$$p\, dy\, dz\, dt=\rho\, dy\, dz\, dt\frac{\overline{v^2}}{3},$$

or

$$p=\rho\,\frac{\overline{v^2}}{3}=\frac{\rho}{mh}.$$

Since the momenta parallel to y and z remain unaltered, it follows that the mutual action or pressure between contiguous portions of the medium in the neighbourhood of any point is normal to the bounding surface at that point. Since also the expression for p or $\frac{\rho}{mh}$ is independent of the direction of the x axis, it follows that the pressure at any point of the medium is the same in all directions.

If the contiguous portions of the medium be separated by a material instead of an ideal plane, it will be necessary for the maintenance of equilibrium that there should be an action between this plane and the adjacent medium, equivalent to the transference of momentum estimated above; but action measured by the rate per unit of time at which momentum is generated constitutes moving force or statical pressure. Hence the force or pressure between the plane and medium is normal to the plane, independent of the direction of the plane through the point, and equal to the value of $\frac{\rho}{mh}$ at the point.

When several sets of spheres are present together in the region under consideration, the distribution of the centres and of the velocities of each set is, as we have seen, independent of the coexistence of the other sets. If therefore ρ_1, ρ_2, &c., be the densities of the matter of the different sets in the neighbourhood of the point x, y, z, and if p_1, p_2, &c., be the pressures at that point defined as above, and if m_1, m_2, &c., be the masses of the spheres of each of the sets, and p the total pressure, we get

$$p = p_1 + p_2 + \text{\&c.}$$
$$= \frac{\rho_1}{m_1h} + \frac{\rho_2}{m_2h} + \text{\&c.}$$

Hence we arrive at the following conclusions:—(1) there is one physical quantity having the same value for every set of spheres—namely, the mean kinetic energy of each sphere, or $\frac{3}{2h}$; let this quantity be called τ; (2) the distribution of the positions and velocities of the spheres of each set is *independent of the coexistence* of the remaining sets, and is in all respects the same as if that particular set existed alone *in the region considered*; (3) the pressure at any point referred to unit of surface at any point of the medium arising from the action of any one of the sets is $\frac{2}{3m}\rho\tau$, where ρ is the density of that particular set at the point in question, and τ is the physical quantity above referred to as common to all the sets.

This third inference may be expanded into the following three laws:—(α) if τ be kept constant, then the pressure arising from each set varies as the density of that set; (β) if ρ be kept constant, then the pressure from each set varies as τ; (γ) if the pressures for all the sets be the same, then $\frac{\rho}{m}$ *is also the same, or the number of spheres per unit volume is the same.*

Now suppose there is a mixture of any number of gases in any *region*; when there is equilibrium there is one physical quantity, namely, temperature, which is the same for all; the intrinsic

Now to find this latter chance we observe that it is the chance of the s group being in their required limits of position and motion, when the internal forces between the r and s group become forces between the s group and fixed centres.

If the total kinetic energy of the r group in their given state be T_r, and that of the $r+s$ group be T_{r+s}, the total kinetic energy of the s group must be $T_{r+s} - T_r$.

Also if the total potential energy of the $r+s$ group under the influence of all forces be χ_{r+s}, this is made up of—

(1) χ_r, the potential energy of the r group to fixed centres, and of its internal forces;

(2) χ_s, similarly taken for the s group; and

(3) ${}_r\chi_s$, the potential energy of the r and s group forces.

And when the r group is fixed the potential energy of the s group is reduced to (2) and (3), or is $\chi_{r+s} - \chi_r$.

Therefore the chance of the s group having its variables within the required limits when the r group is fixed must be

$$\psi\,(E_{r+s} - E_r)\, dq_{r+1}\ldots dp_{r+s}$$

Therefore

$$\psi(E_r)\,\psi\,(E_{r+s} - E_r)\, dq_1\ldots dp_{r+s} = \psi\,(E_{r+s})\, dq_1\ldots dp_{r+s}$$

or

$$\psi\,(E_r)\,\psi\,(E_{r+s} - E_r) = \psi\,(E_{r+s}).$$

Therefore $\psi\,(x) = e^{Cx} = e^{-hx}$ suppose.

And the chances of the r group having its variables between the limits q_1 and $q_1 + dq_1\ldots p_r$ and $p_r + dp_r$ must, in the state of permanent or stable motion, be proportional to

$$e^{-hE_r}\, dq_1\ldots dp_r,$$

which was to be proved.

Supposing now that the aggregate of molecules under consideration consists of a number of sets of similar molecules, the number of molecules in one of these sets being N, where N is very large, and suppose that each of these N molecules possesses σ degrees of freedom defined by the coordinates $q_1\ldots q_\sigma$ with the momenta $p_1\ldots p_\sigma$, and that its mass is m. Three of these coordinates may be taken as the rectangular coordinates of its centre of mass, in which case the corresponding momenta will be mu, mv, mw, where u, v, and w are the component velocities of translation of that centre of mass. Then in this case, if $q_4\ldots q_\sigma$, $p_4\ldots p_\sigma$ be the remaining coordinates and momenta of the molecule, the chance of the molecule's variables being within the limits x and $x + dx\ldots p_\sigma$ and $p_\sigma + dp_\sigma$ will be proportional to

$$e^{-h(\chi + f)}\, dx\, dy\, dz\, dq_4\ldots dp_4\, e^{-h\frac{m}{2}(u^2+v^2+w^2)}\, du\, dv\, dw \ldots \text{(I)},$$

where T, the kinetic energy of the molecule, is equal to

$$\frac{m}{2}(u^2 + v^2 + w^2) + f,$$

where f is a quadratic function of the p's, having as coefficients known functions of the q's.

If we integrate the expression (I) for all possible values of x, y, z, $q_4\ldots q_\sigma$, $p_4\ldots p_\sigma$, we obtain an expression of the form

$$Be^{-h\frac{m}{2}c^2}\, du\, dv\, dw \ldots\ldots\ldots\ldots\ldots\ldots\ldots\text{(II)},$$

where B is independent of u, v, and w, and $c^2 = u^2 + v^2 + w^2$. From the form of (II) it follows, exactly as in the cases of the elastic spheres, that the chances of all directions of the velocity of translation of a molecule are equal, that the mean velocity and mean square velocity of translation of each molecule are

$$\frac{2^{\frac{3}{2}}\sqrt{\pi}}{\sqrt{mh}} \text{ and } \frac{3}{mh}$$

respectively, and that the mean kinetic energy of translation is $\frac{3}{2h}$, and the same for a molecule of any set.

Again, if $\overline{T}$ be the mean total kinetic energy of the molecule, then

$$\overline{T} = \frac{\iiint\ldots T.e^{-h(\chi+T)}\, dx\ldots dp_\sigma}{\iiint\ldots e^{-h(\chi+T)}\, dx\ldots dp_\sigma}\ \ldots\ldots\ldots\text{(III)};$$

and if we evaluate this expression, paying attention to the form of T as a quadratic function of the p's mentioned above, we shall find for (III) the expression $\frac{\sigma}{2h}$.

It follows from this result that each additional degree of freedom of the molecule increases the mean total kinetic energy of the molecule by the quantity $\frac{1}{2h}$, which is the mean kinetic energy of translation parallel to any one of the axes, and that the total kinetic energy is proportional to the number of such degrees of freedom.

If, again, we integrate the expression (I) for all values of the momenta, we obtain an expression of the form

$$Ce^{-h\chi}\, dx\, dy\, dz\, dq_4\ldots dq_\sigma \ldots\ldots\ldots\ldots\ldots\text{(IV)},$$

where χ is the potential energy of the molecule due to fixed centre and to interatomic forces in the position defined by x, y, z, $q_4\ldots q_\sigma$. The dimensions of the molecule are so small that we may regard forces from each fixed centre on different parts of the molecule as parallel and equal and functions of the distance of the centre of mass from that fixed centre, so that, if the part of χ arising from these fixed centre forces be called χ_1, χ_1 will be a function of x, y, z, and of these variables only, the remaining part of χ (arising from interatomic forces), which may be called χ_2, will be a function of the $\sigma - 3$ variables $q_4\ldots q_\sigma$.

If in (IV) we write $\chi_1 + \chi_2$ for χ, and then integrate for all values of $q_4\ldots q_\sigma$, we obtain an expression of the form

$$De^{-h\chi_1}\, dx\, dy\, dz \ldots\ldots\ldots\ldots\ldots\ldots\ldots\text{(V)},$$

where D is independent of x, y, z, and therefore ρ the density of the N molecule matter in the neighbourhood of the point x, y, z, is

$$mDe^{-h\chi_1}.$$

From these results all the propositions proved above with reference to the aggregate of elastic spheres or monatomic molecules, as to the correspondence of the physical properties of such an aggregate with those of gases as indicated by the gaseous laws, may be deduced also for this aggregate of polyatomic molecules. So that if $\overline{T}$ be equal to $\frac{3}{2h}$, or the mean kinetic energy of agitation of any one of the aggregate of moving molecules, if v be the volume occupied by unit of mass, r the number of molecules in unit of volume, and m the mass of each molecule, we have, exactly as in the case referred to,

$$mr = 1,\ \rho v = 1,$$

and

$$pv = \frac{2}{3}\, r\overline{T}.$$

We also get the ordinary hydrostatical equations

$$\frac{dp}{dx} = \rho X,\quad \frac{dp}{dy} = \rho Y,\quad \frac{dp}{dz} = \rho Z$$

from this expression for p combined with the equation

$$\rho = mDe^{-h\chi_1},$$

remembering that

$$\frac{d\chi_1}{dx} = -mX,\quad \frac{d\chi_1}{dy} = -mY,\quad \frac{d\chi_1}{dz} = -mZ,$$

whence the coincidence of the physical properties of this aggregate of polyatomic moving molecules with those of a gas, on the assumption that the temperature represents the mean kinetic energy of agitation, is at once apparent.

It can be shown also that the aggregate of moving molecules, such as we conceive a gas to be, possesses another very important physical property which, by its analogy to the second law of thermodynamics, affords additional evidence of the relation between the phenomena of heat and those of aggregates in some kind of motion,—the property in question being that, if in any aggregate of moving molecules the mean kinetic energy of any one of them be called τ, and if δQ be an increment of energy imparted to the aggregate from without, then $\frac{\delta Q}{\tau}$ is a perfect differential.

If to this aggregate we apply a certain small quantity δQ of heat or energy from without, and if $\delta\tau$ be the increase of the mean kinetic energy of agitation when the volume is unaltered, then this constancy of volume prevents any of the energy δQ from being absorbed in doing external work; but it is conceivable that the increase of τ may cause such a change in the average state of the molecule as to produce a variation $\delta\chi$ in the mean potential energy of the molecule, $\delta\chi$ being proportional to $\delta\tau$.

Therefore

$$\delta Q = r\left\{\frac{d\overline{T}}{d\tau} + \frac{d\chi}{d\tau}\right\}\delta\tau.$$

But

$$\overline{T} = \frac{\sigma}{2h} = \frac{\sigma}{3}\cdot\frac{3}{2h} = \frac{\sigma}{3}\tau;$$

therefore

$$\delta Q = r\left\{\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right\}\delta\tau.$$

If the volume vary by δv, the pressure being constant, then we must add external work, or $p\delta v$, to the energy absorbed, so that if the whole external energy now applied be $\delta' Q$, and the increase of temperature $\delta\tau$ be the same in both cases, we have

$$\frac{\delta' Q}{\delta Q} = \frac{r\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau + p\delta v}{r\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau}.$$

But if p be constant, then as before

$$p\delta v = 2\,\frac{r}{3}\,\delta\tau,$$

Now to find this latter chance we observe that it is the chance of the s group being in their required limits of position and motion, when the internal forces between the r and s group become forces between the s group and fixed centres.

If the total kinetic energy of the r group in their given state be T_r, and that of the $r+s$ group be T_{r+s}, the total kinetic energy of the s group must be $T_{r+s} - T_r$.

Also if the total potential energy of the $r+s$ group under the influence of all forces be χ_{r+s}, this is made up of—

(1) χ_r, the potential energy of the r group to fixed centres, and of its internal forces;

(2) χ_s, similarly taken for the s group; and

(3) ${}_r\chi_s$, the potential energy of the r and s group forces.

And when the r group is fixed the potential energy of the s group is reduced to (2) and (3), or is $\chi_{r+s} - \chi_r$.

Therefore the chance of the s group having its variables within the required limits when the r group is fixed must be

$$\psi\,(E_{r+s} - E_r)\,dq_{r+1}\ldots dp_{r+s}$$

Therefore

$$\psi(E_r)\,\psi\,(E_{r+s} - E_r)\,dq_1\ldots dp_{r+s} = \psi\,(E_{r+s})\,dq_1\ldots dp_{r+s}$$

or

$$\psi\;E_r)\,\psi\,(E_{r+s} - E_r) = \psi\,(E_{r+s}).$$

Therefore

$$\psi\,(x) = c^{\,Cx} = c^{-hx} \text{ suppose.}$$

And the chances of the r group having its variables between the limits q_1 and $q_1 + dq_1 \ldots p_r$ and $p_r + dp_r$ must, in the state of permanent or stable motion, be proportional to

$$c^{-hE_r}\,dq_1\ldots dp_r,$$

which was to be proved.

Supposing now that the aggregate of molecules under consideration consists of a number of sets of similar molecules, the number of molecules in one of these sets being N, where N is very large, and suppose that each of these N molecules possesses σ degrees of freedom defined by the coordinates $q_1 \ldots q_\sigma$ with the momenta $p_1 \ldots p_\sigma$, and that its mass is m. Three of these coordinates may be taken as the rectangular coordinates of its centre of mass, in which case the corresponding momenta will be mu, mv, mw, where u, v, and w are the component velocities of translation of that centre of mass. Then in this case, if $q_4 \ldots q_\sigma$, $p_4 \ldots p_\sigma$ be the remaining coordinates and momenta of the molecule, the chance of the molecule's variables being within the limits x and $x + dx \ldots p_\sigma$ and $p_\sigma + dp_\sigma$ will be proportional to

$$c^{-h\,(\chi+f)}\,dx\,dy\,dz\,dq_4\ldots dp_4\,c^{-h\frac{m}{2}(u^2+v^2+w^2)}\,du\,dv\,dw \ldots \text{(I)},$$

where T, the kinetic energy of the molecule, is equal to

$$\frac{m}{2}(u^2+v^2+w^2)+f,$$

where f is a quadratic function of the p's, having as coefficients known functions of the q's.

If we integrate the expression (I) for all possible values of x, y, z, $q_4 \ldots q_\sigma$, $p_4 \ldots p_\sigma$, we obtain an expression of the form

$$Bc^{-h\frac{m}{2}c^2}\,du\,dv\,dw \ldots\ldots\ldots\ldots\ldots\ldots\text{(II)},$$

where B is independent of u, v, and w, and $c^2 = u^2 + v^2 + w^2$. From the form of (II) it follows, exactly as in the cases of the elastic spheres, that the chances of all directions of the velocity of translation of a molecule are equal, that the mean velocity and mean square velocity of translation of each molecule are

$$\frac{2^{\frac{3}{2}}\sqrt{\pi}}{\sqrt{mh}} \text{ and } \frac{3}{mh}$$

respectively, and that the mean kinetic energy of translation is $\frac{3}{2h}$, and the same for a molecule of any set.

Again, if $\overline{T}$ be the mean total kinetic energy of the molecule, then

$$\overline{T} = \frac{\iiint\ldots T.c^{-h\,(\chi+T)}\,dx\ldots dp_\sigma}{\iiint\ldots c^{-h\,(\chi+T)}\,dx\ldots dp_\sigma}\;\ldots\ldots\ldots\text{(III)};$$

and if we evaluate this expression, paying attention to the form of T as a quadratic function of the p's mentioned above, we shall find for (III) the expression $\frac{\sigma}{2h}$.

It follows from this result that each additional degree of freedom of the molecule increases the mean total kinetic energy of the molecule by the quantity $\frac{1}{2h}$, which is the mean kinetic energy of translation parallel to any one of the axes, and that the total kinetic energy is proportional to the number of such degrees of freedom.

If, again, we integrate the expression (I) for all values of the momenta, we obtain an expression of the form

$$Cc^{-h\chi}\,dx\,dy\,dz\,dq_4\ldots dq_\sigma \ldots\ldots\ldots\ldots\ldots\text{(IV)},$$

where χ is the potential energy of the molecule due to fixed centre and to interatomic forces in the position defined by x, y, z, $q_4 \ldots q_\sigma$. The dimensions of the molecule are so small that we may regard forces from each fixed centre on different parts of the molecule as parallel and equal and functions of the distance of the centre of mass from that fixed centre, so that, if the part of χ arising from these fixed centre forces be called χ_1, χ_1 will be a function of x, y, z, and of these variables only, the remaining part of χ (arising from interatomic forces), which may be called χ_2, will be a function of the $\sigma - 3$ variables $q_4 \ldots q_\sigma$.

If in (IV) we write $\chi_1 + \chi_2$ for χ, and then integrate for all values of $q_4 \ldots q_\sigma$, we obtain an expression of the form

$$Dc^{-h\chi_1}\,dx\,dy\,dz \ldots\ldots\ldots\ldots\ldots\ldots\ldots\text{(V)},$$

where D is independent of x, y, z, and therefore ρ the density of the N molecule matter in the neighbourhood of the point x, y, z, is

$$mDc^{-h\chi_1}.$$

From these results all the propositions proved above with reference to the aggregate of elastic spheres or monatomic molecules, as to the correspondence of the physical properties of such an aggregate with those of gases as indicated by the gaseous laws, may be deduced also for this aggregate of polyatomic molecules. So that if $\overline{T}$ be equal to $\frac{3}{2h}$, or the mean kinetic energy of agitation of any one of the aggregate of moving molecules, if v be the volume occupied by unit of mass, r the number of molecules in unit of volume, and m the mass of each molecule, we have, exactly as in the case referred to,

$$mr = 1,\quad \rho v = 1,$$

and

$$pv = \frac{2}{3}r\overline{T}.$$

We also get the ordinary hydrostatical equations

$$\frac{dp}{dx} = \rho X,\quad \frac{dp}{dy} = \rho Y,\quad \frac{dp}{dz} = \rho Z$$

from this expression for p combined with the equation

$$\rho = mDc^{-h\chi_1},$$

remembering that

$$\frac{d\chi_1}{dx} = -mX,\quad \frac{d\chi_1}{dy} = -mY,\quad \frac{d\chi_1}{dz} = -mZ,$$

whence the coincidence of the physical properties of this aggregate of polyatomic moving molecules with those of a gas, on the assumption that the temperature represents the mean kinetic energy of agitation, is at once apparent.

It can be shown also that the aggregate of moving molecules, such as we conceive a gas to be, possesses another very important physical property which, by its analogy to the second law of thermodynamics, affords additional evidence of the relation between the phenomena of heat and those of aggregates in some kind of motion,—the property in question being that, if in any aggregate of moving molecules the mean kinetic energy of any one of them be called τ, and if δQ be an increment of energy imparted to the aggregate from without, then $\frac{\delta Q}{\tau}$ is a perfect differential.

If to this aggregate we apply a certain small quantity δQ of heat or energy from without, and if $\delta\tau$ be the increase of the mean kinetic energy of agitation when the volume is unaltered, then this constancy of volume prevents any of the energy δQ from being absorbed in doing external work; but it is conceivable that the increase of τ may cause such a change in the average state of the molecule as to produce a variation $\delta\chi$ in the mean potential energy of the molecule, $\delta\chi$ being proportional to $\delta\tau$.

Therefore

$$\delta Q = r\left\{\frac{d\overline{T}}{d\tau} + \frac{d\chi}{d\tau}\right\}\delta\tau.$$

But

$$\overline{T} = \frac{\sigma}{2h} = \frac{\sigma}{3}\cdot\frac{3}{2h} = \frac{\sigma}{3}\tau;$$

therefore

$$\delta Q = r\left\{\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right\}\delta\tau.$$

If the volume vary by δv, the pressure being constant, then we must add external work, or $p\delta v$, to the energy absorbed, so that if the whole external energy now applied be $\delta' Q$, and the increase of temperature $\delta\tau$ be the same in both cases, we have

$$\frac{\delta' Q}{\delta Q} = \frac{r\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau + p\delta v}{r\left(\frac{\sigma}{3} + \frac{d\chi}{d\tau}\right)\delta\tau}.$$

But if p be constant, then as before

$$p\delta v = 2\,\frac{r}{3}\,\delta\tau,$$

$$B=\frac{\omega}{l}\text{; or }\frac{1}{l}=\frac{B}{\omega}.$$

Hence the chance for such a molecule of free path between x and $x+dx$ is

$$\frac{B}{\omega}e^{-\frac{Bx}{\omega}}dx,$$

with the above definition of B.

The chance of a molecule whose velocity is ω having free path x is of course the same as the chance of its free path having the duration $\frac{x}{\omega}$. If $t=\frac{x}{\omega}$, the chance of duration between t and $t+dt$ is thus

$$\frac{B}{\omega}e^{-Bt}\,\omega dt\text{; or }Be^{-Bt}\,dt.$$

Meyer determines the value of B, if the molecules be spheres, in the form

$$B=N\pi s^2\Omega\left\{1+\frac{1}{1}\frac{1}{1.3}\omega^2h-\frac{1}{1.2}\cdot\frac{1}{3.5}\omega^4h^2+\right.$$

$$\left.(-)^{n-1}\frac{1}{\lfloor n}\,\frac{1}{2n-1}\cdot\frac{1}{2n+1}\,(\omega^2h)^n\ldots\right\},$$

where $\Omega=\frac{2}{\sqrt{\pi h}}$, and s is the sum of the radii of two molecules.

It will be observed that the series converges very rapidly if ω^2h is less than unity, the successive coefficients being

$$\frac{1}{3},\ -\frac{1}{30},\ +\frac{1}{210},\ -\frac{1}{1512},\ +\frac{1}{11880},\ \&c.$$

Having found B for the number of encounters experienced per unit of time by a molecule having velocity ω, we have for the average number of encounters experienced by any molecule per unit of time, which we denote by C,

$$C=\frac{4}{\sqrt{\pi}}h^{\frac{3}{2}}\int_0^\infty e^{-h\omega^2}\omega^2B\,d\omega.$$

From which Meyer deduces

$$C=2\frac{\sqrt{2\pi}}{h}\cdot Ns^2$$

$$=\Omega\sqrt{2}.N\pi s^2.$$

Hence the mean value of the free path for all molecules, irrespective of velocity, is $L=\frac{\Omega}{C}=\frac{1}{\pi\sqrt{2}Ns^2}$.

Thus the kinetic theory of gases presents to us the conception of apparently perfect rest, as the result of motion irregular in detail but permanent and stable on the average. Whatever difficulty may be felt at first sight in the acceptance of this theory in the case of a medium at rest is greatly enhanced when we pass to the contemplation of a disturbed medium like a mass of gas through which a wave of sound is passing. In our ordinary investigations of such a disturbance the gas is treated as a continuous body, subjected to small relative motions of its parts, accompanied by corresponding variations of internal pressure. When a disturbance or a local condensation or rarefaction is set up in any portion of this gas we calculate the resulting effects by the well-known equations of sound motion. But on this kinetic theory the medium is supposed to consist of a number of discrete masses—elastic spheres or the like—which preserve the physical properties of the medium merely by the recurrence of their mutual collisions, such collisions obeying no law in individual cases, but preserving a certain average uniformity in the motion of the whole aggregate; and we need some further investigation to assure ourselves of the applicability of the ordinary treatment of wave motion to such a medium.

Now we observe that the physical properties of our medium, so far as the relation between pressure, density, and temperature is concerned, merely require that the temperature be measured by the mean total kinetic energy of translation, and that the mean kinetic energy of translation parallel to any fixed line be equal to one-third of the mean total energy of translation. If the molecules constituting any portion of this medium were animated by a common velocity or acceleration, the physical properties of this portion would be similarly determined by the velocities and kinetic energies relative to the common motion. When the distribution of such relative velocities is stable or permanent, the average relative kinetic energy in any fixed direction is one-third of the average relative total kinetic energy, such property constituting normal distribution.

Suppose that in any portion of a medium, consisting of equal elastic spheres, this distribution has been disturbed—that is, Σmu^2, Σmv^2, and Σmw^2 are unequal. If V were the relative velocity of any pair of spheres after such disturbance and before they collide, and θ the angle between V and the common normal at the point of impact, then the normal and tangential relative velocities before impact are $V\cos\theta$ and $V\sin\theta$, and after impact they become $-V\cos\theta$ and $V\sin\theta$ respectively. The relative velocity after impact, resolved in the direction of relative velocity before impact, is therefore

$$-V\cos^2\theta+V\sin^2\theta,$$

or $-V\cos 2\theta$; and the chance of θ being between θ and $\theta+d\theta$ is

$$\sin 2\theta\,d\theta.$$

Therefore the average square relative velocity resolved in the original direction becomes after impact

$$\overline{V^2}\int_0^{\frac{\pi}{2}}\cos^2 2\theta\sin 2\theta\,d\theta\text{, or }\frac{\overline{V^2}}{3}.$$

The relative velocity after impact in the plane of V, and the normal perpendicular to the direction of V before impact is

$$V\sin\theta\cos\theta+V\sin\theta\cos\theta\text{, or }V\sin 2\theta.$$

And, if a fixed line be taken in the plane perpendicular to V, the average value of the square of the relative velocity after impact, resolved parallel to this line, is

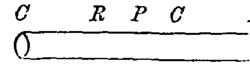
$$\frac{\overline{V^2}}{2\pi}\cdot\int_0^{2\pi}\int_0^{\frac{\pi}{2}}\sin^3 2\theta\cos^2\phi\,d\theta\,d\phi\text{, or }\frac{\overline{V^2}}{3}\text{ as before.}$$

Hence we conclude that, in whatever manner the distribution is disturbed in any portion of the medium at any instant, it will, for all those pairs of spheres which within any given interval encounter each other, have assumed the normal distribution after that interval.

If τ denote the average time between two collisions for any given sphere, the chance that this sphere shall continue for any time t free from collisions is, as we have seen, $c^{-\frac{t}{\tau}}$.

If, therefore, D be the number of spheres within any region whose total relative velocity is between w and $w+dw$, but so distributed that the mean square of their relative velocities along any fixed line is not $\frac{w^2}{3}$, then after a time t considerably greater than τ, say ten times τ, the number of the D spheres which have escaped collision will be utterly inconsiderable, and the distribution will have become normal throughout the region.

Suppose, for instance, that a sound wave is passing along a tube filled with air,



the air in the tube is, at any instant, in a state of alternate compression and rarefaction, as at C, R, C, R above.

If the note sounded be (say) 500 vibrations per second, the length of the wave CR is about $\frac{1100}{500}$ feet, and the time taken by the wave in traversing that distance is about $\frac{1}{500}$th of a second.

The air in any section of the tube near P has alternately a small positive momentum and an equal small negative momentum, the reversal taking place in every $\frac{1}{500}$th of a second; also the same cause which produces the average momentum in either case disturbs the distribution of energy among the x, y, and z directions, *i.e.*, it is always producing an excess or defect in mu^2 above or below that of mv^2 and mw^2. By what has been proved above, this abnormal distribution of energy becomes inappreciable, owing to molecular collisions in a time considerably less than $\frac{1}{1000}$th of a second—in fact, in about $\frac{1}{500000000}$th of a second, when the value of T for atmospheric air is considered. It is therefore legitimate, in calculating the velocity of sound in air (at least on the elastic sphere hypothesis), to regard the distribution as always normal in any section of the tube, the air in that section or in any elementary portion of it possessing, as a whole, any given velocity or acceleration, estimated as if we were dealing with a continuous mass.

Diffusion of Gases.

If any further light is to be thrown on the physical nature of a molecule from investigations, experimental or analytical, concerning gases, it will most probably be by means of experiments on the diffusion of gases, or else on the internal friction or viscosity of gases, and the comparison of these results with those obtained analytically by the methods of the kinetic theory. Such investigations have been undertaken experimentally by Graham, Loschmidt, Maxwell, O. E. Meyer, and others. An account of them will be found in O. E. Meyer's work above referred to. The same problems have also been discussed analytically by Maxwell,[1] and by Stefan, O. E. Meyer, and Boltzmann in the treatises referred to below. We proceed to give a short account of Meyer's results.

[1] *Phil. Mag.*, July 1860, and Feb. and March 1868.

$$B=\frac{\omega}{l}\,;\ \text{or}\ \frac{1}{l}=\frac{B}{\omega}.$$

Hence the chance for such a molecule of free path between x and $x+dx$ is

$$\frac{B}{\omega}\,e^{-\frac{Bx}{\omega}}dx,$$

with the above definition of B.

The chance of a molecule whose velocity is ω having free path x is of course the same as the chance of its free path having the duration $\frac{x}{\omega}$. If $t=\frac{x}{\omega}$, the chance of duration between t and $t+dt$ is thus

$$\frac{B}{\omega}\,e^{-Bt}\,\omega dt\,;\ \text{or}\ Be^{-Bt}\,dt.$$

Meyer determines the value of B, if the molecules be spheres, in the form

$$B=N\pi s^2\Omega\left\{1+\frac{1}{1}\,\frac{1}{1.3}\,\omega^2h-\frac{1}{1.2}\cdot\frac{1}{3.5}\,\omega^4h^2+\right.$$

$$\left.(-)^{n-1}\,\frac{1}{\lfloor n}\,\frac{1}{2n-1}\cdot\frac{1}{2n+1}\,(\omega^2h)^n\ldots\right\},$$

where $\Omega=\frac{2}{\sqrt{\pi h}}$, and s is the sum of the radii of two molecules.

It will be observed that the series converges very rapidly if ω^2h is less than unity, the successive coefficients being

$$\frac{1}{3},\ -\frac{1}{30},\ +\frac{1}{210},\ -\frac{1}{1512},\ +\frac{1}{11880},\ \text{\&c.}$$

Having found B for the number of encounters experienced per unit of time by a molecule having velocity ω, we have for the average number of encounters experienced by any molecule per unit of time, which we denote by C,

$$C=\frac{4}{\sqrt{\pi}}\,h^{\frac{3}{2}}\int_0^\infty e^{-h\omega^2}\omega^2B\,d\omega.$$

From which Meyer deduces

$$C=2\,\frac{\sqrt{2\pi}}{h}\,.\,Ns^2$$
$$=\Omega\sqrt{2}\,.\,N\pi s^2.$$

Hence the mean value of the free path for all molecules, irrespective of velocity, is $L=\frac{\Omega}{C}=\frac{1}{\pi\sqrt{2}Ns^2}$.

Thus the kinetic theory of gases presents to us the conception of apparently perfect rest, as the result of motion irregular in detail but permanent and stable on the average. Whatever difficulty may be felt at first sight in the acceptance of this theory in the case of a medium at rest is greatly enhanced when we pass to the contemplation of a disturbed medium like a mass of gas through which a wave of sound is passing. In our ordinary investigations of such a disturbance the gas is treated as a continuous body, subjected to small relative motions of its parts, accompanied by corresponding variations of internal pressure. When a disturbance or a local condensation or rarefaction is set up in any portion of this gas we calculate the resulting effects by the well-known equations of sound motion. But on this kinetic theory the medium is supposed to consist of a number of discrete masses—elastic spheres or the like—which preserve the physical properties of the medium merely by the recurrence of their mutual collisions, such collisions obeying no law in individual cases, but preserving a certain average uniformity in the motion of the whole aggregate; and we need some further investigation to assure ourselves of the applicability of the ordinary treatment of wave motion to such a medium.

Now we observe that the physical properties of our medium, so far as the relation between pressure, density, and temperature is concerned, merely require that the temperature be measured by the mean total kinetic energy of translation, and that the mean kinetic energy of translation parallel to any fixed line be equal to one-third of the mean total energy of translation. If the molecules constituting any portion of this medium were animated by a common velocity or acceleration, the physical properties of this portion would be similarly determined by the velocities and kinetic energies relative to the common motion. When the distribution of such relative velocities is stable or permanent, the average relative kinetic energy in any fixed direction is one-third of the average relative total kinetic energy, such property constituting normal distribution.

Suppose that in any portion of a medium, consisting of equal elastic spheres, this distribution has been disturbed—that is, Σmu^2, Σmv^2, and Σmw^2 are unequal. If V were the relative velocity of any pair of spheres after such disturbance and before they collide, and θ the angle between V and the common normal at the point of impact, then the normal and tangential relative velocities before impact are $V\cos\theta$ and $V\sin\theta$, and after impact they become $-V\cos\theta$ and $V\sin\theta$ respectively. The relative velocity after impact, resolved in the direction of relative velocity before impact, is therefore

$$-V\cos^2\theta+V\sin^2\theta,$$

or $-V\cos 2\theta$; and the chance of θ being between θ and $\theta+d\theta$ is

$$\sin 2\theta\,d\theta.$$

Therefore the average square relative velocity resolved in the original direction becomes after impact

$$\overline{V}^2\int_0^{\frac{\pi}{2}}\cos^2 2\theta\sin 2\theta\,d\theta,\ \text{or}\ \frac{\overline{V}^2}{3}.$$

The relative velocity after impact in the plane of V, and the normal perpendicular to the direction of V before impact is

$$V\sin\theta\cos\theta+V\sin\theta\cos\theta,\ \text{or}\ V\sin 2\theta.$$

And, if a fixed line be taken in the plane perpendicular to V, the average value of the square of the relative velocity after impact, resolved parallel to this line, is

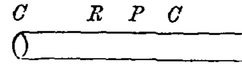
$$\frac{\overline{V}^2}{2\pi}\cdot\int_0^{2\pi}\int_0^{\frac{\pi}{2}}\sin^3 2\theta\cos^2\phi\,d\theta\,d\phi,\ \text{or}\ \frac{\overline{V}^2}{3}\ \text{as before.}$$

Hence we conclude that, in whatever manner the distribution is disturbed in any portion of the medium at any instant, it will, for all those pairs of spheres which within any given interval encounter each other, have assumed the normal distribution after that interval.

If τ denote the average time between two collisions for any given sphere, the chance that this sphere shall continue for any time t free from collisions is, as we have seen, $e^{-\frac{t}{\tau}}$.

If, therefore, D be the number of spheres within any region whose total relative velocity is between w and $w+dw$, but so distributed that the mean square of their relative velocities along any fixed line is not $\frac{w^2}{3}$, then after a time t considerably greater than τ, say ten times τ, the number of the D spheres which have escaped collision will be utterly inconsiderable, and the distribution will have become normal throughout the region.

Suppose, for instance, that a sound wave is passing along a tube filled with air,



the air in the tube is, at any instant, in a state of alternate compression and rarefaction, as at C, R, C, R above.

If the note sounded be (say) 500 vibrations per second, the length of the wave CR is about $\frac{1100}{500}$ feet, and the time taken by the wave in traversing that distance is about $\frac{1}{500}$th of a second.

The air in any section of the tube near P has alternately a small positive momentum and an equal small negative momentum, the reversal taking place in every $\frac{1}{500}$th of a second; also the same cause which produces the average momentum in either case disturbs the distribution of energy among the x, y, and z directions, *i.e.*, it is always producing an excess or defect in mu^2 above or below that of mv^2 and mw^2. By what has been proved above, this abnormal distribution of energy becomes inappreciable, owing to molecular collisions in a time considerably less than $\frac{1}{1000}$th of a second—in fact, in about $\frac{1}{50000000}$th of a second, when the value of T for atmospheric air is considered. It is therefore legitimate, in calculating the velocity of sound in air (at least on the elastic sphere hypothesis), to regard the distribution as always normal in any section of the tube, the air in that section or in any elementary portion of it possessing, as a whole, any given velocity or acceleration, estimated as if we were dealing with a continuous mass.

Diffusion of Gases.

If any further light is to be thrown on the physical nature of a molecule from investigations, experimental or analytical, concerning gases, it will most probably be by means of experiments on the diffusion of gases, or else on the internal friction or viscosity of gases, and the comparison of these results with those obtained analytically by the methods of the kinetic theory. Such investigations have been undertaken experimentally by Graham, Loschmidt, Maxwell, O. E. Meyer, and others. An account of them will be found in O. E. Meyer's work above referred to. The same problems have also been discussed analytically by Maxwell,[1] and by Stefan, O. E. Meyer, and Boltzmann in the treatises referred to below. We proceed to give a short account of Meyer's results.

[1] *Phil. Mag.*, July 1860, and Feb. and March 1868.

Hence, if we attempt to cause one stratum of gas to pass over another in parallel planes, we experience a resistance due to the interchange of molecules between the portions of gas separated by the plane. This is in some respects analogous to sliding friction between solid bodies, and is called by German writers the "friction" (*Reibung*), by Maxwell and others the "viscosity," of the gas. Meyer[1] investigates this effect of friction in a manner somewhat similar to that employed in case of diffusion, and obtains for the coefficient of viscosity $\frac{1}{3}\, mN\overline{\omega l}$.

Relation of the Coefficient of Viscosity to Density and Temperature.—The viscosity of a gas is independent of the density, being, according to O. E. Meyer, $\frac{mN}{3}\overline{\omega l}$. Now, for any one gas, l_ω is, as we have seen, inversely proportional to the density, and therefore $\overline{\omega l}$ is inversely proportional to the density. On the other hand, N is directly proportional to the density. Hence the viscosity is independent of the density. This agrees with the result obtained by Maxwell from the kinetic theory in 1860, and with the results of experiments by Maxwell[2] and O. E. Meyer.[3] Also, experiments by O. E. Meyer and Springmühl[4] on the *transpiration* of gases show that the times in which two different gases under similar circumstances flow through a tube maintain the same constant ratio to one another. As in the case of the coefficient of diffusion, $\overline{\omega l}$ is inversely proportional to the square root of the absolute temperature. As both the coefficient of diffusion and that of viscosity depend on the same function $\overline{\omega l}$, it should be possible from experiments on viscosity to determine the rate of diffusion. Experiments with this object have been conducted by Stefan[5] with very satisfactory results, his calculated values for the coefficient of diffusion agreeing very closely with those determined by Loschmidt's direct experiment.[6]

We have given the above results for the coefficients of diffusion and viscosity from O. E. Meyer's work, because his method has met with very general acceptance. It has been shown, however, by Boltzmann,[7] that the method is incomplete. Meyer's results can only be obtained on the assumption that the molecules of a gas undergoing diffusion or internal friction, which have any given velocity, as w, *are moving with that velocity in all directions indifferently*. We may calculate the number of molecules having velocity w that pass through a given plane during a short time dt, starting from encounters at any given distance from the plane. If we assume that the molecules, issuing from such encounters with velocity w, move indifferently in all directions, we obtain Meyer's result. This assumption is true only of a gas at rest—that is, having no velocity of translation—so that our result so obtained would express, in case of diffusion, *the rate at which two gases begin to diffuse, if* given at any instant both at rest—that is, with no stream velocity—but mixed in unequal proportions in different parts of space. In any actual case of diffusion, either of the two diffusing gases acquires a small velocity of translation. If we take this velocity into account in calculating the number of molecules of the gas passing through a plane, according to Meyer's method, we shall find that it introduces two new terms, one of which, when the motion becomes steady, is equal and opposite to the result obtained by Meyer. This is proved by Boltzmann in the case of viscosity in the treatise above referred to. The same proof is easily applied in the case of diffusion.

Stefan's Method.—Stefan[8] regards the two diffusing gases as having small velocities of translation, or stream velocities, u_1 and u_2, in opposite directions, so that the molecules of one gas, of mass m_1, have an average momentum m_1u_1 in direction from left to right, and those of the other gas, of mass m_2, an average momentum m_2u_2 from right to left. By virtue of encounters between the two sets of molecules, each gas is always imparting to the other a portion of its own average momentum, and receiving from the other a corresponding momentum in the opposite direction. The momentum so transferred or interchanged is what Stefan calls the *resistance* which one gas offers to the other's diffusion. In this investigation Stefan assumes that all classes of molecules of one gas, whatever their molecular velocity in space, have the same average velocity in the direction of diffusion—that is, the same stream velocity—so that the motion of the molecules of a diffusing gas would be exactly represented by considering the molecules of a gas at rest—that is, with only its molecular velocity—at the same temperature and pressure, and then giving to each molecule the additional common velocity u in the direction of diffusion. Boltzmann, however, shows that, in order correctly to represent the motion of the diffusing gas, we must impart to molecules having different molecular velocities independent of direction different common velocities in the direction of diffusion. And it will be found that the resistance of the gases is sensibly modified by this property.[9]

The complete solution of the problem,—that is, the determination of u as a function of w, on the hypothesis that the molecules are elastic spheres,—is difficult.

If we assume molecules to be centres of force varying inversely as the nth power of the distance, so that the force at distance r is $\frac{\mu}{r^n}$, where μ is constant, we obtain the following result. We assume the molecules of gas A whose absolute velocities are between w and $w+dw$ to have an average stream velocity u in direction of the tube, where u is a function of w. Then, if the terminal condition at the ends of the tube *be maintained constant*, we obtain an equation of the form

$$\frac{p}{N}\frac{dN_b}{dx}=\frac{4n-8}{3n-3}C\cdot\frac{m_1m_2}{m_1+m_2}\,\frac{\pi N_aN_b}{\text{unit volume}}$$

multiplied by the average value for all molecules of gas A of $u\,V^{\frac{n-5}{n-1}}$, where V is the relative velocity of two molecules, one taken from each gas, and C is a constant, and m_1, m_2 the masses of the molecules of gas A and gas B respectively.

By making n infinite we obtain the result for elastic spheres: in that case $V^{\frac{n-5}{n-1}}=V$, and the problem is to find the average value of uV.

Since p varies as the absolute temperature, and the average value of V varies as the square root of the absolute temperature, we may infer that the average value of u—that is, the stream velocity—will vary approximately as the square root of the temperature, as it appears to do from experimental evidence. If, on the other hand, $n=5$, V disappears, and $\frac{4n-8}{3n-3}=1$. In this case the analytical determination of u presents no difficulty; but in the result the stream velocity varies as the absolute temperature, which accords less satisfactorily with experiments.

On Molecular Dimensions.

Many attempts have been made in recent years to form an estimate or conjecture, more or less accurate, of the numerical value of the dimensions of a molecule and the absolute force between molecules.[10]

In accordance with the view of the subject considered in this article, we are here concerned with such speculations only in so far as they are founded upon the kinetic theory of gases, or supported by it. The phenomena of diffusion and viscosity especially have afforded grounds for estimates of molecular dimensions.

It is first necessary to define what is meant by the dimensions of a molecule. Regarded as an elastic sphere, it has dimensions with the conception of which we are familiar. It is not, of course, seriously contended by any physicists that the molecules of a gas are actually hard elastic spheres, exerting no force on each other at any distance greater than that of actual contact, and then an infinite force. It is necessary to conceive the forces as finite, although they may diminish so rapidly with the distance as that the motions of molecules in the aggregate differ little from what they would be if the molecules were ideal elastic spheres. Nevertheless, they must be finite forces; and, that being the case, it is difficult, if not impossible, to frame a definition of the boundary of a molecule, except as a certain surface at which the forces acting between the molecule in question and other molecules attain a certain value.

If, for instance, we were to regard a molecule as a centre of force,

7 "Zur Gas-Reibung," in the *Sitzungsber. d. k.-k. Akad.*, 1881.

8 Memoir "On the Dynamical Theory of Diffusion" (*Sitzungsber. d. k.-k. Akad.*, lxv.)

9 For Boltzmann's own treatment of the subject we cannot, within the limits of this article, do more than refer the reader to the memoir above mentioned, "Zur Gas-Reibung," and another as yet unfinished memoir "On Diffusion," in the *Sitzungsber. d. k.-k. Akad.*, 1882.

10 An account of these will be found in O. E. Meyer's *Kin. Theorie d. Gase*, in Professor Tait's *Recent Advances in Physical Science*, lect. xii., and in the following memoirs:—*Phil. Mag.*, July 1879, "On the Size of Molecules," by N. D. C. Hodges; *Phil. Mag.*, March 1880, "On the Mean Free Path of Molecules," by the same author. See also, lecture delivered by Sir W. Thomson at the Royal Institution, 2d Feb. 1883.

Hence, if we attempt to cause one stratum of gas to pass over another *in parallel planes*, we experience a resistance due to the interchange of molecules between the portions of gas separated by the plane. This is in some respects analogous to sliding friction between solid bodies, and is called by German writers the "friction" (*Reibung*), by Maxwell and others the "viscosity," of the gas. Meyer[1] investigates this effect of friction in a manner somewhat similar to that employed in case of diffusion, and obtains for the coefficient of viscosity $\frac{1}{3}\, mN\overline{\omega l}$.

Relation of the Coefficient of Viscosity to Density and Temperature.—The viscosity of a gas is independent of the density, being, according to O. E. Meyer, $\frac{mN}{3}\,\overline{\omega l}$. Now, for any one gas, l_ω is, as we have seen, inversely proportional to the density, and therefore $\overline{\omega l}$ is inversely proportional to the density. On the other hand, N is directly proportional to the density. Hence the viscosity is independent of the density. This agrees with the result obtained by Maxwell from the kinetic theory in 1860, and with the results of experiments by Maxwell[2] and O. E. Meyer.[3] Also, experiments by O. E. Meyer and Springmühl[4] on the *transpiration* of gases show that the times in which two different gases under similar circumstances flow through a tube maintain the same constant ratio to one another. As in the case of the coefficient of diffusion, $\overline{\omega l}$ is inversely proportional to the square root of the absolute temperature. As both the coefficient of diffusion and that of viscosity depend on the same function $\overline{\omega l}$, it should be possible from experiments on viscosity to determine the rate of diffusion. Experiments with this object have been conducted by Stefan[5] with very satisfactory results, his calculated values for the coefficient of diffusion agreeing very closely with those determined by Loschmidt's direct experiment.[6]

We have given the above results for the coefficients of diffusion and viscosity from O. E. Meyer's work, because his method has met with very general acceptance. It has been shown, however, by Boltzmann,[7] that the method is incomplete. Meyer's results can only be obtained on the assumption that the molecules of a gas undergoing diffusion or internal friction, which have any given velocity, as w, are moving with that velocity in all directions indifferently. We may calculate the number of molecules having velocity w that pass through a given plane during a short time dt, starting from encounters at any given distance from the plane. If we assume that the molecules, issuing from such encounters with velocity w, move indifferently in all directions, we obtain Meyer's result. This assumption is true only of a gas at rest—that is, having no velocity of translation—so that our result so obtained would express, in case of diffusion, the rate at which two gases *begin to* diffuse, if given at any instant both at rest—that is, with no stream velocity—but mixed in unequal proportions in different parts of space. In any actual case of diffusion, either of the two diffusing gases acquires a small velocity of translation. If we take this velocity into account in calculating the number of molecules of the gas passing through a plane, according to Meyer's method, we shall find that it introduces two new terms, one of which, when the motion becomes steady, is equal and opposite to the result obtained by Meyer. This is proved by Boltzmann in the case of viscosity in the treatise above referred to. The same proof is easily applied in the case of diffusion.

Stefan's Method.—Stefan[8] regards the two diffusing gases as having small velocities of translation, or stream velocities, u_1 and u_2, in opposite directions, so that the molecules of one gas, of mass m_1, have an average momentum m_1u_1 in direction from left to right, and those of the other gas, of mass m_2, an average momentum m_2u_2 from right to left. By virtue of encounters between the two sets of molecules, each gas is always imparting to the other a portion of its own average momentum, and receiving from the other a corresponding momentum in the opposite direction. The momentum so transferred or interchanged is what Stefan calls the *resistance* which one gas offers to the other's diffusion. In this investigation Stefan assumes that all classes of molecules of one gas, whatever their molecular velocity in space, have the same average velocity in the direction of diffusion—that is, the same stream velocity—so that the motion of the molecules of a diffusing gas would be exactly represented by considering the molecules of a gas at rest—that is, with only its molecular velocity—at the same temperature and pressure, and then giving to each molecule the additional common velocity u in the direction of diffusion. Boltzmann, however, shows that, in order correctly to represent the motion of the diffusing gas, we must impart to molecules having different molecular velocities independent of direction different common velocities in the direction of diffusion. And it will be found that the resistance of the gases is sensibly modified by this property.[9]

The complete solution of the problem,—that is, the determination of u as a function of w, on the hypothesis that the molecules are elastic spheres,—is difficult.

If we assume molecules to be centres of force varying inversely as the nth power of the distance, so that the force at distance r is $\frac{\mu}{r^n}$, where μ is constant, we obtain the following result. We assume the molecules of gas A whose absolute velocities are between w and $w+dw$ to have an average stream velocity u in direction of the tube, where u is a function of w. Then, if the terminal condition at the ends of the tube *be maintained constant*, we obtain an equation of the form

$$\frac{p}{N}\frac{dN_b}{dx} = \frac{4n-8}{3n-3}C \cdot \frac{m_1m_2}{m_1+m_2}\,\frac{\pi N_a N_b}{\text{unit volume}}$$

multiplied by the average value for all molecules of gas A of $u\,V^{\frac{n-5}{n-1}}$, where V is the relative velocity of two molecules, one taken from each gas, and C is a constant, and m_1, m_2 the masses of the molecules of gas A and gas B respectively.

By making n infinite we obtain the result for elastic spheres: in that case $V^{\frac{n-5}{n-1}} = V$, and the problem is to find the average value of uV.

Since p varies as the absolute temperature, and the average value of V varies as the square root of the absolute temperature, we may infer that the average value of u—that is, the stream velocity—will vary approximately as the square root of the temperature, as it appears to do from experimental evidence. If, on the other hand, $n=5$, V disappears, and $\frac{4n-8}{3n-3}=1$. In this case the analytical determination of u presents no difficulty; but in the result the stream velocity varies as the absolute temperature, which accords less satisfactorily with experiments.

On Molecular Dimensions.

Many attempts have been made in recent years to form an estimate or conjecture, more or less accurate, of the numerical value of the dimensions of a molecule and the absolute force between molecules.[10]

In accordance with the view of the subject considered in this article, we are here concerned with such speculations only in so far as they are founded upon the kinetic theory of gases, or supported by it. The phenomena of diffusion and viscosity especially have afforded grounds for estimates of molecular dimensions.

It is first necessary to define what is meant by the dimensions of a molecule. Regarded as an elastic sphere, it has dimensions with the conception of which we are familiar. It is not, of course, seriously contended by any physicists that the molecules of a gas are actually hard elastic spheres, exerting no force on each other at any distance greater than that of actual contact, and then an infinite force. It is necessary to conceive the forces as finite, although they may diminish so rapidly with the distance as that the motions of molecules in the aggregate differ little from what they would be if the molecules were ideal elastic spheres. Nevertheless, they must be finite forces; and, that being the case, it is difficult, if not impossible, to frame a definition of the boundary of a molecule, except as a certain surface at which the forces acting between the molecule in question and other molecules attain a certain value.

If, for instance, we were to regard a molecule as a centre of force,

9 For Boltzmann's own treatment of the subject we cannot, within the limits of this article, do more than refer the reader to the memoir above mentioned, "Zur Gas-Reibung," and another as yet unfinished memoir "On Diffusion," in the *Sitzungsber. d. k.-k. Akad.*, 1882.
10 An account of these will be found in O. E. Meyer's *Kin. Theorie d. Gase*, in Professor Tait's *Recent Advances in Physical Science*, lect. xii., and in the following memoirs:—*Phil. Mag.*, July 1879, "On the Size of Molecules," by N. D. C. Hodges; *Phil. Mag.*, March 1880, "On the Mean Free Path of Molecules," by the same author. See also, lecture delivered by Sir W. Thomson at the Royal Institution, 2d Feb. 1883.

illustration is supplied by mellitic acid. For a long time the formula $C_4H_2O_4$ was used for this acid, and by means of it all the then known derivatives were represented. But later investigations by Baeyer proved that this formula must be multiplied by three, the new derivatives obtained by him not being capable of representation with any formula simpler than $C_{12}H_6O_{12}$. Very many examples of the same kind might be adduced, but those given may serve to show the nature of the difficulty of settling the formula and with it the molecular weight of a substance. It need scarcely be said that the multiple formula represents everything which the simple formula represents and something more, and that chemists as a rule take the simplest formula which will answer the purpose. These chemical methods of determining the formula and molecular weight apply equally to all pure substances, but they do not give us absolute values, only numbers to which the molecular weights are proportional. And for purely chemical purposes these are all that we require. Thus, when a chemist speaks of acting on a molecule of succinic acid with two molecules of pentachloride of phosphorus, he means that he mixes them in the proportion of 118 parts of the former to $2 \times 177{\cdot}5$ of the latter. For the sake of precision we sometimes speak of a molecule of water (or other substance) in grammes, or even of a *gramme-molecule*, a *grain-molecule*, &c. Thus, in the case just mentioned a gramme-molecule of succinic acid means 118 grammes of succinic acid, &c.

But, while for practical purposes these proportional numbers are quite sufficient, we cannot leave out of view their relation to the actual constitution of matter. There is good reason to believe that matter consists of discrete particles, and that every pure substance is made up of small portions of matter, all alike, so that one of them, if we could examine it, would give us a complete idea of the chemical composition, constitution, and character of the substance. These small portions, of which the smallest quantity of the substance which we can examine contains many millions, we may call *molecules*. From the character which we have supposed this molecule to possess—viz., that it fully represents all the chemical properties of the substance—it will be seen that these *real, ultimate* molecules must be proportional to the molecular weights ascertained by chemical means; so that, while for practical laboratory or manufacturing purposes we use the gramme, the pound, or the ton as our unit, and speak of 18 grammes, pounds, or tons, as the case may be, of water, as a molecule (or gramme-molecule, ton-molecule, &c.), in dealing with the actual constitution of matter we should use as our unit the mass of a single atom of hydrogen, and our gramme-molecule would then be a definite, very large, but not yet accurately ascertained, number of real molecules.

It has been already shown above that, on the kinetic theory of gas, a gas consists of a number of particles moving about in straight lines in all directions, and that in a homogeneous gas which follows Boyle's and Charles's laws these particles are all alike. The masses of the particles of different gases are therefore to one another in the same proportion as the densities of the gases, temperature and pressure being the same. Thus, in gases, the independently moving particles of the kinetic theory are the molecules of which the chemist is in search, and it becomes important that we should compare our chemically found molecular weights with the densities. Theoretically accurate results could be obtained only in the case of a perfect gas; but small deviations from Boyle's and Charles's laws do not interfere with the application of this method. Chemical methods, as we have already seen, lead us to a particular number, *or a multiple of it*, so that our choice is as a rule limited to two or three numbers widely differing from one another. We find that if we do not exceed the limits of chemical stability a gas approaches the state of a perfect gas as the temperature increases, or as the pressure diminishes. Now if one of the numbers rendered probable by chemical evidence *nearly* coincides with that given by comparison of gas densities, under conditions where the substance sensibly deviates from Boyle's and Charles's laws, we find that by diminishing the pressure or increasing the temperature within the limits of chemical stability, and thus bringing the substance nearer the state of a perfect gas, the correspondence between these two numbers becomes closer. This has already been pointed out and illustrated in the article CHEMISTRY, vol. v. p. 469.

We can now compare the results, in the case of gases, of the chemical and of the physical determination of molecular weight, by giving some examples, placing side by side the formula and molecular weight adopted by chemists, and the mass, in grammes, of the gas occupying the volume of $22{\cdot}33 \times 760/p \times (273+t)/273$ litres. This volume is that which one gramme of an ideal gas having the molecular weight 1, and perfectly following Boyle's and Charles's laws, would occupy at pressure p millimetres of mercury and temperature $t°$ C. If, then, w be the molecular weight of any gas, w grammes of it should occupy this volume, and slight deviation from this would indicate slight deviation from Boyle's and Charles's laws. In the annexed table w is the molecular weight and m the mass contained in $22{\cdot}33 \times 760/p \times (273+t)/273$ litres. Where the temperature is not specially stated, the determinations were made under the usual atmospheric conditions.

Name.	Formula.	w.	m.

Oil of vitriol ...	H_2SO_4	98	50·24	" 440° C.
Pentachloride of phosphorus ...	PCl_5	208·5	140	" 200° C.
			105·4	" 300° C.
Sulphide of ammonium ...	$(NH_4)_2S$	68	22·76	" 80° C.

A comparison of the values of w and m leads to the following conclusions:—

(1) In the case of a very great number of substances, of which only a few specimens are given in the table, the two determinations agree, the slight differences often observed being evidently due to deviation of the substance from the state of a perfect gas. (2) In a considerable number of substances, physical evidence leads to a multiple of the simplest number satisfying the chemical conditions. This cannot be looked upon as a disagreement between the methods, because, if a particular formula satisfies the chemical conditions, any multiple of it will necessarily do so; and indeed, in many of the cases we are now considering, it is possible from chemical considerations to justify the higher molecular weight after it has been suggested, although such chemical considerations might not in all cases have warranted its adoption without external support. Thus, we are not without chemical evidence in

Thus, we are not without chemical evidence in

limiting value for the internal kinetic energy[1] of a molecule of AB. If a molecule of AB, by encounters with other molecules or with the wall of the vessel containing the gas, acquires a greater amount of internal kinetic energy than this limit, it at once breaks up into A and B, so that in the gaseous mixture there are no molecules of AB having more internal kinetic energy than the limit. Further, if two molecules, one of A and one of B, meet one another with such a velocity and with such an amount of internal kinetic energy that together the internal kinetic energy is less than the limit, they will unite to form a molecule of AB. Thus the molecules with great internal kinetic energy will be separate molecules of A and B; those with small internal kinetic energy will mostly be united as AB. This hypothesis has been to a considerable extent worked out and applied by Pfaundler and by Naumann, and the deductions from it agree fairly well with the results of experiment; but in some points the theory has not been fully developed, and in some it does not seem altogether to accord with observed facts. Some of these difficulties have been mentioned above. We know enough of the nature of dissociation to see that it belongs to the class of *balanced chemical actions*, in which a chemical change is reversible, and equilibrium is kept up, with constant external conditions, by the two opposite chemical changes taking place to an equal extent in a given time. We can see that all such cases are explicable by the statistical method, but we cannot apply this method mathematically until we know more of the intimate nature of the molecules and of the way in which they act upon one another. In this discussion of dissociation we have looked specially at the cases in which A, B, and AB are all gaseous, because it was the question of anomalous vapour densities which led us to treat of the subject. Dissociation also occurs where one or two of the substances are solid or liquid.

We now see with what restrictions the method of vapour density is applicable to the determination of molecular weight, and we can understand more fully the example given in the article CHEMISTRY, vol. v. p. 469. It is there shown that acetic acid vapour does not conform to the laws of Boyle and Charles until the temperature is raised to about 250°, at the ordinary barometric pressure. At and above that temperature the vapour density corresponds to the formula $C_2H_4O_2$. At lower temperatures the density corresponds to a higher molecular weight. Now Playfair and Wanklyn determined the vapour density at much lower temperatures than the ordinary boiling point of acetic acid, by greatly diminishing the pressure of the acetic acid vapour. This they accomplished by mixing it with a large quantity of hydrogen, so that the pressure due to acetic acid vapour formed only a small fraction of the total pressure. The vapour density of acetic acid at the low temperatures at which they worked was found to correspond very nearly with the formula $C_4H_8O_4$, and, by comparing this result with what has been said (p. 620) of the chemical evidence as to the molecular weight of acetic acid, we may reasonably conclude that the molecule of acetic acid at low temperatures is $C_4H_8O_4$, and that as the temperature is raised it undergoes dissociation, each molecule dividing into two of $C_2H_4O_2$. This is then a case where A and B are equal, and AA divides into $A+A$. Another instance of the same kind is probably to be found in peroxide of nitrogen (CHEMISTRY, p. 513), where N_2O_4 divides into NO_2+NO_2. Similarly, sulphur vapour has, at temperatures below 500° C., a density corresponding to the formula S_6. This dissociates as the temperature rises until, about 1000° C., the density corresponds to the formula S_2 (CHEMISTRY, p. 498).

We have now seen that chemistry receives great assistance in the determination of molecular weight from physics, but this assistance is almost entirely confined to the case of gases, or of substances which can be volatilized. The phenomena of the diffusion of liquids show us that there also there are independently moving particles; but the laws of liquid-diffusion have not been sufficiently generalized to give us much help in the determination of the relative masses of these particles. In liquids it is probable that the particles are very near each other, and that their shape and their mutual action, as well as their mass and the temperature, determine their rate of motion.

In solids we have no independently travelling particles, and it is perhaps scarcely correct to speak of a molecular structure of solids at all. Solids are no doubt composed of atoms, and those atoms are evidently arranged in what may be called a tactical order. When the solid is fused or dissolved or volatilized, it breaks into molecules, each repetition of the pattern, if we may use the expression, being ready to become an independent thing under favourable circumstances. But, while these potential molecules of solids cannot perhaps be properly called molecules in a physical sense,[2] for chemical purposes we may call them so, for they are the smallest portions of the substance which fully represent it chemically, and, as we have seen, this is the chemical molecule, the quantity which should be represented by the formula. (A. C. B.)

MOLESKIN is a stout heavy cotton fabric of leathery consistence woven as a satin twill on a strong warp. It is finished generally either as a bleached white or as a slaty drab colour, but occasionally it is printed in imitation of tweed patterns. Being an exceedingly durable and economical texture, it was formerly much more worn by workingmen, especially outdoor labourers, than is now the case. It is also used for gun-cases, carriage-covers, and several purposes in which a fabric capable of resisting rough usage is desirable.

MOLESWORTH, SIR WILLIAM (1810-1855), the eighth baronet, was born in London, 23d May 1810, and succeeded to the extensive family estates in Devon and Cornwall in 1823. On the passing of the Reform Act of 1832 he was returned to parliament, though only twenty-two years old, for the eastern division of the county of Cornwall, to support the ministry of Lord Grey. For some time he took little part in the debates of the House of Commons; but in April 1835 he founded, in conjunction with Mr. Roebuck, the *London Review*, as an organ of the politicians known to the world as "Philosophic Radicals." After the publication of two volumes he purchased the *Westminster Review*, and for some time the united magazines were edited by him and J. S. Mill. From 1837 to 1841 Sir William Molesworth sat for the borough of Leeds, and during those years acquired considerable influence in the House of Commons by his speeches and by his tact in presiding over the select committee on Transportation. From 1841 to 1845 he remained in private life, occupying his leisure time in editing the works in Latin and English of Thomas Hobbes of Malmesbury, a recreation which cost him no less than £6000. In the latter year he was returned for the borough of Southwark, and retained that seat until his death. On his return to parliament he devoted special attention to the condition of the colonies, and delivered many speeches in favour of a reduction in colonial expenditure and on their better administration. His arguments on these questions changed the opinions of the members of the House of Commons; and the criticisms of the daily press, aided by the printing of his speeches, led to the gradual acceptance of his views by the electors at large. It was not, however, until many years afterwards that he was allowed full opportunity for working out the difficult problems connected with the government of Great Britain. Office was conferred upon him in December 1852 by Lord Aberdeen, but it was the minor post of directing the public improvements and crown lands of his own country, and the chief work by which his name was brought into prominence at this time was the construction of the new Westminster Bridge. At last, in July 1855, he was called to preside over the Colonial Office, but unfortunately its duties were no sooner entrusted to his care than he was cut off by death (22d October 1855), to the universal regret of his countrymen, for he had lived down the animosities of his youth, and had attracted to himself the sympathies of all thoughtful men. The influence which his views had acquired, and still retain, may be judged from the fact that in 1878 the delegates of the Transvaal Government put forward, as the chief argument for the withdrawal of the English from the Transvaal, the substance of his speech on the abandonment of the Orange River Territory in 1854.

A full pedigree of the Molesworth family is printed in Sir John Maclean's *Trigg Minor*, vol. i.; the titles of his speeches and works

[1] By internal kinetic energy is meant the kinetic energy of motion of the parts of the molecule relatively to one another, in contradistinction to the kinetic energy of motion of the molecule as a whole.

[2] It may be urged that the cleavage of crystals indicates that they possess a molecular structure, but a tactical or pattern-like arrangement of atoms may easily be supposed to present planes of easier separation, without the assumption of really independent molecules.

limiting value for the internal kinetic energy[1] of a molecule of AB. If a molecule of AB, by encounters with other molecules or with the wall of the vessel containing the gas, acquires a greater amount of internal kinetic energy than this limit, it at once breaks up into A and B, so that in the gaseous mixture there are no molecules of AB having more internal kinetic energy than the limit. Further, if two molecules, one of A and one of B, meet one another with such a velocity and with such an amount of internal kinetic energy that together the internal kinetic energy is less than the limit, they will unite to form a molecule of AB. Thus the molecules with great internal kinetic energy will be separate molecules of A and B; those with small internal kinetic energy will mostly be united as AB. This hypothesis has been to a considerable extent worked out and applied by Pfaundler and by Naumann, and the deductions from it agree fairly well with the results of experiment; but in some points the theory has not been fully developed, and in some it does not seem altogether to accord with observed facts. Some of these difficulties have been mentioned above. We know enough of the nature of dissociation to see that it belongs to the class of *balanced chemical actions*, in which a chemical change is reversible, and equilibrium is kept up, with constant external conditions, by the two opposite chemical changes taking place to an equal extent in a given time. We can see that all such cases are explicable by the statistical method, but we cannot apply this method mathematically until we know more of the intimate nature of the molecules and of the way in which they act upon one another. In this discussion of dissociation we have looked specially at the cases in which A, B, and AB are all gaseous, because it was the question of anomalous vapour densities which led us to treat of the subject. Dissociation also occurs where one or two of the substances are solid or liquid.

We now see with what restrictions the method of vapour density is applicable to the determination of molecular weight, and we can understand more fully the example given in the article CHEMISTRY, vol. v. p. 469. It is there shown that acetic acid vapour does not conform to the laws of Boyle and Charles until the temperature is raised to about 250°, at the ordinary barometric pressure. At and above that temperature the vapour density corresponds to the formula $C_2H_4O_2$. At lower temperatures the density corresponds to a higher molecular weight. Now Playfair and Wanklyn determined the vapour density at much lower temperatures than the ordinary boiling point of acetic acid, by greatly diminishing the pressure of the acetic acid vapour. This they accomplished by mixing it with a large quantity of hydrogen, so that the pressure due to acetic acid vapour formed only a small fraction of the total pressure. The vapour density of acetic acid at the low temperatures at which they worked was found to correspond very nearly with the formula $C_4H_8O_4$, and, by comparing this result with what has been said (p. 620) of the chemical evidence as to the molecular weight of acetic acid, we may reasonably conclude that the molecule of acetic acid at low temperatures is $C_4H_8O_4$, and that as the temperature is raised it undergoes dissociation, each molecule dividing into two of $C_2H_4O_2$. This is then a case where A and B are equal, and AA divides into $A+A$. Another instance of the same kind is probably to be found in peroxide of nitrogen (CHEMISTRY, p. 513), where N_2O_4 divides into NO_2+NO_2. Similarly, sulphur vapour has, at temperatures below 500° C., a density corresponding to the formula S_6. This dissociates as the temperature rises until, about 1000° C., the density corresponds to the formula S_2 (CHEMISTRY, p. 498).

We have now seen that chemistry receives great assistance in the determination of molecular weight from physics, but this assistance is almost entirely confined to the case of gases, or of substances which can be volatilized. The phenomena of the diffusion of liquids show us that there also there are independently moving particles; but the laws of liquid-diffusion have not been sufficiently generalized to give us much help in the determination of the relative masses of these particles. In liquids it is probable that the particles are very near each other, and that their shape and their mutual action, as well as their mass and the temperature, determine their rate of motion.

In solids we have no independently travelling particles, and it is perhaps scarcely correct to speak of a molecular structure of solids at all. Solids are no doubt composed of atoms, and those atoms are evidently arranged in what may be called a tactical order. When the solid is fused or dissolved or volatilized, it breaks into molecules, each repetition of the pattern, if we may use the expression, being ready to become an independent thing under favourable circumstances. But, while these potential molecules of solids cannot perhaps be properly called molecules in a physical sense,[2] for chemical purposes we may call them so, for they are the smallest portions of the substance which fully represent it chemically, and, as we have seen, this is the chemical molecule, the quantity which should be represented by the formula. (A. C. B.)

His arguments on these questions changed the opinions of the members of the House of Commons; and the criticisms of the daily press, aided by the printing of his speeches, led to the gradual acceptance of his views by the electors at large. It was not, however, until many years afterwards that he was allowed full opportunity for working out the difficult problems connected with the government of Great Britain. Office was conferred upon him in December 1852 by Lord Aberdeen, but it was the minor post of directing the public improvements and crown lands of his own country, and the chief work by which his name was brought into prominence at this time was the construction of the new Westminster Bridge. At last, in July 1855, he was called to preside over the Colonial Office, but unfortunately its duties were no sooner entrusted to his care than he was cut off by death (22d October 1855), to the universal regret of his countrymen, for he had lived down the animosities of his youth, and had attracted to himself the sympathies of all thoughtful men. The influence which his views had acquired, and still retain, may be judged from the fact that in 1878 the delegates of the Transvaal Government put forward, as the chief argument for the withdrawal of the English from the Transvaal, the substance of his speech on the abandonment of the Orange River Territory in 1854.

A full pedigree of the Molesworth family is printed in Sir John Maclean's *Trigg Minor*, vol. i.; the titles of his speeches and works

---

[1] By internal kinetic energy is meant the kinetic energy of motion of the parts of the molecule relatively to one another, in contradistinction to the kinetic energy of motion of the molecule as a whole.

[2] It may be urged that the cleavage of crystals indicates that they possess a molecular structure, but a tactical or pattern-like arrangement of atoms may easily be supposed to present planes of easier separation, without the assumption of really independent molecules.

and a number of his biographers in our own day, have attempted to prove that Armande Béjard was not the sister, but the daughter of Madeleine, and even that Molière's wife may have been his own daughter by Madeleine Béjard. The arguments of M. Arsène Houssaye in support of this abominable theory are based on reckless and ignorant confusions, and do not deserve criticism. But the system of M. Loiseleur is more serious, and he goes no further than the idea that Madeleine was the mother of Armande. This, certainly, was the opinion of tradition, an opinion based on the slanders of Montfleury, a rival of Molière's, on the authority of the spiteful and anonymous author of *La Fameuse Comédienne* (1688), and on the no less libellous play, *Élomire Hypochondre*. In 1821 tradition received a shock, for Beffara then discovered Molière's "acte de mariage," in which Armande, the bride, is spoken of as the sister of Madeleine Béjard, by the same father and mother. The old scandal, or part of it, was revived by M. Fournier and M. Bazin, but received another blow in 1863. M. Soulié then discovered a legal document of 10th March 1643, in which the widow of Joseph Béjard renounced, in the name of herself and her children, his inheritance, chiefly a collection of unpaid bills. Now in this document all the children are described as minors, and among them is "*une petite non encore baptisée.*" This little girl, still not christened in March 1643, is universally recognized as the Armande Béjard afterwards married by Molière. We reach this point, then, that when Armande was an infant she was acknowledged as the sister, not as the daughter, of Madeleine Béjard. M. Loiseleur refuses, however, to accept this evidence. Madeleine, says he, had already become the mother, in 1638, of a daughter by Esprit Raymond de Moirmoron, comte de Modène, and chamberlain of Gaston duc d'Orléans, brother of Louis XIII. In 1642 Modène, who had been exiled for political reasons, "was certain to return, for Richelieu had just died, and Louis XIII. was likely to follow him." Now Madeleine was again—this is M. Loiseleur's hypothesis—about to become a mother, and if Modène returned, and learned this fact, he would not continue the *liaison*, still less would he marry her,—which, by the way, he could not do, as his wife was still alive. Madeleine, therefore, induced her mother to acknowledge the little girl as her own child. In the first place, all this is pure unsupported hypothesis. In the second place, it has always been denied that Béjard's wife could have been a mother in 1643, owing to her advanced age, probably fifty-three. But M. Loiseleur himself says that Marie Hervé was young enough to make the story "sufficiently probable." If it was probable, much more was it possible. M. Loiseleur supports his contention by pointing out that two of the other children, described as legally minors, were over twenty-five, and that their age was understated to make the account of Armande's birth more probable. Nothing is less likely than that Modène would have consulted this document to ascertain the truth about the parentage of Armande, yet M. Loiseleur's whole theory rests on that extreme improbability. It must also be observed that the date of the birth of Joseph Béjard is unknown, and he *may* have been, and according to M. Jal (*Dictionnaire Critique*, p. 178) *must* have been, a minor when he was so described in the document of 10th March 1643, while Madeleine had only passed her twenty-fifth birthday, her legal majority, by two months. This view of Joseph's age is supported by Bouquet (*Molière à Rouen*, p. 77). M. Loiseleur's only other proof is that Marie Hervé gave Armande a respectable dowry, and that, as we do not know whence the money came, it must have come from Madeleine. The tradition in Grimarest, which makes Madeleine behave *en femme furieuse*, when she heard of the marriage, is based on a juster appreciation of the character of women. It will be admitted, probably, that the reasons for supposing that Molière espoused the daughter of a woman who had been his mistress (if she had been his mistress) are flimsy and inadequate. The affair of the dowry is insisted on by M. Livet (*La Fameuse Comédienne*, reprint of 1877, p. 143). But M. Livet explains the dowry by the hypothesis that Armande was the daughter of Madeleine and the comte de Modène, which exactly contradicts the theory of M. Loiseleur, and is itself contradicted by dates, at least as understood by M. Loiseleur. Such are the conjectures by which the foul calumnies of Molière's enemies are supported in the essays of modern French critics.

To return to the order of events, Molière passed the year 1643 in playing with, and helping to manage, the Théâtre Illustre. The company acted in various tennis-courts, with very little success. Molière was actually arrested by the tradesman who supplied candles, and the company had to borrow money from one Aubrey to release their leader from the Grand Châtelet (13th August 1645). The process of turning a tennis-court into a theatre was somewhat expensive, even though no seats were provided in the pit. The troupe was for a short time under the protection of the duc d'Orléans, but his favours were not lucrative. The duc de Guise, according to some verses printed in 1646, made Molière a present of his cast-off wardrobe. But costume was not enough to draw the public to the tennis-court theatre of the Croix Noire, and empty houses at last obliged the Théâtre Illustre to leave Paris at the end of 1646.

"Nul animal vivant n'entra dans nôtre salle," says the author of the scurrilous play on Molière, *Élomire Hypochondre*. But at that time some dozen travelling companies found means to exist in the provinces, and Molière determined to play among the rural towns. The career of a strolling player is much the same at all times and in all countries. The *Roman Comique* of Scarron gives a vivid picture of the adventures and misadventures, the difficulty of transport, the queer cavalcade of horses, mules, and lumbering carts that drag the wardrobe and properties, the sudden metamorphosis of the tennis-court, where the balls have just been rattling, into a stage, the quarrels with local squires, the disturbed nights in crowded country inns, all the loves and wars of a troupe on the march. Perrault tells us what the arrangements of the theatre were in Molière's early time. Tapestries were hung round the stage, and entrances and exits were made by struggling through the heavy curtains, which often knocked off the hat of the comedian, or gave a strange cock to the helmet of a warrior or a god. The lights were candles stuck in tin sconces at the back and sides, but luxury sometimes went so far that a chandelier of four candles was suspended from the roof. At intervals the candles were let down by a rope and pulley, and any one within easy reach snuffed them with his fingers. A flute and tambour, or two fiddlers, supplied the music. The highest prices were paid for seats in the *dedans* (cost of admission fivepence); for the privilege of standing up in the pit twopence-halfpenny was the charge. The doors were opened at one o'clock, the curtain rose at two.

The nominal director of the Théâtre Illustre in the provinces was Du Fresne; the most noted actors were Molière, the Béjards, and Du Parc, called Gros René. It is extremely difficult to follow exactly the line of march of the company. They played at Bordeaux, for example, but the date of this performance, when Molière (according to Montesquieu) failed in tragedy and was pelted, is variously given as 1644-45 (Trallage), 1647 (Loiseleur), 1648-58 (Lacroix). Perhaps the theatre prospered better elsewhere than in Paris, where the streets were barricaded in

Perhaps the theatre prospered better elsewhere than in Paris, where the streets were barricaded in

has amazing rapidity, and the vivacity of M. Coquelin in Mascarille still makes *L'Étourdi* a favourite on the stage, though it cannot be read with very much pleasure. The next piece, new in Paris, though not in the provinces, was the *Dépit Amoureux* (first acted at Béziers, 1656). The play was not less successful than *L'Étourdi*. It has two parts, one an Italian *imbroglio*; the other, which alone keeps the stage, is the original work of Molière, though, of course, the idea of *amantium iræ* is as old as literature. "Nothing so good," says Mr. Saintsbury, "had yet been seen on the French stage, as the quarrels and reconciliations of the quartette of master, mistress, valet, and soubrette." Even the hostile Le Boulanger de Chalussay (*Élomire Hypochondre*) admits that the audience was much of this opinion—

> "Et de tous les côtés chacun cria tout haut,
> 'C'est la faire et jouer les pièces comme il faut.'"

The same praise was given, perhaps even more deservedly, to *Les Précieuses Ridicules* (18th November 1659). Doubts have been raised as to whether this famous piece, the first true comic satire of contemporary foibles on the French stage, was a new play. La Grange calls it *pièce nouvelle* in his *Registre*, but, as he enters it as the third *pièce nouvelle*, he may only mean that, like *L'Étourdi*, it was new to Paris. The short life of 1682, produced under La Grange's care, and probably written by Marcel the actor, says the *Précieuses* was "made" in 1659. There is another controversy as to whether the ladies of the Hôtel Rambouillet, or merely their *bourgeoises* and rustic imitators, were laughed at. Ménage, in later years at least, professed to recognize an attack on the over-refinement and affectation of the original and, in most ways, honourable *précieuses* of the Hôtel Rambouillet. But Chapelle and Bachaumont had discovered provincial *précieuses*, hyper-æsthetic literary ladies, at Montpellier before Molière's return to Paris; and Furetière, in the *Roman Bourgeois* (1666), found Paris full of middle-class *précieuses*, who had survived, or, like their modern counterparts, had thriven on ridicule. Another question is—Did Molière copy from the earlier *Précieuses* of the abbé de Pure? This charge of plagiarism is brought by Somaize, in the preface to his *Véritables Précieuses*. De Pure's work was a novel (1656), from which the Italian actors had put together an acting piece in their manner, that is, a thing of "gag," and improvized speeches. The reproach is interesting only because it proves how early Molière found enemies who, like Thomas Corneille in 1659, accused him of being skilled only in farce, or, like Somaize, charged him with literary larceny. These were the stock criticisms of Molière's opponents as long as he lived. The success of the *Précieuses Ridicules* was immense; on one famous occasion the king was a spectator, leaning against the great chair of the dying Cardinal Mazarin. The play can never cease to please while literary affectation exists, and it has a comic force of deathless energy. Yet a modern reader may spare some sympathy for the poor heroines, who do not wish, in courtship, to "begin with marriage," but prefer first to have some less formidable acquaintance with their wooers. Molière's next piece was less important, and more purely farcical, *Sganarelle; ou le Cocu Imaginaire* (28th May 1660). The public taste preferred a work of this light nature, and *Sganarelle* was played every year as long as Molière lived. The play was pirated by a man who pretended to have retained all the words in his memory. The counterfeit copy was published by Ribou, a double injury to Molière, as, once printed, any company might act the play. With his habitual good-nature, Molière not only allowed Ribou to publish later works of his, but actually lent money to that knave (Soulié, *Recherches*, p. 287).

On 11th October 1660 the Théâtre du Petit Bourbon was demolished by the superintendent of works, without notice given to the company. The king gave Molière the Salle du Palais Royal, but the machinery of the old theatre was maliciously destroyed. Meanwhile the older companies of the Marais and the Hôtel de Bourgogne attempted to lure away Molière's troupe, but, as La Grange declares (*Registre*, p. 26), "all the actors loved their chief, who united to extraordinary genius an honourable character and charming manner, which compelled them all to protest that they would never leave him, but always share his fortunes." While the new theatre was being put in order, the company played in the houses of the great, and before the king at the Louvre. In their new house (originally built by Richelieu) Molière began to play on 20th January 1661. Molière now gratified his rivals by a failure. *Don Garcie de Navarre*, a heavy tragi-comedy, which had long lain among his papers, was first represented on 4th February 1661. Either Molière was a poor actor outside comedy, or his manner was not sufficiently "stagy," and, as he says, "demoniac," for the taste of the day. His opponents were determined that he could not act in tragi-comedy, and he, in turn, burlesqued their pretentious and exaggerated manner in a later piece. In the *Précieuses* (sc. ix.) Molière had already rallied "les grands comédiens" of the Hôtel Bourgogne. "Les autres," he makes Mascarille say about his own troupe, "sont des ignorants qui récitent comme l'on parle, ils ne savent pas faire ronfler les vers." All this was likely to irritate the *grands comédiens*, and their friends, who avenged themselves on that unfortunate jealous prince, Don Garcie de Navarre. The subject of this unsuccessful drama is one of many examples which show how Molière's mind was engaged with the serious or comic aspects of jealousy, a passion which he had soon cause to know most intimately. Meantime the everyday life of the stage went on, and the doorkeeper of the Théâtre St. Germain was wounded by some revellers who tried to force their way into the house (La Grange, *Registre*). A year later, an Italian actor was stabbed in front of Molière's house, where he had sought to take shelter (Campardon, *Nouvelles Pièces*, p. 20). To these dangers actors were peculiarly subject: Molière himself was frequently threatened by the marquises and others whose class he ridiculed on the stage, and there seems even reason to believe that there is some truth in the story of the angry marquis who rubbed the poet's head against his buttons, thereby cutting his face severely. The story comes late (1725) into his biography, but is supported by a passage in the contemporary play, *Zélinde* (Paris, 1663, scene viii.). Before Easter, Molière asked for two shares in the profits of his company, one for himself, and one for his wife, if he married. That fatal step was already contemplated (La Grange). On 24th June he brought out for the first time *L'École des Maris*. The general idea of the piece is as old as Menander, and Molière was promptly accused of pilfering from the *Adelphi* of Terence. One of the *ficelles* of the comedy is borrowed from a story as old, at least, as Boccaccio, and still amusing in a novel by Charles de Bernard. It is significant of Molière's talent that the grotesque and baffled paternal wooer, Sganarelle, like several other butts in Molière's comedy, does to a certain extent win our sympathy and pity as well as our laughter. The next new piece was *Les Fascheux*, a *comédie-ballet*, the Comedy of Bores, played before the king at Fouquet's house at Vaux le Vicomte (August 15-20, 1661). The comedians, without knowing it, were perhaps the real "fascheux" on this occasion, for Fouquet was absorbed in the schemes of his insatiable ambition (*Quo non ascendam?* says his motto), and the king was organizing the arrest and fall of Fouquet, his rival in the affections of La Vallière. The author of the prologue to *Les Fascheux*, Pellisson, a friend of Fouquet's, was arrested along with the superintendent of finance. Pellisson's prologue and

One of the *ficelles* of the comedy is borrowed from a story as old, at least, as Boccaccio, and still amusing in a novel by Charles de Bernard. It is significant of Molière's talent that the grotesque and baffled paternal wooer, Sganarelle, like several other butts in Molière's comedy, does to a certain extent win our sympathy and pity as well as our laughter. The next new piece was *Les Fascheux*, a *comédie-ballet*, the Comedy of Bores, played before the king at Fouquet's house at Vaux le Vicomte (August 15-20, 1661). The comedians, without knowing it, were perhaps the real "fascheux" on this occasion, for Fouquet was absorbed in the schemes of his insatiable ambition (*Quo non ascendam?* says his motto), and the king was organizing the arrest and fall of Fouquet, his rival in the affections of La Vallière. The author of the prologue to *Les Fascheux*, Pellisson, a friend of Fouquet's, was arrested along with the superintendent of finance. Pellisson's prologue and

and French stages. Molière made it a new thing: terrible and romantic in its portrait of *un grand seigneur mauvais homme*, modern in its suggested substitution of *la humanité* for religion, comic, even among his comedies, by the mirthful character of Sganarelle. The piece filled the theatre, but was stopped, probably by authority, after Easter. It was not printed by Molière, and even in 1682 the publication of the full text was not permitted. Happily the copy of De la Regnie, the chief of the police, escaped obliterations, and gave us the full scene of Don Juan and the Beggar. The piece provoked a virulent criticism (*Observations sur le Festin de Pierre*, 1665). It is allowed that Molière has some farcical talent, and is not unskilled as a plagiarist, but he "attacks the interests of Heaven," "keeps a school of infidelity," "insults the king," "corrupts virtue," "offends the queen-mother," and so forth. Two replies were published, one of which is by some critics believed to show traces of the hand of Molière. The king's reply, as has been shown, was to adopt Molière's company as his servants, and to pension them. *L'Amour Médecin*, a light comedy, appeared 22d September 1665. In this piece Molière, for the second time, attacked physicians. In December there was a quarrel with Racine about his play of *Alexandre*, which he treacherously transferred to the Hôtel de Bourgogne. June 4, 1666 saw the first representation of that famous play, *Le Misanthrope* (*ou L'Atrabiliaire Amoureux*, as the original second title ran). This piece, perhaps the masterpiece of Molière, was more successful with the critics, with the court, and with posterity than with the public. The rival comedians called it "a new style of comedy," and so it was. The eternal passions and sentiments of human nature, modified by the influence of the utmost refinement of civilization, were the matter of the piece. The school for scandal kept by Célimène, with its hasty judgments on all characters, gave the artist a wide canvas. The perpetual strife between the sensible optimism of a kindly man of the world (Philinte) and the *sæva indignatio* of a noble nature soured (Alceste) supplies the intellectual action. The humours of the joyously severe Célimène and of her court, especially of that deathless minor poet Oronte, supply the lighter comedy. Boileau, Lessing, Goethe have combined to give this piece the highest rank even among the comedies of Molière. As to the "keys" to the characters, and the guesses about the original from whom Alceste was drawn, they are as valueless as other contemporary tattle.

A briefer summary must be given of the remaining years of the life of Molière. The attractions of *Le Misanthrope* were reinforced (6th August) by those of the *Médecin Malgré Lui*, an amusing farce founded on an old *fabliau*. In December the court and the comedians went to Saint Germain, where, among other diversions, the pieces called *Mélicerte*, *La Pastorale Comique* (of which Molière is said to have destroyed the MS.), and the charming little piece *Le Sicilien*, were performed. A cold and fatigue seem to have injured the health of Molière, and we now hear of the consumptive tendency which was cruelly ridiculed in *Élomire Hypochondre*. Molière was doubtless obliged to see too much of the distracted or pedantic physicians of an age when medicine was the battlefield of tradition, superstition, and nascent chemical science. On 17th April 1667 Robinet, the rhyming gazetteer, says that the life of Molière was thought to be in danger. On the 10th of June, however, he played in *Le Sicilien* before the town. In the earlier months of 1667 Louis XIV. was with the army in Flanders. There were embassies sent from the comedy to the camp, and on 5th August it was apparent that Molière had overcome the royal scruples. *Tartuffe* was played, but Lamoignon stopped it after the first night. La Grange and La Torillière hastened to the camp, and got the king's promise that he would reconsider the matter on his return. Molière's next piece (13th January 1668) was *Amphitryon*, a free—a very free—adaptation from Plautus, who then seems to have engaged his attention, for not long afterwards he again borrowed from the ancient writer in *L'Avare*. There is a controversy as to whether *Amphitryon* was meant to ridicule M. de Montespan, the husband of the new mistress of Louis XIV. Michelet has a kind of romance based on this probably groundless hypothesis. The king still saw the piece occasionally, after he had purged himself and forsworn sack under Madame de Maintenon, and probably neither he nor that devout lady detected any personal references in the coarse and witty comedy. As usual, Molière was accused of plagiarizing, this time from Rotrou, who had also imitated Plautus. The next play was the immortal *George Dandin* (10th July), first played at a festival at Versailles. Probably the piece was a rapid palimpsest on the ground of one of his old farces, but the addition of these typical members of a county family, the De Sotenville, raises the work from farce to satiric comedy. The story is borrowed from Boccaccio, but is of unknown age, and always new,—Adolphus Crosbie in *The Small House at Allington* being a kind of modern George Dandin. Though the sad fortunes of this peasant with social ambition do not fail to make us pity him somewhat, it is being too refined to regard *George Dandin* as a comedy with a concealed tragic intention. Molière must have been at work on *L'Avare* before *George Dandin* appeared, for the new comedy after Plautus was first acted on 9th September. There is a tradition that the piece almost failed; but, if unpopular in the first year of its production, it certainly gained favour before the death of its author. *M. de Pourceaugnac* (17th September 1669) was first acted at Chambord, for the amusement of the king. It is a rattling farce. The physicians, as usual, bore the brunt of Molière's raillery, some of which is still applicable. Earlier in 1669 (5th February) *Tartuffe* was played at last, with extraordinary success. *Les Amants Magnifiques*, a comedy-ballet, was acted first at Saint Germain (10th February 1670). The king might have been expected to dance in the ballet, but from Racine's *Britannicus* (13th December 1669) the majestical monarch learned that Nero was blamed for exhibitions of this kind, and he did not wish to out-Nero Nero. Astrology this time took the place of medicine as a butt, but the satire has become obsolete, except, perhaps, in Turkey, where astrology is still a power. The *Bourgeois Gentilhomme*, too familiar to require analysis, was first played on 23d October 1770. The lively *Fourberies de Scapin* "saw the footlights" (if footlights there were) on 24th May 1671, and on 7th May we read in La Grange, "les Repetitions de Spsyche ont commancé." La Grange says the theatre was newly decorated and fitted with machines. A "concert of twelve violins" was also provided, the company being resolute to have everything handsome about them. New singers were introduced, who did not refuse to sing unmasked on the stage. Quinault composed the words for the music, which was by Lulli; Molière and Pierre Corneille collaborated in the dialogue of this magnificent opera, the name of which (*Psyche*) La Grange eventually learned how to spell. The *Comtesse d'Escarbagnas* (2d February 1672) was another piece for the amusement of the court, and made part of an entertainment called *Le Ballet des Ballets*. In this play, a study of provincial manners, Molière attacked the financiers of the time in the person of M. Harpin. The comedy has little importance compared with *Les Femmes Savantes* (11th February), a severer *Précieuses*, in which are satirized the vanity and affectation of sciolists, pedants, and the women who admire them. The satire is never out of date, and finds its modern form in

and French stages. The satire is never out of date, and finds its modern form in

with prohibiting all further discussion of the question "de auxiliis," and studious efforts were made to control the publication even of commentaries on Aquinas. The Molinist subsequently passed into the Jansenist controversy, and it is as a champion of Jansenism that Pascal in the *Provincial Letters* attacks Molina and the *scientia media* (see JANSENISM).

MOLINE, a city of the United States, in Rock Island county, Illinois, is situated in a picturesque district on the left bank of the Mississippi, opposite the upper end of Rock Island. First settled in 1832, the town was organized as a city in 1872. It is noted for its water-power, developed and maintained by the Government, and for the number and importance of its manufacturing establishments. By means of a dam nearly a mile in length, from the Illinois shore to the island, an almost uniform head of 7 feet of water is obtained, which is used in driving the machinery of the Government arsenal on the island, and in supplying power to several factories. Beds of bituminous coal are mined in the neighbourhood, and three lines of railway pass through the city, affording with the river ample means of communication. The most prominent manufactures are agricultural implements and machinery generally, waggons, organs, paper, and stoves. Moline has nine churches, a complete system of graded free schools, including a high school, and a free library. The population increased from 4066 in 1870 to 7805 in 1880, and with the suburbs the number is now estimated at 12,000.

MOLINOS, MIGUEL DE (1627-c. 1696), a Spanish priest whose name is intimately associated with that type of religion known in Italy and Spain during the latter half of the 17th century as Quietism, was born of good family in the diocese of Saragossa, on 21st December 1627. Having entered the priesthood, he settled about his fortieth year in Rome, where he speedily rose to high repute as a father confessor, and gained many distinguished friends, among whom were several cardinals, including Odescalchi (afterwards Innocent XI., 1676). In 1675 he published at Rome a small duodecimo volume entitled *Guida spirituale che disinvolge l'anima e la conduce per l'interior camino all' acquisto della perfetta contemplazione e del ricco tesoro della pace interiore*, which was soon afterwards followed by the *Breve trattato della cottidiana communione*, usually bound up with it in later editions. The work, which breathes a spirit of simple and earnest piety, is designed to show how inward peace may be found by what may be called contemplative or passive prayer, by obedience, by frequent communion, and by inward mortification; it was widely circulated, and greatly increased the popularity of its author, whom Innocent XI. after his elevation provided with rooms in the Vatican, and is said to have also taken as his spiritual director. Its doctrine of the passivity of the highest contemplation and purest prayer does not appear to have raised the slightest discussion until after the publication, in 1681, of the *Concordia tra la fatica e la quiete nell' oratione*, by the Jesuit preacher, Paolo Segneri. Although scrupulously refraining from any mention of the name of Molinos, and indeed displaying considerable moderation as a controversialist, Segneri by this tract and by another with which he followed it up brought upon himself much unpopularity; and so great did the excitement become that a committee was at last appointed by the Inquisition to investigate his own views as well as to examine the writings of Molinos and of his friend Petrucci (author of *La contemplazione mistica acquistata*). The report (1682) was entirely favourable to the doctrines of the *Guida Spirituale*, the writings of Segneri being censured as scandalous and heretical; but in 1685, in consequence of representations made to the pope by Louis XIV., under the Jesuit influence of Père La Chaise, both Petrucci and Molinos were laid under arrest, and the papers of the latter, including a voluminous correspondence, seized. Petrucci was soon afterwards liberated, and relieved from further persecution by the gift of a cardinal's hat; but, after Molinos had languished in confinement for two years, suddenly 200 persons, many of them of high rank, were also apprehended by order of the Inquisition for what were then for the first time called "Quietist" opinions. In 1687 the pope signified his approval of the condemnation pronounced by the Inquisition on sixty-eight doctrines imputed to Molinos. The "heretic" forthwith "abjured" these, and thus escaped the flames indeed, but did not regain his liberty. Of his later years nothing is known; according to the most probable accounts he languished in imprisonment until 28th December 1696.

The evidence on which certain charges of immorality against Molinos were based is unknown, and the degree of his responsibility for certain of the condemned propositions is obscure; but a perusal of the *Guida Spirituale* at least does not disclose to the candid reader any reason wherefore Molinos should not have been tolerated within a church which has canonized St Theresa. The explanation of the treatment to which he was subjected is most probably to be sought rather in the negative than in the positive aspects of his teaching, and still more in the passing exigencies of party politics. As Tholuck remarks, it was hardly to be expected that the Society of Jesus should regard as otherwise than highly dangerous a man who "declared confession and *outward* mortification to be work only for beginners, who himself abstained from confessing for twelve years on end, by whose advice countless monks and nuns had thrown aside chaplets, images, and reliques, that they might worship God in the spirit, and who, moreover, stood well with the fashionable world and with the pope himself." The *Guida Spirituale* was published in Spanish at Madrid in 1676, and frequently afterwards; it was also translated into Latin (*Manuductio Spiritualis*, Leipsic, 1687) by A. H. Francke, the well-known German pietist and philanthropist, and an English version (*The spiritual guide, which disentangles the soul and brings it by the inward way to the getting of perfect contemplation and the rich treasure of eternal peace: with a brief treatise concerning daily communion*) appeared in 1688. The materials for a history of the Quietist controversy are very fully given in the third volume of Gottfried Arnold's *Kirchen-und Ketzerhistorie*. See also Heppe, *Geschichte der quietistischen Mystik in der Katholischen Kirche* (Berlin, 1875); Tholuck's article on "Molinos" in Herzog's *Realencyklopädie*; and Bigelow, *Molinos the Quietist*, New York, 1882.

MOLISE, now CAMPOBASSO, a province of Italy, stretching twenty miles along the coast of the Adriatic, and bounded by the Abruzzi (Chieti and Aquila), Terra di Lavoro (Caserta), Benevento, and Capitanata (Foggia). Most of it lies on the north-eastern side of the Apennines, and is watered by the Biferno, the Forlone, and the Trigno; but it also includes the country on the other side which contains the head streams of the Volturno. About five-sixths of the surface may be described as mountainous or hilly, the loftiest range being the Matese on the borders towards Benevento, with its highest point in Monte Miletto, 6750 feet. The population, which increased from 346,007 in 1861 to 365,434 in 1881, is mainly dependent on pastoral and agricultural pursuits, neither manufactures nor trade being highly developed. According to the census of 1871, there were six places with more than 5000 inhabitants—Campobasso, 12,890; Riccia, 8123; Isernia, 7715; Agnone, 7147; Cascalende, 6217; and Larino, 5357; according to the census of 1881, 21 of the 133 communes had a population exceeding 4000.

The Molise territory was in ancient times part of the country of the Sabines and Samnites. Under the Lombards it was included in the duchy of Benevento; but the districts of Sepino, Boiano, and Isernia were cut off to form a domain for the Bulgarians who had come to assist King Grimoald. About two centuries later this became the countship of Boiano, and the name was soon after changed to countship of Molise, probably because the lordship was held by Ugone di Molisio, or Molise. Attached under Frederick II. to the Terra di Lavoro, and at a later date incorporated with Capitanata, the district did not again become an independent province till 1811. In 1861 it surrendered fifteen communes to Benevento, and received thirteen from Terra di Lavoro.

with prohibiting all further discussion of the question "de auxiliis," and studious efforts were made to control the publication even of commentaries on Aquinas. According to the census of 1871, there were six places with more than 5000 inhabitants—Campobasso, 12,890; Riccia, 8123; Isernia, 7715; Agnone, 7147; Cascalende, 6217; and Larino, 5357; according to the census of 1881, 21 of the 133 communes had a population exceeding 4000.

The Molise territory was in ancient times part of the country of the Sabines and Samnites. Under the Lombards it was included in the duchy of Benevento; but the districts of Sepino, Boiano, and Isernia were cut off to form a domain for the Bulgarians who had come to assist King Grimoald. About two centuries later this became the countship of Boiano, and the name was soon after changed to countship of Molise, probably because the lordship was held by Ugone di Molisio, or Molise. Attached under Frederick II. to the Terra di Lavoro, and at a later date incorporated with Capitanata, the district did not again become an independent province till 1811. In 1861 it surrendered fifteen communes to Benevento, and received thirteen from Terra di Lavoro.

convenient to construct a schematic Mollusc, which shall possess in an unexaggerated form the various structural arrangements which are more or less specialized, exaggerated, or even suppressed in particular members of the group. Such a schematic Mollusc is not to be regarded as an archetype, in the sense which has been attributed to that word, nor as the embodiment of an idea present to a creating mind, nor even as an epitome of developmental laws. Were knowledge sufficient, we should wish to make this schematic Mollusc the representation of the actual Molluscan ancestor from which the various living forms have sprung. To definitely claim for our schematic form any such significance in the present state of knowledge would be premature, but it may be taken as more or less coinciding with what we are justified, under present conditions, in picturing to ourselves as the original Mollusc or archi-Mollusc (more correctly Archimalakion). After describing this schematic form, we shall proceed to show how far it is realized or justified in each class and order of Mollusca successively.

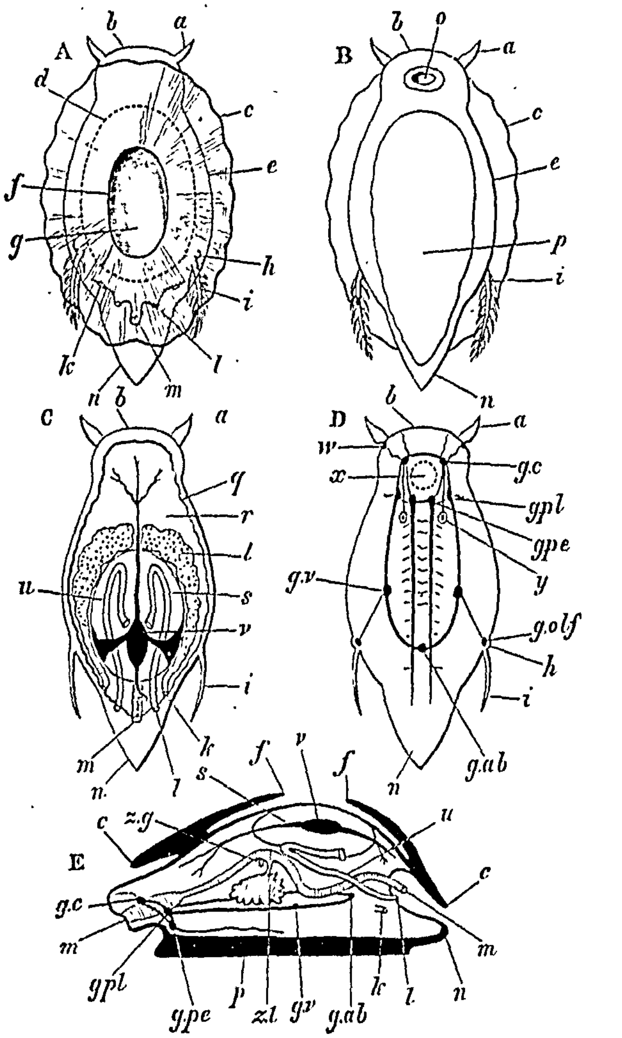

Fig. 1.—Schematic Mollusc. A. Dorsal aspect. B. Ventral aspect. C. The heart, pericardium, gonads, and nephridia shown in position. D. The nervous system; the reader is requested to note that the cord passing backwards from *g.pe* lies beneath, and does not in any way unite with the cord which passes from *g.ab* to *g.pl*. E. Diagram in which the body-wall is represented as cut in the median antero-posterior plane, so as to show organs in position,—the shell-sac is seen in section, but the shell is omitted.

Letters in all the figures as follows:—*a*, cephalic tentacle; *b*, head; *c*, edge of the mantle-skirt or limbus pallialis; *d*, dotted line indicating the line of origin of the free mantle-skirt from the sides of the visceral hump; *e*, outline of the foot seen through the mantle-skirt in A, which is supposed to be transparent, allowing the position of this and of the various parts *h*, *i*, *k*, *l*, *m*, to be seen through its substance; *f*, edge of the shell-follicle; *g*, the shell; *h*, the osphradium, paired (Spengel's olfactory organ); *i*, the ctenidium, paired (gill-plume); *k*, aperture of the gonad, paired; *l*, aperture of one of the two nephridia; *m*, anus; *n*, posterior region of the foot reaching farther back than the mass of viscera (dorsal hump) which it carries; *o*, mouth; *p*, plantar surface of the foot; *q*, cut edge of the body-wall of the dorsal region; *r*, cœlomic space (blood-lymph space or body-cavity), mostly occupied by liver, but to some extent retained as blood-channels and lacunæ; *s*, pericardial cavity; *t*, gonad (ovary or spermary), paired; *u*, nephridium, paired; *v*, ventricle of the heart receiving the right and the left auricles at its sides, and sending off anteriorly a large vessel, posteriorly a small one; *w*, the cephalic eye, paired; *x*, dotted ring to show the position occupied by the œsophagus in relation to the nerve ganglia and cords; *y*, the otocyst, paired; *z.l*, the digestive gland (so-called "liver") of the left side; *z.g*, duct of the digestive gland of the right side; *g.c*, cerebral ganglion united by the cerebral commissure to its fellow; *g.pl*, pleural ganglion united by the cerebro-pleural connective to the cerebral ganglion, and by the pleuro-pedal connective to the pedal ganglion; *g.pe*, the pedal ganglion united to its fellow by the pedal commissure—the two sending off posteriorly the long ladder-like pair of pedal nerves; *g.v*, the visceral ganglion (of the left side) united by the visceral loop or commissure to the similar ganglion on the right side, and by the viscero-pleural connective to the pleural ganglion; *g.ab*, abdominal ganglion developed on the course of the visceral loop; *g.olf*, olfactory ganglion placed near the osphradium on a nerve taking its origin from the visceral ganglion.

The schematic Mollusc (fig. 1, A to E) is oblong in shape, bilaterally symmetrical, with strongly differentiated dorsal and ventral surface, and has a well-marked HEAD, consisting of the prostomium (*b*) and the region immediately behind the mouth. Upon the head we place a pair of short CEPHALIC TENTACLES (*a*). The *mouth* is placed in the median line anteriorly, and is overhung by the prostomium (B, *o*); the *anus* is placed in the median line posteriorly, well raised on the dorsal surface (A, *m*). The apertures of a pair of NEPHRIDIA are seen in the neighbourhood of the anus right and left (A, *l*). Near the nephridial apertures, and in front of them, right and left, are the pair of apertures (*k*) appropriate to the ducts of the GONADS (generative pores).

The most permanent and distinctive Molluscan organ is the FOOT (Podium). This is formed by an excessive development of the somatic musculature along the ventral surface, distinctly ceasing at the region of the head, below which it suddenly projects as a powerful muscular mass (B, *p*; E, *p*). It may be compared, and is probably genetically identical, with the muscular ventral surface of the Planarians and with the suckers of Trematoda, but is more extensively developed than are those corresponding structures. The muscular tissue of the foot, and of all other parts of the body of all Mollusca, is cellular and unstriated, as distinguished from the composite muscular fibre (consisting of cell-fusions instead of separable cells) which occurs in Arthropoda and in Vertebrata, and which has the further distinction of being composed of alternating bands of substance of differing refractive power (hence "striated"). The appearance of cross striation seen in the muscular cells of some Molluscs (odontophore of Haliotis, Patella, &c.) requires further investigation. It is by no means altogether the same thing as the marking characteristic of striated muscular fibre.

Contrasting with the ventral foot is the thin-walled dorsal region of the body, which may be termed the antipodial region. This thin-walled region is formed by soft viscera covered in by the comparatively delicate and non-muscular body-wall (fig. 1, E). As the ventral foot is clearly separate from the projecting head, so is this dorsal region, and it is conveniently spoken of as the VISCERAL HUMP or "dome" (cupola). Protecting the visceral dome is a SHELL (conchylium) consisting of a horny basis impregnated with carbonate of lime,[1] and secreted by the deric epithelium of this region of the body (*g*). The shell in our schematic Mollusc is single, cap-shaped, and symmetrical. It does not lie entirely naked upon the surface of the visceral dome, but is embedded all round its margin, to a large extent in the body-wall. In fact, the integument of the visceral dome forms an open flattened sac in which the shell lies. This is the PRIMARY SHELL-SAC, or FOLLICLE (A and E, *f*). The wall of the body projects all round the visceral dome in the form of a flap or skirt, so as to overhang and conceal to some extent the head and the sides of the foot. This skirt, really an out-

[1] As to the minute structure of the shell in various classes, see Carpenter's article "Shell" in the *Cyclop. of Anat. and Physiol.* The limits of our space do not permit us to deal with this or other histological topics.

the mouth, just as the pedal ganglia are behind it. The right and left pedal ganglia are joined by transverse cords to the right and left visceral cords respectively, the point of union being marked on either side by a swelling (*g.pl*) known as the pleural ganglion. The visceral nerve-cord can also be traced up on each side beyond the pleural ganglion to the cerebral ganglion. Thus we have a nearly complete double nerve-ring formed around the œsophagus by the two pairs of nerve-cords which are in this region drawn, as it were, towards each other and away from their lateral position both behind and before the stomodæal invagination. Whilst the swollen parts of the nerve-tracts are termed *ganglia*, the connecting cords are conveniently distinguished either as *connectives* or as *commissures*. Commissures connect two ganglia of the same pair We have a cerebral commissure, a pedal commissure and a visceral commissure. Connectives connect ganglia of dissimilar pairs, and we speak accordingly of the cerebro-pedal connective, the cerebro-pleural connective, the pleuro-pedal connective, and the viscero-pleural connective.

An ENTERIC NERVOUS SYSTEM forming a plexus on the walls of the alimentary canal exists, but does not exhibit cords and ganglia visible to the naked eye except in the large Dibranchiate Cephalopods.

Our schematic Mollusc is provided with certain ORGANS OF SPECIAL SENSE. Tactile organs occur on the head in the form of short CEPHALIC TENTACLES (*a*). Deeply placed are

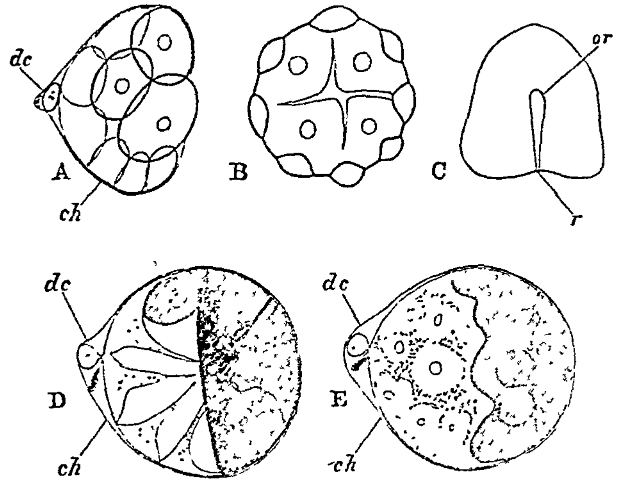

FIG. 3.—Development of the Pond-Snail, *Limnæus stagnalis* (after Lankester, 15). *dc*, directive corpuscles (præseminal outcast cells); *ch*, egg-envelope or chorion; *or*, oral end of the blastopore; *r*, anal end of the blastopore. A. Formation of the Diblastula by the invagination of larger cells into the area of smaller cells (optical section). B. View of the same specimen from the surface of invagination; the smaller cells are seen at the periphery; by division they will multiply and extend themselves over the four larger cells. C. Fully-formed Diblastula, surface view to show the elongated form of the orifice of invagination or blastopore; its middle portion closes up and coincides with the region of the foot; the extremity, *or*, coincides with the mouth and stomodæum, the opposite extremity, *r*, with the anus. D. Optical section of an embryo a little older than A. E. Surface view of the same embryo.

a pair of closed vesicles containing each a calcareous concretion and acting as auditory organs; these are known as OTOCYSTS (D, *y*). They are situated behind the mouth in the foremost portion of the foot. At the base of each cephalic tentacle is a pigmented eye-spot—the CEPHALIC EYE (D, *w*). The OSPHRADIUM (*h*), or peculiar patch of olfactory epithelium at the base of the ctenidium, has already been mentioned.

To the scheme thus exhibited of the possible organization of the ancestral Mollusc we shall now add a sketch of the mode in which this form of body and series of internal organs are developed from the egg.

The egg-cell of Mollusca is either free from food material —a simple protoplasmic corpuscle—or charged with food material to a greater or less extent. Those cases which appear to be most typical—that is to say, which adhere to a

only in later and special lines of descent—show approxi-

B), in an equatorial position. As growth proceeds, one hemisphere remains relatively small, the other elongates and enlarges. Both mouth and anus are placed in the larger area; the smaller area is the prostomium simply; the ciliated band is therefore in front of the mouth. The larval form thus produced is known as the Trochosphere. It exactly agrees with the larval form of many Chætopod worms and other Cœlomata. Most remarkable is its agreement with the adult form of the Wheel animalcules or Rotifera, which retain the præ-oral ciliated band as their chief organ of locomotion and prehension throughout life. So far the young Mollusc has not reached a definitely Molluscan stage of development, being only in a condition common to it and other Cœlomata. It now passes to the veliger phase, a definitely Molluscan form, in which the disproportion between the area in front of the ciliated circlet and that behind it is very greatly increased, so that the former is now simply an emarginated region of the head fringed with cilia (fig. 8; fig. 6, F; fig. 7, F; and fig. 60, A). It is termed the "velum," and is frequently drawn out into lobes and processes. As in the Rotifera, it serves the veliger larva as an organ of locomotion.

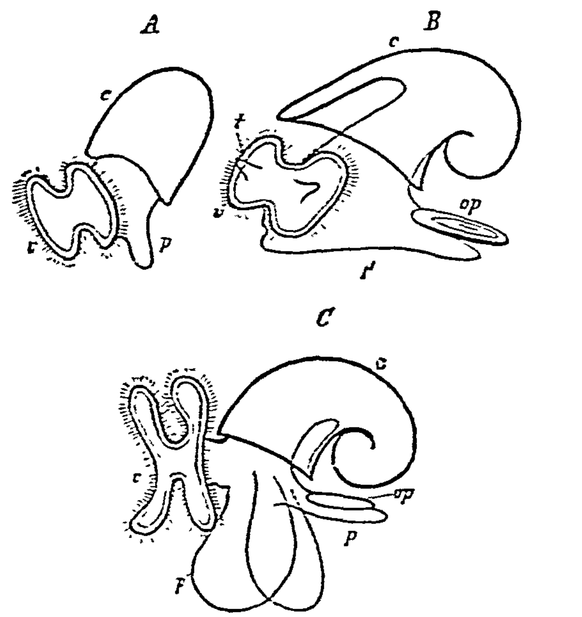

FIG. 8.—"Veliger" embryonic form of Molluscs (from Gegenbaur). *v*, velum; *c*, visceral dome with dependent mantle-skirt; *p*, foot; *t*, cephalic tentacles; *op*, operculum. A. Earlier, and B, later. Veliger of a Gastropod. C. Veliger of a Pteropod showing lobe-like processes of the velum and the great paired outgrowths of the foot.

In a very few Molluscs, but notably in the Common Pond-Snail, the emarginated bilobed velum is retained in full proportions in adult life (fig. 70), having lost its marginal fringe of specially long cilia and its locomotor function. The body of the Veliger is characterized by the development of the visceral hump on one surface, and by that of the foot on the other. Growth is greater in the vertical dorso-ventral axis than in the longitudinal oro-anal axis; consequently the foot is relatively small and projects as a blunt process between mouth and anus, which are not widely distant from one another, whilst the antipedal area projects in the form of a great hump or dome. In the centre of this antipedal area there has appeared (often at a very early period) a gland-like depression or follicle of the integument (fig. 6, C, *sk*; fig. 7, E, F, *shgl*; fig. 60, B; fig. 68, *shs*; fig. 72***, *ss*). This is the primitive shell-sac discovered by Lankester (18) in 1871, and shown by him to precede the development of the permanent shell in a variety of Molluscan types. The cavity of this small sac becomes filled by a horny substance, and then it very usually disappears, whilst a delicate shell, commencing from this spot as a centre, forms and spreads upon the surface of the visceral dome.

The embryonic shell-sac or shell-gland represents in a transient form, in the individual development of most Mollusca, that condition of the shell-forming area which we have sketched above in the schematic Mollusc. In very few instances (in Chiton, and probably in Limax), as we shall see below, the *primitive shell-sac* is retained and enlarged as the permanent shell-forming area. It is supplanted in other Molluscs by a *secondary shell-forming area*, namely, that afforded by the free surface of the visceral hump, the shell-forming activity of which extends even to the surface of the depending mantle-skirt. Accordingly, in most Mollusca the *primitive shell* is represented only by the horny plug of the primitive shell-sac. The permanent shell is a new formation on a new area, and should be distinguished as a *secondary shell.*

The ctenidia, it will be observed, have not yet been mentioned, and they are indeed the last of the characteristic Molluscan organs to make their appearance. Their possible relation to the præ-oral and post-oral ciliated bands of embryos similar to the Trochosphere are discussed by the writer in the *Quart. Jour. Micr. Sci.*, vol. xvii. p. 423. The Veliger, as soon as its shell begins to assume definite shape, is no longer of a form common to various classes of Mollusca, but acquires characters peculiar to its class. At this point, therefore, we shall for the present leave it.

SYSTEMATIC REVIEW OF THE CLASSES AND ORDERS OF MOLLUSCA.

We are now in a position to pass systematically in review the various groups of Mollusca, showing in what way they conform to the organization of our schematic Mollusc, and in what special ways they have modified or even suppressed parts present in it, or phases in the representative embryonic history which has just been sketched. It will be found that the foot, the shell, the mantle-skirt, and the ctenidia, undergo the most remarkable changes of form and proportionate development in the various classes —changes which are correlated with extreme changes and elaboration in the respective functions of those parts.

Division of the Phylum into two Branches.—The Mollusca are sharply divided into two great lines of descent or branches, according as the prostomial region is atrophied on the one hand, or largely developed on the other.

The probabilities are in favour of any ancestral form—the hypothetical archi-Mollusc which connected the Mollusca with their non-Molluscan forefathers—having possessed, as do all the more primitive forms of Cœlomata, a well-marked prostomium, and consequently a head. The one series of Mollusca descended from the primitive head-bearing Molluscs have acquired an organization in which the Molluscan characteristics have become modified in definite relation to a sessile inactive life. As the most prominent result of the adaptation to such sessile life they exhibit an atrophy of the cephalic region. They form the branch LIPOCEPHALA—the mussels, oysters, cockles, and clams. The other series have retained an active, in many cases a highly aggressive, mode of life; they have, correspondingly, not only retained a well-developed head, but have developed a special aggressive organ in connexion with the mouth, which, on account of its remarkable nature and the peculiarities of the details of its mechanism, serves to indicate a very close genetic connexion between all such animals as possess it. This remarkable organ is the odontophore, consisting of a lingual ribbon, rasp, or radula, with its cushion and muscles. On account of the possession of this organ this great branch of the Molluscan phylum may be best designated GLOSSOPHORA. Any term

B), in an equatorial position. As growth proceeds, one hemisphere remains relatively small, the other elongates and enlarges. Both mouth and anus are placed in the larger area; the smaller area is the prostomium simply; the ciliated band is therefore in front of the mouth. The larval form thus produced is known as the Trochosphere. It exactly agrees with the larval form of many Chætopod worms and other Cœlomata. Most remarkable is its agreement with the adult form of the Wheel animalcules or Rotifera, which retain the præ-oral ciliated band as their chief organ of locomotion and prehension throughout life. So far the young Mollusc has not reached a definitely Molluscan stage of development, being only in a condition common to it and other Cœlomata. It now passes to the veliger phase, a definitely Molluscan form, in which the disproportion between the area in front of the ciliated circlet and that behind it is very greatly increased, so that the former is now simply an emarginated region of the head fringed with cilia (fig. 8; fig. 6, F; fig. 7, F; and fig. 60, A). It is termed the "velum," and is frequently drawn out into lobes and processes. As in the Rotifera, it serves the veliger larva as an organ of loco-

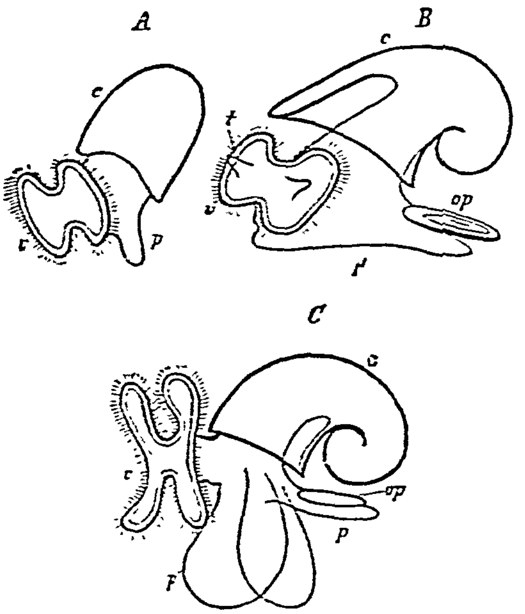

FIG. 8.—"Veliger" embryonic form of Molluscs (from Gegenbaur). *v*, velum; *c*, visceral dome with dependent mantle-skirt; *p*, foot; *t*, cephalic tentacles; *op*, operculum. A. Earlier, and B, later, Veliger of a Gastropod. C. Veliger of a Pteropod showing lobe-like processes of the velum and the great paired outgrowths of the foot.

motion. In a very few Molluscs, but notably in the Common Pond-Snail, the emarginated bilobed velum is retained in full proportions in adult life (fig. 70), having lost its marginal fringe of specially long cilia and its locomotor function. The body of the Veliger is characterized by the development of the visceral hump on one surface, and by that of the foot on the other. Growth is greater in the vertical dorso-ventral axis than in the longitudinal oro-anal axis; consequently the foot is relatively small and projects as a blunt process between mouth and anus, which are not widely distant from one another, whilst the antipedal area projects in the form of a great hump or dome. In the centre of this antipedal area there has appeared (often at a very early period) a gland-like depression or follicle of the integument (fig. 6, C, *sk*; fig. 7, E, F, *shgl*; fig. 60, B; fig. 68, *shs*; fig. 72***, *ss*). This is the primitive shell-sac discovered by Lankester (18) in 1871, and shown by him to precede the development of the permanent shell in a variety of Molluscan types. The cavity of this small sac becomes filled by a horny substance, and then it very usually disappears, whilst a delicate shell, commencing from this spot as a centre, forms and spreads upon the surface of the visceral dome.

The embryonic shell-sac or shell-gland represents in a transient form, in the individual development of most Mollusca, that condition of the shell-forming area which we have sketched above in the schematic Mollusc. In very few instances (in Chiton, and probably in Limax), as we shall see below, the *primitive shell-sac* is retained and enlarged as the permanent shell-forming area. It is supplanted in other Molluscs by a *secondary shell-forming area*, namely, that afforded by the free surface of the visceral hump, the shell-forming activity of which extends even to the surface of the depending mantle-skirt. Accordingly, in most Mollusca the *primitive shell* is represented only by the horny plug of the primitive shell-sac. The permanent shell is a new formation on a new area, and should be distinguished as a *secondary shell.*

The ctenidia, it will be observed, have not yet been mentioned, and they are indeed the last of the characteristic Molluscan organs to make their appearance. Their possible relation to the præ-oral and post-oral ciliated bands of embryos similar to the Trochosphere are discussed by the writer in the *Quart. Jour. Micr. Sci.*, vol. xvii. p. 423. The Veliger, as soon as its shell begins to assume definite shape, is no longer of a form common to various classes of Mollusca, but acquires characters peculiar to its class. At this point, therefore, we shall for the present leave it.

SYSTEMATIC REVIEW OF THE CLASSES AND ORDERS OF MOLLUSCA.

We are now in a position to pass systematically in review the various groups of Mollusca, showing in what way they conform to the organization of our schematic Mollusc, and in what special ways they have modified or even suppressed parts present in it, or phases in the representative embryonic history which has just been sketched. It will be found that the foot, the shell, the mantle-skirt, and the ctenidia, undergo the most remarkable changes of form and proportionate development in the various classes —changes which are correlated with extreme changes and elaboration in the respective functions of those parts.

Division of the Phylum into two Branches.—The Mollusca are sharply divided into two great lines of descent or branches, according as the prostomial region is atrophied on the one hand, or largely developed on the other.

The probabilities are in favour of any ancestral form—the hypothetical archi-Mollusc which connected the Mollusca with their non-Molluscan forefathers—having possessed, as do all the more primitive forms of Cœlomata, a well-marked prostomium, and consequently a head. The one series of Mollusca descended from the primitive head-bearing Molluscs have acquired an organization in which the Molluscan characteristics have become modified in definite relation to a sessile inactive life. As the most prominent result of the adaptation to such sessile life they exhibit an atrophy of the cephalic region. They form the branch LIPOCEPHALA—the mussels, oysters, cockles, and clams. The other series have retained an active, in many cases a highly aggressive, mode of life; they have, correspondingly, not only retained a well-developed head, but have developed a special aggressive organ in connexion with the mouth, which, on account of its remarkable nature and the peculiarities of the details of its mechanism, serves to indicate a very close genetic connexion between all such animals as possess it. This remarkable organ is the odontophore, consisting of a lingual ribbon, rasp, or radula, with its cushion and muscles. On account of the possession of this organ this great branch of the Molluscan phylum may be best designated GLOSSOPHORA. Any term

1.0.1, the central tooth being absent and the lateral teeth peculiarly long and connected with muscles. The term Ptenoglossa (fig. 9, D) is applied to those Glossophora in which the radula presents no median tooth, but an indefinite and large number of admedian teeth, giving the formula x.0.x. When the admedian teeth are indefinite (forty to fifty), and a median tooth is present, the term Myriaglossa is applied (formula, x.1.x). It must be understood that the pieces or teeth thus formulated may themselves vary much in form, being either flat plates, or *denticulated, hooked, or spine-like bodies.* We shall revert to the terms thus explained in the systematic descriptions of the groups of Glossophora.

The muscular development in connexion with the whole buccal mass, and with each part of the radular apparatus, is exceedingly complicated,—as many as twenty distinct muscles having been enumerated in connexion with this organ. In addition to the radula, and correlated with its development, we find almost universally present in the Glossophora a pair of horny jaws (usually calcified) developed as cuticular productions upon the epidermis of the lips (fig. 9, A, *b*). The radula and the shelly jaws of the Glossophora enable their possessors not only to voraciously attack vegetable food, but the radula is used in some instances for boring the shells of other Mollusca, and the jaws for crushing the shells of Crustacea, and for wounding even Vertebrata.

PHYLUM MOLLUSCA.

BRANCH A.—*GLOSSOPHORA.*

Characters.—Mollusca with head-region more or less prominently developed; always provided with a peculiar rasping-tongue—the odontophore—rising from the floor of the buccal cavity.

The Glossophora comprise three classes, chiefly distinguished from one another by the modifications of the foot.

Class I.—**GASTROPODA.**

Characters.—Glossophora in which (with special exception of swimming forms) the FOOT is simple, median in position, and flattened so as to form a broad sole-like surface, by the contractions of which the animal crawls, often divided into three successive regions—the pro-, meso-, and meta-podium—by lateral constrictions.

The Gastropoda exhibit two divergent lines of descent indicated by the term sub-class (see p. 649).

Sub-class 1.—GASTROPODA ISOPLEURA.

Characters.—Gastropoda in which not only the head and foot but also the visceral dome with its contents and the mantle retain the primitive BILATERAL SYMMETRY of the archi-Mollusc. The anus retains its position in the median line at the posterior end of the body. The whole visceral mass together with the foot is elongated, so that the axis joining mouth and anus is relatively long, whilst the dorso-pedal axis at right angles to it is short. The CTENIDIA, the NEPHRIDIA, GENITAL DUCTS, and CIRCULATORY ORGANS are paired and bilaterally symmetrical. The pedal and visceral NERVE-CORDS are straight, parallel with one another, and all extend the whole length of the body; the ganglionic enlargements are feebly or not at all developed. The Isopleura comprise three orders.

Order 1.—**Polyplacophora** (the Chitons).

Characters.—Gastropoda Isopleura with a metameric repetition of the shell to the number of eight. The shells of the primitive type are partially or wholly concealed in shell-sacs comparable to the single embryonic shell-sac of other Mollusca. On the surface of the mantle-flap numerous calcified spines and knobs are frequently developed. The ctenidia are of the typical form, small in size and metamerically repeated along the sides of the body to the

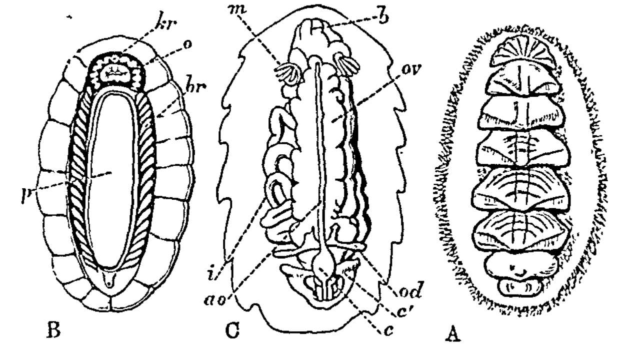

FIG. 10.—Three views of Chiton. A. Dorsal view of *Chiton Wosnessenksii*, Midd., showing the eight shells. (After Middendorf.) B. View from the pedal surface of a species of Chiton from the Indian Ocean. *p*, foot; *o*, mouth (at the other end of the foot is seen the anus raised on a papilla); *kr*, oral fringe; *br*, the numerous ctenidia (branchial plumes); spreading beyond these, and all round the animal, is the mantle-skirt. (After Cuvier.) C. The same species of Chiton, with the shells removed and the dorsal integument reflected. *b*, buccal mass; *m*, retractor muscles of the buccal mass; *ov*, ovary; *od*, oviduct; *i*, coils of intestines; *ao*, aorta; *c'*, left auricle; *c*, ventricle.

number of sixteen or more; an osphradium or area of "olfactory epithelium" (Spengel) is found at the base of each ctenidium. The other organs are not subject to metameric repetition. The odontophore is highly developed; the teeth of the lingual ribbon are varied in form,—several in each transverse row (fig. 9, E). Paired genital ducts distinct from the paired nephridia are present.

The order Polyplacophora contains but one family, the *Chitonidæ*, with the genera: *Chiton*, Lin. (figs. 10, 15, &c.); *Cryptochiton*, Midd., 1847; and *Cryptoplax* (= *Chitonellus*), Blainv., 1818.

Order 2.—**Neomeniæ.**

Characters.—Gastropoda Isopleura devoid of a shell, which is replaced by innumerable microscopic calcified plates or spicules set in the dorsal epidermis; mantle-flap not lateral, but reduced to a small collar surrounding the

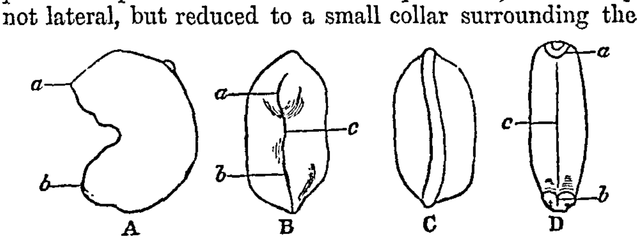

FIG. 11.—*Neomenia carinata*, Tullberg (after Tullberg). A. Lateral view. B. Ventral view. C. Dorsal view. D. Ventral view of a more extended specimen. *a*, anterior; *b*, posterior extremity; *c*, furrow, in which the narrow foot is concealed.

anus; ctenidia represented by a symmetrical group of branchial filaments on either side of the anus; foot very narrow, sunk in a groove; odontophore feebly developed, but the radula many-toothed; gonads placed in the pericardium discharging by the nephridia; no special generative ducts.

The order Neomeniæ contains the two genera *Neomenia*, Tullberg (*Solenopus, Sars*) (fig. 11); and *Proneomenia*, Hubrecht.

Order 3.—**Chætoderma.**

Characters.—Gastropoda Isopleura devoid of a shell which is replaced by numerous minute calcareous s

standing up like hairs on the surface of the body; bod

nephridia of Conchifera (organ of Bojanus), the internal aperture lies near the external. From the folded stem of the nephridium very numerous secreting cæca are given off, —omitted in the diagram (fig. 14, D), but accurately drawn in fig. 15. The sexes in Chiton are distinct, and the ovary or testis, as the case may be, though lying in and filling a chamber of the original cœlom, does not discharge into the pericardium, but has its own ducts, which pass to the exterior just in front of those of the nephridia (fig. 14, D, *g*, and fig. 16). In this respect Chiton is less primitive than the other Isopleura, and even than some other Gastropods (the Zygobranchia), and some Conchifera (Spondylus, &c.), which have no special genital apertures, but make use of the nephridia for this purpose. In *Chiton discrepans*, in which there are sixteen pairs of ctenidia, the orifices of the nephridia are coincident with the sixteenth pair of ctenidia, those of the genital ducts with a point between the thirteenth and fourteenth ctenidia.

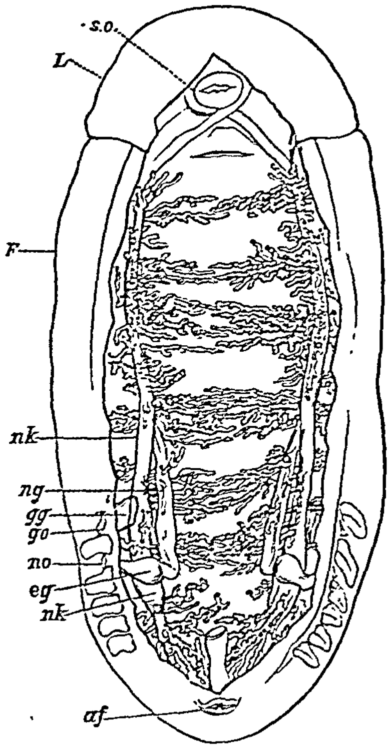

FIG. 15.—Dissection of the renal organs (nephridia) of *Chiton siculus*, after Haller (*Arbeiten, Zool. Instit.*, Vienna, 1882). *F*, foot; *L*, edge of the mantle not removed in the front part of the specimen; *s.o.*, œsophagus; *af*, anus; *gg*, genital duct; *go*, external opening of the same; *eg*, stem of the nephridium leading to *no*, its external aperture; *nk*, reflected portion of the nephridial stem; *ng*, fine cæca of the nephridium, which are seen ramifying transversely over the whole inner surface of the pedal muscular mass.

In the Neomeniæ and Chætoderma the nephridia are short and wide (*N* in fig. 14, A, B, C), and function as excretory ducts for the genital products, the gonads being lodged in the long pericardium. Their separate or united apertures open near the anus into the small chamber formed by the restriction of the mantle-skirt to the immediate neighbourhood of the anus.

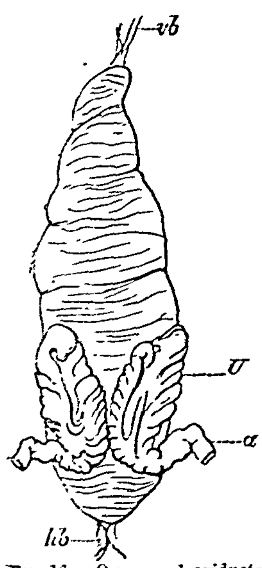

FIG. 16.—Ovary and oviducts of *Chiton siculus* (after Haller, *loc. cit.*). *vb*, *hb*, anterior and posterior suspensor of the ovary; *U*, uterus (enlarged part of oviduct); *a*, oviduct.

The nervous system of the Gastropoda Isopleura is represented in the diagram fig. 17. In all it is important to observe that nerve-ganglion cells are by no means limited to special swellings—the ganglia—but are abundant along the whole course of the four great longitudinal trunks. This is a primitive character comparable to that presented by the nerve-cords of Nemertine worms, and of the Arthropod Peripatus. Higher differentiation in other Mollusca leads to predominance if not an exclusive presence of nerve-*fibres* in the cords, and of nerve-*ganglion cells* in the specialized ganglia. The numerous transverse connexions of the pedal nerve-cords in Chiton and Neomenia (seen also in Fissurella (fig. 36) and some other Gastropods) are comparable to the transverse connexions of the ventral nerve-cords of Chætopod worms and Arthropods. In the abundance of the nervous network connected with its longitudinal nerve-tracts, Chiton appears to retain something of the early condition of the Cœlomate nervous system when it had the form of a sub-epidermic network or nerve-tunic (seen more clearly in Planarians and some Nemertines), and when the concentration into definitely compacted cords had not set in.

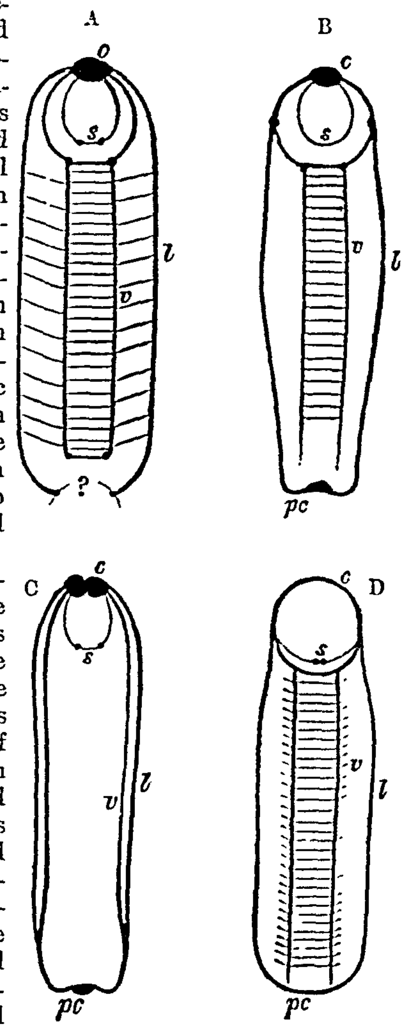

FIG. 17.—Diagrams of the nervous system of Isopleura (after Hubrecht, *loc. cit.*). *c*, cerebral ganglia; *s*, sublingual ganglia; *v*, pedal (ventral) nerve-cord; *l*, visceral (lateral) nerve-cord; *pc*, post-anal junction of the visceral nerve-cords. A. Proneomenia. B. Neomenia. C. Chætoderma. D. Chiton.

Ganglia are, however, distinguishable upon the nervous cords of Chiton (fig. 18). The cerebral ganglia are not distinguishable as such, but a pair of buccal ganglia (B in fig. 18) are developed on two connectives which pass forward from the cerebral region to the great muscular mass of the mouth. These buccal ganglia are special developments connected with the special muscularity of the lips and odontophore, and are found in all Glossophora, but not in the Lipocephala. Such special ganglia related to special organs (and not introduced in our schematic Mollusc, fig. 1) we find in connexion with the siphons of the Lipocephala, and in various positions upon the visceral nerve-cords of other Mollusca, both Glossophora and Lipocephala. A pair of pedal ganglia little developed (*p* in fig. 18) and a special group of sublingual ganglia are present in Chiton. On the whole, the nervous system of the Isopleura is exceedingly simple and archaic, whilst it does not well serve as a type with which to compare that of other Mollusca on account of the small amount of concentration of its nerve-ganglion cells into ganglia, such as we find well developed in other forms.

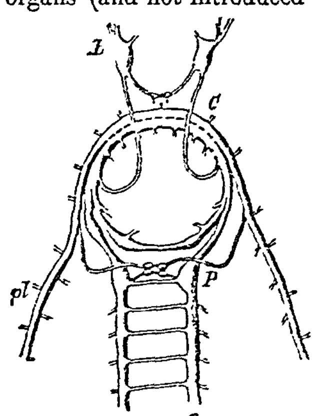

FIG. 18.—Anterior part of the nervous system of *Chiton cinereus*, in more detail (from Gegenbaur, *Elements of Comp. Anatomy*). *B*, buccal ganglia (concerned with the odontophore); *C*, cerebral nerve-mass; *P*, pedal ganglion and commencement of pedal nerve-cord; *pl*, visceral nerve-cord. The sublingual ganglia are not lettered.

The development of Neomenia and Chætoderma is

nephridia of Conchifera (organ of Bojanus), the internal aperture lies near the external. The development of Neomenia and Chætoderma h

twisted into a figure-of-eight—the STREPTONEURA (fig. 21). Probably the Euthyneura and the Streptoneura have developed independently from the ancestral bilaterally symmetrical Gastropods. The escape of the visceral nerve-loop from the torsion depends on its having acquired a somewhat deeper position and shorter extent, previously to the commencement of the phenomenon of torsion, in the ancestors of the Euthyneura than in those of the Streptoneura. In the ancestral Streptoneura the visceral loop was lateral and superficial as in the living Isopleura.

Branch *a*.—*STREPTONEURA* (Spengel, 1881).

Characters.—Gastropoda Anisopleura in which the visceral "loop" (the conterminous visceral nerves) was adherent to the body-wall and so shared in the torsion of the visceral hump, the right cord crossing above the left so as to form a figure-of-eight (see fig. 19).

The Streptoneura comprise two orders—the Zygobranchia and the Azygobranchia.

Order 1.—Zygobranchia.

Characters.—Streptoneura in which, whilst the visceral torsion is very complete so as to bring the anus into the middle line anteriorly or nearly so, the atrophy of the primitively left-side organs is not carried out. The right and left ctenidia, which have now become left and right respectively, are of equal size, and are placed symmetrically on either side of the neck in the pallial space. Related to them is a simple pair of osphradial patches. Both right

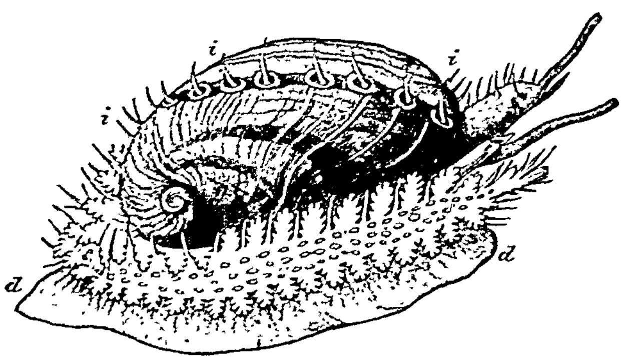

FIG. 23.—*Haliotis tuberculata.* *d*, foot; *i*, tentacular processes of the mantle. (From Owen, after Cuvier.)

and left nephridia are present, the actual right one being much larger than the left. Two auricles may be present right and left of a median ventricle (Haliotis), or only one (Patella). The Zygobranchia are further very definitely characterized by the archaic character of absence of special genital ducts. The generative products escape by the larger nephridium. The sexes are distinct, and there is no copulatory or other accessory generative apparatus. The teeth of the lingual ribbon are highly differentiated (Rhipidoglossate). The visceral dome lies close upon the oval sucker-like foot, and is coextensive with its prolongation in the aboral direction.

The Zygobranchia comprise three families, arranged in two suborders.

Sub-order 1. *Ctenidiobranchia.*

Character.—Large paired ctenidia acting as gills.

Family 1.—*Haliotidæ.*
Genera: *Haliotis* (Ear-Shell, Ormer in Guernsey); mostly tropical; *Teinotis.*

Family 2.—*Fissurellidæ.*
Genera: *Fissurella* (Key-hole Limpet) (figs. 24, 36), *Emarginula*, *Parmophorus* (fig. 25); mostly tropical.

Sub-order 2. *Phyllidiobranchia.*

Characters.—Ctenidia reduced to wart-like papillæ; special sub-pallial lamellæ, similar to those of the Opisthobranch Pleurophyllidia, perform the function of gills.

Family 3.—*Patellidæ.*
Genera: *Patella* (Limpet, figs. 26, &c.), *Nacella* (Bonnet-Limpet), *Lottia.*

Further Remarks on Zygobranchia.—The Common Limpet is a specially interesting and abundant example of the remarkable order Zygobranchia. A complete and accurate account of its anatomy has yet to be written. Here we have only space for a brief outline. The foot of the Limpet is a nearly circular disc of muscular tissue; in front, projecting from and raised above it, are the head and neck (figs. 26, 30). The visceral hump forms a low conical dome above the sub-circular foot, and standing out all round the base of this dome so as to completely overlap the head and foot, is the circular mantle-skirt. The depth of free mantle-skirt is greatest in front, where the head and neck are covered in by it. Upon the surface of the visceral dome, and extending to the edge of the free mantle-skirt, is the conical shell. When the shell is taken away (best effected by immersion in hot water) the surface of the visceral dome is found to be covered by a black-coloured epithelium, which may be removed, enabling the observer to note the position of some organs lying below the transparent integument (fig. 27). The muscular columns (attaching the foot to the shell form a ring incomplete i front, external to which is the mantle-skirt. The limits of th large area formed by the flap o the head and neck (*ecr*) can be traced and we note the anal papilla sh ing through and opening on the rig shoulder, so to speak, of the into the large anterior region of t sub-pallial space. Close to this small renal organ (*i*, mediad) and larger renal organ (*k*, to the ri and posteriorly) are seen, also pericardium (*l*) and a coil of the testine (*int*) embedded in the pact liver.

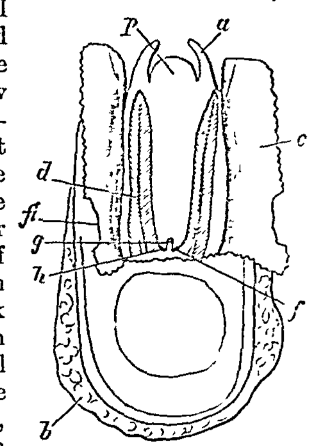

FIG. 24.—Dorsal aspect of a specimen of Fissurella from which the shell has been removed, whilst the anterior area of the mantle-skirt has been longitudinally slit and its side reflected. *a*, cephalic tentacle; *b*, foot; *d*, left (archaic right) gill plume; *e*, reflected mantle-flap; the fissure or hole in the mant traversed by the longitudinal incision; *f*, right (archaic left) dium's aperture; *g*, anus; *h*, (archaic right) aperture of nephridium; *p*, snout. (Original.)

On cutting away the anterior of the mantle-skirt so as to exp the sub-pallial chamber in the regi of the neck, we find the right left renal papillæ (discovered by kester (27) in 1867) on either the anal papilla (fig. 28), but no g If a similar examination be of the allied genus Fissurella (24, *d*), we find right and left of the two renal ape a right and left gill-plume or ctenidium, which by presence here and in Haliotis furnish the distinctive ch acter to which the name Zygobranchia refers. In Pa no such plumes exist, but right and left of the neck seen a pair of minute oblong yellow bodies (fig. 28, which were originally described by Lankester as possibly connected with the evacuation of the

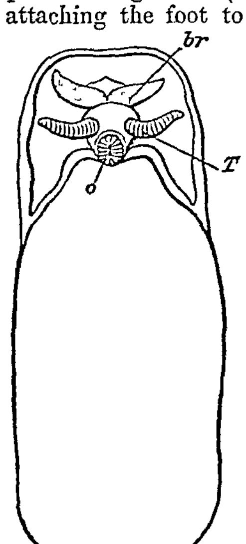

FIG. 25.—Parmophorus, seen from the pedal surface. *o*, mouth; *T*, cephalic tentacle; *br*, one of the two symmetrical gills placed on the neck. (Original.)

twisted into a figure-of-eight—the STREPTONEURA (fig. 21). Probably the Euthyneura and the Streptoneura have developed independently from the ancestral bilaterally symmetrical Gastropods. The escape of the visceral nerve-loop from the torsion depends on its having acquired a somewhat deeper position and shorter extent, previously to the commencement of the phenomenon of torsion, in the ancestors of the Euthyneura than in those of the Streptoneura. In the ancestral Streptoneura the visceral loop was lateral and superficial as in the living Isopleura.

Branch *a.*—*STREPTONEURA* (Spengel, 1881).

Characters.—Gastropoda Anisopleura in which the visceral "loop" (the conterminous visceral nerves) was adherent to the body-wall and so shared in the torsion of the visceral hump, the right cord crossing above the left so as to form a figure-of-eight (see fig. 19).

The Streptoneura comprise two orders—the Zygobranchia and the Azygobranchia.

Order 1.—Zygobranchia.

Characters.—Streptoneura in which, whilst the visceral torsion is very complete so as to bring the anus into the middle line anteriorly or nearly so, the atrophy of the primitively left-side organs is not carried out. The right and left ctenidia, which have now become left and right respectively, are of equal size, and are placed symmetrically on either side of the neck in the pallial space. Related to them is a simple pair of osphradial patches. Both right

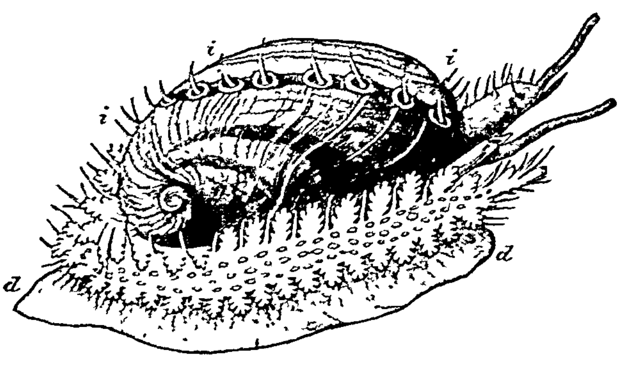

FIG. 23.—*Haliotis tuberculata* *d*, foot; *i*, tentacular processes of the mantle. (From Owen, after Cuvier.)

and left nephridia are present, the actual right one being much larger than the left. Two auricles may be present right and left of a median ventricle (Haliotis), or only one (Patella). The Zygobranchia are further very definitely characterized by the archaic character of absence of special genital ducts. The generative products escape by the larger nephridium. The sexes are distinct, and there is no copulatory or other accessory generative apparatus. The teeth of the lingual ribbon are highly differentiated (Rhipidoglossate). The visceral dome lies close upon the oval sucker-like foot, and is coextensive with its prolongation in the aboral direction.

The Zygobranchia comprise three families, arranged in two sub-orders.

Sub-order 1. *Ctenidiobranchia.*

Character.—Large paired ctenidia acting as gills.

Family 1.—*Haliotidæ.*

Genera: *Haliotis* (Ear-Shell, Ormer in Guernsey); mostly tropical; *Teinotis.*

Family 2.—*Fissurellidæ.*

Genera: *Fissurella* (Key-hole Limpet) (figs. 24, 36), *Emarginula*, *Parmophorus* (fig. 25); mostly tropical.

Sub-order 2. *Phyllidiobranchia.*

Characters.—Ctenidia reduced to wart-like papillæ; special sub-pallial lamellæ, similar to those of the Opisthobranch Pleurophyllidia, perform the function of gills.

Family 3.—*Patellidæ.*

Genera: *Patella* (Limpet, figs. 26, &c.), *Nacella* (Bonnet-Limpet), *Lottia.*

Further Remarks on Zygobranchia.—The Common Limpet is a specially interesting and abundant example of the remarkable order Zygobranchia. A complete and accurate account of its anatomy has yet to be written. Here we have only space for a brief outline. The foot of the Limpet is a nearly circular disc of muscular tissue; in front, projecting from and raised above it, are the head and neck (figs. 26, 30). The visceral hump forms a low conical dome above the sub-circular foot, and standing out all round the base of this dome so as to completely overlap the head and foot, is the circular mantle-skirt. The depth of free mantle-skirt is greatest in front, where the head and neck are covered in by it. Upon the surface of the visceral dome, and extending to the edge of the free mantle-skirt, is the conical shell. When the shell is taken away (best effected by immersion in hot water) the surface of the visceral dome is found to be covered by a black-coloured epithelium, which may be removed, enabling the observer to note the position of some organs lying below the transparent integument (fig. 27). The muscular columns (attaching the foot to the shell form a ring incomplete i front, external to which is the mantle-skirt. The limits of th large area formed by the flap o the head and neck (*ecr*) can be traced and we note the anal papilla sho ing through and opening on the rig shoulder, so to speak, of the into the large anterior region of t sub-pallial space. Close to this small renal organ (*i*, mediad) and larger renal organ (*k*, to the ri and posteriorly) are seen, also pericardium (*l*) and a coil of the i testine (*int*) embedded in the pact liver.

dium of the smaller of the two renal organs was demonstrated by Lankester in 1867, at a time when the fact that the renal organ of the Mollusca, as a rule, opens into the pericardium, and is therefore a typical nephridium, was not known. Subsequent investigations (27) carried on under the direction of the same naturalist have shown that the larger as well as the smaller renal sac is in communication with the pericardium. The walls of the renal sacs are deeply plaited and thrown into ridges. Below the surface these walls are excavated with blood-vessels, so that the sac is practically a series of blood-vessels covered with renal epithelium, and forming a mesh-work within a space communicating with the exterior. The larger renal sac (remarkably enough, that which is aborted in other Anisopleura) extends between the liver and the integument of the visceral dome very widely. It also bends round the liver as shown in fig. 30, and forms a large sac on half of the upper surface of the muscular mass of the foot. Here it lies close upon the genital body (ovary or testis), and in such intimate relationship with it that, when ripe, the gonad bursts into the renal sac, and its products are carried to the exterior by the papilla on the right side of the anus (Robin, Dall). This fact led Cuvier erroneously to the belief that a d existed leading from the gonad to this papilla. Th position of the gonad, best seen in the diagram in

        - " 2.—*Stylommatophora.*

Family 11.—*Naticidæ.*
Genera: *Natica*, Lam.; *Sigaretus*, Lam.; *Neritopsis*, Gratel.
Family 12.—*Entoconchidæ.*
The single genus and species *Entoconcha mirabilis*, discovered by Joh. Müller in 1851, parasitic in *Synapta digitata*. The adult form is not known.
Family 13.—*Marsenidæ.*
Genera: *Marsenia*, Leach; *Onchidiopsis*, Beck.
Family 14.—*Acmæidæ.*
Genera: *Acmæa*, Eschsch.; *Lottia*, Gr.; (probably these will be found to belong to the Zygobranchia).
Family 15.—*Capulidæ.*
Genera: *Capulus*, Montf.; *Calyptræa*, Lam. (fig. 40); *Trochita*, Schum.
Family 16.—*Littorinidæ.*
Genera: *Littorina* (the Periwinkles, fig. 46); *Modulus*, Gray; *Lacuna*, Turt.; *Rissoa*, Frem.; *Hydrobia*, Hartm.; *Assiminia*, Leach.
Family 17.—*Paludinidæ.*
Genera: *Paludina* (River-Snail) (figs. 7, 21); *Bithynia*, Gray; *Tanalia*, Gray.
Family 18.—*Valvatidæ.*
Genus: *Valvata* (fig. 45), fresh-water.
Family 19.—*Ampullaridæ.*
Genus: *Ampullaria* (can breathe air by means of the walls of the pallial chamber as well as water by the gill; fresh-waters of tropical America, Africa, and East Indies).

Sub-order 2.—*Pneumonochlamyda.*

Characters.—Pallial chamber a lung-sac; no gill; mouth on a rostrum, not a retractile proboscis; terrestrial habit.

Family 20.—*Cyclostomidæ.*
Genera: *Cyclostoma*, Lam.; *Cyclophorus*, Montf.; *Ferussina*, Gratel.; *Pupina*, Vignard.
Family 21.—*Helicinidæ* (radula rhipidoglossate rather than tænioglossate).
Genera: *Stoastoma*, Adams; *Trochatella*, Swains.; *Helicina*, Lam.; *Proserpina*, Guild.
Family 22.—*Aciculidæ.*
Genera: *Acicula*, Hartm.; *Geomelania*, Pfr.

Sub-order 3.—*Siphonochlamyda.*

Characters.—Reptant Azygobranchia with the margin of the mantle drawn out to form a trough-like siphon which notches lip of the shell; shell always spiral; usually an operculum, horn or lamelliform; either a rostrum or a retractile proboscis; exclusive marine; mostly carnivorous.

(From Owen.)

the nerve which is distributed to the parabranchia, proves it to be the same organ which is found universally in Molluscs at the base of each gill-plume, and tests the indrawn current of water by the sense of smell. The nerve to this

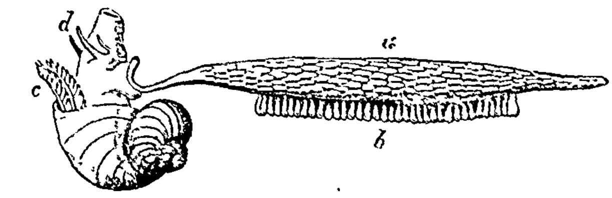

FIG. 44.—Female Janthina, with egg-float (*a*) attached to the foot; *b*, egg-capsules; *c*, ctenidium (gill-plume); *d*, cephalic tentacles.

organ is given off from the superior (original right, see fig. 19) visceral ganglion.

The figures which are here given of various Azygobranchia are in most cases sufficiently explained by the references attached to them. As an excellent general type of the nervous system, attention may be directed to that of Paludina drawn in fig. 21. On the whole, the ganglia are strongly individualized in the Azygobranchia, nerve-cell tissue being concentrated in the ganglia and absent from the cords (contrast with Zygobranchia and Isopleura). At the same time, the junction of the visceral loop above the intestine prevents in all Streptoneura the shortening of the visceral loop, and it is rare to find a fusion of the visceral ganglia with either pleural, pedal, or cerebral—a fusion which can and does take place where the visceral loop is not above but below the intestine, *e.g.*, in the Euthyneura (fig. 67), Cephalopoda (fig. 112), and Lamellibranchia (fig. 144). As contrasted with the Zygobranchia and the Isopleura, we find that in the Azygobranchia the pedal nerves are distinctly nerves given off from the pedal ganglia, rather than cord-like nerve-tracts containing both nerve-cells or ganglionic elements and nerve-fibres. Yet in some Azygobranchia (Paludina) a ladder-like arrangement of the two pedal nerves and their lateral branches has been detected (30). The histology of the nervous system of Mollusca has yet to be seriously inquired into.

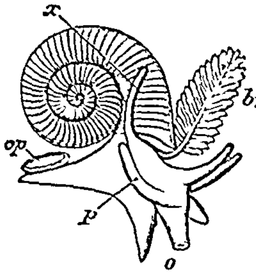

FIG. 45.—*Valvata cristata*, Müll. *o*, mouth; *op*, operculum; *br*, ctenidium (branchial plume); *x*, filiform appendage (? rudimentary ctenidium). The freely projecting ctenidium of typical form not having its axis fused to the roof of the branchial chamber is the notable character of this genus.

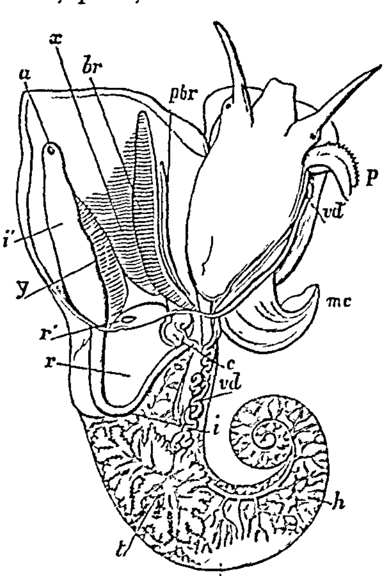

FIG. 46.—Male of *Littorina littoralis*, Lin., removed from its shell; the mantle-skirt cut along its right line of attachment and thrown over to the left side of the animal so as to expose the organs on its inner face. *a*, anus; *i*, intestine; *r*, nephridium (kidney); *r'*, aperture of the nephridium; *c*, heart; *br*, ctenidium (gill-plume); *pbr*, parabranchia (=the osphradium or olfactory patch); *x*, glandular lamellæ of the inner face of the mantle skirt; *y*, adrectal (purpuriparous) gland; *t*, testis; *vd*, vas deferens; *p*, penis; *mc*, columella muscle (muscular process grasping the shell); *r*, stomach; *h*, liver. *N.B.* Note the simple snout or rostrum not introverted as a "proboscis."

The alimentary canal of the Azygobranchia presents little diversity of character, except in so far as the buccal region is concerned. Salivary glands are present, and in some carnivorous forms (Dolium) these secrete free sul-

termed, which is also the condition presented by the mouth-bearing region in nearly all other Gastropoda. One of the best examples of the introversible mouth-cylinder or proboscis which can be found is that of the Common Whelk and its immediate allies. In fig. 37 the proboscis is seen in an everted state; it is only so carried when feeding, being withdrawn when the animal is at rest. Probably its use is to enable the animal to introduce its rasping and licking apparatus into very narrow apertures for the purpose of feeding, *e.g.*, into a small hole bored in the shell of another Mollusc.

The foot of the Azygobranchia, unlike the simple muscular disc of the Isopleura and Zygobranchia, is very often divided into lobes, a fore, middle, and hind lobe (pro-, meso-, and meta-podium, see figs. 39 and 43). Very usually, but not universally, the meta-podium carries an operculum. The division of the foot into lobes is a simple case of that much greater elaboration or breaking up into processes and regions which it undergoes in the class Cephalopoda. Even among some Gastropoda (viz., the Opisthobranchia), we find the lobation of the foot still further carried out by the development of lateral lobes, the epipodia, whilst there are many Azygobranchia, on the other hand, in which the foot has a simple oblong form without any trace of lobes.

The development of the Azygobranchia from the egg has been followed in several examples, *e.g.*, Paludina, Purpura, Nassa, Vermetus, Neritina. As in other Molluscan groups, we find a wide variation in the early process of the formation of the first embryonic cells, and their arrangement as a *Diblastula dependent on the greater or less amount of* food-yelk which is present in the egg-cell when it commences its embryonic changes. In fig. 7, the early stages of *Paludina vivipara* are represented. There is but very little food-material in the egg of this Azygobranch, and consequently the Diblastula forms by invagination; the blastopore or orifice of invagination coincides with the anus, and never closes entirely. A well-marked Trochosphere is formed by the development of an equatorial ciliated band; and subsequently, by the disproportionate growth of the lower hemisphere, the Trochosphere becomes a Veliger. The primitive shell-sac or shell-gland is well marked at this stage, and the pharynx is seen as a new ingrowth (the stomodæum), about to fuse with and open into the primitively invaginated arch-enteron (fig. 7, F).

In other Azygobranchs (and such variations are representative for all Mollusca, and not characteristic only of Azygobranchia), we find that there is a very unequal division of the egg-cell at the commencement of embryonic development, as in Nassa (fig. 5). Consequently there is strictly speaking no invagination (emboly), but an overgrowth (epiboly) of the smaller cells to enclose the larger. The general features of this process and of the relation of the blastopore to mouth and anus have been explained above in treating of the development of Mollusca generally. In such cases the blastopore may entirely close, and both mouth and anus develop as new ingrowths (stomodæum and proctodæum), whilst, according to the observations of Bobretzky, the closed blastopore may coincide in position with the mouth in some instances (Nassa, &c.), instead of with the anus. But in these epibolic forms, just as in the embolic Paludina, the embryo proceeds to develop its ciliated band and shell-gland, passing through the earlier condition of a Trochosphere to that of the Veliger. In the veliger stage many Azygobranchia (Purpura, Nassa, &c.) exhibit, in the dorsal region behind the head, a contractile area of the body-wall. This acts as a larval heart, but ceases to pulsate after a time. Similar rhythmically contractile areas are found on the foot of the embryo Pulmonate Limax and on the yelk-sac (distended foot-surface) of the Cephalopod Loligo (see fig. 72**).

The history of the shell in the development of Azygobranchia (and other Gastropods) is important. Just as the primitive shell-sac aborts and gives place to a cap-like or boat-like shell, so in some cases (Marsenia, Krohn) has this first shell been observed to be shed, and a second shell of different shape is formed beneath it.

A detailed treatment of what is known of the histogenesis in relation to the cell-layers in these Mollusca would take us far beyond the limits of this article, which aims at exposing only the well-ascertained characteristic features of the Mollusca and the various subordinate groups. There is still a great deficiency in our knowledge of the development of the Gastropoda, as indeed of all classes of animals. The development of the gill (ctenidium) as well as of the renal organ, and details as to the process of torsion of the visceral hump, are still quite insufficiently known.

One further feature of the development of the Azygobranchia deserves special mention. Many Gastropoda deposit their eggs, after fertilization, enclosed in capsules; others, as Paludina, are viviparous; others, again, as the Zygobranchia, agree with the Lamellibranch Conchifera (the Bivalves) in having simple exits for the ova without glandular walls, and therefore discharge their eggs unenclosed in capsules freely into the sea-water; such unencapsuled eggs are merely enclosed each in its own delicate chorion. When egg-capsules are formed they are often of large size, have tough walls, and in each capsule are several eggs floating in a viscid fluid. In some cases all the eggs in a capsule develop; in other cases one egg only in a capsule (Neritina), or a small proportion (Purpura, Buccinum), advance in development; the rest are arrested either after the first process of cell-division (cleavage) or before that process. The arrested embryos or eggs are then swallowed and digested by those in the same capsule which have advanced in development. The details of this history require renewed study, our present knowledge of it being derived from the works of Koren and Danielssen, Carpenter and Claparède. In any case it is clearly the same process in essence as that of the formation of a vitellogenous gland from part of the primitive ovary, or of the feeding of an ovarian egg by the absorption of neighbouring potential eggs; but here the period at which the sacrifice of one egg to another takes place is somewhat late. What it is that determines the arrest of some eggs and the progressive development of others in the same capsule is at present unknown.

Section *b* (of the Azygobranchia).—*NATANTIA.*

Characters.—Azygobranchiate Streptoneura which have the form and texture of the body adapted to a free-swimming pelagic habit. They appear to be derived from holochlamydic forms of Reptant Azygobranchia. The foot takes the form of a swimming organ. The nervous system and sense-organs (eyes, otocysts, and osphradium) are highly developed. The odontophore also is remarkably developed, its admedian teeth being mobile, and it serves as an efficient organ for attacking other pelagic forms upon which the Natantia prey. The sexes are distinct as in all Streptoneura; and genital ducts and accessory glands and pouches are present as in all Azygobranchia. The Natantia exhibit a series of modifications of the form and proportions of the visceral mass and foot, leading from a condition readily comparable with that of a typical Azygobranch such as Rostellaria, with the three regions of the foot (pro-, meso-, and meta-podium) strongly marked, and a coiled visceral hump of the usual proportions, up to a condition in which the whole body is of a tapering cylindrical shape, the foot a plate-like vertical fin, and the visceral hump almost completely atrophied. Three steps of this modification may be distinguished as three sub-orders, the *Atlantacea*, the *Carinariacea*, and the *Pterotracheacea.*

Sub-order 1.—*Atlantacea.*

Characters.—Natantia with a large spirally-wound visceral hump, covered by a hyaline spiral shell; mantle-skirt large, overhanging a well-developed sub-pallial branchial chamber as in Azygobranchia, to the wall of which is attached the branchial ctenidium; foot well developed, divisible into a mobile propodium, a mesopodium on which is formed a sucker, and a metapodium which, when the animal is expanded, extends backwards beyond the shell and visceral

termed, which is also the condition presented by the mouth-bearing region in nearly all other Gastropoda. One of the best examples of the introversible mouth-cylinder or proboscis which can be found is that of the Common Whelk and its immediate allies. In fig. 37 the proboscis is seen in an everted state; it is only so carried when feeding, being withdrawn when the animal is at rest. Probably its use is to enable the animal to introduce its rasping and licking apparatus into very narrow apertures for the purpose of feeding, *e.g.*, into a small hole bored in the shell of another Mollusc.

The foot of the Azygobranchia, unlike the simple muscular disc of the Isopleura and Zygobranchia, is very often divided into lobes, a fore, middle, and hind lobe (pro-, meso-, and meta-podium, see figs. 39 and 43). Very usually, but not universally, the meta-podium carries an operculum. The division of the foot into lobes is a simple case of that much greater elaboration or breaking up into processes and regions which it undergoes in the class Cephalopoda. Even among some Gastropoda (viz., the Opisthobranchia), we find the lobation of the foot still further carried out by the development of lateral lobes, the epipodia, whilst there are many Azygobranchia, on the other hand, in which the foot has a simple oblong form without any trace of lobes.

The development of the Azygobranchia from the egg has been followed in several examples, *e.g.*, Paludina, Purpura, Nassa, Vermetus, Neritina. As in other Molluscan groups, we find a wide variation in the early process of the formation of the first embryonic cells, and their arrangement as a *Diblastula dependent on the greater or less amount of* food-yelk which is present in the egg-cell when it commences its embryonic changes. In fig. 7, the early stages of *Paludina vivipara* are represented. There is but very little food-material in the egg of this Azygobranch, and consequently the Diblastula forms by invagination; the blastopore or orifice of invagination coincides with the anus, and never closes entirely. A well-marked Trochosphere is formed by the development of an equatorial ciliated band; and subsequently, by the disproportionate growth of the lower hemisphere, the Trochosphere becomes a Veliger. The primitive shell-sac or shell-gland is well marked at this stage, and the pharynx is seen as a new ingrowth (the stomodæum), about to fuse with and open into the primitively invaginated arch-enteron (fig. 7, F).

In other Azygobranchs (and such variations are representative for all Mollusca, and not characteristic only of Azygobranchia), we find that there is a very unequal division of the egg-cell at the commencement of embryonic development, as in Nassa (fig. 5). Consequently there is strictly speaking no invagination (emboly), but an overgrowth (epiboly) of the smaller cells to enclose the larger. The general features of this process and of the relation of the blastopore to mouth and anus have been explained above in treating of the development of Mollusca generally. In such cases the blastopore may entirely close, and both mouth and anus develop as new ingrowths (stomodæum and proctodæum), whilst, according to the observations of Bobretzky, the closed blastopore may coincide in position with the mouth in some instances (Nassa, &c.), instead of with the anus. But in these epibolic forms, just as in the embolic Paludina, the embryo proceeds to develop its ciliated band and shell-gland, passing through the earlier condition of a Trochosphere to that of the Veliger. In the veliger stage many Azygobranchia (Purpura, Nassa, &c.) exhibit, in the dorsal region behind the head, a contractile area of the body-wall. This acts as a larval heart, but ceases to pulsate after a time. Similar rhythmically contractile areas are found on the foot of the embryo Pulmonate Limax and on the yelk-sac (distended foot-surface) of the Cephalopod Loligo (see fig. 72**).

The history of the shell in the development of Azygobranchia (and other Gastropods) is important. Just as the primitive shell-sac aborts and gives place to a cap-like or boat-like shell, so in some cases (Marsenia, Krohn) has this first shell been observed to be shed, and a second shell of different shape is formed beneath it.

A detailed treatment of what is known of the histogenesis in relation to the cell-layers in these Mollusca would take us far beyond the limits of this article, which aims at exposing only the well-ascertained characteristic features of the Mollusca and the various subordinate groups. There is still a great deficiency in our knowledge of the development of the Gastropoda, as indeed of all classes of animals. The development of the gill (ctenidium) as well as of the renal organ, and details as to the process of torsion of the visceral hump, are still quite insufficiently known.

One further feature of the development of the Azygobranchia deserves special mention. Many Gastropoda deposit their eggs, after fertilization, enclosed in capsules; others, as Paludina, are viviparous; others, again, as the Zygobranchia, agree with the Lamellibranch Conchifera (the Bivalves) in having simple exits for the ova without glandular walls, and therefore discharge their eggs unenclosed in capsules freely into the sea-water; such unencapsuled eggs are merely enclosed each in its own delicate chorion. When egg-capsules are formed they are often of large size, have tough walls, and in each capsule are several eggs floating in a viscid fluid. In some cases all the eggs in a capsule develop; in other cases one egg only in a capsule (Neritina), or a small proportion (Purpura, Buccinum), advance in development; the rest are arrested either after the first process of cell-division (cleavage) or before that process. The arrested embryos or eggs are then swallowed and digested by those in the same capsule which have advanced in development. The details of this history require renewed study, our present knowledge of it being derived from the works of Koren and Danielssen, Carpenter and Claparède. In any case it is clearly the same process in essence as that of the formation of a vitellogenous gland from part of the primitive ovary, or of the feeding of an ovarian egg by the absorption of neighbouring potential eggs; but here the period at which the sacrifice of one egg to another takes place is somewhat late. What it is that determines the arrest of some eggs and the progressive development of others in the same capsule is at present unknown.

Section *b* (of the Azygobranchia).—*NATANTIA.*

Characters.—Azygobranchiate Streptoneura which have the form and texture of the body adapted to a free-swimming pelagic habit. They appear to be derived from holochlamydic forms of Reptant Azygobranchia. The foot takes the form of a swimming organ. The nervous system and sense-organs (eyes, otocysts, and osphradium) are highly developed. The odontophore also is remarkably developed, its admedian teeth being mobile, and it serves as an efficient organ for attacking other pelagic forms upon which the Natantia prey. The sexes are distinct as in all Streptoneura; and genital ducts and accessory glands and pouches are present as in all Azygobranchia. The Natantia exhibit a series of modifications of the form and proportions of the visceral mass and foot, leading from a condition readily comparable with that of a typical Azygobranch such as Rostellaria, with the three regions of the foot (pro-, meso-, and meta-podium) strongly marked, and a coiled visceral hump of the usual proportions, up to a condition in which the whole body is of a tapering cylindrical shape, the foot a plate-like vertical fin, and the visceral hump almost completely atrophied. Three steps of this modification may be distinguished as three sub-orders, the *Atlantacea*, the *Carinariacea*, and the *Pterotracheacea.*

Sub-order 1.—*Atlantacea.*

Characters.—Natantia with a large spirally-wound visceral hump, covered by a hyaline spiral shell; mantle-skirt large, overhanging a well-developed sub-pallial branchial chamber as in Azygobranchia, to the wall of which is attached the branchial ctenidium; foot well developed, divisible into a mobile propodium, a mesopodium on which is formed a sucker, and a metapodium which, when the animal is expanded, extends backwards beyond the shell and visceral

Branch *b*.—*EUTHYNEURA* (Spengel, 1881).

Characters. — Gastropoda Anisopleura in which the visceral loop (the conterminous visceral nerves) does not share in the torsion of the visceral hump, but, being sunk entirely below the body-wall, remains straight and untwisted. Although the anus is not brought so far forward

FIG. 52.—*Bulla textilum* (Chemnitz), as seen crawling. *a*, oral hood (compare with Tethys, fig. 62, B), possibly a continuation of the epipodia; *b*, *b′*, cephalic tentacles. (From Owen.)

by the visceral torsion as in the Streptoneura, and may even by *secondary* growth assume a posterior median position, yet, as fully developed, an asymmetry has resulted as in the Azygobranchia, only the original right renal organ, right *ctenidium* (*if any*), right osphradium, right side of the heart, and right genital ducts being retained. All the Euthyneura are hermaphrodite. The lingual ribbon has very usually numerous fine denticles undifferentiated into series in each row. The shell is light and little calcified; often it is not developed in the adult, though present in the embryo. An operculum, often found in the embryo, is never present in the adult (except in Tornatella, fig. 53). Many Euthyneura show a tendency to, or a complete accomplishment of, the suppression of the mantle-skirt as well as of the shell, also of the ctenidium, and acquire at the same time a more or less cylindrical (slug-like) form of body.

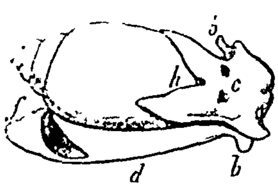

FIG. 53.—Tornatella. *h*, shell; *b*, oral hood; *d*, foot; *f*, operculum.

The Euthyneura comprise two orders, the Opisthobranchia and the Pulmonata.

Order 1.—Opisthobranchia.

Marine Euthyneura the more archaic forms of which have a relatively large foot and a small visceral hump, from the base of which projects on the right side a short mantle-skirt. The anus is placed in such forms far back

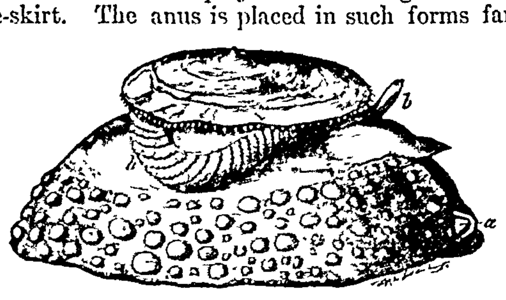

FIG. 54.—*Umbrella mediterranea.* *a*, mouth; *b*, cephalic tentacle; *h*, gill (ctenidium). The free edge of the mantle is seen just below the margin of the shell (compare with Aplysia, fig. 63) (From Owen.)

beyond the mantle-skirt. In front of the anus, and only partially covered by the mantle-skirt, is the ctenidium with its free end turned backwards. The heart lies in front of, instead of to the side of, the attachment of the ctenidium, —hence Opisthobranchia as opposed to "Prosobranchia," which correspond to the Streptoneura. A shell is possessed in the adult state by but few Opisthobranchia, but all pass through a veliger larval stage with a nautiloid shell (fig. 60). Many Opisthobranchia have by a process of atrophy lost the typical ctenidium and the mantle-skirt, and have developed other organs in their place. As in some Azygobranchia, the free margin of the mantle-skirt is frequently reflected over the shell when a shell exists; and, as in some Azygobranchia, broad lateral outgrowths of the foot (epipodia) are often developed, which, as does *not* occur in Azygobranchia, may be thrown over the shell or naked dorsal surface of the body.

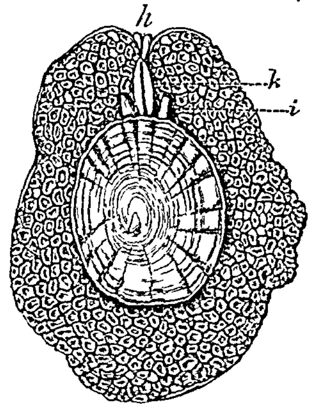

FIG. 55.—*Umbrella mediterranea*, seen from above. *h*, mouth; *i*, cephalic tentacles; *k*, penis sheath. (After Keferstein.)

The variety of special developments of structure accompanying the atrophy of typical organs in the Opisthobranchia and general degeneration of organization is very great, and renders their classification difficult. Two sections of the order may be distinguished, according as the typical Molluscan mantle-skirt (limbus pallialis) is or is not atrophied, and within each section certain sub-orders.

Section *a*.—*PALLIATA* (= *Tectibranchiata*, Woodward)—the typical Molluscan mantle-skirt or pallium retained.

Sub-order 1.—*Ctenidiobranchia.*

Characters.—Palliata in which the ctenidium is retained as the branchial organ; with rare exceptions a delicate shell, which may be very small or completely enclosed by the reflected margin of the mantle; epipodia (lateral outgrowths of the foot) frequently present.

Family 1.—*Tornatellidæ.*
Genera: *Tornatella*, Lam. (fig. 53); *Cinulia*, Gray, &c.
Family 2.—*Bullidæ.*
Genera: *Bulla*, Lam. (fig. 52); *Acera*, Muller; *Scaphander*, Montf.; *Bullæa*, Lam.; *Doridium*, Meckel; *Gastropteron*, Meckel, &c.
Family 3.—*Aplysiidæ.*
Genera: *Aplysia*, Gmelin (the Sea-Hare) (figs. 20, 56, &c.); *Dolobella*, Lam.; *Lobiger*, Krohn, &c.
Family 4.—*Pleurobranchidæ.*
Genera: *Pleurobranchus*, Cuvier; *Umbrella*, Chemnitz (figs. 54, 55); *Runcina*, Forbes, &c.

Sub-order 2.—*Phyllidiobranchia.*

Characters.—Palliata in which the ctenidia have atrophied; much as in Patellidæ among the Zygobranchiate Streptoneura their place is taken by laterally-placed lamellæ, developed from the inner surface of the bilaterally-disposed mantle-skirt in two lateral rows.

Family 5.—*Phyllidiadæ.*
Genera: *Phyllidia*, Cuiver; *Pleurophyllidia*, Meck. (fig. 57).

Section *b*.—*NON-PALLIATA.*

Characters.—The typical Molluscan mantle-skirt is atrophied in the adult. No shell is present in the adult, though the dorsal integument may be strengthened by calcareous spicules (Doris). The otocysts are not sessile on the pedal ganglia as in other Gastropods, but, as in the Natantia Azygobranchia, lie close to the cerebral ganglia. In one sub-order (Pygobranchia) the typical ctenidium appears to be retained in a modified form; in the others special developments of the body-wall take its place, or no special respiratory processes exist at all. The general form of the body is slug-like, the foot and visceral hump being coextensive, and a secondary bilateral symmetry is asserted by the usually median (sometimes right-sided) dorsal position of the anus on the hinder part of the body.

Sub-order 1.—*Pygobranchia.*

Characters.—The ctenidium assumes the form of a circlet of pinnate processes surrounding the median dorsal anus; a strongly-marked epipodial fold may occur all round the foot and simulate a mantle-skirt (see fig. 62, C, Doris); papillæ or "cerata" of the dorsal integument may occur as well as the true ctenidium (fig. 61).

Family 6.—*Dorididæ.*
Genera: *Doris*, L; *Goniodoris*, Forbes; *Triopa*, Johnst.; *Ægirus*, Loven; *Thecacera*, Fleming; *Polycera*, Cuvier; *Idalia*, Leuckart; *Ancula*, Loven; *Ceratosoma*, Adams; *Onchidoris*, Blainv.

Branch *b.—EUTHYNEURA* (Spengel, 1881).

Characters. — Gastropoda Anisopleura in which the visceral loop (the conterminous visceral nerves) does not share in the torsion of the visceral hump, but, being sunk entirely below the body-wall, remains straight and untwisted. Although the anus is not brought so far forward

FIG. 52.—*Bulla textilum* (Chemnitz), as seen crawling. *á*, oral hood (compare with Tethys, fig. 62, B), possibly a continuation of the epipodia; *b*, *b′*, cephalic tentacles. (From Owen.)

by the visceral torsion as in the Streptoneura, and may even by *secondary* growth assume a posterior median position, yet, as fully developed, an asymmetry has resulted as in the Azygobranchia, only the original right renal organ, right ctenidium (if any), right osphradium, right side of the heart, and right genital ducts being retained. All the Euthyneura are hermaphrodite. The lingual ribbon has very usually numerous fine denticles undifferentiated into series in each row. The shell is light and little calcified; often it is not developed in the adult, though present in the embryo. An operculum, often found in the embryo, is never present in the adult (except in Tornatella, fig. 53). Many Euthyneura show a tendency to, or a complete accomplishment of, the suppression of the mantle-skirt as well as of the shell, also of the ctenidium, and acquire at the same time a more or less cylindrical (slug-like) form of body.

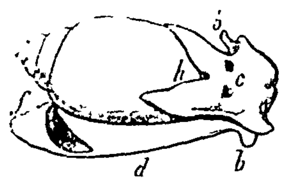

FIG. 53.—Tornatella. *h*, shell; *b*, oral hood; *d*, foot; *f*, operculum.

The Euthyneura comprise two orders, the Opisthobranchia and the Pulmonata.

Family 3.—*Aplysiidæ.*

Genera: *Aplysia*, Gmelin (the Sea-Hare) (figs. 20, 56, &c.); *Dolobella*, Lam.; *Lobiger*, Krohn, &c.

Family 4.—*Pleurobranchidæ.*

Genera: *Pleurobranchus*, Cuvier; *Umbrella*, Chemnitz (figs. 54, 55); *Runcina*, Forbes, &c.

Sub-order 2.—*Phyllidiobranchia.*

Characters.—Palliata in which the ctenidia have atrophied; much as in Patellidæ among the Zygobranchiate Streptoneura their place is taken by laterally-placed lamellæ, developed from the inner surface of the bilaterally-disposed mantle-skirt in two lateral rows.

Family 5.—*Phyllidiadæ.*

Genera: *Phyllidia*, Cuiver; *Pleurophyllidia*, Meck. (fig. 57).

Section *b.—NON-PALLIATA.*

Characters.—The typical Molluscan mantle-skirt is atrophied in the adult. No shell is present in the adult, though the dorsal integument may be strengthened by calcareous spicules (Doris). The otocysts are not sessile on the pedal ganglia as in other Gastropods, but, as in the Natantia Azygobranchia, lie close to the cerebral ganglia. In one sub-order (Pygobranchia) the typical ctenidium appears to be retained in a modified form; in the others special developments of the body-wall take its place, or no special respiratory processes exist at all. The general form of the body is slug-like, the foot and visceral hump being coextensive, and a secondary bilateral symmetry is asserted by the usually median (sometimes right-sided) dorsal position of the anus on the hinder part of the body.

Sub-order 1.—*Pygobranchia.*

Characters.—The ctenidium assumes the form of a circlet of pinnate processes surrounding the median dorsal anus; a strongly-marked epipodial fold may occur all round the foot and simulate a mantle-skirt (see fig. 62, C, Doris); papillæ or "cerata" of the dorsal integument may occur as well as the true ctenidium (fig. 61).

Family 6.—*Dorididæ.*

Genera: *Doris*, L.; *Goniodoris*, Forbes; *Triopa*, Johnst.; *Ægirus*, Loven; *Thecacera*, Fleming; *Polycera*, Cuvier; *Idalia*, Leuckart; *Ancula*, Loven; *Ceratosoma*, Adams; *Onchidoris*, Blainv.

63 projecting from the branchial sub-pallial space. The relation of the delicate shell to the mantle is peculiar, since it occupies an oval area upon the visceral hump, the extent of which is indicated in fig. 56, C, but may be better understood by a glance at the figures of the allied genus Umbrella (figs. 54, 55), in which the margin of the mantle-skirt coincides, just as it does in the Limpet, with the margin of the shell. But in Aplysia the mantle is reflected over the edge of the shell, and grows over its upper surface so as to completely enclose it, excepting at the small central area *s* where the naked shell is exposed. This enclosure of the shell is a permanent development of the arrangement seen in many Streptoneura (*e.g.*, Pyrula, Ovulum, see figs. 38 and 41), where the border of the mantle can be, and usually is, drawn over the shell, though it is withdrawn (as it cannot be in Aplysia) when they are irritated. From the fact that Aplysia commences its life as a free-swimming Veliger with a nautiloid shell not enclosed in any way by the border of the mantle, it is clear that the enclosure of the shell in the adult is a secondary process. Accordingly, the shell of Aplysia must not be confounded with a primitive shell in its shell-sac, such as we find realized in the shells of Chiton and in the plugs which form in the remarkable transitory "shell-sac" or "shell-gland" of Molluscan embryos

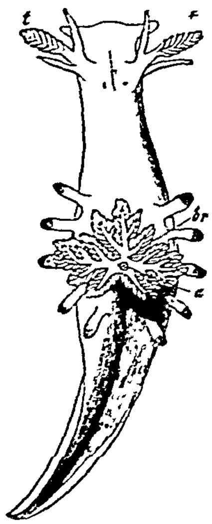

FIG. 61.—*Polycera cristata*, one of the Pygobranchiate Opisthobranchs (dorsal view). *a*, anus; *br*, the ctenidium peculiarly modified so as to encircle the anus; *t*, cephalic tentacles. External to the branchial ctenidium are seen ten club-like processes of the dorsal wall, these are the "cerata" which are characteristically developed in another sub-order of Opisthobranchs, the Ceratonota (see fig. 62, A). (From Gegenbaur, after Alder and Hancock.)

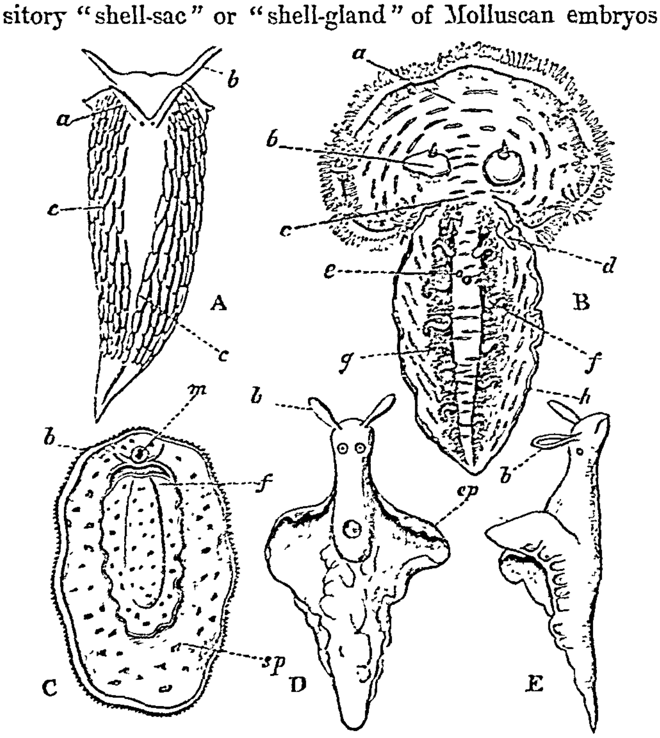

FIG. 62.

(see figs. 7, 68, and 72***). Aplysia, like other Mollusca, develops a primitive shell-sac in its trochosphere stage of development (fig. 68), which disappears and is succeeded by a nautiloid shell (fig. 60). This forms the nucleus of the adult shell, and, as the animal grows, becomes enclosed by a reflexion of the mantle-skirt. In reference to the possible comparison of the enclosed shell of Aplysia and its allies with those of some Slugs and of Cuttle-fishes, the reader is referred to the paragraphs dealing especially with those Molluscs. When the shell of an Aplysia enclosed in its mantle is pushed well to the left, the sub-pallial space is fully exposed as in fig. 63, and the various apertures of the body are seen. Posteriorly we have the anus, in front of this the lobate gill-plume, between the two (hence corresponding in position to that of the Azygobranchia) we have the aperture of the renal organ. In front, near the anterior attachment of the gill-plume, is the osphradium (olfactory organ) discovered by Spengel, yellowish in colour, in the typical position, and overlying an olfactory ganglion with typical nerve-connexion (see fig. 20). To the right of Spengel's osphradium is the opening of a peculiar gland which has, when dissected out, the form of a bunch of grapes; its secretion is said to be poisonous. On the under side of the free edge of the mantle are situated the numerous small cutaneous glands which, in the large *Aplysia camelus* (not in other species), form the purple secretion which was known to the ancients. In front of the osphradium is the single genital pore, the aperture of the common or hermaphrodite duct. From this point there stretches forward to the right side of the head a groove—the spermatic groove—down which the spermatic fluid passes. In other Euthyneura this groove may close up and form a canal. At its termination by the side of the head is the muscular introverted penis. In the hinder part of the foot (not shown in any of the diagrams) is the opening of a large mucous-forming gland very often found in the Molluscan foot.

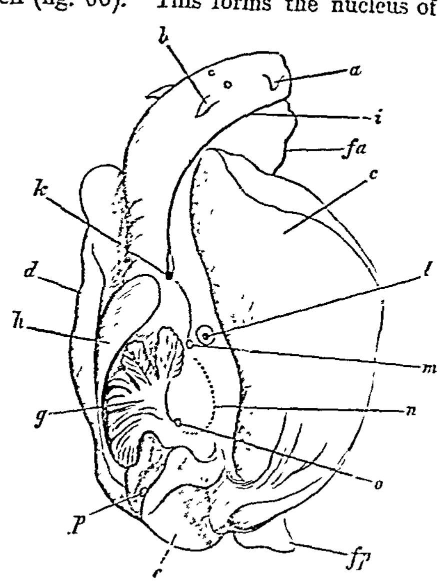

FIG. 63.—*Aplysia leporina* (*camelus*, Cuv.), with epipodia and mantle reflected away from the mid-line. *a*, anterior cephalic tentacle; *b*, posterior do.; between *a* and *b*, the eyes; *c*, right epipodium; *d*, left epipodium; *e*, hinder part of visceral hump; *fp*, posterior extremity of the foot; *fa*, anterior part of the foot underlying the head; *g*, the ctenidium (branchial plume); *h*, the mantle-skirt tightly spread over the horny shell and pushed with it towards the left side; *i*, the spermatic groove; *k*, the common genital pore (male and female); *l*, orifice of the grape-shaped (supposed poisonous) gland; *m*, the osphradium (olfactory organ of Spengel); *n*, outline of part of the renal sac (nephridium) below the surface; *o*, external aperture of the nephridium; *p*, anus. (Original.)

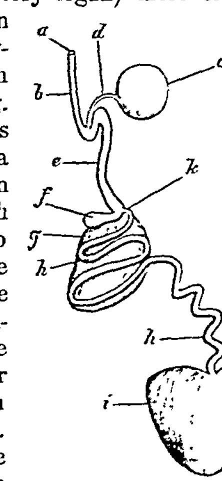

FIG. 64.—Gonad, and accessory glands and ducts of Aplysia. *i*, ovo-testis; *h*, hermaphrodite duct; *g*, albuminiparous gland; *f*, vesicula seminalis; *k*, opening of the albuminiparous gland into the hermaphrodite duct; *e*, hermaphrodite duct (uterine portion); *b*, vaginal portion of the uterine duct; *c*, spermatheca; *d*, its duct; *a*, genital pore. (Original.)

63 projecting from the branchial sub-pallial space. The relation of the delicate shell to the mantle is peculiar, since it occupies an oval area upon the visceral hump, the extent of which is indicated in fig. 56, C, but may be better understood by a glance at the figures of the allied genus Umbrella (figs. 54, 55), in which the margin of the mantle-skirt coincides, just as it does in the Limpet, with the margin of the shell. But in Aplysia the mantle is reflected over the edge of the shell, and grows over its upper surface so as to completely enclose it, excepting at the small central area *s* where the naked shell is exposed. This enclosure of the shell is a permanent development of the arrangement seen in many Streptoneura (*e.g.*, Pyrula, Ovulum, see figs. 38 and 41), where the border of the mantle can be, and usually is, drawn over the shell, though it is withdrawn (as it cannot be in Aplysia) when they are irritated. From the fact that Aplysia commences its life as a free-swimming Veliger with a nautiloid shell not enclosed in any way by the border of the mantle, it is clear that the enclosure of the shell in the adult is a secondary process. Accordingly, the shell of Aplysia must not be confounded with a primitive shell in its shell-sac, such as we find realized in the shells of Chiton and in the plugs which form in the remarkable transitory "shell-sac" or "shell-gland" of Molluscan embryos (see figs. 7, 68, and 72***). Aplysia, like other Mollusca, develops a primitive shell-sac in its trochosphere stage of development (fig. 68), which disappears and is succeeded by a nautiloid shell (fig. 60). This forms the nucleus of the adult shell, and, as the animal grows, becomes enclosed by a reflexion of the mantle-skirt. In reference to the possible comparison of the enclosed shell of Aplysia and its allies with those of some Slugs and of Cuttle-fishes, the reader is referred to the paragraphs dealing especially with those Molluscs. When the shell of an Aplysia enclosed in its mantle is pushed well to the left, the sub-pallial space is fully exposed as in fig. 63, and the various apertures of the body are seen.

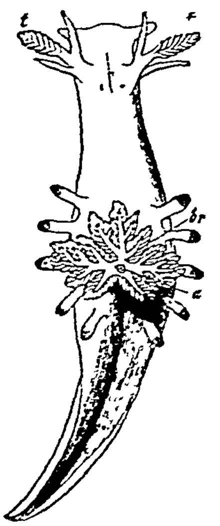

FIG. 61.—*Polycera cristata*, one of the Pygobranchiate Opisthobranchs (dorsal view). *a*, anus; *br*, the ctenidium peculiarly modified so as to encircle the anus; *t*, cephalic tentacles. External to the branchial ctenidium are seen ten club-like processes of the dorsal wall, these are the "cerata" which are characteristically developed in another sub-order of Opisthobranchs, the Ceratonota (see fig. 62, A). (From Gegenbaur, after Alder and Hancock.)

A. *Eolis papillosa* (Lin.), dorsal view. *a*, *b*, posterior and anterior cephalic tentacles; *c*, the dorsal "cerata" (hence Ceratobranchia).
B. *Tethys leporina*, dorsal view. *a*, the cephalic hood; *b*, cephalic tentacles; *c*, neck; *d*, genital pore; *e*, anus; *f*, large cerata; *g*, smaller cerata; *h*, margin of the foot.
C. *Doris (Actinocyclus) tuberculatus* (Cuv.), seen from the pedal surface. *m*, mouth; *b*, margin of the head; *f*, sole of the foot; *ep*, the mantle-like epipodium.
D, E. Dorsal and lateral view of *Elysia (Actæon) viridis*. *ep*, epipodial outgrowths. (After Keferstein.)

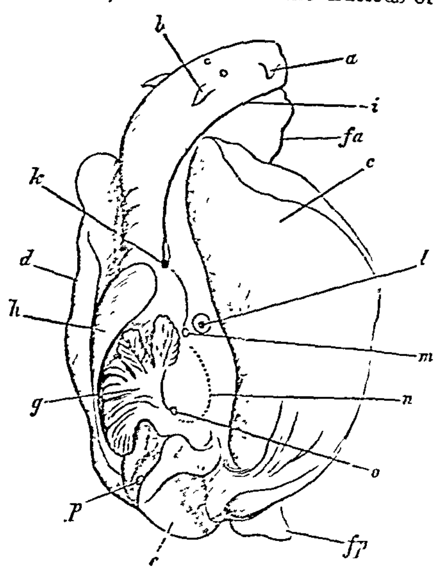

FIG. 63.—*Aplysia leporina* (*camelus*, Cuv.), with epipodia and mantle reflected away from the mid-line. *a*, anterior cephalic tentacle; *b*, posterior do.; between *a* and *b*, the eyes; *c*, right epipodium; *d*, left epipodium; *e*, hinder part of visceral hump; *fp*, posterior extremity of the foot; *fa*, anterior part of the foot underlying the head; *g*, the ctenidium (branchial plume); *h*, the mantle-skirt tightly spread over the horny shell and pushed with it towards the left side; *i*, the spermatic groove; *k*, the common genital pore (male and female); *l*, orifice of the grape-shaped (supposed poisonous) gland; *m*, the osphradium (olfactory organ of Spengel); *n*, outline of part of the renal sac (nephridium) below the surface; *o*, external aperture of the nephridium; *p*, anus. (Original.)

Posteriorly we have the anus, in front of this the lobate gill-plume, between the two (hence corresponding in position to that of the Azygobranchia) we have the aperture of the renal organ. In front, near the anterior attachment of the gill-plume, is the osphradium (olfactory organ) discovered by Spengel, yellowish in colour, in the typical position, and overlying an olfactory ganglion with typical nerve-connexion (see fig. 20). To the right of Spengel's osphradium is the opening of a peculiar gland which has, when dissected out, the form of a bunch of grapes; its secretion is said to be poisonous. On the under side of the free edge of the mantle are situated the numerous small cutaneous glands which, in the large *Aplysia camelus* (not in other species), form the purple secretion which was known to the ancients. In front of the osphradium is the single genital pore, the aperture of the common or hermaphrodite duct. From this point there stretches forward to the right side of the head a groove—the spermatic groove—down which the spermatic fluid passes. In other Euthyneura this groove may close up and form a canal. At its termination by the side of the head is the muscular introverted penis. In the hinder part of the foot (not shown in any of the diagrams) is the opening of a large mucous-forming gland very often found in the Molluscan foot.

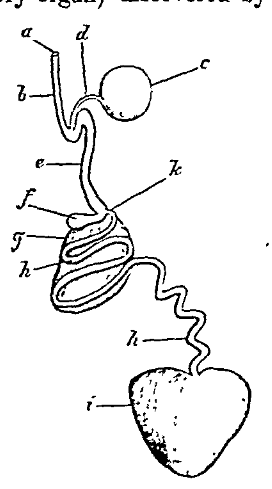

FIG. 64.—Gonad, and accessory glands and ducts of Aplysia. *i*, ovo-testis; *h*, hermaphrodite duct; *g*, albuminiparous gland; *f*, vesicula seminalis; *l*, opening of the albuminiparous gland into the hermaphrodite duct; *e*, hermaphrodite duct (uterine portion); *b*, vaginal portion of the uterine duct; *c*, spermatheca; *d*, its duct; *a*, genital pore. (Original.)

Aplysia hybrida of the English coast), placed at its extreme limit, representing both the right and left visceral ganglia and the third or abdominal ganglion, which are so often separately present. The diagram (fig. 20) shows the nerve connecting this abdomino-visceral ganglion with the olfactory ganglion of Spengel. It is also seen to be connected with a more remote ganglion—the genital. Such special irregularities in the development of ganglia upon the visceral loop, and on one or more of the main nerves connected with it, are, as the figures of Molluscan nervous systems given in this article show, very frequent. Our figure of the nervous system of Aplysia does not give the small pair of buccal ganglia which are, as in all Glossophorous Molluscs, present upon the nerves passing from the cerebral region to the odontophore.

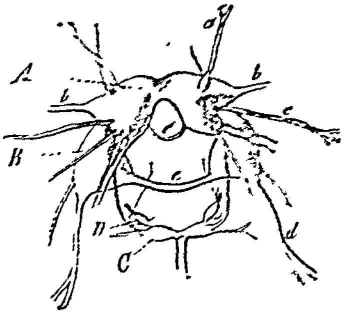

FIG. 67.—Central nervous system of Fiona (one of the Ceratonotous Opisthobranchs), showing a tendency to fusion of the great ganglia. *A*, cerebral, pleural, and visceral ganglia united; *B*, pedal ganglion; *C*, buccal ganglion; *D*, œsophageal ganglion connected with the buccal; *a*, nerve to superior cephalic tentacle; *b*, nerves to inferior cephalic tentacles; *c*, nerve to generative organs; *d*, pedal nerve; *e*, pedal commissure; *e'*, visceral loop or commissure (?). (From Gegenbaur, after Bergh.)

For a comparison of various Opisthobranchs, Aplysia will be found to present a convenient starting-point. It is one of the more typical Opisthobranchs, that is to say, it belongs to the section Palliata, but other members of the Palliata, namely, Bulla and Tornatella (figs. 52 and 53), are less abnormal than Aplysia in regard to their shells and the form of the visceral hump. They have naked spirally-twisted shells which may be concealed from view in the living animal by the expansion and reflexion of the epipodia,

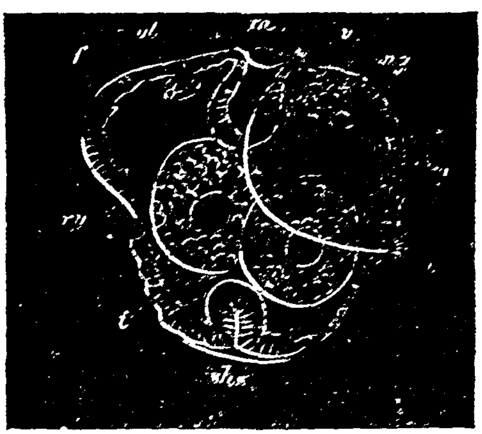

FIG. 68.—Young veliger larva of an Opisthobranch (Pleuro-branchidium). *m*, mouth; *v*, ciliated band marking off the velum; *ng*, cerebral ganglion developing from epiblast, within the velar area; *ot*, otocyst also developing from epiblast; *f*, foot; *i*, intestine; *ry*, residual nutritive yelk; *sh*, primitive shell-sac or shell-gland. (From Lankester.)

but are not enclosed by the mantle, whilst Tornatella is remarkable amongst all Euthyneura for possessing an operculum like that of so many Streptoneura.

The great development of the epipodia seen in Aplysia is usual in Palliate Opisthobranchs; it occurs also in Elysia (fig. 62, D) among Non-Palliata; in Doris it seems probable that the mantle-like fold overhanging the foot is to be interpreted as epipodium, the mantle-skirt being altogether absent, as shown by the naked position of the gills and anus on the dorsal surface (figs. 61 and 62, C). The whole surface of the body becomes greatly modified in those Non-Palliate forms which have lost, not only the mantle-skirt and the shell, but also the ctenidium. Many of these (Ceratonota) have peculiar processes developed on the dorsal surface (fig. 62, A, B), or retain purely negative characters (fig. 62, D). The chief modification of internal organization presented by these forms, as compared with Aplysia, is found in the condition of the alimentary canal. The liver is no longer a compact organ opening by a pair of ducts into the median digestive tract, but we find very numerous hepatic diverticula on a shortened axial tract (fig. 66). These diverticula extend usually one into each of the dorsal papillæ or "cerata" when these are present. They are not merely digestive glands, but are sufficiently wide to act as receptacles of food, and in them the digestion of food proceeds just as in the axial portion of the canal. A precisely similar modification of the liver or great digestive gland is found in the Scorpions, where the axial portion of the digestive canal is short and straight, and the lateral ducts sufficiently wide to admit food into the ramifications of the gland there to be digested; whilst in the Spiders the gland is reduced to a series of simple cæca.

The typical character is retained by the heart, pericardium, and the communicating nephridium or renal organ in all Opisthobranchs. An interesting example of this is furnished by the fish-like transparent Phyllirhoë (fig. 58), in which it is possible most satisfactorily to study in the living animal, by means of the microscope, the course of the blood-stream, and also the reno-pericardial communication. With reference to the existence of pores placing the vascular system in open communication with the surrounding water, see the paragraph as to Mollusca generally. In a form closely allied to Aplysia (Pleurobranchus) such a pore leading outwards from the branchial vein has been precisely described by Lacaze Duthiers. No such pore has been detected in Aplysia. In many of the Non-Palliate Opisthobranchs the nervous system presents a concentration of the ganglia (fig. 67), contrasting greatly with what we have seen in Aplysia. Not only are the pleural ganglia fused to the cerebral, but also the visceral to these (see in further illustration the condition attained by the Pulmonate Limnæus, fig. 22), and the visceral loop is astonishingly short and insignificant (fig. 67, *e'*). That the parts are rightly thus identified is probable from Spengel's observation of the osphradium and its nerve-supply in these forms; the nerve to that organ, which is placed somewhat anteriorly—on the dorsal surface—being given off from the hinder part (visceral) of the right compound ganglion—the fellow to that marked A in fig. 67. The Ceratonotous Opisthobranchs, amongst other specialities of structure, are stated to possess (in some cases at any rate) apertures at the apices of the "cerata" or dorsal papillæ, which lead from the exterior into the hepatic cæca. This requires confirmation. Some amongst them (Tergipes, Eolis) are also remarkable for possessing peculiarly modified epidermic cells placed in sacs at the apices of these same papillæ, which resemble the "thread-cells" of the Planarian Flatworms and of the Cœlentera. The existence of these thread-cells is sufficiently remarkable, seeing that the Non-Palliate Opisthobranchs resemble in general form and habit the Planarian worms, many of which also possess thread-cells. But it is not conceivable that their presence is an indication of genetic affinity between the two groups, rather they are instances of homoplasy. The development of many Opisthobranchia has been examined—*e.g.*, Aplysia, Pleurobranchidium, Elysia, Polycera, Doris, Tergipes. All pass through trochosphere and veliger stages, and in all a nautiloid or boat-like shell is developed, preceded by a well-marked "shell-gland" (see figs. 60 and 68). The transition from the free-swimming veliger larva with its nautiloid shell (fig. 60) to the adult form has not been properly observed, and many interesting points as to the true nature of folds (whether epipodia or mantle or velum) have yet to be cleared up by a knowledge of such development in forms like Tethys, Doris, Phyllidia, &c.

Aplysia hybrida of the English coast), placed at its extreme limit, representing both the right and left visceral ganglia and the third or abdominal ganglion, which are so often separately present. The diagram (fig. 20) shows the nerve connecting this abdomino-visceral ganglion with the olfactory ganglion of Spengel. It is also seen to be connected with a more remote ganglion—the genital. Such special irregularities in the development of ganglia upon the visceral loop, and on one or more of the main nerves connected with it, are, as the figures of Molluscan nervous systems given in this article show, very frequent. A precisely similar modification of the liver or great digestive gland is found in the Scorpions, where the axial portion of the digestive canal is short and straight, and the lateral ducts sufficiently wide to admit food into the ramifications of the gland there to be digested, whilst in the Spiders the gland is reduced to a series of simple cæca.

The typical character is retained by the heart, pericardium, and the communicating nephridium or renal organ in all Opisthobranchs. An interesting example of this is furnished by the fish-like transparent Phyllirhoe (fig. 58), in which it is possible most satisfactorily to study in the living animal, by means of the microscope, the course of the blood-stream, and also the reno-pericardial communication. With reference to the existence of pores placing the vascular system in open communication with the surrounding water, see the paragraph as to Mollusca generally. In a form closely allied to Aplysia (Pleurobranchus) such a pore leading outwards from the branchial vein has been precisely described by Lacaze Duthiers. No such pore has been detected in Aplysia. In many of the Non-Palliate Opisthobranchs the nervous system presents a concentration of the ganglia (fig. 67), contrasting greatly with what we have seen in Aplysia. Not only are the pleural ganglia fused to the cerebral, but also the visceral to these (see in further illustration the condition attained by the Pulmonate Limnæus, fig. 22), and the visceral loop is astonishingly short and insignificant (fig. 67, *e′*). That the parts are rightly thus identified is probable from Spengel's observation of the osphradium and its nerve-supply in these forms; the nerve to that organ, which is placed somewhat anteriorly—on the dorsal surface—being given off from the hinder part (visceral) of the right compound ganglion—the fellow to that marked A in fig. 67. The Ceratonotous Opisthobranchs, amongst other specialities of structure, are stated to possess (in some cases at any rate) apertures at the apices of the "cerata" or dorsal papillæ, which lead from the exterior into the hepatic cæca. This requires confirmation. Some amongst them (Tergipes, Eolis) are also remarkable for possessing peculiarly modified epidermic cells placed in sacs at the apices of these same papillæ, which resemble the "thread-cells" of the Planarian Flatworms and of the Cœlentera. The existence of these thread-cells is sufficiently remarkable, seeing that the Non-Palliate Opisthobranchs resemble in general form and habit the Planarian worms, many of which also possess thread-cells. But it is not conceivable that their presence is an indication of genetic affinity between the two groups, rather they are instances of homoplasy. The development of many Opisthobranchia has been examined—*e.g.*, Aplysia, Pleurobranchidium, Elysia, Polycera, Doris, Tergipes. All pass through trochosphere and veliger stages, and in all a nautiloid or boat-like shell is developed, preceded by a well-marked "shell-gland" (see figs. 60 and 68). The transition from the free-swimming veliger larva with its nautiloid shell (fig. 60) to the adult form has not been properly observed, and many interesting points as to the true nature of folds (whether epipodia or mantle or velum) have yet to be cleared up by a knowledge of such development in forms like Tethys, Doris, Phyllidia, &c.

The same general range of body-form is shown in Pulmonata as in the Natant Azygobranchia and in the Opisthobranchia; at one extreme we have Snails with coiled visceral hump, at the other cylindrical or flattened Slugs (see fig. 69). Limpet-like forms are also found (fig. 71, Ancylus). The foot is always simple, with its flat crawling surface extending from end to end, but in the embryo Limnæus (fig. 4, H) it shows a bilobed character, which leads on to the condition characteristic of Pteropoda.

FIG. 71.—*Ancylus fluviatilis*, a patelliform aquatic Pulmonate.

The adaptation of the Pulmonata to terrestrial life has entailed little modification of the internal organization. The vascular system appears to be more complete in them than in other Gastropoda, fine vessels and even capillaries being present in place of lacunæ, in which arteries and veins find their meeting-point. The subject has not, however, been investigated by the proper methods of recent histology, and our knowledge of it, as of the vascular system of Molluscs generally, is most unsatisfactory. In one genus (Planorbis) the plasma of the blood is coloured red by hæmoglobin, this being the only instance of the presence of this body in the blood of Glossophorous Mollusca, though it occurs in corpuscles in the blood of the bivalves Arca and Solen (Lankester, **31**).

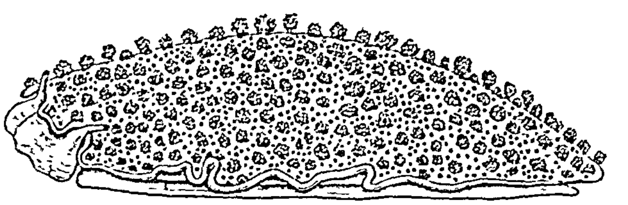

FIG. 72.—*Peronia Tongæ*, a littoral Pulmonate, found on the shores of the Indian and Pacific Oceans (Mauritius, Japan).

The generative apparatus of the Snail (Helix) may serve as an example of the hermaphrodite apparatus common to the Pulmonata and Opisthobranchia (fig. 72*). From the ovo-testis, which lies near the apex of the visceral coil, a common hermaphrodite duct *v.e* proceeds, which receives the duct of the compact white albuminiparous gland *E.d.*, and then becomes much enlarged, the additional width being due to the development of glandular folds, which are regarded as forming a uterus *u*. Where these folds cease the common duct splits into two portions, a male and a female. The male duct *v.d* becomes fleshy and muscular near its termination at the genital pore, forming the penis *p*. Attached to it is a diverticulum *fl.*, in which the spermatozoa which have descended from the ovo-testis are stored and modelled into sperm ropes or spermatophores. The female portion of the duct is more complex. Soon after quitting the uterus it is joined by a long duct leading from a glandular sac, the spermatheca (*R.f*). In this duct and sac the spermatophores received in copulation from another snail are lodged. In *Helix hortensis* the spermatheca is simple. In other species of Helix a second duct (as large in *Helix aspersa* as the chief one) is given off from the spermathecal duct, and in the natural state is closely adherent to the wall of the uterus. This second duct has normally no spermathecal gland at its termination, which is simple and blunt. But in rare cases in *Helix aspersa* a second spermatheca is found at the end of this second duct. Tracing the widening female duct onwards we now come to the openings of the digitate accessory glands *d*, *d*, which probably assist in the formation of the egg-capsule. Close to them is the remarkable dart-sac *ps*, a thick-walled sac, in the lumen of which a crystalline four-fluted rod or dart consisting of carbonate of lime is found. It is supposed to act in some way as a stimulant in copulation, but possibly has to do with the calcareous covering of the egg-capsule. Other Pulmonata exhibit variations of secondary importance in the details of this hermaphrodite apparatus.

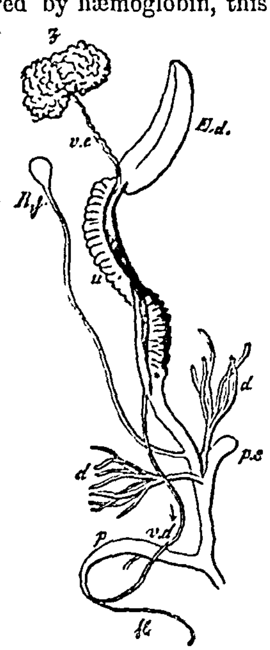

FIG. 72*.—Hermaphrodite reproductive apparatus of the Garden Snail (*Helix hortensis*). *z*, ovo-testis; *v.e*, hermaphrodite duct; *E.d.*, albuminiparous gland; *u*, uterine dilatation of the hermaphrodite duct; *d*, digitate accessory glands on the female duct; *p.s*, calciferous gland or dart-sac on the female duct; *R.f*, spermatheca or receptacle of the sperm in copulation, opening into the female duct; *v.d*, male duct (vas deferens); *p*, penis; *fl.*, flagellum.

The nervous system of Helix is not favourable as an example on account of the fusion of the ganglia to form an almost uniform ring of nervous matter around the œsophagus. The Pond-Snail (Limnæus) furnishes, on the other hand, a very beautiful case of distinct ganglia and connecting cords (fig. 22). The demonstration which it affords of the extreme shortening of the Euthyneurous visceral nerve-loop is most instructive and valuable for comparison with and explanation of the condition of the nervous centres in Cephalopoda, as also of some Opisthobranchia. The figure (fig. 22) is sufficiently described in the letterpress attached to it; the pair of buccal ganglia joined by the connectives to the cerebrals are, as in most of our figures, omitted. Here we need only further draw attention to the osphradium, discovered by Lacaze Duthiers (**32**), and shown by Spengel to agree in its innervation with that organ in all other Gastropoda. On account of the shortness of the visceral loop and the proximity of the right visceral ganglion to the œsophageal nerve-ring, the nerve to the osphradium and olfactory ganglion is very long. The position of the osphradium corresponds more or less closely with that of the vanished right ctenidium, with which it is normally associated. In Helix and Limax the osphradium has not been described, and possibly its discovery might clear up the doubts which have been raised as to the nature of the mantle-chamber of those genera. In Planorbis, which is dexiotropic (as are a few other genera or exceptional varieties of various Anisopleurous Gastropods) instead of being leiotropic, the osphradium is on the left side, and receives its nerve from the left visceral ganglion, the whole series of unilateral organs being reversed. This is, as might be expected, what is found to be the case in all "reversed" Gastropods. It is also the case in the Pulmonate Auricula, which is leiotropic.

The shell of the Pulmonata, though always light and delicate, is in many cases a well-developed spiral "house," into which the creature can withdraw itself; and, although the foot possesses no operculum, yet in Helix the aperture of the shell is closed in the winter by a complete lid, the "hybernaculum," more or less calcareous in nature, which is secreted by the foot. In Clausilia a peculiar modification of this lid exists permanently in the adult, attached by an elastic stalk to the mouth of the shell, and known as the "clausilium." In Limnæus the permanent shell is preceded in the embryo by a well-marked shell-gland or primitive shell-sac (fig. 72***), at one time supposed to be the developing anus, but shown by Lankester to be identical with the "shell-gland" discovered by him in other Mollusca (Pisidium, Pleurobranchidium, Neritina, &c.). As in other Gastropoda Anisopleura, this shell-sac may abnormally develop a plug of chitonous matter, but normally it flattens out and disappears, whilst the cap-like rudiment of the permanent shell is shed out from the dome-like surface

The same general range of body-form is shown in Pulmonata as in the Natant Azygobranchia and in the Opisthobranchia; at one extreme we have Snails with coiled visceral hump, at the other cylindrical or flattened Slugs (see fig. 69). Limpet-like forms are also found (fig. 71, Ancylus). The foot is always simple, with its flat crawling surface extending from end to end, but in the embryo Limnæus (fig. 4, H) it shows a bilobed character, which leads on to the condition characteristic of Pteropoda.

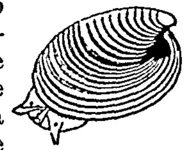

Fig. 71.—*Ancylus fluviatilis*, a patelliform aquatic Pulmonate.

The adaptation of the Pulmonata to terrestrial life has entailed little modification of the internal organization. The vascular system appears to be more complete in them than in other Gastropoda, fine vessels and even capillaries being present in place of lacunæ, in which arteries and veins find their meeting-point. It is supposed to act in some way as a stimulant in copulation, but possibly has to do with the calcareous covering of the egg-capsule. Other Pulmonata exhibit variations of secondary importance in the details of this hermaphrodite apparatus.

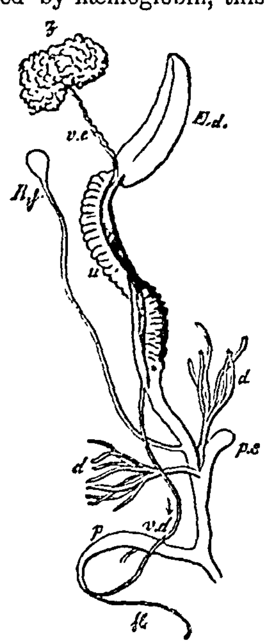

Fig. 72*.—Hermaphrodite reproductive apparatus of the Garden Snail (*Helix hortensis*). *z*, ovo-testis; *v.e*, hermaphrodite duct; *E.d.*, albuminiparous gland; *u*, uterine dilatation of the hermaphrodite duct; *d*, digitate accessory glands on the female duct; *p.s*, calciferous gland or dart-sac on the female duct; *R.f*, spermatheca or receptacle of the sperm in copulation, opening into the female duct; *v.d*, male duct (vas deferens); *p*, penis; *fl.*, flagellum.

The nervous system of Helix is not favourable as an example on account of the fusion of the ganglia to form an almost uniform ring of nervous matter around the œsophagus. The Pond-Snail (Limnæus) furnishes, on the other hand, a very beautiful case of distinct ganglia and connecting cords (fig. 22). The demonstration which it affords of the extreme shortening of the Euthyneurous visceral nerve-loop is most instructive and valuable for comparison with and explanation of the condition of the nervous centres in Cephalopoda, as also of some Opisthobranchia. The figure (fig. 22) is sufficiently described in the letterpress attached to it; the pair of buccal ganglia joined by the connectives to the cerebrals are, as in most of our figures, omitted. Here we need only further draw attention to the osphradium, discovered by Lacaze Duthiers (32), and shown by Spengel to agree in its innervation with that organ in all other Gastropoda. On account of the shortness of the visceral loop and the proximity of the right visceral ganglion to the œsophageal nerve-ring, the nerve to the osphradium and olfactory ganglion is very long. The position of the osphradium corresponds more or less closely with that of the vanished right ctenidium, with which it is normally associated. In Helix and Limax the osphradium has not been described, and possibly its discovery might clear up the doubts which have been raised as to the nature of the mantle-chamber of those genera. In Planorbis, which is dexiotropic (as are a few other genera or exceptional varieties of various Anisopleurous Gastropods) instead of being leiotropic, the osphradium is on the left side, and receives its nerve from the left visceral ganglion, the whole series of unilateral organs being reversed. This is, as might be expected, what is found to be the case in all "reversed" Gastropods. It is also the case in the Pulmonate Auricula, which is leiotropic.

The shell of the Pulmonata, though always light and delicate, is in many cases a well-developed spiral "house," into which the creature can withdraw itself; and, although the foot possesses no operculum, yet in Helix the aperture of the shell is closed in the winter by a complete lid, the "hybernaculum," more or less calcareous in nature, which is secreted by the foot. In Clausilia a peculiar modification of this lid exists permanently in the adult, attached by an elastic stalk to the mouth of the shell, and known as the "clausilium." In Limnæus the permanent shell is preceded in the embryo by a well-marked shell-gland or primitive shell-sac (fig. 72***), at one time supposed to be the developing anus, but shown by Lankester to be identical with the "shell-gland" discovered by him in other Mollusca (Pisidium, Pleurobranchidium, Neritina, &c.). As in other Gastropoda Anisopleura, this shell-sac may abnormally develop a plug of chitonous matter, but normally it flattens out and disappears, whilst the cap-like rudiment of the permanent shell is shed out from the dome-like surface

"mesoblasts," which bud off from the invaginated arch-enteron, partly to cells derived from the ectoderm, which at a very early stage is connected by long processes with the invaginated endoderm, as shown in fig. 3, D. The external form of the embryo goes through the same changes as in other Gastropods, and is not, as was held previously to Lankester's observations, exceptional. When the middle and hinder regions of the blastopore are closing in, an equatorial ridge of ciliated cells is formed, converting the embryo into a typical "Trochosphere" (fig. 4, E, F).

The foot now protrudes below the mouth (fig. 4), and the post-oral hemisphere of the Trochosphere grows more rapidly than the anterior or velar area. The young foot shows a bilobed form (fig. 4, D, *f*). Within the velar area the eyes and the cephalic tentacles commence to rise up (fig. 4, D, *t*), and on the surface of the post-oral region is formed a cap-like shell and an encircling ridge, which gradually increases in prominence and becomes the freely depending mantle-skirt. The outline of the velar area becomes strongly emarginated and can be traced through the more mature embryos to the cephalic lobes or labial processes of the adult Limnæus (fig. 70).

This permanence of the distinction of the part known as the velar area through embryonic life to the adult state is exceptional among Mollusca, and is therefore a point of especial interest in Limnæus. None of the figures of adult Limnæus in recent works on Zoology show properly the form of the head and these velar lobes, and accordingly the figures here given have been specially sketched for the present article. The increase of the visceral dome, its spiral twisting, and the gradual closure of the space overhung by the mantle-skirt so as to convert it into a lung-sac with a small contractile aperture, belong to stages in the development later than any represented in our figures.

We may now revert briefly to the internal organization at a period when the Trochosphere is beginning to show a prominent foot growing out from the area where the mid-region of the elongated blastopore was situated, and having therefore at one end of it the mouth and at the other the anus. Fig. 72*** represents such an embryo under slight compression as seen by transmitted light. The ciliated band of the left side of the velar area is indicated by a line extending from *v* to *v*; the foot *f* is seen between the pharynx *ph* and the pedicle of invagination *pi*. The mass of the arch-enteron or invaginated endodermal sac has taken on a bilobed form (compare Pisidium, fig. 151), and its cells are swollen (*gs* and *tge*). This bilobed sac becomes entirely the liver in the adult; the intestine and stomach are formed from the pedicle of invagination, whilst the pharynx, œsophagus, and crop form from the stomodæal invagination *ph*. To the right (in the figure) of the rectal peduncle is seen the deeply invaginated shell-gland *ss*, with a secretion *sh* protruding from it. The shell-gland is destined in Limnæus to become very rapidly stretched out, and to disappear. Farther up, within the velar area, the rudiments of the cerebral nerve-ganglion *ng* are seen separating from the ectoderm. A remarkable cord of cells having a position just below the integument occurs on each side of the head. In the figure the cord of the left side is seen, marked *re*. This paired organ consists of a string of cells which are perforated by a duct. The opening of the duct at either end is not known. Such cannulated cells are characteristic of the nephridia of many worms, and it is held that the organs thus formed in the embryo Limnæus are embryonic nephridia. The most important fact about them is that they disappear, and are in no way connected with the typical nephridium of the adult. In reference to their first observer they are conveniently called "Stiebel's canals." Other Pulmonata possess, when embryos, Stiebel's canals in a more fully-developed state, for instance the common slug Limax (fig. 72**, *pk*). Here too they disappear during embryonic life. Further knowledge concerning them is greatly needed. It is not clear whether there is anything equivalent to them in the embryos of marine Gastropoda or other Mollusca, the ectodermal cells called "embryonic renal organs" in some Gastropod embryos having only a remote resemblance to them. The three pairs of transient embryonic nephridia of the medicinal leech, the ciliated cephalic pits of Nemertines, and the anterior nephridia of Gephyræans, all suggest themselves for comparison with these enigmatical canals.

Marine Pulmonata.—Whilst the Pulmonata are essentially a terrestrial and fresh-water group, there is one genus of slug-like Pulmonates which frequent the sea-coast (Peronia, fig. 72), whilst their immediate congeners (Onchidium) are found in marshes of brackish water. Semper (33) has shown that these slugs have, in addition to the usual pair of cephalic eyes, a number of eyes developed upon the dorsal integument. These dorsal eyes are very perfect in elaboration, possessing lens, retinal nerve-end cells, retinal pigment, and optic nerve. Curiously enough, however, they differ from the cephalic Molluscan eye (for an account of which see fig. 118) in the fact that, as in the vertebrate eye, the filaments of the optic nerve penetrate the retina, and are connected with the surfaces of the nerve-end cells nearer the lens instead of with the opposite end. The significance of this arrangement is not known, but it is important to note, as shown by Hensen, Hickson, and others, that in the bivalves Pecten and Spondylus, which also have eyes upon the mantle quite distinct from typical cephalic eyes, there is the same relationship as in Onchidiadæ of the optic nerve to the retinal cells (fig. 145). In both Onchidiadæ and Pecten the pallial eyes have probably been developed by the modification of tentacles, such as coexist in an unmodified form with the eyes. The Onchidiadæ are, according to Semper, pursued as food by the leaping fish Periophthalmus, and the dorsal eyes are of especial value to them in aiding them to escape from this enemy.

Class II.—SCAPHOPODA.

Characters.—Mollusca Glossophora with the FOOT adapted to a BURROWING life in sand (figs. 73, 74, *f*). The body,

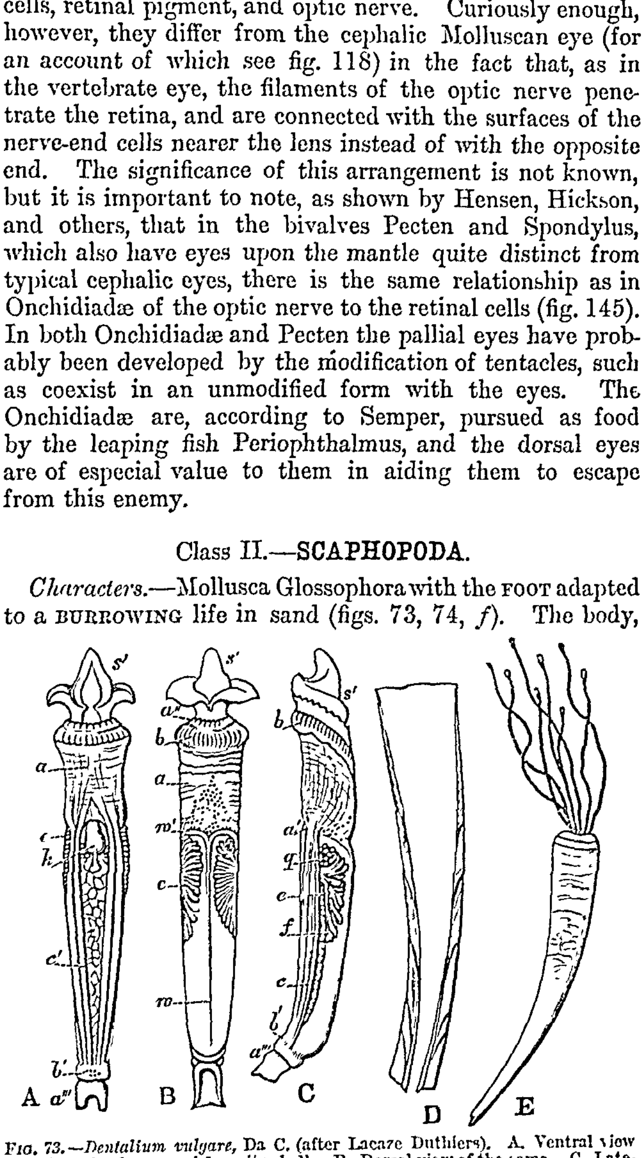

FIG. 73.—*Dentalium vulgare*, Da C. (after Lacaze Duthiers). A. Ventral view of the animal removed from its shell. B. Dorsal view of the same. C. Lateral view of the same. D. The shell in section. E. Surface view of the shell with gill-tentacles exserted as in life. *a*, mantle; *a'*, longitudinal muscle; *a''*, fringe surrounding the anterior opening of the mantle-chamber; *a'''*, the posterior appendix of the mantle; *b*, anterior circular muscle of the mantle; *b'*, posterior do.; *c*, *c'*, longitudinal muscle of mantle; *e*, liver; *f*, gonad; *k*, buccal mass (showing through the mantle); *q*, left nephridium; *s'*, club-shaped extremity of the foot; *w*, *w'*, longitudinal blood-sinus of the mantle.

and to a much greater extent the mantle-skirt and the foot, are elongated along the primitive antero-posterior (oro-anal)

"mesoblasts," which bud off from the invaginated arch-enteron, partly to cells derived from the ectoderm, which at a very early stage is connected by long processes with the invaginated endoderm, as shown in fig. 3, D. The external form of the embryo goes through the same changes as in other Gastropods, and is not, as was held previously to Lankester's observations, exceptional. When the middle and hinder regions of the blastopore are closing in, an equatorial ridge of ciliated cells is formed, converting the embryo into a typical "Trochosphere" (fig. 4, E, F).

The foot now protrudes below the mouth (fig. 4), and the post-oral hemisphere of the Trochosphere grows more rapidly than the anterior or velar area. The young foot shows a bilobed form (fig. 4, D, *f*). Within the velar area the eyes and the cephalic tentacles commence to rise up (fig. 4, D, *t*), and on the surface of the post-oral region is formed a cap-like shell and an encircling ridge, which gradually increases in prominence and becomes the freely depending mantle-skirt. The outline of the velar area becomes strongly emarginated and can be traced through the more mature embryos to the cephalic lobes or labial processes of the adult Limnæus (fig. 70).

This permanence of the distinction of the part known as the velar area through embryonic life to the adult state is exceptional among Mollusca, and is therefore a point of especial interest in Limnæus. None of the figures of adult Limnæus in recent works on Zoology show properly the form of the head and these velar lobes, and accordingly the figures here given have been specially sketched for the present article. The Onchidiadæ are, according to Semper, pursued as food by the leaping fish Periophthalmus, and the dorsal eyes are of especial value to them in aiding them to escape from this enemy.

Class II.—SCAPHOPODA.

Characters.—Mollusca Glossophora with the FOOT adapted to a BURROWING life in sand (figs. 73, 74, *f*). The body,

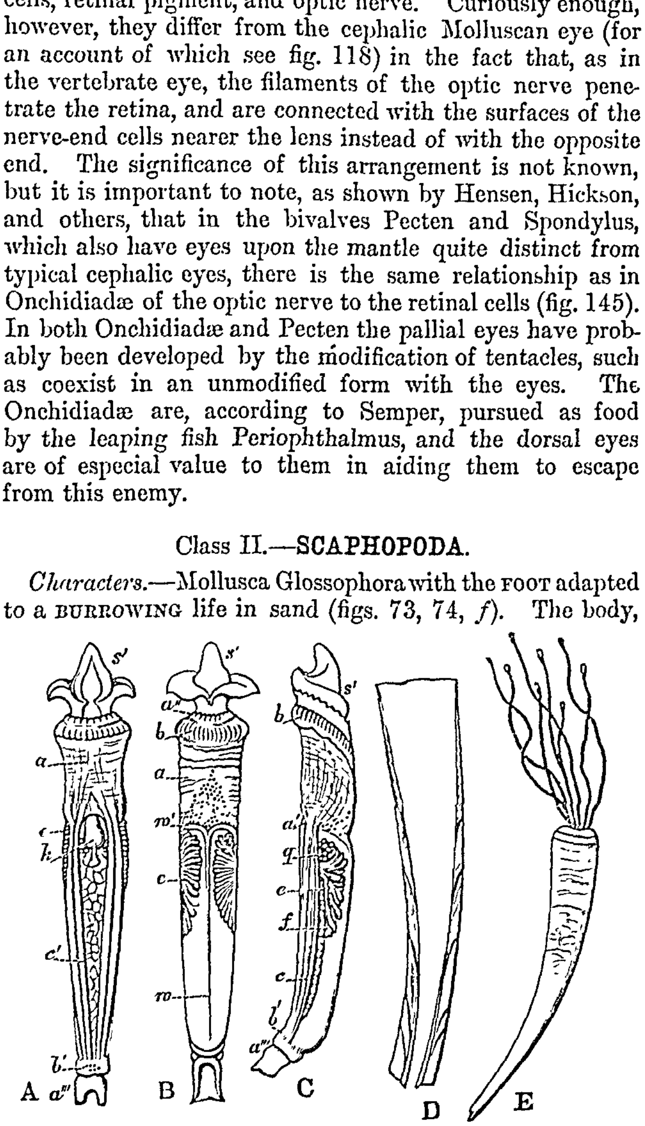

FIG. 73.—*Dentalium vulgare*, Da C. (after Lacaze Duthiers). A. Ventral view of the animal removed from its shell. B. Dorsal view of the same. C. Lateral view of the same. D. The shell in section. E. Surface view of the shell with gill-tentacles exserted as in life. *a*, mantle; *a'*, longitudinal muscle; *a''*, fringe surrounding the anterior opening of the mantle-chamber; *a'''*, the posterior appendix of the mantle; *b*, anterior circular muscle of the mantle; *b'*, posterior do.; *c*, *c'*, longitudinal muscle of mantle; *e*, liver; *f*, gonad; *k*, buccal mass (showing through the mantle); *q*, left nephridium; *s'*, club-shaped extremity of the foot; *w*, *w'*, longitudinal blood-sinus of the mantle.

and to a much greater extent the mantle-skirt and the foot, are elongated along the primitive antero-posterior (oro-anal)

like processes, either very short and conical (Clio, Eurybia), or lengthy (Pneumodermon, Octopus); these may be beset with suckers or hooks, or both. The mid-foot (fig. 75, *mf*) is expanded into a pair of muscular lobes right and left, which either are used for striking the water like the wings of a butterfly (Pteropoda), or are bent round towards one another so that their free margins meet and constitute a short tube,—the siphon or funnel (Siphonopoda). The hind foot is either very small or absent.

A distinctive feature of the Cephalopoda is the ABSENCE of anything like the TORSION of the visceral mass seen in the Anisopleurous Gastropoda, although as an exception this torsion occurs in one family (the Limacinidæ).

The ANUS, although it may be a little displaced from the median line, is (except in Limacinidæ) approximately median and posterior. The MANTLE-SKIRT may be aborted (Gymnosomatous Pteropoda); when present it is deeply produced posteriorly, forming a large sub-pallial chamber around the anus. As in our schematic Mollusc, by the side of the anus are placed the single or paired apertures of the NEPHRIDIA, the GENITAL APERTURES (paired only in Nautilus, in female Octopoda, female Ommastrephes, and male Eledone), and the paired CTENIDIA (absent in all Pteropoda). The VISCERAL HUMP or dome is elevated, and may be very much elongated (see fig. 75, (4), (5), (6)) in a direction almost at right angles to the primary horizontal axis (A, P in fig. 75) of the foot.

A SHELL is frequently, but not invariably, secreted on the visceral hump and mantle-skirt of Cephalopoda; but there are both Pteropoda and Siphonopoda devoid of any shell. The shell is usually light in substance or lightened by air-chambers in correlation with the free-swimming habits of the Cephalopoda. It may be external, when it is box-like or boat-like, or internal, when it is plate-like. Very numerous minute pigmented sacs capable of expansion and contraction, and known as CHROMATOPHORES, are usually present in the integument in both branches of the class. The GONADS of both sexes are developed in one individual in some Cephalopoda (Pteropoda), in others the sexes are separate.

SENSE-ORGANS, especially the cephalic eyes and the otocysts, are very highly developed in the higher Cephalopoda. The osphradia have the typical form and position in the lower forms, but appear to be more or less completely replaced by other olfactory organs in the higher. The normal NERVE-GANGLIA are present, but the connectives are shortened, and the ganglia concentrated and fused in the cephalic region. Large special ganglia (optic, stellate, and supra-buccal) are developed in the higher forms (Siphonopoda).

The Cephalopoda exhibit a greater range from low to high organization than any other Molluscan class, and hence they are difficult to characterize in regard to several groups of organs; but they are definitely held together by the existence in all of the encroachment of the fore-foot so as

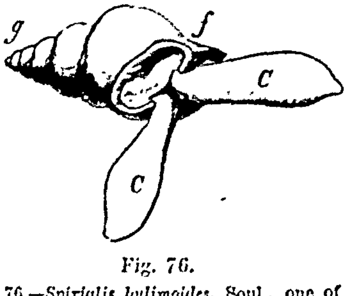

Fig. 76.

Fig. 77.

FIG. 76.—*Spirialis bulimoides*, Soul., one of the Limacinidæ enlarged (from Owen). *C C*, pteropodial lobes of the mid-foot; *f*, operculum carried on the hind-foot; *g*, spiral shell.
FIG. 77.—Operculum of Spirialis enlarged.

to surround the head, and by the functionally important BILOBATION OF THE MID-FOOT.

Two very distinct branches of the Cephalopoda are to be recognized: the one, the Pteropoda, more archaic in the condition of its bilobed mid-foot, including a number of minute, and in all probability degenerate, oceanic forms of simplified and obscure organization; the other, the Siphonopoda, containing the Pearly Nautilus and the Cuttles, which have for ages (as their fossil remains show) dominated among the inhabitants of the sea, being more highly gifted in special sense, more varied in movement, more powerful in proportion to size, and more heavily equipped with destructive weapons of offence than any other marine organisms.

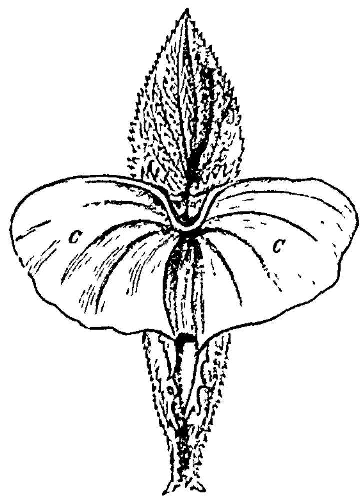

FIG. 77a.—*Cymbulia Peronii*, Cuvier (from Owen). *C, C*, the expanded pteropodial lobes or wing-like fins of the mid-foot.

Branch *a*.—*PTEROPODA*.

Characters.—Cephalopoda in which the mid-region of the foot is (as compared with the Siphonopoda) in its more primitive condition, being relatively largely developed and drawn out into a pair of wing-like muscular lobes (identical with the two halves of the siphon of the Siphonopoda) which are used as paddles (see figs. 76-86). The hind-region of the foot is often aborted, but may carry an operculum (figs. 76, 77). The fore-region of the foot (that embracing the head) is also often rudimentary, but may be drawn out into one or more pairs of tentacles, simulating cephalic tentacles, and provided with suckers (figs. 84, 85).

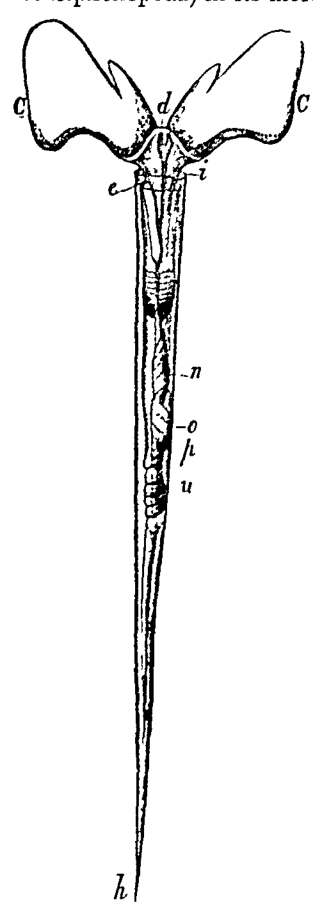

FIG. 78.—*Styliola acicula*, Rang. sp. enlarged (from Owen). *C, C*, the wing-like lobes of the mid-foot; *d*, median fold of same; *e*, copulatory organ; *h*, pointed extremity of the shell; *i*, anterior margin of the shell; *n*, stomach *o*, liver; *u*, hermaphrodite gonad.

Though the visceral hump is not twisted except in the Limacinidæ (fig. 76), there is a very general tendency to one-sided development of the viscera, and of their external apertures (as contrasted with Siphonopoda). *The ctenidia* are aborted, with the possible exception of the processes (fig. 85, *c*) at the end of the body of Pneumodermon. The vascular system resembles that of the Gastropoda. The nephridium is a single tubular body corresponding to the right nephridium of the typical pair of the archi-Mollusc. The anal aperture is usually placed a little to the left of the median line, more rarely to the right. In the Limacinidæ it has an exceptional position, owing to the torsion of the visceral mass, as in Anisopleurous Gastropoda.

like processes, either very short and conical (Clio, Eurybia), or lengthy (Pneumodermon, Octopus); these may be beset with suckers or hooks, or both. The mid-foot (fig. 75, *mf*) is expanded into a pair of muscular lobes right and left, which either are used for striking the water like the wings of a butterfly (Pteropoda), or are bent round towards one another so that their free margins meet and constitute a short tube,—the siphon or funnel (Siphonopoda). The hind foot is either very small or absent.

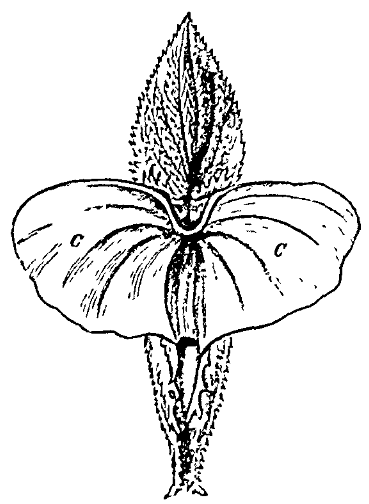

FIG. 77*a*.—*Cymbulia Peronii*, Cuvier (from Owen). *C, C*, the expanded pteropodial lobes or wing-like fins of the mid-foot.

Branch *a*.—*PTEROPODA*.

Characters.—Cephalopoda in which the mid-region of the foot is (as compared with the Siphonopoda) in its more primitive condition, being relatively largely developed and drawn out into a pair of wing-like muscular lobes (identical with the two halves of the siphon of the Siphonopoda) which are used as paddles (see figs. 76-86). The hind-region of the foot is often aborted, but may carry an operculum (figs. 76, 77). The fore-region of the foot (that embracing the head) is also often rudimentary, but may be drawn out into one or more pairs of tentacles, simulating cephalic tentacles, and provided with suckers (figs. 84, 85).

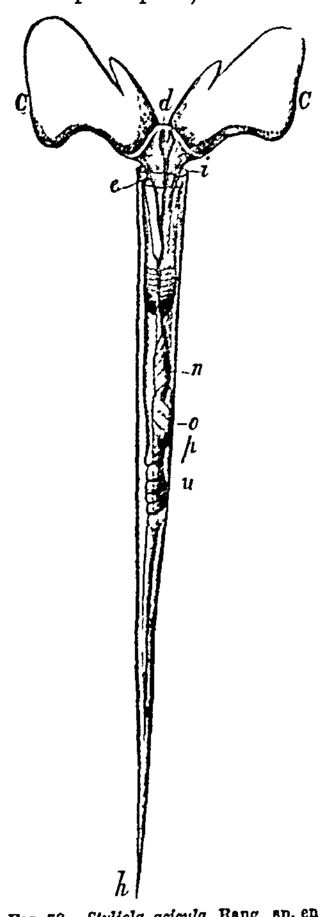

FIG. 78.—*Styliola acicula*, Rang. sp. enlarged (from Owen). *C, C*, the wing-like lobes of the mid-foot; *d*, median fold of same; *e*, copulatory organ; *h*, pointed extremity of the shell; *i*, anterior margin of the shell; *n*, stomach *o*, liver; *u*, hermaphrodite gonad.

Though the visceral hump is not twisted except in the Limacinidæ (fig. 76), there is a very general tendency to one-sided development of the viscera, and of their external apertures (as contrasted with Siphonopoda). The ctenidia are aborted, with the possible exception of the processes (fig. 85, *c*) at the end of the body of Pneumodermon. The vascular system resembles that of the Gastropoda. The nephridium is a single tubular body corresponding to the right nephridium of the typical pair of the archi-Mollusc. The anal aperture is usually placed a little to the left of the median line, more rarely to the right. In the Limacinidæ it has an exceptional position, owing to the torsion of the visceral mass, as in Anisopleurous Gastropoda.

The fore-part of the foot which surrounds the mouth, as in all Cephalopoda, is drawn out into four or five pairs of lobes, sometimes short, but usually elongated and even filiform. These lobes either carry peculiar sheathed tentacles (*Nautilus*), or, on the other hand, acetabuliform suckers, which may be associated with claw-like hooks (Dibranchiata). The hind-foot is probably represented by the valve which depends from the inner wall of the siphon in many cases.

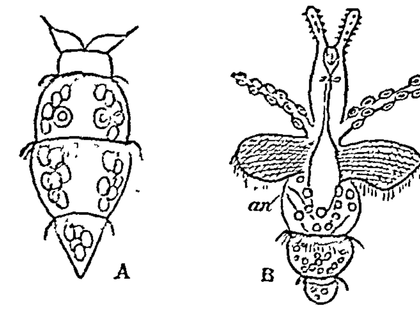

Fig. 84.

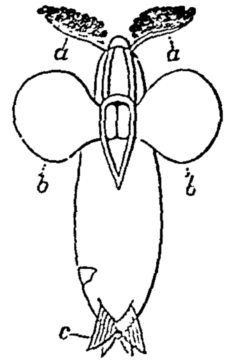

Fig. 85.

Fig. 84.—Larvæ of Pneumodermon (from Balfour, after Gegenbaur). The præ-oral ciliated band of the trochosphere stage (velum) has atrophied. In A three post-oral circlets of cilia are present. The otocysts are seen, and the rudiments of a pair of processes growing from the head. In B the foremost ciliated ring has disappeared; the cephalic region is greatly developed, and, as compared with the adult (fig. 85), is large and free; the pair of hook-bearing processes on each side of the mouth are retractile, probably part of the fore-foot. At the base of the cephalic snout are seen the pair of arm-like processes (fore-foot) provided with suckers, and behind these the broad pteropodial lobes or wing-like fins of the mid-foot.

Fig. 85.—*Pneumodermon violaceum*, d'Orb.; magnified five diameters. *a*, the sucker-bearing arms; *b*, the fins of the mid-foot (in the middle line, between these, is seen the sucker-like median portion of the foot, by means of which the animal can crawl as a Gastropod); *c*, the four branchial processes. (After Keferstein.)

A shell (figs. 89, 100) is very generally present, affording protection to the visceral mass and attachment for muscles. It may be external or enclosed in dorsal upgrowing folds of the mantle, which (except in Spirula) close up at an early period of development, so as to form a shut sac in which the shell is secreted. The ctenidia are well developed as paired gill-plumes, serving as the efficient branchial organs (figs. 101, 103, and fig. 2, B).

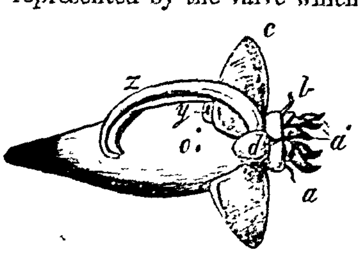

Fig. 86.—*Clione borealis*, L.; magnified two diameters,—postero-ventral aspect. *a*, the cephalic region carrying *a′*—three pairs of cephalic cones provided each with very numerous minute sucker-like processes, and surrounded by a hood-like upgrowth,—and *b*, the more elongated tentacles (the retractile eye-tentacles are not seen, being placed dorsally); *c*, the pteropodial fins; *d*, the median portion of the foot; *o*, the anus; *y*, the vagina; *z*, the penis. (From Owen, after Eschricht.)

The vascular system is very highly developed; the heart consists of a pair of auricles and a ventricle (figs. 104, 105). Branchial hearts are formed on the advehent vessels of the branchiæ. It is not known to what extent the minute subdivision of the arteries extends, or whether there is a true capillary system.

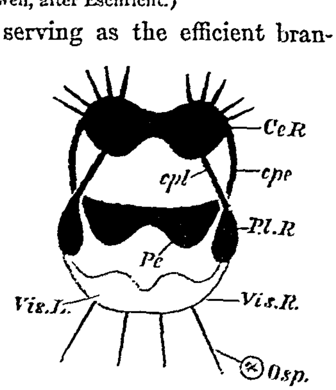

Fig. 87.—Enlarged diagram of the nerve-centres of Pneumodermon (from Spengel, after Souleyet). *CeR*, right cerebral ganglion; *Pl.R*, right pleural ganglion; *Pe*, right pedal ganglion; *Vis.R.*, right visceral ganglion; *Vis.L.*, left visceral ganglion; *cpe*, right cerebro-pedal connective; *cpl*, right cerebro-pleural connective; *Osp.*, osphradium connected by a nerve with the right visceral ganglion.

The pericardium is extended so as to form a very large sac passing among the viscera dorsal wards and sometimes containing the ovary or testis—the viscero-pericardial sac—which opens to the exterior either directly or through the nephridia. It has no connexion with the vascular system. The nephridia are always paired sacs, the walls of which invest the branchial advehent vessels (figs. 104, 108). They open each by a pore into the viscero-pericardial sac except in Nautilus. The anal aperture is median and raised on a papilla. Jaws (fig. 88, *e*) and a lingual ribbon (fig. 107) are well developed. The jaws have the form of a pair of powerful beaks, either horny or calcified (Nautilus), and are capable of inflicting severe wounds.

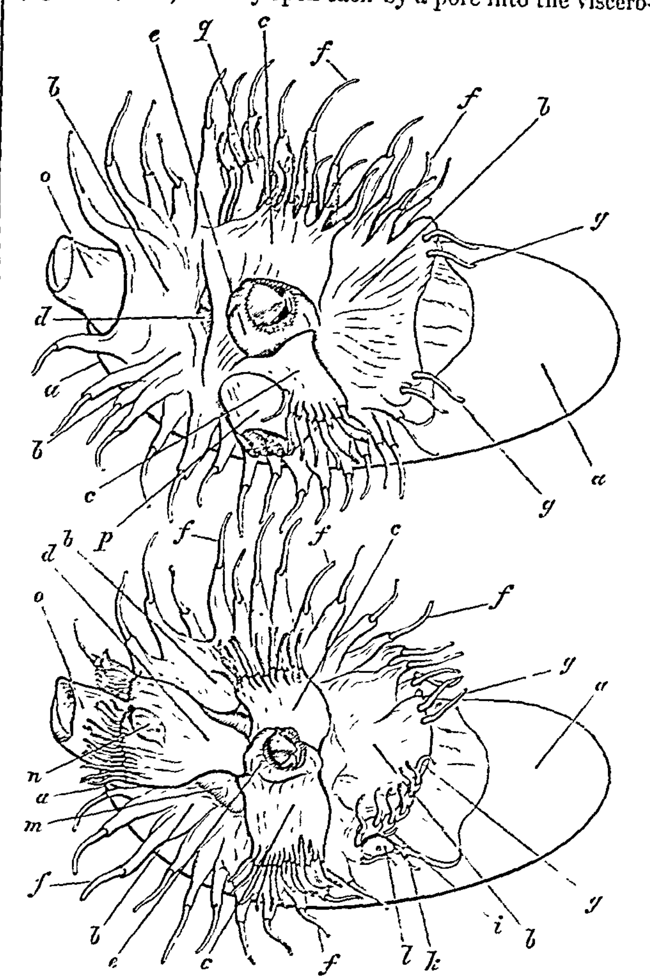

Fig. 88.—Male (upper) and female (lower) specimens of *Nautilus pompilius* as seen in the expanded condition, the observer looking down on to the buccal cone *e*; one-third the natural size linear. The drawings have been made from actual specimens by A. G. Bourne, B.Sc., and serve to show the natural disposition of the tentaculiferous lobes and tentacles of the circum-oral portion of the foot in the living state, as well as the great differences between the two sexes. *a*, the shell; *b*, the *outer* ring-like expansion (annular lobe) of the circum-oral muscular mass of the fore-foot, carrying nineteen tentacles on each side—posteriorly this is enlarged to form the "hood" (marked *v* in fig. 89 and *m*. in figs. 90 and 91), giving off the pair of tentacles marked *g* in the present figure; *c*, the right and left inner lobes of the fore-foot, each carrying twelve tentacles in the female, in the male subdivided into *p*, the "spadix" or hectocotylus on the left side, and *q*, the "anti-spadix," a group of four tentacles on the right side,—it is thus seen that the subdivided right and left inner lobes of the male correspond to the undivided right and left inner lobes of the female; *d*, the inner inferior lobe of the fore-foot, a bilateral structure in the female carrying two groups, each of fourteen tentacles, separated from one another by a lamellated organ *n*, supposed to be olfactory in function—in the male the inner inferior lobe of the fore-foot is very much reduced, and has the form of a paired group of lamellæ (*d* in the upper figure); *e*, the buccal cone, rising from the centre of the three inner lobes, and fringing the protruded calcareous beaks or jaws with a series of minute papillæ; *f*, the tentacles of the outer circum-oral lobe or annular lobe of the fore-foot projecting from their sheaths; *g*, the two most posterior tentacles of this series belonging to that part of the annular lobe which forms the hood (*m*. in figs. 90 and 91); *i*, superior ophthalmic tentacle; *k*, inferior ophthalmic tentacle; *l*, eye; *m*, paired laminated organ on each side of the base of the inner inferior lobe (*d*) of the female, probably olfactory in function; *n*, olfactory lamellæ upon the inner inferior lobe (in the female); *o*, the siphon (mid-foot); *p*, the spadix (in the male), the hectocotylized portion of the left inner lobe of the fore-foot representing four modified tentacles, eight being left unmodified; *q*, the anti-spadix (in the male), being four of the twelve tentacles of the right inner lobe of the fore-foot isolated from the remaining eight, and representing on the right side the differentiated spadix of the left side. The four tentacles of the anti-spadix are set, three on one base and one on a separate base.

There are thus in the female, where they are most numerous, ninety-four tentacles, thirty-eight on the outer annular lobe, four ophthalmic (a pair to each eye), twelve on each of the right and left inner lobes, and twenty-eight on the inner inferior lobe.

The fore-part of the foot which surrounds the mouth, as in all Cephalopoda, is drawn out into four or five pairs of lobes, sometimes short, but usually elongated and even fili-

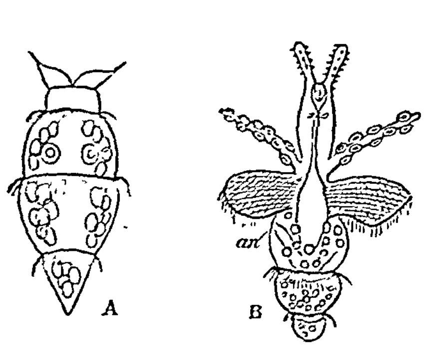

Fig. 84.

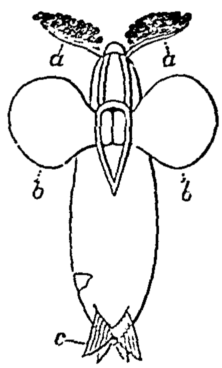

Fig. 85.

FIG. 84.—*Larvæ of Pneumodermon* (from Balfour, after Gegenbaur). The pre-oral ciliated band of the trochosphere stage (velum) has atrophied. In A three post-oral circlets of cilia are present. The otocysts are seen, and the rudiments of a pair of processes growing from the head. In B the foremost ciliated ring has disappeared; the cephalic region is greatly developed, and, as compared with the adult (fig. 85), is large and free; the pair of hook-bearing processes on each side of the mouth are retractile, probably part of the fore-foot. At the base of the cephalic snout are seen the pair of arm-like processes (fore-foot) provided with suckers, and behind these the broad pteropodial lobes or wing-like fins of the mid-foot.

FIG. 85.—*Pneumodermon violaceum*, d'Orb.; magnified five diameters. *a*, the sucker-bearing arms; *b*, the fins of the mid-foot (in the middle line, between these, is seen the sucker-like median portion of the foot, by means of which the animal can crawl as a Gastropod); *c*, the four branchial processes. (After Keferstein.)

form. These lobes either carry peculiar sheathed tentacles (Nautilus), *or, on the other hand, acetabuliform suckers*, which may be associated with claw-like hooks (Dibranchiata). The hind-foot is probably represented by the valve which depends from the inner wall of the siphon in many cases.

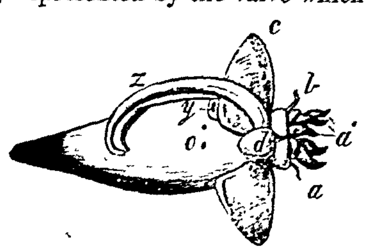

FIG. 86.—*Clione borealis*, L.; magnified two diameters,—postero-ventral aspect. *a*, the cephalic region carrying *a'*—three pairs of cephalic cones provided each with very numerous minute sucker-like processes, and surrounded by a hood-like upgrowth,—and *b*, the more elongated tentacles (the retractile eye-tentacles are not seen, being placed dorsally); *c*, the pteropodial fins; *d*, the median portion of the foot; *o*, the anus; *y*, the vagina; *z*, the penis. (From Owen, after Eschricht.)

A shell (figs. 89, 100) is very generally present, affording protection to the visceral mass and attachment for muscles. It may be external or enclosed in dorsal upgrowing folds of the mantle, which (except in Spirula) close up at an early period of development, so as to form a shut sac in which the shell is secreted. The ctenidia are well developed as paired gill-plumes, serving as the efficient branchial organs (figs. 101, 103, and fig. 2, B).

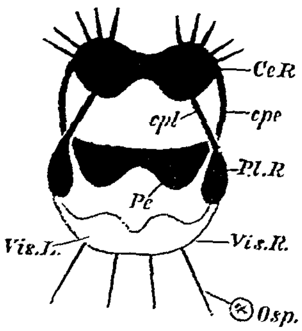

FIG. 87.—Enlarged diagram of the nerve-centres of Pneumodermon (from Spengel, after Souleyet). *CeR*, right cerebral ganglion; *Pl.R*, right pleural ganglion; *Pe*, right pedal ganglion; *Vis.R.*, right visceral ganglion; *Vis.L.*, left visceral ganglion; *cpe*, right cerebro-pedal connective; *cpl*, right cerebro-pleural connective; *Osp.*, osphradium connected by a nerve with the right visceral ganglion.

The vascular system is very highly developed; the heart consists of a pair of auricles and a ventricle (figs. 104, 105). Branchial hearts are formed on the advehent vessels of the branchiæ. It is not known to what extent the minute subdivision of the arteries extends, or whether there is a true capillary system.

The pericardium is extended so as to form a very large sac passing among the viscera dorsal wards and sometimes containing the ovary or testis—the viscero-pericardial sac—which opens to the exterior either directly or through the nephridia. It has no connexion with the vascular system. The nephridia are always paired sacs, the walls of which invest the branchial advehent vessels (figs. 104, 108). They open each by a pore into the viscero-

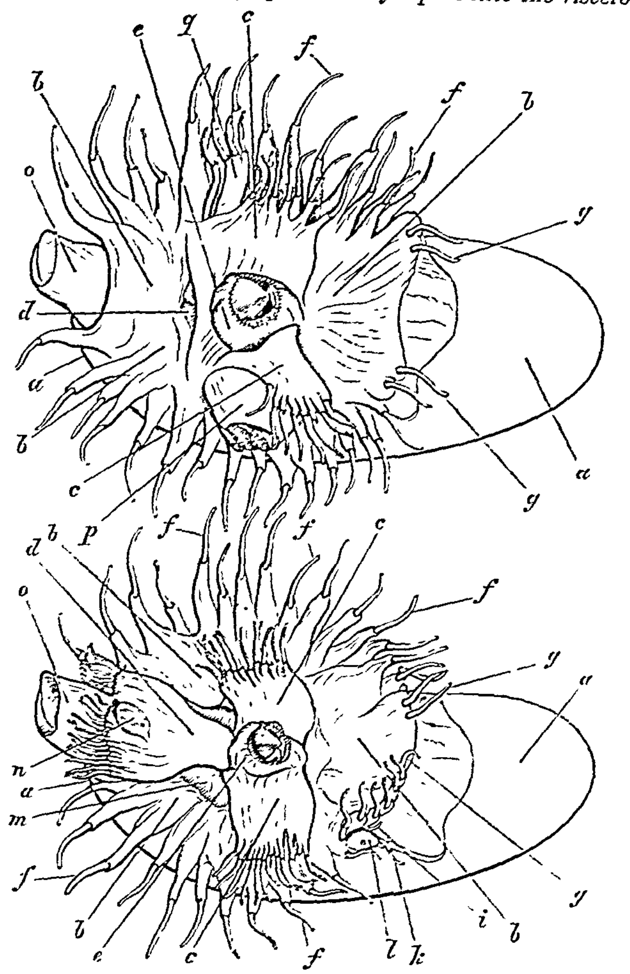

FIG. 88.—Male (upper) and female (lower) specimens of *Nautilus pompilius* as seen in the expanded condition, the observer looking down on to the buccal cone *e*; one-third the natural size linear. The drawings have been made from actual specimens by A. G. Bourne, B.Sc., and serve to show the natural disposition of the tentaculiferous lobes and tentacles of the circum-oral portion of the foot in the living state, as well as the great differences between the two sexes. *a*, the shell; *b*, the *outer* ring-like expansion (annular lobe) of the circum-oral muscular mass of the fore-foot, carrying nineteen tentacles on each side—posteriorly this is enlarged to form the "hood" (marked *v* in fig. 89 and *m.* in figs. 90 and 91), giving off the pair of tentacles marked *g* in the present figure; *c*, the right and left inner lobes of the fore-foot, each carrying twelve tentacles in the female, in the male subdivided into *p*, the "spadix" or hectocotylus on the left side, and *q*, the "anti-spadix," a group of four tentacles on the right side,—it is thus seen that the subdivided right and left inner lobes of the male correspond to the undivided right and left inner lobes of the female; *d*, the inner inferior lobe of the fore-foot, a bilateral structure in the female carrying two groups, each of fourteen tentacles, separated from one another by a lamellated organ *n*, supposed to be olfactory in function—in the male the inner inferior lobe of the fore-foot is very much reduced, and has the form of a paired group of lamellæ (*d* in the upper figure); *e*, the buccal cone, rising from the centre of the three inner lobes, and fringing the protruded calcareous beaks or jaws with a series of minute papillæ; *f*, the tentacles of the outer circum-oral lobe or annular lobe of the fore-foot projecting from their sheaths; *g*, the two most posterior tentacles of this series belonging to that part of the annular lobe which forms the hood (*m.* in figs. 90 and 91); *i*, superior ophthalmic tentacle; *k*, inferior ophthalmic tentacle; *l*, eye; *m*, paired laminated organ on each side of the base of the inner inferior lobe (*d*) of the female, probably olfactory in function; *n*, olfactory lamellæ upon the inner inferior lobe (in the female); *o*, the siphon (mid-foot); *p*, the spadix (in the male), the hectocotylized portion of the left inner lobe of the fore-foot representing four modified tentacles, eight being left unmodified; *q*, the anti-spadix (in the male), being four of the twelve tentacles of the right inner lobe of the fore-foot isolated from the remaining eight, and representing on the right side the differentiated spadix of the left side. The four tentacles of the anti-spadix are set, three on one base and one on a separate base.

There are thus in the female, where they are most numerous, ninety-four tentacles, thirty-eight on the outer annular lobe, four ophthalmic (a pair to each eye), twelve on each of the right and left inner lobes, and twenty-eight on the inner inferior lobe.

pericardial sac except in Nautilus. The anal aperture is median and raised on a papilla. Jaws (fig. 88, *e*) and a lingual ribbon (fig. 107) are well developed. The jaws have the form of a pair of powerful beaks, either horny or calcified (Nautilus), and are capable of inflicting severe wounds.

Family 1.—*Nautilidæ.*
Genera: [*Orthoceras*], Breyn.; [*Cyrtoceras*], Goldfuss; [*Gomphoceras*], Münster; [*Phragmoceras*], Brod.; [*Gyroceras*], Meyer; [*Ascoceras*], Barrande; [*Oncoceras*], Hall; [*Lituites*], Breyn.; [*Trochoceras*], Barrande; *Nautilus*, L. (figs. 88, 89, 90, &c.); [*Clymenia*], Münst.; [*Nothoceras*], Barrande.
Family 2.—*Ammonitidæ.*
Genera: [*Bactrites*], Sanderg.; [*Goniatites*], de Haan; [*Rhabdoceras*], Hauer; [*Clydonites*], Hauer; [*Cochloceras*], Hauer; [*Baculina*], d'Orb.; [*Ceratites*], de Haan; [*Baculites*], Lam.; [*Toxoceras*], d'Orb.; [*Crioceras*], Leveillé; [*Ptychoceras*], d'Orb.; [*Hamites*], Parkinson; [*Ancyloceras*], d'Orb.; [*Scaphites*], Parkinson; [*Ammonites*], Breyn.; [*Turrilites*], Lam.; [*Helioceras*], d'Orb.; [*Heteroceras*], d'Orb.
N.B.—The names in brackets are those of extinct genera.

Order 2.—**Dibranchiata** (=Holosiphona, Acetabulifera).

Characters.—Siphonopodous Cephalopods in which the inflected lateral margins of the mid-foot are fused so as to form a complete tubular siphon (fig. 96, *i*). The circumoral lobes of the fore-foot carry suckers disposed upon them in rows (as in the Pteropod Pneumodermon), *not* tentacles (see figs. 92, 95, 96). There is a single pair of typical ctenidia (fig. 103) acting as gills (hence Dibranchiata), and

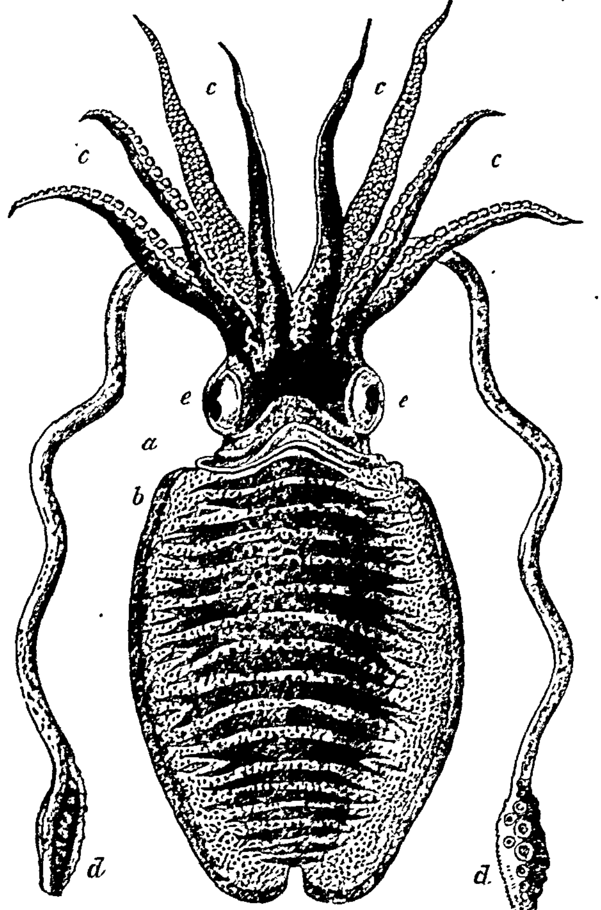

FIG. 92.—*Sepia officinalis*, L., half the natural size, as seen when dead, the long prehensile arms being withdrawn from the pouches at the side of the head, in which they are carried during life when not actually in use. *a*, neck; *b*, lateral fin of the mantle-sac; *c*, the eight shorter arms of the fore-foot; *d*, the two long prehensile arms; *e*, the eyes.

a single pair of nephridia opening by apertures right and left of the median anus (fig. 103, *r*), and by similar internal pores into the pericardial chamber, which consequently does not open directly to the surface as in Nautilus. The oviducts are sometimes paired right and left (Octopoda), sometimes that of one side only is developed (Decapoda, except Ommastrephes). The sperm-duct is always single except, according to Keferstein, in *Eledone moschata.*

A plate-like shell is developed in a closed sac formed by the mantle (figs. 98, 99), except in the Octopoda, which have none, and in Spirula (fig. 100, D) and the extinct Belemnitidæ, which have a small chambered shell resembling that of Nautilus with or without the addition of plate-like and cylindrical accessory developments (fig. 100, C).

The pair of cephalic eyes are highly-developed vesicles with a refractive lens (fig. 120), cornea, and lid-folds,—the vesicle being in the embryo an open sac like that of Nautilus (fig. 119). Osphradia are not present, but cephalic olfactory organs are recognized. One or two pairs of large salivary glands with long ducts are present. An ink-sac formed as a diverticulum of the rectum and opening near the anus is present in all Dibranchiata (fig. 103, *t*), and has been detected even in the fossil Belemnitidæ. Branchial hearts are developed on the two branchial advehent blood-vessels (fig. 104, *vc'*, *vi*).

The Dibranchiata are divisible into two sub-orders, according to the number and character of the arm-like sucker-bearing processes of the fore-foot.

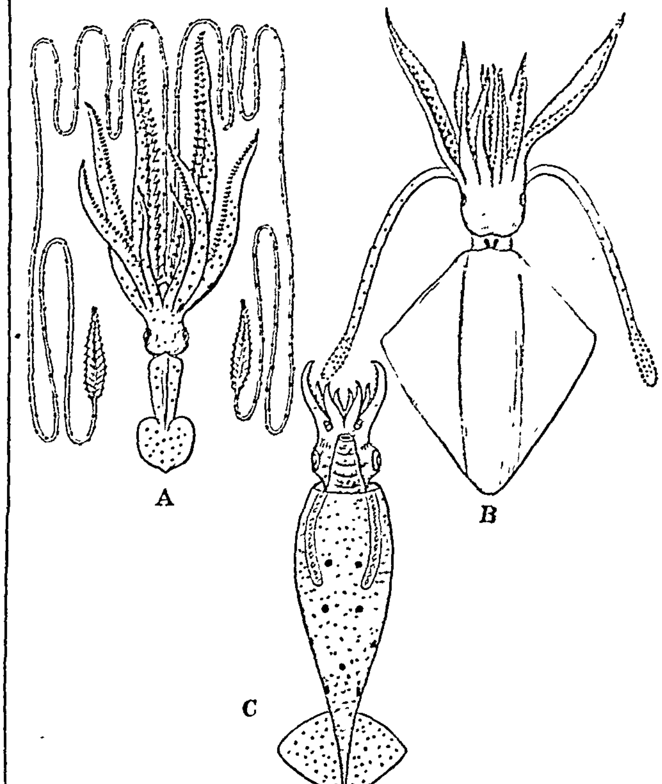

FIG. 93.—Decapodous Siphonopods; one-fourth the natural size linear. A. *Cheiroteuthis Veranyi*, d'Orb. (from the Mediterranean) B. *Thysanoteuthis rhombus*, Troschel (from Messina). C. *Loligopsis cyclura*, Fér. and d'Orb. (from the Atlantic Ocean).

Sub-order 1.—*Decapoda.*

Characters.—Dibranchiata with the fore-foot drawn out into eight shorter and two longer arms (prehensile arms), the latter being placed right and left between the third and fourth shorter arms. The suckers are stalked and strengthened by a horny ring. The eyes are large and have a horizontal in place of a sphincter-like lid. The body is elongated and provided with lateral fins (lamelliform expansions of the mantle). The mouth has a buccal membrane. The mantle-margin is locked to the base of the siphon by a specially-developed cartilaginous apparatus. Numerous water-pores are present in the head and anterior region of the body, leading into recesses of the integument of unknown significance. The oviduct is single; large nidamental glands are present. The viscero-pericardial space is large, and lodges the ovary (Sepia). There is always a shell present which is enclosed by the upgrowth of the mantle, so as to become "internal."

body. Amongst Gastropods it is not very unusual to find the animal slipping forward in its shell as growth advances and leaving an unoccupied chamber in the apex of the shell. This may indeed become shut off from the occupied cavity by a transverse septum, and a series of such septa may be formed (fig. 42), but in no Gastropod are these apical chambers known to contain a gas during the life of the animal in whose shell they occur. A further peculiarity of the Nautilus shell and of that of the allied extinct Ammonites, Scaphites, Orthoceras, &c., and of the living Spirula, is that the series of deserted air-chambers are traversed by a cord-like pedicle extending from the centro-dorsal area of the visceral hump to the smallest and first-formed chamber of the series. No structure comparable to this siphuncular pedicle is known in any other Mollusca. Its closest representative is found in the so-called "contractile cord" of the remarkable form Rhabdopleura, referred according to present knowledge to the Polyzoa. There appears to be no doubt that the deserted chambers of the Nautilus shell contain in the healthy living animal a gas which serves to lessen the specific gravity of the whole organism. The gas is said to be of the same composition as the atmosphere, with a larger proportion of nitrogen. With regard to its origin we have only conjectures. Each septum shutting off an air-containing chamber is formed during a period of quiescence, probably after the reproductive act, when the visceral mass of the Nautilus may be slightly shrunk, and gas is secreted from the dorsal integument so as to fill up the space previously occupied by the animal. A certain stage is reached in the growth of the animal when no new chambers are formed. The whole process of the loosening of the animal in its chamber and of its slipping forward when a new septum is formed, as well as the mode in which the air-chambers may be used as a hydrostatic apparatus, and the relation to this use, if any, of the siphuncular pedicle, is involved in obscurity, and is the subject of much ingenious speculation. In connexion with the secretion of gas by the animal, besides the parallel cases ranging from the Protozoon Arcella to the Physoclistic Fishes, from the Hydroid Siphonophora to the insect-larva Corethra, we have the identical phenomenon observed in the closely-allied Sepia when recently hatched. Here, in the pores of the internal rudimentary shell, gas is observable, which has necessarily been liberated by the tissues which secrete

Shell of *Spirula lævis*, Gray (New Zealand).

Whilst the Tetrabranchiata, so far as we can recognize their remains, are characterized by these large chambered shells, which, as in Nautilus, were with the exception of some narrow-mouthed forms such as Gomphoceras but very partially covered by reflexions of the mantle-skirt (fig. 89, *b*), the Dibranchiata present an interesting series of gradations, in which we trace—(*a*) the diminution in relative size of the chambered shell; (*b*) its complete investiture by reflected folds of the mantle (S[illegible] fig. 100, D); (*c*) the concrescence

sac opens by a pore into each nephridium instead of directly to the surface. A single pair of ctenidia (gill-plumes) is present instead of the two pairs in Nautilus. The existence of two pairs of ctenidia and of two pairs of nephridia in Nautilus, placed one behind the other, is highly remarkable. The interest of this arrangement is in relation to the general morphology of the Mollusca, for it is impossible to view this repetition of organs in a linear series as anything else than an instance of metameric segmentation, comparable to the segmentation of the ringed worms and Arthropods. The only other example which we have of this metamerism in the Mollusca is presented by the Chitons. There we find not two pairs of ctenidia merely, but sixteen pairs (in some species more) accompanied by a similar metamerism of the dorsal integument, which carries eight shells. In Chiton the nephridia are not affected by the metamerism as they are in Nautilus. It is impossible on the present occasion to discuss in the way which their importance demands the significance of these two instances among Mollusca of incomplete or partial metamerism; but it would be wrong to pass them by without insisting upon the great importance which the occurrence of these isolated instances of metameric segmentation in a group of otherwise unsegmented organisms possesses, and the light which they may be made to throw upon the nature of metameric segmentation in general.

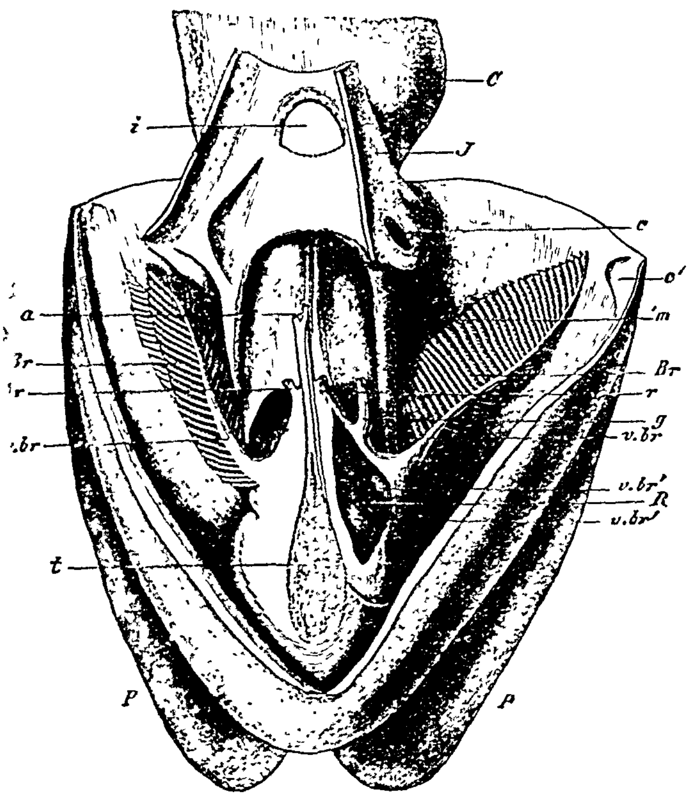

FIG. 103.—View of the postero-ventral surface of a male Sepia, obtained by cutting longitudinally the firm mantle-skirt and drawing the divided halves apart. This figure is strictly comparable with fig. 101. *C*, the head; *J*, the *mid-foot or siphon*, which has been cut open so as to display the valve *i*; *R*, the glandular tissue of the left nephridium or renal-sac, which has been cut open (see fig. 108); *P*, *P*, the lateral fins of the mantle-skirt; *Br*, the single pair of branchiæ (ctenidia); *a*, the anus,—immediately below it is the opening of the ink-bag; c, cartilaginous socket in the siphon to receive *c′*, the cartilaginous knob of the mantle-skirt,—the two constituting the "pallial hinge apparatus" characteristic of Decapoda, not found in Octopoda; *g*, the azygos genital papilla and aperture; *′i*, valve of the siphon (possibly the rudimentary hind-foot); *m*, muscular band connected with the fore-foot and mid-foot (siphon) and identical with the muscular mass *k* in fig. 91; *r*, renal papillæ, carrying the apertures of the nephridia; *v.br*, branchial efferent blood-vessel; *v.br′*, bulbous enlargements of the branchial blood vessels (see figs. 104, 108); *t*, ink-bag. (From Gegenbaur.)

The foot and head of Nautilus are in the adult inextricably grown together, the eye being the only part belonging primarily to the head which projects from the all-embracing foot. The fore-foot or front portion of the foot in Nautilus has the form of a number of lobes carrying tentacles and completely surrounding the mouth (figs. 88, 89, 91). The mid-foot is a broad median muscular process which exhibits in the most interesting manner a curling in of its margins so as to form an incomplete siphon (fig. 101), a condition which is completed and rendered permanent in the tubular funnel, which is the form presented by the corresponding part of Dibranchiata (fig. 96). The hind-foot possibly is represented by the valvular fold on the surface of the siphon-like mid-foot. In the Pteropoda the wing-like swimming lobes (epipodia or pteropodia) correspond to the two halves of the siphon, and are much the largest element of the foot. The fore-foot surrounding the head is often quite small, but in Clione and Pneumodermon carries lobes and suckers. A hind-foot is in Pteropoda often distinctly present; it is open to doubt as to whether the corresponding region of the foot in Siphonopoda is developed at all.

The lobes of the fore-foot of Nautilus and of the other Siphonopoda require further description. It has been doubted whether these lobes were rightly referred (by Huxley) to the fore-foot, and it has been maintained by some zoologists (Grenacher, Jhering) that they are truly processes of the head. It appears to the present writer to be impossible to doubt that the lobes in question are the fore-portion of the foot when their development is examined (see fig. 121, and especially fig. 72**), further, when the fact is considered that they are innervated by the pedal ganglion, and, lastly, when the comparison of such a Siphonopod as Sepia is made with such a Pteropod as Pneumodermon in its *larval* (fig. 84) as well as in its adult condition (fig. 85). The

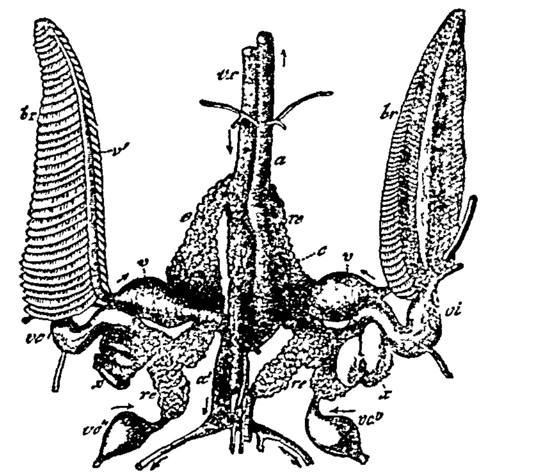

FIG. 104.—Circulatory and excretory organs of Sepia (from Gegenbaur, after John Hunter). *br*, branchiæ (ctenidia); *c*, ventricle of the heart; *a*, anterior artery (aorta); *a′*, posterior artery; *v*, the right and left auricles (enlargements of the efferent branchial veins); *v′*, efferent branchial vein on the free face of the gill-plume; *v.c*, vena cava; *vi*, *vc′*, advehent branchial vessels (branches of the vena cava, see fig. 108); *vc″*, abdominal veins; *x*, branchial hearts and appendages; *re*, *e*, glandular substance of the nephridia developed on the wall of the great veins on their way to the gills. The arrows indicate the direction of the blood-current.

larval Pneumodermon shows clearly that the sucker-bearing processes of that Mollusc are originally far removed from the head and close in position to the pteropodial lobes of the foot. By differential growth they gradually embrace and obliterate the head, as do the similar sucker-bearing processes of Sepia. In both cases the sucker-bearing processes are "fore-foot." The fore-foot of Nautilus completely surrounds the buccal cone (fig. 88, *e*), so as to present an appearance with its expanded tentacles similar to that of the disc of a sea-anemone (Actinia). No figure has hitherto been published exhibiting this circum-oral disc with its tentacles in natural position as when the animal is alive and swimming, the small figure of Valenciennes being deficient in detail. All the published figures represent the actual appearance of the contracted spirit-specimens. Mr A. G.

sac opens by a pore into each nephridium instead of directly to the surface. A single pair of ctenidia (gill-plumes) is present instead of the two pairs in Nautilus. The existence of two pairs of ctenidia and of two pairs of nephridia in Nautilus, placed one behind the other, is highly remarkable. The interest of this arrangement is in relation to the general morphology of the Mollusca, for it is impossible to view this repetition of organs in a linear series as anything else than an instance of metameric segmentation, comparable to the segmentation of the ringed worms and Arthropods. The only other example which we have of this metamerism in the Mollusca is presented by the Chitons. There we find not two pairs of ctenidia merely, but sixteen pairs (in some species more) accom-

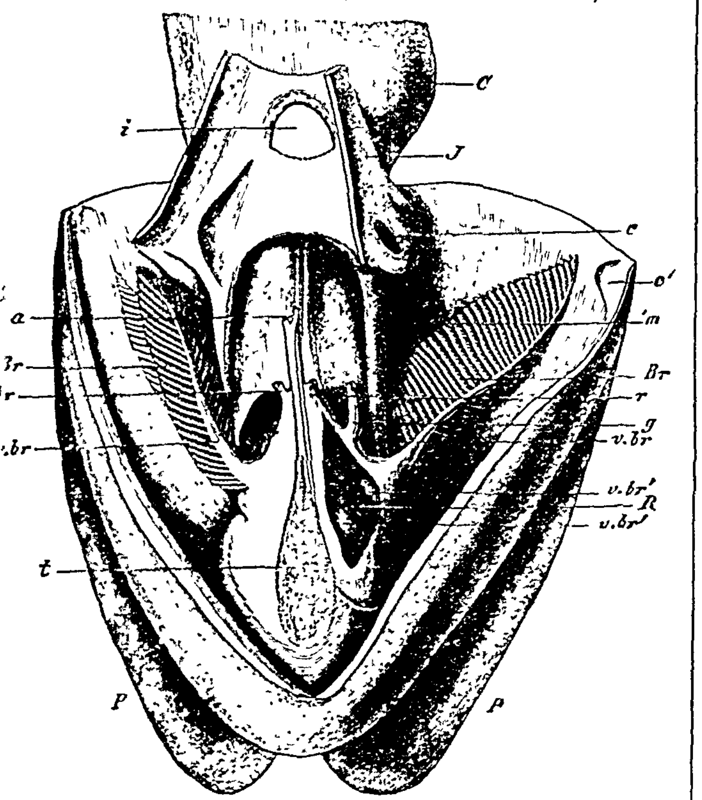

FIG. 103.—View of the postero-ventral surface of a male Sepia, obtained by cutting longitudinally the firm mantle-skirt and drawing the divided halves apart. This figure is strictly comparable with fig. 101. *C*, the head; *J*, the *mid-foot or siphon*, which has been cut open so as to display the valve *i*; *R*, the glandular tissue of the left nephridium or renal-sac, which has been cut open (see fig. 108); *P*, *P*, the lateral fins of the mantle-skirt; *Br*, the single pair of branchiæ (ctenidia); *a*, the anus,—immediately below it is the opening of the ink-bag; *c*, cartilaginous socket in the siphon to receive *c′*, the cartilaginous knob of the mantle-skirt,—the two constituting the "pallial hinge apparatus" characteristic of Decapoda, not found in Octopoda; *g*, the azygos genital papilla and aperture; *′i*, valve of the siphon (possibly the rudimentary hind-foot); *m*, muscular band connected with the fore-foot and mid-foot (siphon) and identical with the muscular mass *k* in fig. 91; *r*, renal papillæ, carrying the apertures of the nephridia; *v.br*, branchial efferent blood-vessel; *v.br′*, bulbous enlargements of the branchial blood vessels (see figs. 104, 108); *t*, ink-bag. (From Gegenbaur.)

panied by a similar metamerism of the dorsal integument, which carries eight shells. In Chiton the nephridia are not affected by the metamerism as they are in Nautilus. It is impossible on the present occasion to discuss in the way which their importance demands the significance of these two instances among Mollusca of incomplete or partial metamerism; but it would be wrong to pass them by without insisting upon the great importance which the occurrence of these isolated instances of metameric segmentation in a group of otherwise unsegmented organisms possesses, and the light which they may be made to throw upon the nature of metameric segmentation in general.

The foot and head of Nautilus are in the adult inextricably grown together, the eye being the only part belonging primarily to the head which projects from the all-embracing foot. The fore-foot or front portion of the foot in Nautilus has the form of a number of lobes carrying tentacles and completely surrounding the mouth (figs. 88, 89, 91). The mid-foot is a broad median muscular process which exhibits in the most interesting manner a curling in of its margins so as to form an incomplete siphon (fig. 101), a condition which is completed and rendered permanent in the tubular funnel, which is the form presented by the corresponding part of Dibranchiata (fig. 96). The hind-foot possibly is represented by the valvular fold on the surface of the siphon-like mid-foot. In the Pteropoda the wing-like swimming lobes (epipodia or pteropodia) correspond to the two halves of the siphon, and are much the largest element of the foot. The fore-foot surrounding the head is often quite small, but in Clione and Pneumodermon carries lobes and suckers. A hind-foot is in Pteropoda often distinctly present; it is open to doubt as to whether the corresponding region of the foot in Siphonopoda is developed at all.

The lobes of the fore-foot of Nautilus and of the other Siphonopoda require further description. It has been doubted whether these lobes were rightly referred (by Huxley) to the fore-foot, and it has been maintained by some zoologists (Grenacher, Jhering) that they are truly processes of the head. It appears to the present writer to be impossible to doubt that the lobes in question are the fore-portion of the foot when their development is examined (see fig. 121, and especially fig. 72**), further, when the fact is considered that they are innervated by the pedal ganglion, and, lastly, when the comparison of such a Siphonopod as Sepia is made with such a Pteropod as Pneumodermon in its *larval* (fig. 84) as well as in its adult condition (fig. 85). The

larval Pneumodermon shows clearly that the sucker-bearing processes of that Mollusc are originally far removed from the head and close in position to the pteropodial lobes of the foot. By differential growth they gradually embrace and obliterate the head, as do the similar sucker-bearing processes of Sepia. In both cases the sucker-bearing processes are "fore-foot." The fore-foot of Nautilus completely surrounds the buccal cone (fig. 88, *e*), so as to present an appearance with its expanded tentacles similar to that of the disc of a sea-anemone (Actinia). No figure has hitherto been published exhibiting this circum-oral disc with its tentacles in natural position as when the animal is alive and swimming, the small figure of Valenciennes being deficient in detail. All the published figures represent the actual appearance of the contracted spirit-specimens. Mr A. G.

Octopoda they are not unfrequently connected by a web, and form an efficient swimming-bell. The suckers are placed on the ad-oral surface of the arms, and may be in one, two, or four rows, and very numerous. In place of suckers in some genera we find on certain arms or parts of the arms horny hooks; in other cases a hook rises from the centre of each sucker. The hooks on the long arms of Onychoteuthis are drawn in fig. 97. The fore-foot, with its apparatus of suckers and hooks, is in the Dibranchiata essentially a prehensile apparatus, though the whole series of arms in the Octopoda serve as swimming organs, and in many (*e.g.*, the Common Octopus or Poulp) the sucker-bearing surface is used as a crawling organ.

In the males of the Dibranchiata one of the arms is more or less modified in connexion with the reproductive function, and is called the "hectocotylized arm." This name is derived from the condition assumed by the arm in those cases in which its modification is carried out to the greatest extent. These cases are those of the Octopods *Argonauta argo* and *Parasira catenulata* (fig. 96). In the males of these the third arm (on the left side in Argonauta, on the right side in Parasira) is found before the breeding season to be represented by a globular sac of integument. This sac bursts, and from it issues an arm larger than its neighbours, having a small sac at its extremity in Parasira (fig. 96, *x*), from which subsequently a long filament issues. Before copulation the male charges this arm with the spermatophores or packets of spermatozoa removed from its generative orifice beneath the mantle-skirt, and during coitus the arm becomes detached and is left adhering to the female by means of its suckers. A new arm is formed at the cicatrix before the next breeding season. The female, being much larger than the male, swims away with the detached arm lodged beneath her mantle-skirt. There, in a way which is not understood, the fertilization of the eggs is effected. Specimens of the female Parasira with the detached arm adherent were examined by Cuvier, who mistook the arm for a parasitic worm and gave to it the name Hectocotylus. Accordingly, the correspondingly modified arms of other Siphonopoda are said to be hectocotylized. Steenstrup has determined the hectocotylized condition of one or other of the arms in a number of male Dibranchs as follows:—in all, excepting Argonauta and Parasira, the modification of the arm is slight, consisting in a small enlargement of part or the whole of the arm, and the obliteration of some of its suckers, as shown in fig. 95, A, B; in Octopus and Eledone the third right arm is hectocotylized; in Rossia the first left arm is hectocotylized along its whole length, and the first right arm also in the middle only; in Sepiola only the first left arm along its whole length; in Sepia it is the fourth left arm which is modified, and at its base only; in Sepioteuthis, the same at its apex; in Loligo, the same also at its apex; in Loliolus, the same along its whole length; in Ommastrephes, Onychoteuthis, and Loligopsis no hectocotylized arm has hitherto been observed.

In the females of several Dibranchs (Sepia, &c.) the packets of spermatozoa or spermatophores received from the male have been observed adhering to the smaller arms. How they are passed in this case by the female to the ova in order to fertilize them is unknown.

Musculature, Fins, and Cartilaginous Skeleton.—Without entering into a detailed account of the musculature of Nautilus, we may point out that the great muscular masses of the fore-foot and of the mid-foot (siphon) are ultimately traceable to a large transverse mass of muscular tissue, the ends of which are visible through the integument on the right and left surfaces of the body dorsal of the free flap of the mantle-skirt (fig. 89, *l*, *l*, and fig. 91, *k*). These muscular areæ have a certain adhesion to the shell, and serve both to hold the animal in its shell and as the fixed supports for the various movements of the tentaculiferous lobes and the siphon. They are to be identified with the ring-like area of adhesion by which the foot-muscle of the Limpet is attached to the shell of that animal (see fig. 27). In the Dibranchs a similar origin of the muscular masses of the fore-foot and mid-foot from the sides of the shell—modified, as this is, in position and relations—can be traced.

In Nautilus there are no fin-like expansions of the integument, whereas such occur in the Decapod Dibranchs along the sides of the visceral hump (figs. 92, 93). As an exception among Octopoda lateral fins occur in Pinnoctopus (fig. 94, A), and in Cirrhoteuthis (fig. 94, D). In the Pteropodous division of the Cephalopoda such fin-like expansions of the dorsal integument do not occur, which is to be connected with the fact that another region, the mid-foot, which in Siphonopods is converted into a siphon, is in them expanded as a pair of fins.

In Nautilus there is a curious plate-like expansion of integument in the mid-dorsal region just behind the hood, lying between that structure and the portion of mantle-skirt which is reflected over the shell. This is shown in fig. 90, *b*. If we trace out the margin of this plate we find that it becomes continuous on each side with the sides of the siphon or mid-foot. In Sepia and other Decapods (not in Octopods) a closely similar plate exists in an exactly corresponding position (see *b* in figs. 110, 111). In Sepia a cartilaginous development occurs here immediately below the integument forming the so-called "nuchal plate," drawn in fig. 116, D. The morphological significance of this nuchal lamella, as seen both in Nautilus and in Sepia, is not obvious. Cartilage having the structure shown in fig. 117 occurs in various regions of the body of Siphonopoda. In all Glossophorous Mollusca the lingual apparatus is supported by internal skeletal pieces, having the character of cartilage; but in the Siphonopodous Cephalopoda such cartilage has a wider range.

In Nautilus a large H-shaped piece of cartilage is found forming the axis of the mid-foot or siphon (fig. 116, A, B). Its hinder part extends up into the head and supports the peri-œsophageal nerve-mass (*a*), whilst its two anterior rami extend into the tongue-like siphon. In Sepia, and Dibranchs generally, the cartilage takes a different form, as shown in fig. 116, C. The processes of this cartilage cannot be identified in any way with those of the capito-pedal cartilage of Nautilus. The lower larger portion of this cartilage in Sepia is called the cephalic cartilage, and forms a complete ring round the œsophagus; it completely invests also the ganglionic nerve-collar, so that all the nerves from the latter have to pass through foramina in the cartilage. The outer angles of this cartilage spread out on each side so as to form a cup-like receptacle for the eyes. The two processes springing right and left from this large cartilage in the median line (fig. 116, C) are the "præ-orbital cartilages;" in front of these, again, there is seen a piece like an inverted T, which forms a support to the base of the "arms" of the fore-foot, and is the "basi-brachial" cartilage. The Decapod Dibranchs have, further, the "nuchal cartilage" already mentioned, and in Sepia, a thin plate-like "sub-ostracal" or (so-called) dorsal cartilage, the anterior end of which rests on and fits into the concave nuchal cartilage. In Octopoda there is no nuchal cartilage, but two band-like "dorsal cartilages." In Decapods there are also two cartilaginous sockets on the sides of the funnel —"siphon-hinge cartilages"—into which fleshy knobs of the mantle-skirt are loosely fitted. In Sepia, along the whole base-line of each lateral fin of the mantle (fig. 92), is a "basi-pterygial cartilage." It is worthy of remark that we have, thus developed, in Dibranch Siphonopods a more

Octopoda they are not unfrequently connected by a web, and form an efficient swimming-bell. The suckers are placed on the ad-oral surface of the arms, and may be in one, two, or four rows, and very numerous. general Molluscan characters in regard to these organs. Whilst the general body-cavity or cœlom forms a lacunar blood-system or series of narrow spaces, connected with the trunks of a well-developed vascular system, that part of the original cœlom surrounding the heart and known as the Molluscan pericardium becomes shut off from this general blood-lymph system, and communicates, directly in Nautilus, in the rest through the nephridia, with the exterior. In the Siphonopoda this specialized pericardial cavity is particularly large, and has been recognized as distinct from the blood-carrying spaces, even by anatomists who have not considered the pericardial space of other Mollusca to be thus isolated. The enlarged pericardium, which may even take the form of a pair of sacs, has been variously named, but is best known as the viscero-pericardial sac or chamber. In Nautilus this sac occupies the whole of the postero-dorsal surface and a part of the antero-dorsal (see fig. 110, *x*), investing the genital and other viscera which lie below it, and having the ventricle of the heart suspended in it. Certain membranes forming incomplete septa, and a curious muscular band—the pallio-cardiac band—traverse the sac. The four branchial advehent veins, which in traversing the walls of the four nephridial sacs give off, as it were, glandular diverticula into those sacs, also give off at the same points four much larger glandular

masses, which hang freely into the viscero-pericardial chamber (fig. 109, *r.e*). In Nautilus the viscero-pericardial sac opens to the exterior directly by a pair of apertures, one placed close to the right and one close to the left posterior nephridial aperture (fig. 101, *viscper.*). This direct opening of the pericardial sac to the exterior is an exception to what occurs in all other Mollusca. In all other Molluscs the pericardial sac opens into the nephridia, and through them or the one nephridium to the exterior. In Nautilus there is no opening from the viscero-pericardial sac into the nephridia. Therefore the external pore of the viscero-pericardial sac may possibly be regarded as a shifting of the reno-pericardial orifice from the actual wall of the nephridial sac to a position alongside of its orifice. Parallel cases of such shifting are seen in the varying position of the orifice of the ink-bag in Dibranchiata, and in the orifice of the genital ducts of Mollusca, which in some few cases (*e.g.*, Spondylus) open into the nephridia, whilst in other cases they open close by the side of the nephridia on the surface of the body. The viscero-pericardial sac of the

in relative size as the volume of the sac increases. Its outer surface acquires a metallic iridescence similar to that of the integuments of many fishes. The opening of the ink-sac is in the adult sometimes distinct from but near to

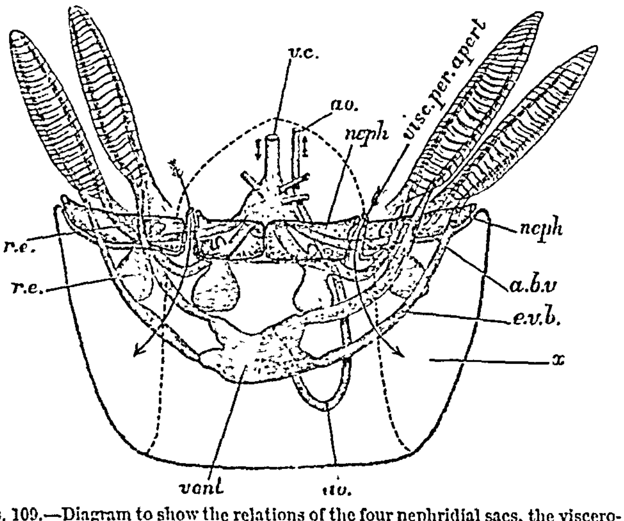

FIG. 109.—Diagram to show the relations of the four nephridial sacs, the viscero-pericardial sac, and the heart and large vessels in Nautilus (drawn by A. G. Bourne). *neph*, *neph*, on the right side point to the two nephridia of that side (the two of the opposite side are not lettered),—each is seen to have an independent aperture; *x* is the viscero-pericardial sac, the dotted line indicating its backward extension; *visc.per.apert* marks an arrow introduced into the right aperture of the viscero-pericardial sac; *r.e.*, *r.e.*, point to the glandular enlarged walls of the advehent branchial vessels,—two small glandular bodies of the kind are seen to project into each nephridial sac, whilst a larger body of the same kind depends from each of the four branchial advehent vessels into the viscero-pericardial sac; *v.c.*, vena cava; *vent*, ventricle of the heart; *ao.*, cephalic aorta (the small abdominal aorta not drawn); *a.b.v*, advehent branchial vessel; *e.v.b.*, efferent branchial vessel.

the anus (Sepia); in other cases it opens into the rectum near the anus. The ink-bag of Dibranch Siphonopoda is possibly to be identified with the adrectal (purpuriparous) gland of some Gastropoda.

Cœlom, Blood-vascular System, and Excretory Organs.—Nautilus and the other Siphonopoda conform to the

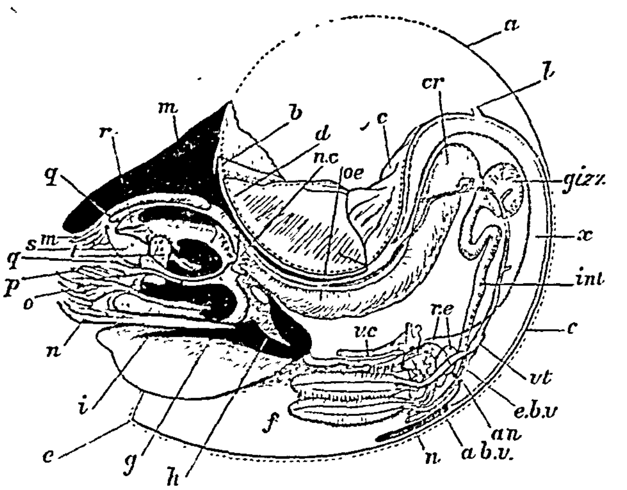

FIG. 110.—Diagram representing a vertical approximately median antero posterior section of *Nautilus pompilius* (from a drawing by A. G. Bourne). general Molluscan characters in regard to these organs. Whilst the general body-cavity or cœlom forms a lacunar blood-system or series of narrow spaces, connected with the trunks of a well-developed vascular system, that part of the original cœlom surrounding the heart and known as the Molluscan pericardium becomes shut off from this general blood-lymph system, and communicates, directly in Nautilus, in the rest through the nephridia, with the exterior. In the Siphonopoda this specialized pericardial cavity is particularly large, and has been recognized as distinct from the blood-carrying spaces, even by anatomists who have not considered the pericardial space of other Mollusca to be thus isolated. The enlarged pericardium, which may even take the form of a pair of sacs, has been variously named, but is best known as the viscero-pericardial sac or chamber. In Nautilus this sac occupies the whole of the postero-dorsal surface and a part of the antero-dorsal (see fig. 110, *x*), investing the genital and other viscera which lie below it, and having the ventricle of the heart suspended in it. Certain membranes forming incomplete septa, and a curious muscular band—the pallio-cardiac band—traverse the sac. The four branchial advehent veins, which in traversing the walls of the four nephridial sacs give off, as it were, glandular diverticula into those sacs, also give off at the same points four much larger glandular

masses, which hang freely into the viscero-pericardial chamber (fig. 109, *r.e*). In Nautilus the viscero-pericardial sac opens to the exterior directly by a pair of apertures, one placed close to the right and one close to the left posterior nephridial aperture (fig. 101, *viscper.*). This direct opening of the pericardial sac to the exterior is an exception to what occurs in all other Mollusca. In all other Molluscs the pericardial sac opens into the nephridia, and through them or the one nephridium to the exterior. In Nautilus there is no opening from the viscero-pericardial sac into the nephridia. Therefore the external pore of the viscero-pericardial sac may possibly be regarded as a shifting of the reno-pericardial orifice from the actual wall of the nephridial sac to a position alongside of its orifice. Parallel cases of such shifting are seen in the varying position of the orifice of the ink-bag in Dibranchiata, and in the orifice of the genital ducts of Mollusca, which in some few cases (*e.g.*, Spondylus) open into the nephridia, whilst in other cases they open close by the side of the nephridia on the surface of the body. The viscero-pericardial sac of the

of the two nephridia to form one sac is still more obvious, since the ventral portions are united. In Octopus the nephridia are quite separate.

Tegumental pores have not been described in Nautilus, but exist in Dibranchiata, and have been (probably erroneously, but further investigation is needed) supposed to introduce water into the vascular system. A pair of

FIGS. 113, 114.—Nerve-centres of Octopus. Figure 113 gives a view from the dorsal aspect, figure 114 one from the ventral aspect. *buc*, the buccal mass; *ped*, pedal ganglion; *opt*, optic ganglion; *cer*, cerebral ganglion; *pl*, pleural ganglion; *visc*, visceral ganglion; *œs*, œsophagus; *f*, foramen in the nerve-mass formed by pedal, pleural, and visceral ganglion-pairs, traversed by a blood-vessel.

such pores leading into sub-tegumental spaces of considerable area, the nature of which is imperfectly known, exist on the back of the head in Philonexis, Tremoctopus, and Argonauta. At the base of the arms and mouth four such pores are found in Histioteuthis and Ommastrephes, six in Sepia, Loligo, Onychoteuthis. Lastly, a pair of such pores are found in the Decapoda at the base of the long arms, leading into an extensive sub-tegumental pouch on each side of the head into which the long arms can be, and usually are, withdrawn. In Sepia, Sepiola, and Rossia the whole arm is coiled up in these sacs; in Loligo only a part of it is so; in Histioteuthis, Ommastrephes, and Onychoteuthis, the sacs are quite small and do not admit the arms.

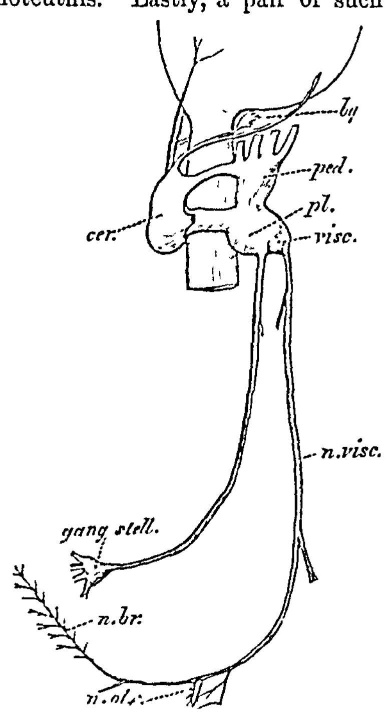

FIG. 115.—Lateral view of the nervous centres and nerves of the right side of *Octopus vulgaris* (from a drawing by A. G. Bourne). *bg*, buccal ganglion; *cer.*, cerebral ganglion; *ped.*, pedal ganglion; *pl.*, pleural, and *visc.*, visceral region of the pleuro-visceral ganglion; *gang. stell.*, the right stellate ganglion of the mantle connected by a nerve to the pleural portion; *n.visc.*, the right visceral nerve; *n.olf.*, its (probably) olfactory branches; *n.br.*, its branchial branches.

Nervous System.—Nautilus, like the other Cephalopoda (*e.g.*, Pneumodermon, fig. 87; Octopus, fig. 113), exhibits a great concentration of the typical Molluscan ganglia, as shown in fig. 112. The ganglia take on a band-like form, and are but little differentiated from their commissures and connectives,—an archaic condition reminding us of Chiton. The special optic outgrowth of the cerebral ganglion, the optic ganglion (fig. 112, *o*), is characteristic of the big-eyed Siphonopoda. The cerebral ganglion-pair (*a*) lying above the œsophagus is connected with two sub-œsophageal ganglion-pairs of band-like form. The anterior of these is the pedal *b*, *b*, and supplies the fore-foot with nerves *t'*, *t*, as also the mid-foot (siphon). The hinder band is the visceral and pleural pair fused (compare fig. 112 with fig. 87, and especially with the typical Euthyneurous nervous system of Limnæus, fig. 22); from its pleural portion nerves pass to the mantle, from its visceral portion nerves to the branchiæ and genital ganglion (*d* in fig. 112), and in immediate connexion with the latter is a nerve to the osphradium or olfactory papilla. No buccal ganglia have been observed in Nautilus, nor has an enteric nervous system been described in this animal, though both attain a special development in the Dibranchiata. The figures (114 and 115) representing the nerve-centres of Octopus serve to exhibit the disposition of these parts in the Dibranchiata. The ganglia are more distinctly swollen than in Nautilus. In Octopus an infra-buccal ganglion-pair are present corresponding to the buccal ganglion-pair of Gastropoda. In Decapoda a supra-buccal ganglion-pair connected with these are also developed. Instead of the numerous radiating pallial nerves of Nautilus, we have in the Dibranchiata on each side (right and left) a large pleural erve passing from the pleural portion of the pleuro-visceral ganglion to the mantle, where it enlarges to form the stellate ganglion. From each stellate ganglion nerves radiate to supply the powerful muscles of the mantle-skirt. The nerves from the visceral portion of the pleuro-visceral ganglion have the same course as in Nautilus, but no osphradial papilla is present. An enteric nervous system is richly developed in the Dibranchiata, connected with the somatic nervous centres through the buccal ganglia, as in the Arthropoda through the stomato-gastric ganglia, and anastomosing with deep branches of the visceral nerves of the viscero-pleural ganglion-pair. It has been especially described by Hancock (39) in Ommastrephes. Upon the stomach it forms a single large and readily-detected gastric ganglion. It is questionable as to how far this and the "caval ganglion" formed in some Decapoda by branches of the visceral nerves which accompany the vena cava are to be considered as the equivalents of the "abdominal ganglion," which in a typical Gastropod nervous system lies in the middle of the visceral nerve-loop or commissure, having the right and left visceral ganglia on either side of it, separated by a greater or less length of visceral nerve-cord (see figs. 20, 21, 22). There can be little doubt that the enteric nervous system is much more developed in the Dibranchiata than in other Mollusca, and that it effects a fusion with the typical "visceral" cords more extensive than obtains even in Gastropoda, where such a fusion no doubt must also be admitted.

Special Sense-Organs.—Nautilus possesses a pair of osphradial papillæ (fig. 101, *olf*) corresponding in position and innervation to Spengel's organ placed at the base of the ctenidia (branchiæ) in all classes of Mollusca. This organ has not been detected in other Siphonopoda. In Pteropoda it is well developed as a single ciliated pit, although the ctenidia are in that group aborted (fig. 87, *Osp.*). Nautilus possesses other olfactory organs in the region of the head. Just below the eye is a small triangular process (not seen in our figures), having the structure of a shortened and highly-modified tentacle and sheath. By Valenciennes, who is followed by Keferstein, this is regarded as an olfactory organ. The large nerve which runs to this organ originates from the point of juncture of the pedal with the optic ganglion. The lamelliform organ upon the inner inferior tentacular lobe of Nautilus is possibly also olfactory in function. In Dibranchs behind the eye is a pit or open canal supplied by a nerve corresponding in origin to the olfactory nerve of Nautilus above mentioned.

of the two nephridia to form one sac is still more obvious, since the ventral portions are united. In Octopus the nephridia are quite separate.

Tegumental pores have not been described in Nautilus, but exist in Dibranchiata, and have been (probably erroneously, but further investigation is needed) supposed to introduce water into the vascular system. A pair of such pores leading into sub-tegumental spaces of considerable area, the nature of which is imperfectly known, exist on the back of the head in Philonexis, Tremoctopus, and Argonauta. At the base of the arms and mouth four such pores are found in Histioteuthis and Ommastrephes, six in Sepia, Loligo, Onychoteuthis. Lastly, a pair of such pores are found in the Decapoda at the base of the long arms, leading into an extensive sub-tegumental pouch *on each side of the head* into which the long arms can be, and usually are, withdrawn. In Sepia, Sepiola, and Rossia the whole arm is coiled up in these sacs; in Loligo only a part of it is so; in Histioteuthis, Ommastrephes, and Onychoteuthis, the sacs are quite small and do not admit the arms.

lens forms as a structureless growth, projecting inwards from the front wall of this vesicle (fig. 123, B, *l*). The integument around the primitive optic vesicle which has sunk below

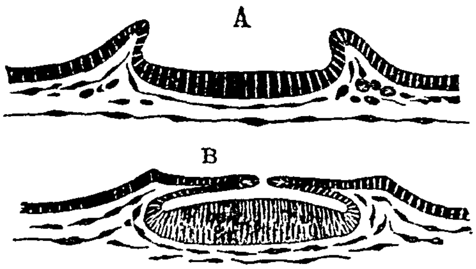

FIG. 119.—Diagrams of sections showing the early stage of development of the eye of Loligo when it is, like the permanent eye of Nautilus and of Patella, an open sac. A. First appearance of the eye as a ring-like upgrowth. B. Ingrowth of the ring-like wall so as to form a sac, the primitive optic vesicle of Loligo. (From Lankester.)

the surface now rises up and forms firstly nearest the axis of the eye the iridian folds (*if* in B, fig. 123; *ik* in fig. 120; *Ir in fig. 118), and then secondly an outer circular fold* grows up like a wall and completely closes over the iridian folds and the axis of the primitive vesicle (fig. 120, C). This covering is transparent, and is the cornea. In the oceanic Decapoda the cornea does not completely close, but leaves a central aperture traversed by the optic axis. These forms are termed Oigopsidæ by d'Orbigny (42), whilst the Decapoda with closed cornea are termed Myopsidæ. In the Octopoda the cornea is closed, and there is yet another fold thrown over the eye. The skin surrounding the cornea presents a free circular margin, and can be drawn over the surface of the cornea by a sphincter muscle. It thus acts as an adjustable diaphragm, exactly similar in

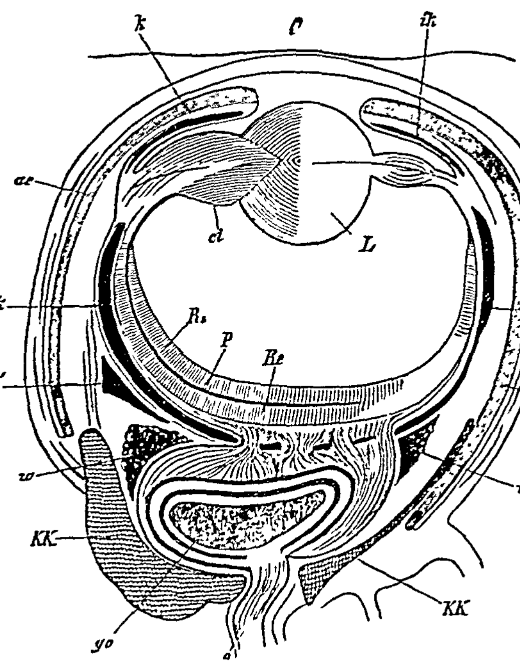

FIG. 120.—Horizontal section of the eye of Sepia (Myopsid). *KK*, cephalic cartilages (see fig. 116); *C*, cornea (closed); *L*, lens; *ci*, ciliary body; *Ri*, internal layer of the retina; *Re*, external layer of the retina; *p*, pigment between these; *o*, optic nerve; *go*, optic ganglion; *k* and *k'*, capsular cartilage; *ik*, cartilage of the iris; *w*, white body; *ae*, argentine integument. (From Gegenbaur, after Hensen.)

movement to the iris of Vertebrates. Sepia and allied Decapods have a horizontal lower eyelid, that is to say, only one-half of the sphincter-like fold of integument is movable. The exact history of the later growth of the lens in the Dibranchs' eye is not clear. As seen in fig. 120, it appears, after attaining a certain size, to push through the front wall of the primitive optic vesicle at the point corresponding to its centre of closure, and to project a little into the anterior chamber formed by the cornea. The wall of the primitive optic vesicle adjacent to the embedded lens (L) now becomes modified, forming a so-called "ciliary body," in which muscular tissue is present, serving to regulate the focus of the lens (*ci* in fig. 120). Bobretzky (43) differs from Lankester, whose view is above given, in assigning a distinct origin to the protruding anterior segment of the lens (l^1 in fig. 118). The optic ganglion, as well as the other large ganglia of the Dibranchiata, originate in the mesoblast of the embryo. The connexion between the cells of the retina and the nerve-fibres proceeding from the optic ganglion must therefore be a secondary one.

Chromatophores.—In Nautilus these remarkable structures, which we mention here as being intimately associated with the nervous system, appear to be absent. In Dibranchiata they play an important part in the economy, enabling their possessor, in conjunction with the discharge of the contents of the ink-bag, to elude the observation of either prey or foe. They consist of large vesicular cells (true nucleated cells converted into vesicles), arranged in *a layer immediately below the epidermis. Each chromatophore*-cell has from six to ten muscular bands attached to its walls, radiating from it star-wise. The contraction of these fibres causes the chromatophore-cell to widen out; it returns to its spherical resting state by its own elasticity. In the spherical resting state such a cell may measure ·01 mm., whilst when fully stretched by its radiating muscles it covers an area of ·5 mm. The substance of the chromatophore-cells is intensely coloured with one of the following colours—scarlet, yellow, blue, brown—which are usually of the greatest purity and brilliance. The action of the chromatophores may be watched most readily in young Loligo, either under the microscope or with the naked eye. The chromatophores are suddenly expanded, and more slowly retracted with rapidly-recurring alternation. All the blue, or all the red, or all the yellow may be expanded and the other colours left quiescent. Thus the animal can assume any particular hue, and change its appearance in a dazzling way with extraordinary rapidity. There is a definite adaptation of the colour assumed in the case of Sepia and others to the colour of the surrounding rock and bottom.

Gonads and Genital Ducts.—In Nautilus it has recently been shown by Lankester and Bourne (37) that the genital ducts of both sexes are paired right and left, the left duct being rudimentary and forming the "pyriform appendage," described by Owen as adhering by membranous attachment to the ventricle of the heart, and shown by Keferstein to communicate by a pore with the exterior. Thus the Cephalopoda agree with our archi-Mollusc in having bilaterally symmetrical genital ducts in the case of the most archaic member of the class. The ovary (female gonad) or the testis (male gonad) lies in Nautilus as in the Dibranchs in a distinct cavity walled off from the other viscera, near the centro-dorsal region. This chamber is formed by the cœlomic or peritoneal wall; the space enclosed is originally part of the cœlom, and in Sepia and Loligo is, in the adult, part of the viscero-pericardial chamber. In Octopus it is this genital chamber which communicates by a right and a left canal with the nephridium, and is the only representative of pericardium. The ovary or testis is itself a growth from the inner wall of this chamber, which it only partly fills. In Nautilus the right genital duct, which is functional, is a simple continuation to the pore on the postero-dorsal surface of the membranous walls of the capsule in which lies the ovary or the testis, as the case may be. The gonad itself appears to represent a single median or bilateral organ.

The true morphological nature of the genital ducts of the Cephalopoda and of other Mollusca is a subject which invites speculation and inquiry. In all the cases in which such

lens forms as a structureless growth, projecting inwards from the front wall of this vesicle (fig. 123, B, *l*). The integument around the primitive optic vesicle which has sunk below

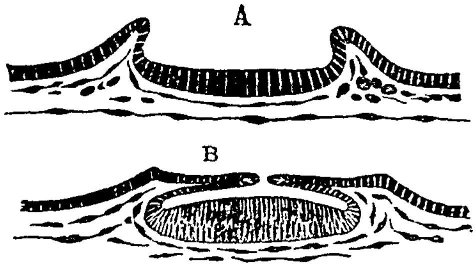

FIG. 119.—Diagrams of sections showing the early stage of development of the eye of Loligo when it is, like the permanent eye of Nautilus and of Patella, an open sac. A. The ovary or testis is itself a growth from the inner wall of this chamber, which it only partly fills. In Nautilus the right genital duct, which is functional, is a simple continuation to the pore on the postero-dorsal surface of the membranous walls of the capsule in which lies the ovary or the testis, as the case may be. The gonad itself appears to represent a single median or bilateral organ.

The true morphological nature of the genital ducts of the Cephalopoda and of other Mollusca is a subject which invites speculation and inquiry. In all the cases in which such

that in the chick the orifice of closure of the overspreading blastoderm does not represent the whole of the blastopore,

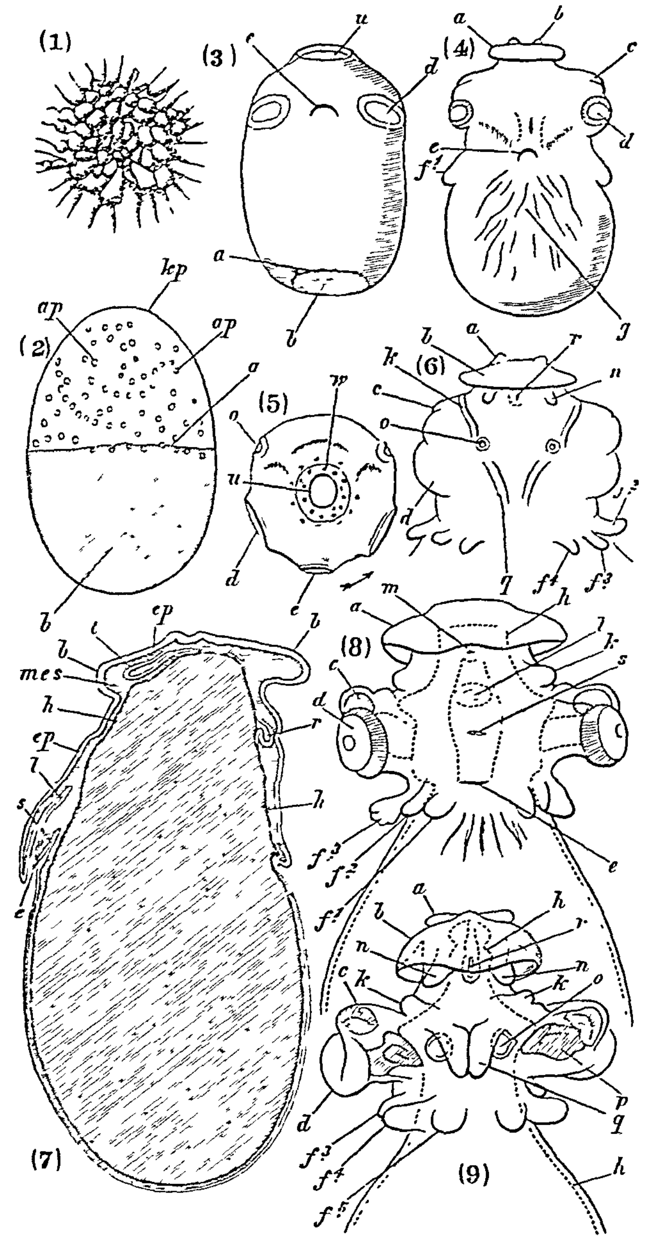

FIG. 121.—Development of Loligo. (1) View of the cleavage of the egg during the first formation of embryonic cells. (2) Lateral view of the egg at a little later stage. *a*, limit to which the layer of cleavage-cells has spread over the egg; *b*, portion of the egg (shaded) as yet uncovered by cleavage-cells; *ap*, the autoplasts; *kp*, cleavage-pole where first cells were formed. (3) Later stage, the limit *a* now extended so as to leave but little of the egg-surface (*b*) unenclosed. The eyes (*d*), mouth (*e*), and mantle-sac (*u*) have appeared. (4) Later stage, anterior surface, the embryo is becoming nipped off from the yelk sac (*g*). (5) View of an embryo similar to (3) from the cleavage-pole or centro-dorsal area. (6) Later stage, posterior surface. (7) Section in a median dorso-ventral and antero-posterior plane of an embryo of the same age as (4). (8) View of the anterior face of an older embryo. (9) View of the posterior face of an embryo of the same age as (8). Letters in (3) to (9):—*a*, lateral fins of the mantle; *b*, mantle-skirt; *c*, supra-ocular invagination to form the "white body"; *d*, the eye; *e*, the mouth; $f^1, ^2, ^3, ^4, ^5$, the five paired processes of the fore-foot; *g*, rhythmically contractile area of the yelk-sac, which is itself a hernia-like protrusion of the median portion of the fore foot (see fig. 72**); *h*, dotted line showing internal area occupied by yelk (food-material of the egg); *k*, first rudiment of the mid-foot (paired ridges which unite to form the siphon or funnel); *l*, sac of the radula or lingual ribbon; *m*, stomach; *n*, rudiments of the gills (paired ctenidia); *o*, the otocysts,—a pair of invaginations of the surface of the mid-foot; *p*, the optic ganglion; *q*, the distal portion of the ridges which form the siphon or mid-foot, *k* being the basal portion of the same structure; *r*, the vesicle-like rudiment of the intestine formed independently of the parts connected with the mouth, *s*, *k*, *m*, and without invagination; *s*, rudiment of the salivary glands; *t* in (7), the shell-sac at an earlier stage open (see fig. 122), now closed up; *u*, the open shell-sac formed by an uprising ring-like growth of the centro-dorsal area; *w* in (5), the mantle skirt commencing to be raised up around the area of the shell-sac. In (7) *mes* points to the middle cell-layer of the embryo, *ep* to the outer layer, and *h* to the deep layer of fusiform cells which separates everywhere the embryo from the yelk or food-material lying within it. (Original.)

but that this is in part to be sought in the widely-separated primitive streak. The present writer has little doubt that a structure corresponding to the primitive streak of the chick, and lying near the klastic pole, will be found in Sepia and Loligo, and the strange vesicular origin of the mid-gut will be traced to and explained by it.

Leaving this difficult question of the cell-layers of the embryo, we would draw the reader's attention to the series of sketches representing the semi-transparent embryo of Loligo, drawn in fig. 121. When the cleavage cells have nearly enclosed the yelk, the upper or embryonic area shows the rudiments of the centro-dorsal mantle-sac or pen-sac, the mouth, the paired optic pits, and the paired

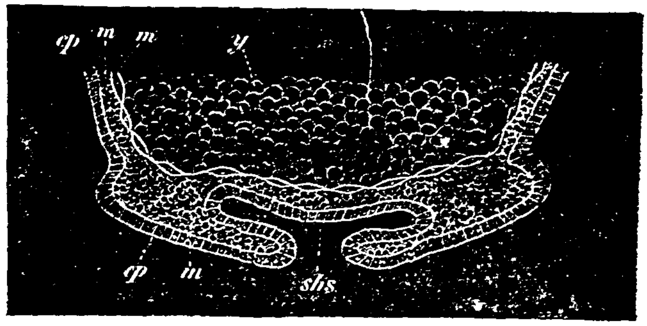

FIG. 122.—Section through the still open shell-sac occupying the centro-dorsal area of an embryo of Loligo; the position is inverted as compared with fig. 121 (3) and (7). *ep*, outer cell-layer; *m*, middle cell-layer; *m'*, deep cell-layer of fusiform cells; *y*, the granular yelk or food-material of the egg; *shs*, the still open shell-sac. (From Lankester.)

otic pits (fig. 121, (3), (5)). The eye-pits close up (fig. 119), the orifice of the mantle-sac narrows, and its margin becomes raised and freely produced as mantle-skirt; at the same time an hour-glass-like pinching in of the whole embryo commences, separating the embryo proper from the so-called yelk-sac (fig. 121, (4)). Around the "waist" of constriction, pair by pair, ten lobes arise (fig. 121, (8)),—the arms of the fore-foot. It now becomes obvious that the yelk-sac is but the median surface of the fore-foot bulged out inordinately by food-yelk, just as the hind region of the foot is in the embryo slug (see fig. 72**, and explanation). Just as in the slug, this dilated yelk-holding foot is rhythmically contractile, and pulsates steadily over the area *g* in fig. 121, (4). At this stage, and long subsequently, the mouth of the young Cephalopod is in no way surrounded by the fore-foot, but lies well above its nascent lobes (*e* in fig. 121). Subsequently it sinks, as it were, between the right and left most anterior pair of the series, which grow towards one another and fuse above it, and leave no trace of their original position and relations. Fig. 121, (6) gives a view of the postero-dorsal surface of an embryo, in which the important fact is seen of the formation of the funnel or siphon by the union of two pieces (*q*), which grow up each independently, one right and one left, like the sides of the siphon of Nautilus or the swimming lobes of a Pteropod, and subsequently come together, as shown in (9), where the same letter *q* indicates the same part. The explanations of figs. 121 and 123 are given very full, and here, therefore, we shall only allude to two additional points. A curious mass of tissue of unknown significance occurs in the orbit of Dibranchs, known as the white body (*w* in fig. 120). A strongly-marked invagination just above the orbit is a very prominent feature in the embryo of Loligo, Sepia, and Octopus, and appears to give rise to this so-called white body. This invaginated portion of the outer cell-layer is seen in fig. 121, (8) and (9), lettered *c*; in fig. 123, A and B, it is lettered *wb*.

Lastly, in fig. 123, A, the origin of the optic nerve-ganglion *ng* from the cells of the middle layer should be especially noticed. In some other Molluscs the nerve-ganglia have been definitely traced to the outer cell-layer,

that in the chick the orifice of closure of the overspreading blastoderm does not represent the whole of the blastopore,

(From Lankester.)

otic pits (fig. 121, (3), (5)). The eye-pits close up (fig. 119), the orifice of the mantle-sac narrows, and its margin becomes raised and freely produced as mantle-skirt; at the same time an hour-glass-like pinching in of the whole embryo commences, separating the embryo proper from the so-called yelk-sac (fig. 121, (4)). Around the "waist" of constriction, pair by pair, ten lobes arise (fig. 121, (8)),—the arms of the fore-foot. It now becomes obvious that the yelk-sac is but the median surface of the fore-foot bulged out inordinately by food-yelk, just as the hind region of the foot is in the embryo slug (see fig. 72**, and explanation). Just as in the slug, this dilated yelk-holding foot is rhythmically contractile, and pulsates steadily over the area *g* in fig. 121, (4). At this stage, and long subsequently, the mouth of the young Cephalopod is in no way surrounded by the fore-foot, but lies well above its nascent lobes (*e* in fig. 121). Subsequently it sinks, as it were, between the right and left most anterior pair of the series, which grow towards one another and fuse above it, and leave no trace of their original position and relations. Fig. 121, (6) gives a view of the postero-dorsal surface of an embryo, in which the important fact is seen of the formation of the funnel or siphon by the union of two pieces (*q*), which grow up each independently, one right and one left, like the sides of the siphon of Nautilus or the swimming lobes of a Pteropod, and subsequently come together, as shown in (9), where the same letter *q* indicates the same part. The explanations of figs. 121 and 123 are given very full, and here, therefore, we shall only allude to two additional points. A curious mass of tissue of unknown significance occurs in the orbit of Dibranchs, known as the white body (*w* in fig. 120). A strongly-marked invagination just above the orbit is a very prominent feature in the embryo of Loligo, Sepia, and Octopus, and appears to give rise to this so-called white body. This invaginated portion of the outer cell-layer is seen in fig. 121, (8) and (9), lettered *c*; in fig. 123, A and B, it is lettered *wb*.

Lastly, in fig. 123, A, the origin of the optic nerve-ganglion *ng* from the cells of the middle layer should be especially noticed. In some other Molluscs the nerve-ganglia have been definitely traced to the outer cell-layer,

veloped only in those few forms which are inequivalve. The typical PERICARDIUM is well developed. It appears, as in other Mollusca, not to be a blood-space although developed from the cœlom, and it communicates with the exterior by the pair of nephridia. As in Cephalopoda (and possibly other Mollusca) water can be introduced through the nephridia into this space. The ALIMENTARY CANAL keeps very nearly to the median vertical plane whilst exhibiting a number of flexures and loopings in this plane. A pair of large glandular outgrowths, the so-called "liver" or great digestive gland, exists as in other Molluscs. A pair of pedal OTOCYSTS, and a pair of OSPHRADIA at the base of the gills, appear to be always present. A typical NERVOUS SYSTEM is present (fig. 144), consisting of a cerebro-pleuro-visceral ganglion-pair, united by connectives to a pedal ganglion-pair and an osphradial ganglion-pair (parieto-splanchnic).

A special cæcum connected with the pharynx is sometimes found, containing a tough flexible cylinder of transparent cartilaginous appearance and unknown significance, called the "crystalline style" (Mactra), which possibly represents the radular sac of Glossophora. In many Lamellibranchs a gland is found on the hinder surface of the foot in the mid line, which secretes a substance which sets into the form of threads—the so-called "byssus"—by means of which the animal can fix itself. Sometimes this gland is found in the young and not in the adult (Anodon, Unio, Cyclas). In some Lamellibranchs (Pecten, Spondylus, Pholas, Mactra, Tellina, Pectunculus, Galeomma, &c.), although cephalic eyes are always absent, special eyes are developed on the free margin of the mantle-skirt, apparently by the modification of tentacles which are commonly found there (fig. 145). The existence of pores in the foot and elsewhere in Lamellibranchia by which liquid can pass into and out of the vascular system, although asserted as in the case of other Mollusca, appears to be improbable. It has yet to be shown by satisfactory microscopic sections that the supposed pores are anything but epidermal glands.

The Lamellibranchia live chiefly in the sea, some in fresh waters. A very few have the power of swimming by opening and shutting the valves of the shell (Pecten, Lima); most can slowly crawl or rapidly burrow; others are, when adult, permanently fixed to stones or rocks either by the shell or the byssus. In development some Lamellibranchia pass through a free-swimming trochosphere stage with præoral ciliated band; other fresh-water forms which carry the young in brood-pouches formed by the ctenidia have suppressed this larval phase.

The following classification and enumeration of genera are based primarily upon the characters of the adductor muscles. The Heteromya and Monomya must be conceived of as derived from forms resembling such Gastropodous Isomya as Nucula and Trigonia, which undoubtedly are the nearest living representatives of the ancestral Lipocephala, and bring us nearest to the other branch of the Mollusca, the Glossophora.

Order 1.—Isomya.

Character.—Anterior and posterior adductor muscles of approximately equal size.

Sub-order 1.—*Integripallia.*

Characters.—Marginal attachment of the mantle to the shell not inflected to form a sinus; siphons not developed in some, present in most.

Family 1.—*Arcacea.*
Genera: *Arca*, L. (fig. 132); *Cucullæa*, Lam.; *Pectunculus*, Lam.; *Limopsis*, Sassi; *Nucula*, Lam. (fig. 134); *Isoarca*, Münster; *Leda*, Schu.; *Yoldia*, Möll.; *Solenella*, Sowerby, &c.
Family 2.—*Trigoniacea.*
Genera: *Trigonia*, Brug.; *Axinus*, Sow.; *Lyrodesma*, Conrad.
Family 3.—*Unionacea.*
Genera: *Unio*, Retz.; *Castalia*, Lam.; *Anodon*, Cuv. (figs. 124, &c.); *Iridina*, Lam.; *Mycetopus*, d'Orb., &c.
Family 4.—*Lucinacea.*
Genera: *Lucina*, Brug.; *Corbis*, Cuv.; *Diplodonta*, Brown; *Kellia*, Turton; *Montacuta*, Turton; *Lepton*, Turton; *Galeomma*, Turton; *Astarte*, Sow.; *Crassatella*, Lam.; *Cardinia*, Ag.; *Cardita*, Brug., &c.
Family 5.—*Cyprinacea.*
Genera: *Tridacna*, Da C.; *Chama*, L.; *Dimya*, Ron.; *Diceras*, Lk.; *Isocardia*, Lam.; *Hippopodium*, Sow.; *Cardium*, L.; *Corbicula*, Meg.; *Cyrena*, Lk.; *Cyclas*, Brug. (fig. 146); *Pisidium*, Pfr. (figs. 148-153); *Cyprina*, Lam., &c.

Sub-order 2.—*Sinupallia.*

Characters.—Marginal attachment of the mantle to the shell inflected so as to form a sinus into which the pallial siphons can be withdrawn; siphons always present, and large.

Family 6.—*Veneracea.*
Genera: *Cypricardia*, Lam.; *Tapes*, Megl.; *Cyclina*, Desh.; *Cytherea*, Lam. (figs. 125, &c.); *Chione*, Megl.; *Venus*, L.; *Lucinopsis*, F. H.; *Sanguinolaria*, Lam.; *Psammobia*, Lam. (fig. 130); *Tellina*, L.; *Donax*, L.; *Scrobicularia*, Schu.; *Cumingia*, Sow.; *Rangia*, Dsml.; *Mactra*, L. (fig. 140); *Trigonella*, Da C.; *Vaganella*, Gr.; *Lutraria*, Lam.
Family 7.—*Myacea.*
Genera: *Myochama*, Stb.; *Chamostrea*, Rois; *Pandora*, Sol.; *Thracia*, Leach; *Thetis*, Sow.; *Pholadomya*, Sow.; *Corbula*, Brug.; *Mya*, Lam.; *Saxicava*, Fleur; *Panopæa*, Ad.; *Glycimeris*, Lam.; *Siliqua*, Mhlf., &c.; *Solen*, L.
Family 8.—*Pholadacea.*
Genera: *Clavagella*, Lam.; *Aspergillum*, Lam. (figs. 128, 129); *Humphreyia*, Gr.; *Pholas*, L.; *Pholadidea*, Turt.; *Teredo*, L.; *Teredina*, Lam.; *Furcella*, Oken, &c.

Order 2.—Heteromya.

Characters.—Anterior adductor (pallial adductor) much smaller than the posterior adductor (pedal adductor); siphons rarely present.

Family 1.—*Mytilacea.*
Genera: *Mytilus*, L. (fig. 133); *Modiola*, Lam.; *Crenella*, Brown; *Lithodomus*, Cuv.; *Dreissena*, Ben. (fig. 136); *Modiolarca*, Gr., &c.
Family 2.—*Mulleriacea.*
Genera: *Aetheria*, Lam.; *Mulleria*, Fér.

Order 3.—Monomya.

Characters.—Anterior adductor absent in the adult; siphons never developed.

Family 1.—*Aviculacea.*
Genera: *Cardiola*, Brdp.; *Avicula*, Kl.; *Malleus*, Lam.; *Inoceramus*, Sow.; *Crenatula*, Lam.; *Perna*, Brug., &c.
Family 2.—*Ostracea.*
Genera: *Ostrea*, L. (fig. 6); *Anomia*, L.; *Spondylus*, L.; *Plicatula*, Lam.; *Vulsella*, Lam.; *Lima*, Brug.; *Pecten*, L.; *Hiunites*, Dfr., &c.

Further Remarks on the Lamellibranchia.—The Lamellibranchia are the only members of the Lipocephalous branch of Mollusca existing at the present day; and we must suppose that, whilst on the one hand the earliest Glossophorous forms were developing from the archi-Mollusca by the elaboration of the buccal apparatus, the bivalved sessile Lamellibranchs were developing in another direction from univalve cephalophorous ancestors. The large bilobed mantle-flap with its pair of shells covering in the whole animal, the current-producing largely-expanded ctenidia, and the reduced cephalic region are characters which go hand in hand, and were simultaneously acquired, each being related to the development of the others. Unless the "crystalline style" of Lamellibranchs is to be considered as the rudiment of the "radular sac" of Glossophora, as suggested by Balfour, there is no indication whatever that the ancestors of the Lamellibranchia had acquired a representative of the buccal apparatus—so highly developed in Glossophora—before diverging from the archi-Mollusca; that is to say, the common ancestors of the two great branches of Mollusca presented the distinctive character of neither branch—they had not an aborted cephalic region, and they had not a lingual ribbon.

As an example of the organization of a Lamellibranch, we shall review the structure of the Common Pond-Mussel (*Anodonta cygnea*), comparing its structure with those of

veloped only in those few forms which are inequivalve. The typical PERICARDIUM is well developed. It appears, as in other Mollusca, not to be a blood-space although developed from the cœlom, and it communicates with the exterior by the pair of nephridia. As in Cephalopoda (and possibly other Mollusca) water can be introduced through the nephridia into this space. The ALIMENTARY CANAL keeps very nearly to the median vertical plane whilst exhibiting a number of flexures and loopings in this plane. A pair of large glandular outgrowths, the so-called "liver" or great digestive gland, exists as in other Molluscs. A pair of pedal OTOCYSTS, and a pair of OSPHRADIA at the base of the gills, appear to be always present. A typical NERVOUS SYSTEM is present (fig. 144), consisting of a cerebro-pleuro-visceral ganglion-pair, united by connectives to a pedal ganglion-pair and an osphradial ganglion-pair (parieto-splanchnic).

A special cæcum connected with the pharynx is sometimes found, containing a tough flexible cylinder of transparent cartilaginous appearance and unknown significance, called the "crystalline style" (Mactra), which possibly represents the radular sac of Glossophora. In many Lamellibranchs a gland is found on the hinder surface of the foot in the mid line, which secretes a substance which sets into the form of threads—the so-called "byssus"—by means of which the animal can fix itself. Sometimes this gland is found in the young and not in the adult (Anodon, Unio, Cyclas). In some Lamellibranchs (Pecten, Spondylus, Pholas, Mactra, Tellina, Pectunculus, Galeomma, &c.), although cephalic eyes are always absent, special eyes are developed on the free margin of the mantle-skirt, apparently by the modification of tentacles which are commonly found there (fig. 145). The existence of pores in the foot and elsewhere in Lamellibranchia by which liquid can pass into and out of the vascular system, although asserted as in the case of other Mollusca, appears to be improbable. It has yet to be shown by satisfactory microscopic sections that the supposed pores are anything but epidermal glands.

The Lamellibranchia live chiefly in the sea, some in fresh waters. A very few have the power of swimming by opening and shutting the valves of the shell (Pecten, Lima); most can slowly crawl or rapidly burrow; others are, when adult, permanently fixed to stones or rocks either by the shell or the byssus. In development some Lamellibranchia pass through a free-swimming trochosphere stage with præoral ciliated band; other fresh-water forms which carry the young in brood-pouches formed by the ctenidia have suppressed this larval phase.

Further Remarks on the Lamellibranchia.—The Lamellibranchia are the only members of the Lipocephalous branch of Mollusca existing at the present day; and we must suppose that, whilst on the one hand the earliest Glossophorous forms were developing from the archi-Mollusca by the elaboration of the buccal apparatus, the bivalved sessile Lamellibranchs were developing in another direction from univalve cephalophorous ancestors. The large bilobed mantle-flap with its pair of shells covering in the whole animal, the current-producing largely-expanded ctenidia, and the reduced cephalic region are characters which go hand in hand, and were simultaneously acquired, each being related to the development of the others. Unless the "crystalline style" of Lamellibranchs is to be considered as the rudiment of the "radular sac" of Glossophora, as suggested by Balfour, there is no indication whatever that the ancestors of the Lamellibranchia had acquired a representative of the buccal apparatus—so highly developed in Glossophora—before diverging from the archi-Mollusca; that is to say, the common ancestors of the two great branches of Mollusca presented the distinctive character of neither branch—they had not an aborted cephalic region, and they had not a lingual ribbon.

As an example of the organization of a Lamellibranch, we shall review the structure of the Common Pond-Mussel (*Anodonta cygnea*), comparing its structure with those of

that the Monomya have been developed from Isomya-like ancestors, and have lost by atrophy their anterior adductor. The single adductor muscle of the Monomya is separated by a difference of fibre into two portions, but neither of these can be regarded as possibly representing the anterior adductor of the other Lamellibranchs. One of these portions is more ligamentous, and serves to keep the two shells constantly attached to one another, whilst the more fleshy portion serves to close the shell rapidly when it has been gaping.

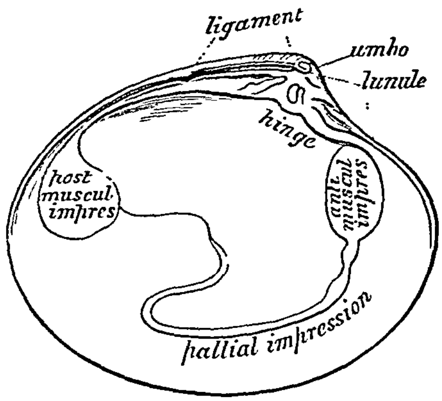

Fig. 127.—Left valve of the same shell from the inner face. (Figs. 125, 126, 127 from Owen.)

In removing the valves of the shell from an Anodon, it is necessary not only to cut through the muscular attachments of the body-wall to the shell but to sever also a *strong elastic ligament, or spring resembling india-rubber*, joining the two shells about the umbonal area. The shell of Anodon does not present these parts in the most strongly marked condition, and accordingly our figures (figs. 125, 126, 127) represent the valves of the Sinupalliate genus Cytherea. The corresponding parts are recognizable in Anodon. Referring to the figures (125, 126) for an explanation of terms applicable to the parts of the valve and the markings on its inner surface—corresponding to the muscular area which we have already noted on the surface of the animal's body—we must specially note here the position of that denticulated thickening of the dorsal margin of the valve which is called the hinge (fig. 127). By this hinge one valve is closely fitted to the other. Below this hinge each shell becomes concave, above it each shell rises a little to form the umbo, and it is into this ridge-like upgrowth of each valve that the elastic ligament or spring is fixed (fig. 127). As shown in the diagram (fig. 127*) representing a transverse section of the two valves of a Lamellibranch, the two shells form a double lever, of which the toothed-hinged is the fulcrum. The adductor muscles placed in the concavity of the shells act upon the long arms of the lever at a mechanical advantage; their contraction keeps the shells shut, and stretches the ligament or spring *h*. On the other hand, the ligament *h* acts upon the short arm formed by the umbonal ridge of the shells; whenever the adductors relax, the elastic substance of the ligament contracts, and the shells gape. It is on this account that the valves of a dead Lamellibranch always gape; the elastic ligament is no longer counteracted by the effort of the adductors. The state of closure of the valves of the shell is not, therefore, one of rest; when it is at rest—that is, when there is no muscular effort—the valves of a Lamellibranch are slightly gaping, and are closed by the action of the adductors when the animal is disturbed. The ligament is simple in Anodon; in many Lamellibranchs it is separated into two layers, an outer and an inner (thicker and denser). That the condition

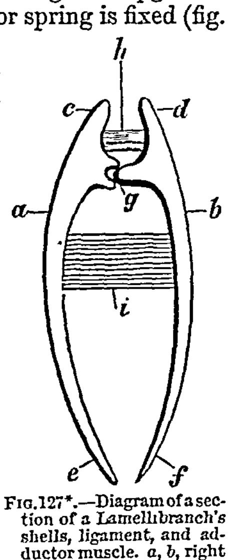

Fig. 127*.—Diagram of a section of a Lamellibranch's shells, ligament, and adductor muscle. *a*, *b*, right and left valves of the shell; *c*, *d*, the umbones or short arms of the lever; *e*, *f*, the long arms of the lever; *g*, the hinge; *h*, the ligament; *i*, the adductor muscle.

of gaping of the shell-valves is essential to the life of the Lamellibranch appears from the fact that food to nourish it, water to aerate its blood, and spermatozoa to fertilize its eggs, are all introduced into this gaping chamber by currents of water, which are set going by the highly-developed ctenidia. The current of water enters into the sub-pallial space at the spot marked *e* in fig. 124, (1), and, after passing as far forward as the mouth *w* in fig. 124, (5), takes an outward course and leaves the sub-pallial space by the upper notch *d*. These notches are known in Anodon as the afferent and efferent siphonal notches respectively, and correspond to the long tube-like afferent inferior and efferent superior "siphons" formed by the mantle in many other Lamellibranchs (fig. 130).

Whilst the valves of the shell are equal in Anodon we find in many Lamellibranchs (Ostræa, Chama, Corbula, &c.) one valve larger, and the other smaller and sometimes flat, whilst the larger shell may be fixed to rock or to stones (Ostræa, &c.). A further variation consists in the development of additional shelly plates upon the dorsal line between the two large valves (Pholadidæ). In *Pholas dactylus* we find a pair of umbonal plates, a dors-umbonal plate and a dorsal plate. It is to be remembered that the whole of the cuticular hard product produced on the dorsal surface and *on the mantle-flaps* is to be regarded as the "shell," of which a median band-like area, the ligament, usually remains uncalcified, so as to result in the production of two valves united by the elastic ligament. But the shelly substance does not always in boring forms adhere to this form after its first growth. In Aspergillum the whole of the tubular mantle area secretes a continuous shelly tube, although in the young condition two valves were present. These are seen (fig. 129) set in the firm substance of the adult tubular shell, which has even replaced the ligament, so that the tube is complete. In Teredo a similar tube is formed as the animal elongates (boring in wood), the original shell-valves not adhering to it but remaining movable and provided with a special muscular apparatus in place of a ligament.

Let us now examine the organs which lie beneath the mantle-skirt of Anodon, and are bathed by the current of water which cir-

culates through it. This can be done by lifting up and throwing back the left half of the mantle-skirt as is represented in fig. 124, (3). We thus expose the plough-like foot (*f*), the two left labial tentacles, and the two left gill-plates or left ctenidium. In fig. 124, (5), one of the labial tentacles *n* is also thrown back so as to show

that the Monomya have been developed from Isomya-like ancestors, and have lost by atrophy their anterior adductor. The single adductor muscle of the Monomya is separated by a difference of fibre into two portions, but neither of these can be regarded as possibly representing the anterior adductor of the other Lamellibranchs. One of these portions is more ligamentous, and serves to keep the two shells constantly attached to one another, whilst the more fleshy portion serves to close the shell rapidly when it has been gaping.

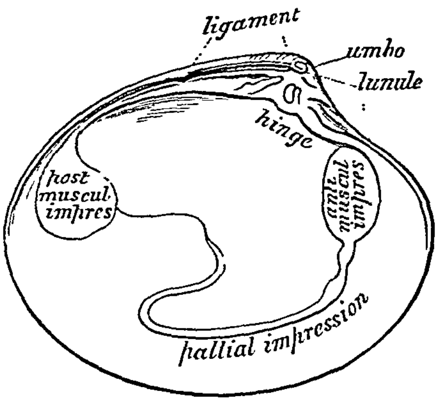

FIG. 127.—Left valve of the same shell from the inner face. (Figs. 125, 126, 127 from Owen.)

In removing the valves of the shell from an Anodon, it is necessary not only to cut through the muscular attachments of the body-wall to the shell but to sever also a strong elastic ligament, or spring resembling india-rubber, joining the two shells about the umbonal area. The shell of Anodon does not present these parts in the most strongly marked condition, and accordingly our figures (figs. 125, 126, 127) represent the valves of the Sinupalliate genus Cytherea. The corresponding parts are recognizable in Anodon. Referring to the figures (125, 126) for an explanation of terms applicable to the parts of the valve and the markings on its inner surface—corresponding to the muscular area which we have already noted on the surface of the animal's body—we must specially note here the position of that denticulated thickening of the dorsal margin of the valve which is called the hinge (fig. 127). By this hinge one valve is closely fitted to the other. Below this hinge each shell becomes concave, *above it each shell rises a* little to form the umbo, and it is into this ridge-like upgrowth of each valve that the elastic ligament or spring is fixed (fig. 127). As shown in the diagram (fig. 127*) representing a transverse section of the two valves of a Lamellibranch, the two shells form a double lever, of which the toothed-hinged is the fulcrum. The adductor muscles placed in the concavity of the shells act upon the long arms of the lever at a mechanical advantage; their contraction keeps the shells shut, and stretches the ligament or spring *h*. On the other hand, the ligament *h* acts upon the short arm formed by the umbonal ridge of the shells; whenever the adductors relax, the elastic substance of the ligament contracts, and the shells gape. It is on this account that the valves of a dead Lamellibranch always gape; the elastic ligament is no longer counteracted by the effort of the adductors. The state of closure of the valves of the shell is not, therefore, one of rest; when it is at rest—that is, when there is no muscular effort—the valves of a Lamellibranch are slightly gaping, and are closed by the action of the adductors when the animal is disturbed. The ligament is simple in Anodon; in many Lamellibranchs it is separated into two layers, an outer and an inner (thicker and denser). That the condition

of gaping of the shell-valves is essential to the life of the Lamellibranch appears from the fact that food to nourish it, water to aerate its blood, and spermatozoa to fertilize its eggs, are all introduced into this gaping chamber by currents of water, which are set going by the highly-developed ctenidia. The current of water enters into the sub-pallial space at the spot marked *e* in fig. 124, (1), and, after passing as far forward as the mouth *w* in fig. 124, (5), takes an outward course and leaves the sub-pallial space by the upper notch *d*. These notches are known in Anodon as the afferent and efferent siphonal notches respectively, and correspond to the long tube-like afferent inferior and efferent superior "siphons" formed by the mantle in many other Lamellibranchs (fig. 130).

Whilst the valves of the shell are equal in Anodon we find in many Lamellibranchs (Ostræa, Chama, Corbula, &c.) one valve larger, and the other smaller and sometimes flat, whilst the larger shell may be fixed to rock or to stones (Ostræa, &c.). A further variation consists in the development of additional shelly plates upon the dorsal line between the two large valves (Pholadidæ). In *Pholas dactylus* we find a pair of umbonal plates, a dors-umbonal plate and a dorsal plate. It is to be remembered that the whole of the cuticular hard product produced on the dorsal surface and on the mantle-flaps is to be regarded as the "shell," of which a median band-like area, the ligament, usually remains uncalcified, so as to result in the production of two valves united by the elastic ligament. But the shelly substance does not always in boring forms adhere to this form after its first growth. In Aspergillum the whole of the tubular mantle area secretes a continuous shelly tube, although in the young condition two valves were present. These are seen (fig. 129) set in the firm substance of the adult tubular shell, which has even replaced the ligament, so that the tube is complete. In Teredo a similar tube is formed as the animal elongates (boring in wood), the original shell-valves *not adhering to it but remaining movable* and provided with a special muscular apparatus in place of a ligament.

Let us now examine the organs which lie beneath the mantle-skirt of Anodon, and are bathed by the current of water which circulates through it. This can be done by lifting up and throwing back the left half of the mantle-skirt as is represented in fig. 124, (3). We thus expose the plough-like foot (*f*), the two left labial tentacles, and the two left gill-plates or left ctenidium. In fig. 124, (5), one of the labial tentacles *n* is also thrown back so as to show

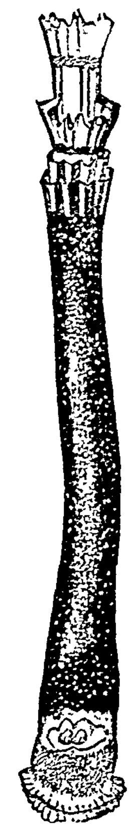

Fig. 128.

doubled on themselves in fact—and thus form an additional row of filaments (see fig. 133, B). Consequently, each primitive filament has a descending and an ascending ramus, and instead of each row forming a simple plate, the plate is double, consisting of a descending and an ascending lamella. As the axis of the ctenidium lies by the side of the body, and is very frequently connate with the body, as so often happens in Gastropods also, we find it convenient to speak of the two plate-like structures formed on each ctenidial axis as the outer and the inner gill-plate; each of these is

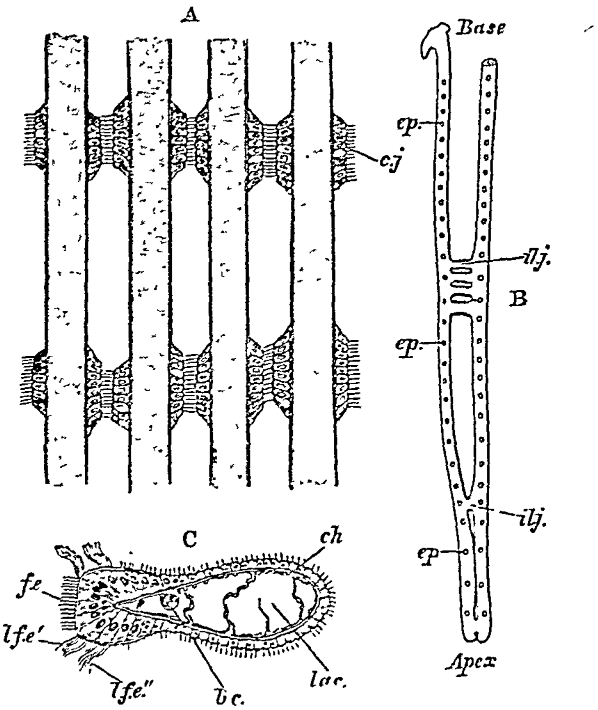

Fig. 133.—Filaments of the ctenidium of *Mytilus edulis* (after Holman Peck). A. Part of four filaments seen from the outer face in order to show the ciliated junctions *c.j.* B. Diagram of the posterior face of a single complete filament with descending ramus and ascending ramus ending in a hook like process. *ep.*, *ep.*, the ciliated junctions; *il.j.*, inter-lamellar junction. C. composed of two lamellæ, an outer (the reflected) and an adaxial in the case of the outer gill-plate, and an adaxial and an inner (the reflected) in the case of the inner gill-plate. This is the condition seen in Arca and Mytilus, the so-called plates dividing upon the slightest touch into their constituent filaments, which are but loosely conjoined by their "ciliated junctions." Complications follow upon this in other forms. Even in Mytilus and Arca a connexion is here and there formed between the ascending and descending rami of a filament by hollow extensible outgrowths called "interlamellar junctions" (*il.j* in B, fig. 133). Nevertheless the filament is a complete tube formed of chitonous substance and clothed externally by ciliated epithelium, internally by endothelium and lacunar tissue—a form of connective tissue—as shown in fig. 133, C. Now let us suppose, as happens in the genus Dreissena—a genus not far removed from Mytilus—that the ciliated inter-filamentar junctions (fig. 136) give place to solid permanent inter-filamentar junctions, so that the filaments are converted, as it were, into a trellis-work. Then let us suppose that the inter-lamellar junctions which we have already noted in Mytilus become very numerous, large, and irregular; by them the two trellis-works of filaments would be united so as to leave only a sponge-like set of spaces between them. Within the trabeculæ of the sponge-work blood circulates, and between the trabeculæ the water passes, having entered by the apertures left in the trellis-work formed by the united gill-filaments (fig. 138, A, B). The larger the intra-lamellar spongy

growth becomes, the more do the original gill-filaments lose the character of blood-holding tubes and tend to become dense elastic rods for the simple purpose of supporting the spongy growth. This is seen both in the section of Dreissena gill (fig. 136) and in those of Anodon (fig. 137, A, B, C). In the drawing of Dreissena the individual filaments *f*, *f*, *f* are cut across in one lamella at the horizon of an inter-filamentar junction, in the other (lower in the figure) at a point where they are free. The chitonous substance *ch* is observed to be greatly thickened as compared with what it is in fig. 133, C, tending in fact to obliterate altogether the lumen of the filament. And in Anodon (fig. 137, C) this obliteration is effected. In Anodon, besides being thickened, the skeletal substance of the filament develops a specially dense rod-like body on each side of each filament. Although the structure of the ctenidium is thus highly complicated in Anodon, it is yet more so in some of the Siphonate genera of Lamellibranchs. The filaments take on a secondary grouping, the surface of the lamella being thrown into a series of half-cylindrical ridges, each consisting of ten or twenty filaments; a filament

doubled on themselves in fact—and thus form an additional row of filaments (see fig. 133, B). Consequently, each primitive filament has a descending and an ascending ramus, and instead of each row forming a simple plate, the plate is double, consisting of a descending and an ascending lamella. As the axis of the ctenidium lies by the side of the body, and is very frequently connate with the body, as so often happens in Gastropods also, we find it convenient to speak of the two plate-like structures formed on each ctenidial axis as the outer and the inner gill-plate; each of these is

growth becomes, the more do the original gill-filaments lose the character of blood-holding tubes and tend to become dense elastic rods for the simple purpose of supporting the spongy growth. This is seen both in the section of Dreissena gill (fig. 136) and in those of Ano[illegible] (fig. 137, A, B, C). In the drawing of Dreissena th[illegible] individual filaments *f*, *f*, *f* are cut across in one lamella a[illegible] the horizon of an inter-filamentar junction, in the othe[illegible] (lower in the figure) at a point where they are free. [illegible] chitonous substance *ch* is observed to be greatly thicken[illegible] as compared with what it is in fig. 133, C, tending [illegible] fact to obliterate altogether the lumen of the filament. And in Anodon (fig. 137, C) this obliteration is effected. I[illegible] Anodon, besides being thickened, the skeletal substance [illegible] the filament develops a specially dense rod-like body o[illegible] each side of each filament. Although the structure of th[illegible] ctenidium is thus highly complicated in Anodon, it is [illegible] more so in some of the Siphonate genera of Lamellibranc[illegible] The filaments take on a secondary grouping, the surface o[illegible] the lamella being thrown into a series of half-cylindri[illegible] ridges, each consisting of ten or twenty filaments; a filamen[illegible]

get the arrangement shown diagrammatically in fig. 135, C, and more correctly in fig. 142. In this region the inner lamellæ of the inner gill-plates are no longer affixed to the foot. Passing still further back behind the foot, we find

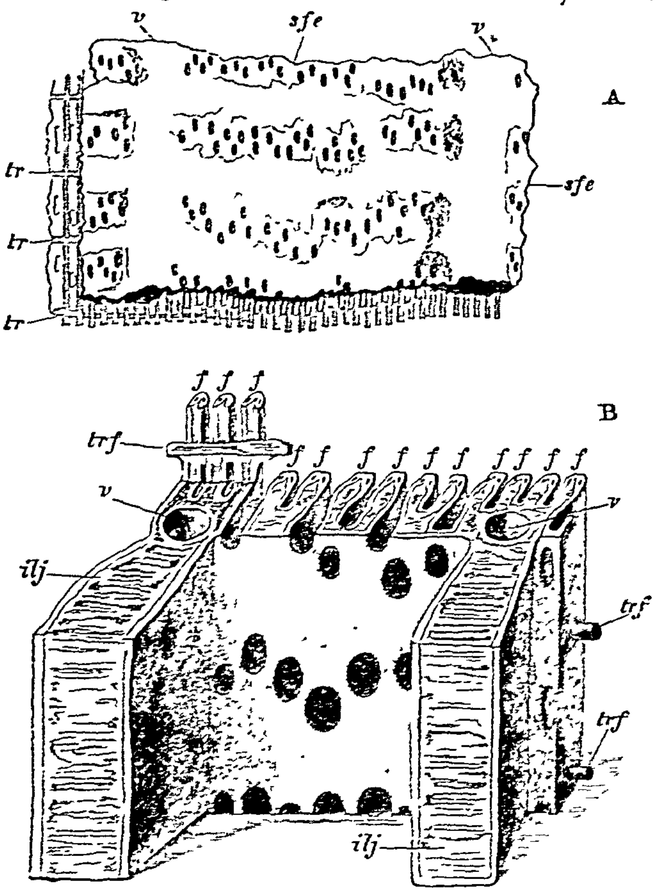

FIG. 138.—Gill-lamellæ of Anodon (after Peck). A. Fragment of the outer lamella of an inner gill-plate torn from the connected inner lamella, the sub-filamentar tissue also partly cut away round the edges so as to expose the filaments, their transverse junctions *tr*, and the "windows" left in the lattice-work; *sfe*, internal surface of the lamella; *v*, vessel. B. Diagram of a block cut from the outer lamella of the outer gill-plate and seen from the inter-lamellar surface (after Peck). *f*, constituent filaments; *trf*, fibrous tissue of the transverse inter-filamentar junctions; *v*, blood-vessel; *ilj*, inter-lamellar junction. The series of oval holes on the back of the lamella are the water-pores which open between the filaments in irregular rows separated horizontally by the transverse inter-filamentar junctions.

in Anodon the condition shown in the section D, fig. 135. The axes *i* are now free; the outer lamellæ of the outer gill-plates (*er*) still adhere by concrescence to the mantle-skirt, whilst the inner lamellæ of the inner gill-plates meet one another and fuse by concrescence at *g*. In the lateral view of the animal with reflected mantle-skirt and gill-plates, the line of concrescence of the inner lamellæ of the inner gill-plates is readily

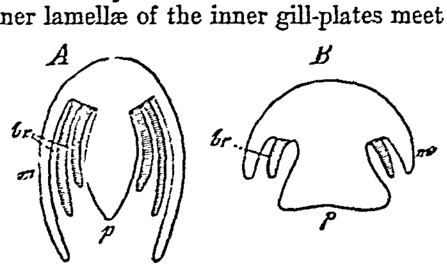

FIG. 139.—Transverse sections of *A*, a Lamellibranch, and *B*, an Isopleurous Gastropod (Chiton), to show the relations of *p*, the foot; *br*, the branchiæ; and *m*, the mantle. (From Gegenbaur.)

seen; it is marked *aa* in fig. 124, (5). In the same figure the free part of the inner lamella of the inner gill-plate resting on the foot is marked *z*, whilst the attached part—the most anterior—has been snipped with scissors so as to show the genital and nephridial apertures *x* and *y*. The concrescence, then, of the free edge of the reflected lamellæ of the gill-plates of Anodon is very extensive. It is important, because such a concrescence is by no means universal, and does not occur, for example, in Mytilus or in Arca; further, because when its occurrence is once appreciated, the reduction of the gill-plates of Anodon to the plume-type of the simplest ctenidium presents no difficulty; and, lastly, it has importance in reference to its physiological significance. The mechanical result of the concrescence of the outer lamellæ to the mantle-flap, and of the inner lamellæ to one another as shown in section D, fig. 135, is that the sub-pallial space is divided into two spaces by a horizontal septum. The upper space (*i*) communicates with the outer world by the excurrent or superior siphonal notch of the mantle (fig. 124, *d*); the lower space communicates by the lower siphonal notch (*e* in fig. 124). The only communication between the two spaces, excepting through the trellis-work of the gill-plates, is by the slit (*z* in fig. 124, (5)) left by the non-concrescence of a part of the inner lamella of the inner gill-plate with the foot. A probe (*g*) is introduced through this slit-like passage, and it is seen to pass out by the excurrent siphonal notch. It is through this passage, or indirectly through the pores of the gill-plates, that the water introduced into the lower sub-pallial space must pass on its way to the excurrent siphonal notch. Such a subdivision of the pallial chamber, and direction of the

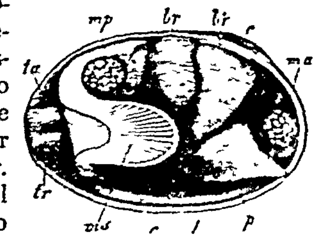

FIG. 140.—Lateral view of a Mactra, the right valve of the shell and right mantle-flap removed, and the siphons retracted. *br*, *br'*, outer and inner gill-plates; *t*, labial tentacle; *ta*, *tr*, upper and lower siphons; *ms*, siphonal muscle of the mantle flap; *ma*, anterior adductor muscle; *mp*, posterior adductor muscle; *p*, foot; *c*, umbo. (From Gegenbaur.)

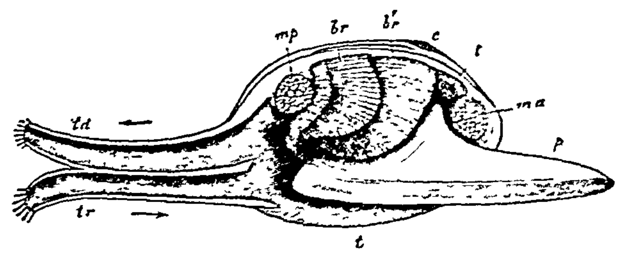

FIG. 141.—The same animal as fig. 140, with its foot and siphons expanded. Letters as in fig. 140. (From Gegenbaur.)

currents set up within it do not exist in a number of Lamellibranchs which have the gill-lamellæ comparatively free (Mytilus, Arca, Trigonia, &c.), and it is in these f[illegible] that there is least modification by concrescence of the pri[illegible] mary filamentous elements of the lamellæ. Probably th[illegible] gill-structure of Lamellibranchs will ultimately fu[illegible] some classificatory characters of value when they ha[illegible] been thoroughly investigated throughout the class.

The alimentary canal of Anodon is shown in fig. 124, (4[illegible] The mouth is placed between the anterior adductor an[illegible] the foot; the anus opens on a median papilla overlyin[illegible] the posterior adductor, and discharges into the superio[illegible] pallial chamber along which the excurrent stream passes The coil of the intestine in Anodon is similar to that [illegible] other Lamellibranchs, but the crystalline style and [illegible] diverticulum are not present here. The rectum traver[illegible] the pericardium, and has the ventricle of the heart wrap[illegible] as it were, around it. This is not an unusual arrangeme[illegible] in Lamellibranchs, and a similar disposition occurs in [illegible] Gastropoda (Haliotis). A pair of ducts (*ai*) lead from t[illegible] first enlargement of the alimentary tract called stoma[illegible] into a pair of large digestive glands, the so-called li[illegible] the branches of which are closely packed in this regi[illegible] (*af*). The food of the Anodon, as of other Lamellibranch[illegible] consists of microscopic animal and vegetable organism[illegible] which are brought to the mouth by the stream which se[illegible] into the sub-pallial chamber at the lower siphonal not[illegible] (*e* in fig. 124). Probably a straining of water from sol[illegible]

get the arrangement shown diagrammatically in fig. 135, C, and more correctly in fig. 142. In this region the inner lamellæ of the inner gill-plates are no longer affixed to the foot. Passing still further back behind the foot, we find

in Anodon the condition shown in the section D, fig. 135. The axes *i* are now free; the outer lamellæ of the outer gill-plates (*er*) still adhere by concrescence to the mantle-skirt, whilst the inner lamellæ of the inner gill-plates meet one another and fuse by concrescence at *g*. In the lateral view of the animal with reflected mantle-skirt and gill-plates, the line of concrescence of the inner lamellæ of the inner gill-plates is readily

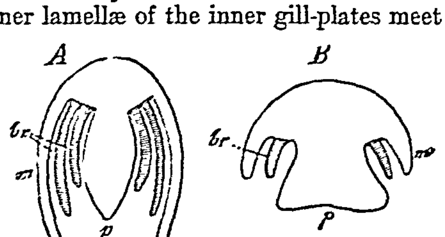

FIG. 139.—Transverse sections of *A*, a Lamellibranch, and *B*, an Isopleurous Gastropod (Chiton), to show the relations of *p*, the foot; *br*, the branchiæ; and *m*, the mantle. (From Gegenbaur.)

seen; it is marked *aa* in fig. 124, (5). In the same figure the free part of the inner lamella of the inner gill-plate resting on the foot is marked *z*, whilst the attached part—the most anterior—has been snipped with scissors so as to show the genital and nephridial apertures *x* and *y*. The concrescence, then, of the free edge of the reflected lamellæ of the gill-plates of Anodon is very extensive. It is important, because such a concrescence is by no means universal, and does not occur, for example, in Mytilus or in Arca; further, because when its occurrence is once appreciated, the reduction of the gill-plates of Anodon to the plume-type of the simplest ctenidium presents no difficulty; and, lastly, it has importance in reference to its physiological significance. The mechanical result of the concrescence of the outer lamellæ to the mantle-flap, and of the inner lamellæ to one another as shown in section D, fig. 135, is that the sub-pallial space is divided into two spaces by a horizontal septum. The upper space (*t*) communicates with the outer world by the excurrent or superior siphonal notch of the mantle (fig. 124, *d*); the lower space communicates by the lower siphonal notch (*e* in fig. 124). The only communication between the two spaces, excepting through the trellis-work of the gill-plates, is by the slit (*z* in fig. 124, (5)) left by the non-concrescence of a part of the inner lamella of the inner gill-plate with the foot. A probe (*g*) is introduced through this slit-like passage, and it is seen to pass out by the excurrent siphonal notch. It is through this passage, or indirectly through the pores of the gill-plates, that the water introduced into the lower sub-pallial space must pass on its way to the excurrent siphonal notch. Such a subdivision of the pallial chamber, and direction of the

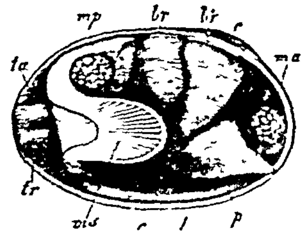

FIG. 140.—Lateral view of a Mactra, the right valve of the shell and right mantle-flap removed, and the siphons retracted. *br*, *br'*, outer and inner gill-plates; *t*, labial tentacle; *ta*, *tr*, upper and lower siphons; *mr*, siphonal muscle of the mantle flap; *ma*, anterior adductor muscle; *mp*, posterior adductor muscle; *p*, foot; *c*, umbo. (From Gegenbaur.)

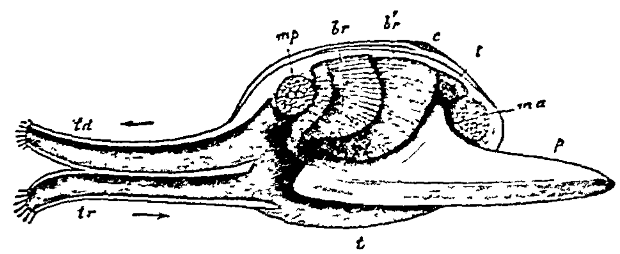

FIG. 141.—The same animal as fig. 140, with its foot and siphons expanded. Letters as in fig. 140. (From Gegenbaur.)

currents set up within it do not exist in a number of Lamellibranchs which have the gill-lamellæ comparatively free (Mytilus, Arca, Trigonia, &c.), and it is in these f[illegible] that there is least modification by concrescence of the pri mary filamentous elements of the lamellæ. Probably th gill-structure of Lamellibranchs will ultimately fu[illegible] some classificatory characters of value when they ha been thoroughly investigated throughout the class.

The alimentary canal of Anodon is shown in fig. 124, (4) The mouth is placed between the anterior adductor an the foot; the anus opens on a median papilla overlyin the posterior adductor, and discharges into the superio pallial chamber along which the excurrent stream passes The coil of the intestine in Anodon is similar to that [illegible] other Lamellibranchs, but the crystalline style and diverticulum are not present here. The rectum traver[illegible] the pericardium, and has the ventricle of the heart wrap[illegible] as it were, around it. This is not an unusual arrangeme in Lamellibranchs, and a similar disposition occurs in [illegible] Gastropoda (Haliotis). A pair of ducts (*ai*) lead from th first enlargement of the alimentary tract called stomac into a pair of large digestive glands, the so-called li[illegible] the branches of which are closely packed in this regic (*af*). The food of the Anodon, as of other Lamellibranch consists of microscopic animal and vegetable organism which are brought to the mouth by the stream which se into the sub-pallial chamber at the lower siphonal notc (*e* in fig. 124). Probably a straining of water from soli

mouth (fig. 144, B, *a*) and connected in front of it by a commissure, are the representatives of the cerebral, pleural, and visceral ganglia of the typical Mollusc, which are not here differentiated as they are in Gastropods (compare, however, fig. 67). A pair placed close together in the foot (fig. 144, B, *b*, and fig. 124, (6), *ax*) are the typical *pedal ganglia; they* are joined to the cerebro-pleuro-visceral ganglia by connectives.

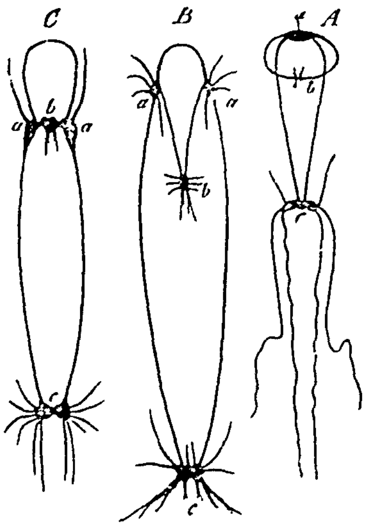

FIG 144.—Nerve ganglia and cords of three Lamellibranchs (from Gegenbaur): *A*, of Teredo; *B*, of Anodonta; *C*, of Pecten. *a*, cerebral ganglion pair (=cerebro pleuro visceral); *b*, pedal ganglion-pair; *c*, olfactory (osphradial) ganglion pair.

Posteriorly beneath the posterior adductors, and covered only by a thin layer of elongated epidermal cells, are the olfactory ganglia, their epidermal clothing constituting the pair of osphradia, which are thus seen in Lamellibranchs to occupy their typical position and to have the typical innervation,—the nerve to each osphradium being given off by the visceral ganglion—that is to say, by the undifferentiated cerebro-pleuro-visceral ganglion of its proper side. This identification of the posterior ganglion-pair of Lamellibranchs is due to Spengel (11). Other

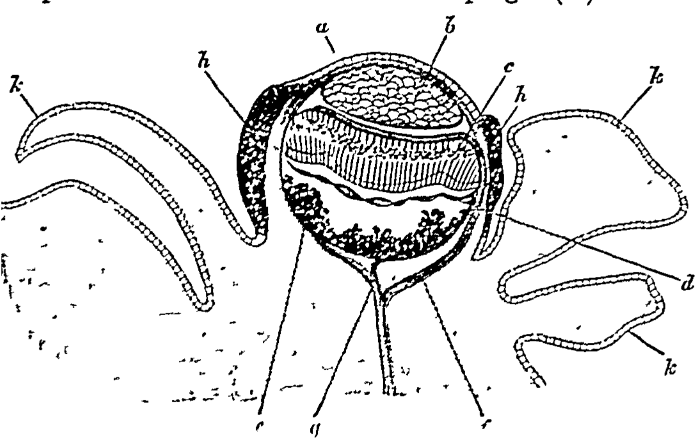

FIG 145.—Pallial eye of Spondylus (from Hickson) *a*, præ-corneal epithelium; *b*, cellular lens; *c*, retinal body; *d*, tapetum; *e*, pigment; *f*, retinal nerve; *g*, complementary nerve; *h*, epithelial cells filled with pigment; *k*, tentacle

anatomists have considered this ganglion-pair as corresponding to either the pleural or the visceral of Gastropoda, or to both, and very usually it is termed "the parieto-splanchnic" (Huxley).

The sense-organs of Anodon other than the osphradia consist of a pair of otocysts attached to the pedal ganglia (fig. 124, (6), *ay*). The otocysts of Cyclas are peculiarly favourable for study on account of the transparency of the small foot in which they lie, and may be taken as typical of those of Lamellibranchs generally. The structure of one is exhibited in fig. 146. A single otolith is present as in the veliger embryos of Opisthobranchia. In adult Gastropoda there are frequently a large number of rod-like otoliths instead of one.

Anodon has no eyes of any sort, and the tentacles on the mantle edge are limited to its posterior border. This deficiency is very usual in the class; at the same time, many Lamellibranchs have tentacles on the edge of the mantle supplied by a pair of large well-developed nerves, which are given off from the cerebro-pleuro-visceral ganglion-pair, and very frequently some of these tentacles have undergone a special metamorphosis converting them into highly-organized eyes. Such eyes on the mantle-edge are found in Pecten, Spondylus, Lima, Ostrea (?), Pinna, Pectunculus, Modiola, Mytilus (?), Cardium, Tellina, Mactra, Venus, Solen, Pholas, and Galeomma. They are totally distinct from the cephalic eyes of typical Mollusca, and have a different structure and historical development. They have not originated as pits but as tentacles. They agree with the dorsal eyes of Onchidium (Pulmonata) in the curious fact that the optic nerve penetrates the capsule of the eye and passes in front of the retinal body (fig. 145), so that its fibres join the anterior faces of the nerve-end cells as in Vertebrates, instead of their posterior faces as in the cephalic eyes of Mollusca and Arthropoda; moreover, the lens is not a cuticular product but a cellular structure, which, again, is a feature of agreement with the Vertebrate eye. It must, however, be distinctly borne in mind that there is a fundamental difference between the eye of Vertebrates and of all other groups in the fact that in the Vertebrata the retinal body is itself a part of the central nervous system, and not a separate modification of the epidermis—myelonic as opposed to epidermic. The structure of the reputed eyes of several of the above-named genera has not been carefully examined. In Pecten and Spondylus, however, they have been fully studied (see fig. 145, and explanation).

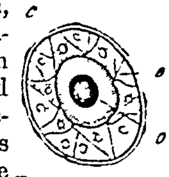

FIG 146.—Otocyst of Cyclas (from Gegenbaur) *c*, capsule, *e*, ciliated cells lining the same, *o*, otolith.

The gonads of Anodon are placed in distinct male and female individuals. In some Lamellibranchs—for instance, the European Oyster and the *Pisidium pusillum*—the sexes are united in the same individual; but here, as in most hermaphrodite animals, the two sexual elements are not ripe in the same individual at the same moment. It has been conclusively shown that the *Ostrea edulis* does not fertilize itself. The American Oyster (*O. virginiana*) and the Portuguese Oyster (*O. angulata*) have the sexes separate, and fertilization is effected in the open water after the discharge of the ova and the spermatozoa from the females and males respectively. In the *Ostrea edulis* fertilization of the eggs is effected at the moment of their escape from the uro-genital groove, or even before, by means of spermatozoa drawn into the sub-pallial chamber by the incurrent ciliary stream, and the embryos pass through the early stages of development whilst entangled between the gill-lamellæ of the female parent (fig. 6). In Anodon the eggs pass into the space between the two lamellæ of the outer gill-plate, and are there fertilized, and advance whilst

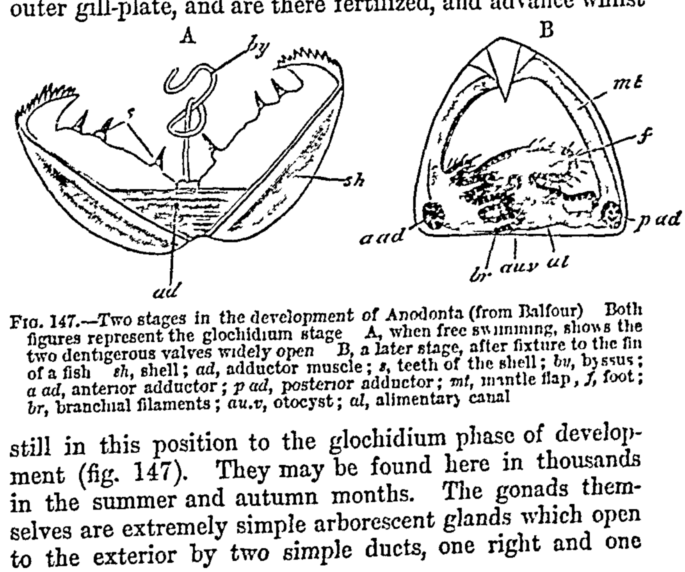

FIG. 147.—Two stages in the development of Anodonta (from Balfour) Both figures represent the glochidium stage A, when free swimming, shows the two dentigerous valves widely open B, a later stage, after fixture to the fin of a fish *sh*, shell; *ad*, adductor muscle; *s*, teeth of the shell; *by*, byssus; *a ad*, anterior adductor; *p ad*, posterior adductor; *mt*, mantle flap; *f*, foot; *br*, branchial filaments; *au.v*, otocyst; *al*, alimentary canal

still in this position to the glochidium phase of development (fig. 147). They may be found here in thousands in the summer and autumn months. The gonads themselves are extremely simple arborescent glands which open to the exterior by two simple ducts, one right and one

mouth (fig. 144, B, *a*) and connected in front of it by a commissure, are the representatives of the cerebral, pleural, and visceral ganglia of the typical Mollusc, which are not here differentiated as they are in Gastropods (compare, however, fig. 67). A pair placed close together in the foot (fig. 144, B, *b*, and fig. 124, (6), *ax*) are the typical pedal ganglia; they are joined to the cerebro-pleuro-visceral ganglia by connectives.

In Anodon the eggs pass into the space between the two lamellæ of the outer gill-plate, and are there fertilized, and advance whilst

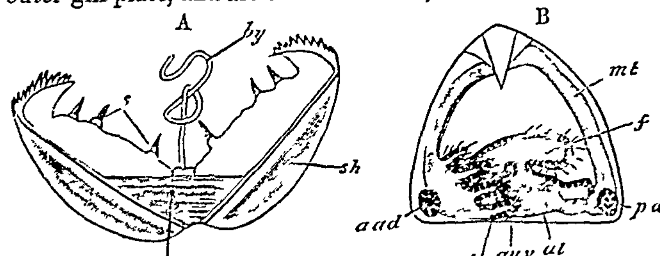

FIG. 147.—Two stages in the development of Anodonta (from Balfour) Both figures represent the glochidium stage A, when free swimming, shows the two dentigerous valves widely open B, a later stage, after fixture to the fin of a fish *sh*, shell; *ad*, adductor muscle; *s*, teeth of the shell; *by*, byssus; *a ad*, anterior adductor; *p ad*, posterior adductor; *mt*, mantle flap, *f*, foot; *br*, branchial filaments; *au.v*, otocyst; *al*, alimentary canal

still in this position to the glochidium phase of development (fig. 147). They may be found here in thousands in the summer and autumn months. The gonads themselves are extremely simple arborescent glands which open to the exterior by two simple ducts, one right and one

The embryonic cells continue to divide, and form an oval vesicle containing liquid (fig. 149); within this, at one pole, is seen the mass of invaginated cells (fig. 150, *hy*). These invaginated cells are the arch-enteron; they proliferate and give off branching cells, which apply themselves (fig. 150, C) to the inner face of the vesicle, thus forming the meso-

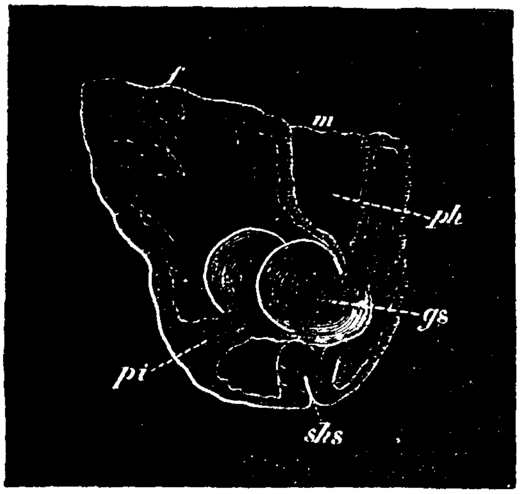

FIG. 152.—Diagram of embryo of Pisidium in the same stage as E in fig. 151. *m*, mouth; *f*, foot; *ph*, pharynx; *gs*, met-enteron; *pi*, rectal peduncle or pedicle of invagination; *shs*, shell-gland. (From Lankester.)

blast or cœlomic outgrowths. The outer single layer of cells which constitutes the surface of the vesicle (fig. 147) is the ectoderm or epiblast or deric cell-layer. The little mass of hypoblast or enteric cell-mass now enlarges, but remains connected with the cicatrix of the blastopore or orifice of invagination by a stalk, the rectal peduncle (fig. 151, A, *rp*). The enteron itself becomes bilobed and is joined by a new invagination, that of the mouth and stomodæum, *ph*. Fig. 151, B shows the origin of the mouth *o*, being a deeper view of the same specimen in the same position which is drawn in fig. 151, A. The mesoblast multiplies its cells, which become partly muscular and partly skeleto-trophic. Centro-dorsally now appears the embryonic shell-gland (fig. 151, C, *sh*). The pharynx or stomodæum is still small, the foot not yet prominent. A later stage is seen in fig. 152, where the pharynx is widely open and the foot prominent. No ciliated velum or præ-oral (cephalic) lobe ever develops. The shell-gland disappears, the mantle-skirt is raised as a ridge (fig. 151, E, *mn*), the paired shell-valves are secreted, the anus opens by a proctodæal ingrowth into the rectal peduncle, and the rudiments of the gills (*br*) and of the nephridia (B) appear (figs. 151, F, and 153, dorsal and lateral views of same stage), and thus the chief organs and general form of the adult are

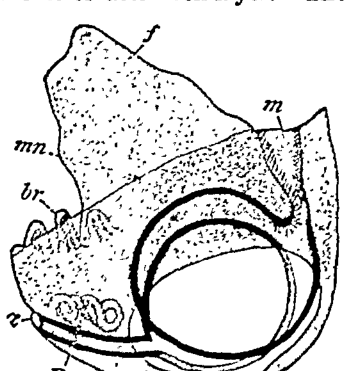

FIG. 153.—Diagram of embryo of Pisidium, in same stage as F in fig. 151 (after Lankester). *m*, mouth; *z*, anus; *f*, foot; *br*, branchial filaments; *mn*, margin of the mantle-skirt; *B*, organ of Bojanus (nephridium). The unshaded area gives the position of the shell-valve.

acquired. Later changes, not drawn here, consist in the growth of the shell-valves over the whole area of the mantle-flaps, and in the multiplication of the gill-filaments and their consolidation to form gill-plates. It is important to note that the gill-filaments are formed one by one *posteriorly*. The labial tentacles are formed late. In the allied genus Cyclas, a byssus gland is formed in the foot and subsequently disappears, but no such gland occurs in Pisidium. The nerve-ganglia and the otocysts probably form from thickenings of the epiblast, but detailed observation on this and other points of histogenesis in the Lamellibranchia is still wanting.

MOLLUSCOIDS. See BRACHIOPODA and POLYZOA.

MOLOCH, or MOLECH—in Hebrew, with the doubtful exception of 1 Kings xi. 7, always הַמֹּלֶךְ with the article—is the name or title of the divinity which the men of Judah in the last ages of the kingdom were wont to propitiate by the sacrifice of their own children. The phrase employed in speaking of these sacrifices is "to make one's son or daughter pass through fire to the Moloch" (2 Kings xxiii.

The embryonic cells continue to divide, and form an oval vesicle containing liquid (fig. 149); within this, at one pole, is seen the mass of invaginated cells (fig. 150, *hy*). These invaginated cells are the arch-enteron; they proliferate and give off branching cells, which apply themselves (fig. 150, C) to the inner face of the vesicle, thus forming the meso-

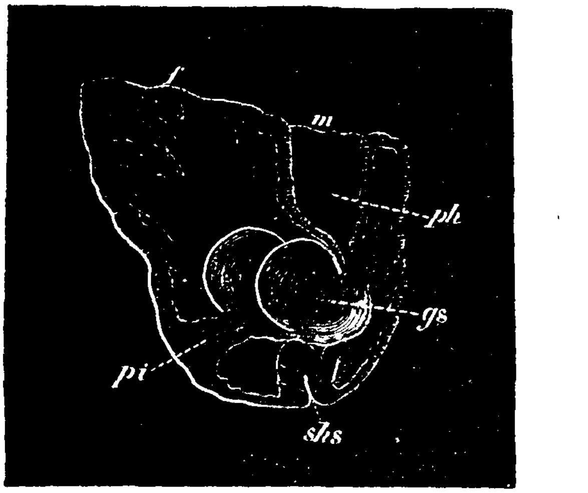

FIG. 152.—Diagram of embryo of Pisidium in the same stage as E in fig. 151. *m*, mouth; *f*, foot; *ph*, pharynx; *gs*, met-enteron; *pi*, rectal peduncle or pedicle of invagination; *shs*, shell-gland. (From Lankester.)

blast or cœlomic outgrowths. The outer single layer of cells which constitutes the surface of the vesicle (fig. 147) is the ectoderm or epiblast or deric cell-layer. The little mass of hypoblast or enteric cell-mass now enlarges, but remains connected with the cicatrix of the blastopore or orifice of invagination by a stalk, the rectal peduncle (fig. 151, A, *rp*). The enteron itself becomes bilobed and is joined by a new invagination, that of the mouth and stomodæum, *ph*. Fig. 151, B shows the origin of the mouth *o*, being a deeper view of the same specimen in the same position which is drawn in fig. 151, A.

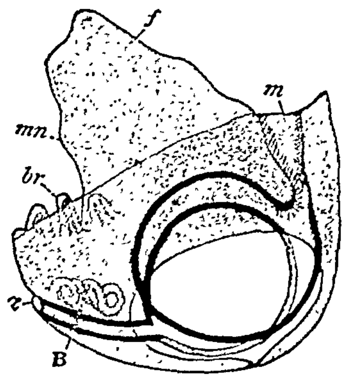

FIG. 153.—Diagram of embryo of Pisidium, in same stage as F in fig. 151 (after Lankester). *m*, mouth; *x*, anus; *f*, foot; *br*, branchial filaments; *mn*, margin of the mantle-skirt; *B*, organ of Bojanus (nephridium). The unshaded area gives the position of the shell-valve.

The mesoblast multiplies its cells, which become partly muscular and partly skeleto-trophic. Centro-dorsally now appears the embryonic shell-gland (fig. 151, C, *sh*). The pharynx or stomodæum is still small, the foot not yet prominent. A later stage is seen in fig. 152, where the pharynx is widely open and the foot prominent. No ciliated velum or præ-oral (cephalic) lobe ever develops. The shell-gland disappears, the mantle-skirt is raised as a ridge (fig. 151, E, *mn*), the paired shell-valves are secreted, the anus opens by a proctodæal ingrowth into the rectal peduncle, and the rudiments of the gills (*br*) and of the nephridia (B) appear (figs. 151, F, and 153, dorsal and lateral views of same stage), and thus the chief organs and general form of the adult are acquired. Later changes, not drawn here, consist in the growth of the shell-valves over the whole area of the mantle-flaps, and in the multiplication of the gill-filaments and their consolidation to form gill-plates. It is important to note that the gill-filaments are formed one by one *posteriorly*. The labial tentacles are formed late. In the allied genus Cyclas, a byssus gland is formed in the foot and subsequently disappears, but no such gland occurs in Pisidium. The nerve-ganglia and the otocysts probably form from thickenings of the epiblast, but detailed observation on this and other points of histogenesis in the Lamellibranchia is still wanting.

MOLLUSCOIDS. See BRACHIOPODA and POLYZOA.

MOLOCH, or MOLECH—in Hebrew, with the doubtful exception of 1 Kings xi. 7, always הַמֹּלֶךְ with the article—is the name or title of the divinity which the men of Judah in the last ages of the kingdom were wont to propitiate by the sacrifice of their own children. The phrase employed in speaking of these sacrifices is "to make one's son or daughter pass through fire to the Moloch" (2 Kings xxiii.

thus distributed over an area measuring about 450 miles from east to west, and about 800 from north to south, and include—(1) the Moluccas proper or Ternate group, of which Jilolo is the largest and Ternate the capital; (2) the Batchian, Obi, and Sula groups; (3) the Ambon or Amboyna group, of which Ceram (Serang) and Buru are the largest; (4) the Banda Islands (the spice or nutmeg islands *par excellence*), of which Lantoir or Great Banda is the largest, and Neira politically the most important; (5) the south-eastern islands, comprising Tenimber or Timor-Laut, Larat, &c.; (6) the Kei Islands and the Aru Islands, of which the former are sometimes attached to the south-eastern group; and (7) the south-western islands or the Babber, Sermatta, Letti, Wetter, Roma, and Damme groups. At the close of the 16th century this part of the archipelago was divided among four rulers settled at Ternate, Tidore, Jilolo, and Batchian. The northern portion belongs to the Dutch residentship of Ternate, the southern portion to that of Amboyna.

The name Moluccas seems to be probably derived from the Arabic for "king." Argensola (1609) uses the forms *islas Malucas*, *Maluco*, and *el Maluco*; Coronel (1623), *islas del Moluco*; and Camoens, *Maluco*.

Compare the articles on INDIAN ARCHIPELAGO, ARU ISLANDS, JILOLO, TERNATE, &c., and J. J. de Hollander, *Handleiding bij de Beoefening der Land- en Volkenkunde van Ned. Oost. Indië*, Breda, 1877 and 1882.

MOLYBDENUM, one of the rarer metallic elements (symbol for atomic weight, Mo = 96; H = 1), occurs in nature chiefly in the two forms of Yellow Lead Ore ($PbOMoO_3$) and Molybdenite (MoS_2). The latter mineral is very similar in appearance and in mechanical properties to graphite or black lead, and, in fact, was long confounded with it chemically, until Scheele in 1778 and 1779 proved their difference by showing that only the mineral now called molybdenite yields a white earth on oxidation. The metallic radical of the earth, after its discovery by Hjelm, was called molybdenum, from μόλυβδος, lead.

By heating molybdenite in a combustion tube in a current of air, we obtain the trioxide MoO_3 (molybdic acid) as a white crystalline sublimate. This substance, when heated to redness in close vessels, fuses without much volatilization into a yellow liquid, which, on cooling, freezes into a crystalline radiated mass of 4·39 specific gravity. It dissolves in 500 parts of cold, and in 960 of hot water. It dissolves readily in aqueous ammonia or alkalies, forming *molybdates*. Like silica, it combines with bases in a great variety of proportions. Of these many salts, an ammonia salt of the composition $3(NH_4)_2O \cdot 7MoO_3 + 4H_2O$ (known in laboratory parlance simply as molybdate of ammonia) is the most important, affording, as it does, the most delicate, characteristic, and widely applicable precipitant for ortho-phosphoric acid. To detect phosphoric acid in any substance soluble in water or nitric acid, add first to a solution of molybdate of ammonia an excess of nitric acid, and then (not too much) of the nitric solution of the phosphate, and keep the mixture at 40° C.; the whole of the phosphoric acid gradually separates out in the shape of a canary-yellow crystalline precipitate of "*phospho-molybdate of ammonia*," of the composition

$$\left.\begin{array}{l}24MoO_3 \cdot P_2O_5 \cdot 3(NH_4)_2O \\ +24MoO_3 \cdot P_2O_5 \cdot 2(NH_4)_2O \cdot H_2O\end{array}\right\} + 16H_2O$$

(according to Gibbs), which is insoluble in the reagent, even in the presence of dilute nitric acid, but soluble in excess of phosphoric acid. By treatment of this complex ammonia salt with aqua regia we can eliminate its acid $24MoO_3 \cdot P_2O_5 \cdot 3H_2O$ as a substance soluble in water and crystallizing from this solution with 59 molecules of water.

This phospho-molybdic acid plays a great part in chemical toxicology, being a generically characteristic precipitant for all (organic) alkaloids, which combine with it, pretty much as ammonia does, into precipitates insoluble in dilute mineral acids. A solution of the acid sufficient for this purpose may be obtained by saturating carbonate of soda solution with molybdic acid, adding phosphate of soda, one part for every five of MoO_3, evaporating to dryness, fusing, dissolving in water, filtering, and adding nitric acid until the liquid becomes yellow.

Metallic molybdenum is obtained by reduction of the trioxide in hydrogen gas at very high temperatures. It is thus obtained in small crystalline granules which are infusible even in the oxy-hydrogen flame. An alloy of the metal with four or five per cent. of carbon (formerly accepted as molybdenum) fuses in the oxy-hydrogen flame into a silver-white metal, of 8·6 specific gravity, which is harder than topaz (Debray).

Analysis.—Molybdenum in all its forms is readily converted into molybdic acid by oxidizing agents, such as nitric acid; or if in non-volatile forms into alkaline molybdate by fusion with carbonate of alkali and nitre. Alkaline molybdate is soluble in water; the solution, on a gradual addition of hydrochloric acid, gives first a white precipitate, which then dissolves in the excess of acid. When a piece of zinc is added to such a solution, the latter, through gradual reduction of its MoO_3 to lower oxides, assumes first a blue, then a green, and lastly a deep blackish-brown colour. Molybdic acid colours the blowpipe flame yellowish green. It dissolves in fused borax, forming a bead which in the oxidizing flame becomes yellow in the heat, but almost colourless on cooling; the reducing flame colours it dark brown, and may cause the separation of brown flakes of MoO_2. Compare CHEMISTRY, vol. v. pp. 541, 542.

MOMBASA, or less correctly MOMBAS, the *Mwita* of the Sawahili, a town on the east coast of Africa, in 4° 4′ S. lat., with the best harbour on all the Zanzibar mainland. The coralline island of which it occupies the eastern portion is 3 miles long by 2½ broad, and lies in the middle of a double inlet of the sea stretching northward into Port Tudor (so called after the English officer who surveyed it) and westward into Port Reitz (after the English resident who died while exploring the Pangani river in 1823). Except at the western end, the coast of the island consists of cliffs from 40 to 60 feet high. In the vicinity of the town palms, mangoes, guavas, baobabs, and cinnamon-trees flourish abundantly, and farther to the west are stretches of virgin forest, the haunt of monkeys, wild hogs, and hyænas. The citadel, originally constructed by Xeixas and Cabrera in 1635, still remains in good condition, "a picturesque yellow pile with long buttressed curtains," but has preserved little of its Portuguese architecture. Of the twenty Portuguese churches which Mombasa once contained, only two or three can be identified. A few of the houses are built of stone, but most of them are mere thatched huts. The population in 1844 was, according to Dr Krapf, from 8000 to 10,000, mostly Wasawahili, but with a considerable number of Arabs and some thirty or forty Banyans. In 1857 Burton estimated the inhabitants at 8000 to 9000, and in 1883 they numbered about 20,000. The Arabs, the Wamwita, and the Wakilindini (the two divisions of the Wasawahili residents, of which the former is the original stock) have each their own chief. In 1875-76 the Church Missionary Society, which made Mombasa one of its stations in 1844, established a settlement for liberated slaves at Freretown (Kisauni) on the mainland, opposite Mombasa. By 1881 it consisted of about 450 persons, of whom about one-fourth were children attending school. The pupils are taught to read both English and Sawahili (*Ch. Miss. Intelligencer*, 1875-76 and 1881). A branch station at Rabbai numbers 600 inhabitants.

Mombasa takes its name from Mombasa in Oman. It is mentioned by Ibn Batúta in 1331 as a large place, and at the time of Vasco da Gama's visit it was the residence of Calicut Banyans and Christians of St Thomas, and the seat of considerable commerce. The "king" of the city, however, tried to entrap Da Gama, and with this began a series of troubles which give full force to the native name *Mwita* (war). The principal incidents are the capture and burning of the place by Almeyda (1505), Nuno da Cunha (1529), and Duarte de Menezes (1587)—this last as a revenge for its submission to the sultan of Constantinople—the building of the Portuguese fort (1594), the revolt of Yusuf ibn Ahmed (1631), the erection of the Portuguese citadel (1635), the five years' siege by the imam of Oman (1660-65), and the final expulsion of the Portuguese (1698). In 1823 the Mazara family, who had ruled in Mombasa from the early part of the 18th century, placed the city under British protection; but Britain soon withdrew, and left the place to be bombarded and captured by Sayyid Said of Zanzibar, who was obliged to make repeated attacks between 1829 and 1833, and only got possession in 1834 by treachery. A revolt against Zanzibar in 1875 was put down by British assistance.

See Capt. W. F. W. Owen, *Narrative*, &c. (1833); Capt. Thomas Boteler, *Narrative*, &c. (1835); Guillain, *Voyage*, (Paris, 1856); Krapf, *Travels*, (1860); Burton, *Zanzibar*, (1872).

thus distributed over an area measuring about 450 miles from east to west, and about 800 from north to south, and include—(1) the Moluccas proper or Ternate group, of which Jilolo is the largest and Ternate the capital; (2) the Batchian, Obi, and Sula groups; (3) the Ambon or Amboyna group, of which Ceram (Serang) and Buru are the largest; (4) the Banda Islands (the spice or nutmeg islands *par excellence*), of which Lantoir or Great Banda is the largest, and Neira politically the most important; (5) the south-eastern islands, comprising Tenimber or Timor-Laut, Larat, &c.; (6) the Kei Islands and the Aru Islands, of which the former are sometimes attached to the south-eastern group; and (7) the south-western islands or the Babber, Sermatta, Letti, Wetter, Roma, and Damme groups. A revolt against Zanzibar in 1875 was put down by British assistance.

See Capt. W. F. W. Owen, *Narrative, &c.* (1833); Capt. Thomas Boteler, *Narrative, &c.* (1835); Guillain, *Voyage,* (Paris, 1856); Krapf, *Travels,* (1860); Burton, *Zanzibar,* (1872).

were urged on to still greater severity of life when the rapid progress of Christianity brought large numbers of merely nominal converts in, whose practice fell too conspicuously below their profession. The desire of protest against such a state of things led to the gradual separation of the devotees into a kind of order within the main body, and to their actual withdrawal from habitual intercourse with their less strict fellows, which led in turn to their departure from the towns into more secluded places, even before any formal conception of the monastic life had shaped itself in their minds. But the first glimpse obtainable of the "common life," and that only an indistinct one, is in the New Testament, and applies to women alone. There is mention in the pastoral epistles (1 Tim. v. 9-12) of a class of widows, apparently not as mere recipients of relief, but as constituting an ecclesiastical grade; while in Acts ix. 39 it appears as if a number of women belonging to this order were united in some kind of community under the headship of Dorcas, for the narrative rather implies that they were her assistants in making clothing for the poor than themselves the objects of her bounty. This conjecture receives some confirmation from the mention of "the virgins who are called widows" (τὰς παρθένους τὰς λεγομένας χῆρας) in the shorter recension of the Ignatian Epistle to the Smyrnæans, and from the statement of Athanasius, that Anthony, when himself about to begin the solitary life which he is regarded as having instituted, first placed his sister in a convent of virgins (παρθενῶνα),—facts which prove the organization of women at an earlier date in community life than of men, and lend some probability to the notion that it may have begun very soon indeed, especially when the prominence given to the virgins as a separate and seemingly long-established order in the church by such early writers as Tertullian and Cyprian is borne in mind.

Two other causes must be taken into account as tending to stimulate monachism when once it began. First is the theological opinion, early formulated, and never since without many advocates, that two distinct standards of life and holiness are set forth in the gospel: that of precept, and that of "counsels of perfection,"—the former binding all Christians without exception, the latter being voluntary, and merely offered for acceptance to such as aim at especial sanctity. The second, and even more powerful, agent was Gnosticism, not only in its earlier forms and in the kindred spirit of Montanism, but still more in its Manichæan development, when its dualism led to exaggeration of the antagonism between flesh and spirit, and the human body was regarded no longer as a servant to be trained, but as an enemy to be crushed and beaten down with unrelenting hostility. But in every age of monachism, from the earliest to the latest, social disorders and insecurity have proved the chief feeders of the cloister, never widely popular in times of healthy and orderly national life, but eagerly resorted to as a place of shelter from social turbulence.

There are five main classes of monastic institutions, each of which approximately marks a new departure in the history of Western monachism (for the East has never had more than the first), as they succeed one another in chronological order, without in any instance involving the abandonment of the previous foundations. They are—(1) Monks; (2) Canons Regular; (3) Military Orders; (4) Friars; (5) Clerks Regular. All of these have communities of women, either actually affiliated to them, or formed on similar lines.

ly etics.

There is no doubt as to the time and the person, when, and by whom, the first decisive step was taken which left a marked interval for all time between those ascetics who continued to live in family life, if not really part of it, or who at least dwelt close to some ordinary church, to which they resorted habitually, and the seekers after some more retired and separate mode of life, whether singly or in communities. During the stress of the Decian persecution (249-250 A.D.) Paul, a native of the Lower Thebaid, born of wealthy parents about 228, was denounced by his brother-in-law to the authorities as a Christian, and fled for safety into the desert, where he established himself in a cavern, shaded by a palm-tree, and with a spring of water close by. There he remained till extreme old age, dying, if we may accept Jerome's chronology, in his hundred and thirteenth year, about 342. Although he did not collect any band of disciples around him, nor even, so far as is recorded, attract any casual visitors, except his more famous successor, Anthony, who is alleged, in a narrative containing many legendary details, to have had an interview with him when himself a very old man, the day before Paul's death; yet there seems reason to believe that the fame of his example spread sufficiently to induce imitation of it, and that anchoretic cells began to be set up sparsely in the deserts even before Anthony adopted that mode of life. Anthony's career differed in various respects from that of his precursor. In the first place, it was voluntary choice, not fear of persecution, which sent him into solitude. He was born about 250 at Coma in Upper Egypt, of wealthy Christian parents, and was left at eighteen years of age in possession of a large fortune and of the guardianship of a younger sister. He had received what was probably a fair vernacular education, but distaste for study, or perhaps more probably that difficulty which contemplative intellects experience in the acquisition of languages, left him unacquainted with Greek or Latin; yet the intimate knowledge of Scripture which he afterwards displayed cannot be satisfactorily accounted for in any other way than as the result of attentive perusal, since no mere listening to the lections in church would suffice to convey it; and we must therefore take Athanasius's statement of his ignorance of letters to denote the absence of culture, not as implying actual illiteracy. One day, hearing the gospel read, "Go and sell that thou hast, and give to the poor . . . and come, and follow Me," he took it as a direct address to himself, and at once returned home, distributed his property amongst his neighbours, reserving only a small sum for the support of his sister whom he placed in charge of some Christian virgins, and then betook himself to a solitary life, first visiting the most eminent ascetics and anchorets he could find, in order that he might learn the peculiar merit of each, and imitate it. He fixed his dwelling first in a tomb, then in a ruined fort near the Nile, where he remained for twenty years, leaving it but once, in 311, to encourage the Christians of Alexandria during the persecution of Maximin; and lastly in a small grove of date-palms, a few miles west of the western coast of the Red Sea, near the base of Mount Kolzim, where he made an enclosure and planted it as a garden. He quitted this retirement but once in his remaining life, when he again visited Alexandria in 335, at the request of Athanasius, to preach against the Arians. Yet his fame drew not only frequent visitors to his cell, but numerous disciples and imitators around him, attracted not alone by his pious austerities, but by his cheerful and courteous manners and shrewd practical judgment. He made the solitary life honourable and popular, fully justifying Jerome's phrase in comparing him with Paul, "Hujus vitæ auctor Paulus, illustrator etiam Antonius." When Anthony died in 365, aged one hundred and five, the desert was already studded with hermitages in every direction, and the second great step in the development of monachism had been long taken by Pachomius, who stands out in history at once as the founder of the cœnobitic life amongst Christians and as the author of the first formal monastic rule. Born about 292,

were urged on to still greater severity of life when the rapid progress of Christianity brought large numbers of merely nominal converts in, whose practice fell too conspicuously below their profession. The desire of protest against such a state of things led to the gradual separation of the devotees into a kind of order within the main body, and to their actual withdrawal from habitual intercourse with their less strict fellows, which led in turn to their departure from the towns into more secluded places, even before any formal conception of the monastic life had shaped itself in their minds. But the first glimpse obtainable of the "common life," and that only an indistinct one, is in the New Testament, and applies to women alone. There is mention in the pastoral epistles (1 Tim. v. 9-12) of a class of widows, apparently not as mere recipients of relief, but as constituting an ecclesiastical grade; while in Acts ix. 39 it appears as if a number of women belonging to this order were united in some kind of community under the headship of Dorcas, for the narrative rather implies that they were her assistants in making clothing for the poor than themselves the objects of her bounty. This conjecture receives some confirmation from the mention of "the virgins who are called widows" (τὰς παρθένους τὰς λεγομένας χῆρας) in the shorter recension of the Ignatian Epistle to the Smyrnæans, and from the statement of Athanasius, that Anthony, when himself about to begin the solitary life which he is regarded as having instituted, first placed his sister in a convent of virgins (παρθενῶνα),—facts which prove the organization of women at an earlier date in community life than of men, and lend some probability to the notion that it may have begun very soon indeed, especially when the prominence given to the virgins as a separate and seemingly long-established order in the church by such early writers as Tertullian and Cyprian is borne in mind.

When Anthony died in 365, aged one hundred and five, the desert was already studded with hermitages in every direction, and the second great step in the development of monachism had been long taken by Pachomius, who stands out in history at once as the founder of the cœnobitic life amongst Christians and as the author of the first formal monastic rule. Born about 292,

While the system won the admiration of all the most eminent Christian teachers of the age which saw its birth and early growth, and while we are met by a still more remarkable fact that from the time when monachism was fairly established till we enter on the Middle Ages there are but two or three names of distinction amongst the clergy, whether as writers or administrators, to be found outside the ranks of monachism, amongst whom the most famous are Ambrose and Leo the Great, nevertheless, there is a heavy account on the other side. Not only did the institute speedily find itself caricatured by the Messalians, Euchites, Gyrovagi, Sarabaites or Remoboth, Circumcelliones, and other companies of professed ascetics, wild in doctrine, vagrant in habits, and turbulent in conduct, but the more genuine societies had scarcely fewer faults in too many cases. Lay in their origin, and for the greater part of their earlier history having but rarely ecclesiastics amongst them (a single priest ordained for each monastery to minister to its inmates being the utmost allowed for a considerable time), they were not subject to the same strict inspection and discipline as the clergy, in case a whole community chose to disregard its rule; though of course it was easy to deal with an offender who had the tone of his monastery against him. The clergy were subject to the direct control of the bishops, and many disciplinary canons of councils laid down rules for their conduct; but this was not the case with the monks for a considerable time—nor indeed ever effectively in the East—and their lay character gave them practical independence of any authority external to their abbot. And, despite the stringency of the monastic rule itself, which, even before actual vows began to be introduced (probably on the recommendation of Basil), always involved during compliance with it the three engagements to the observance of poverty, chastity, and obedience, which make up the staple of the monastic principle, and though pains were taken to exclude unfit applicants (such as criminals, slaves who had fled for reasons other than ill-treatment, or persons who had kindred dependent on them), while a long probation was exacted from all who were accepted, yet it was impossible that more than a small proportion of the many thousands who flocked in during the first enthusiasm for the new movement should have had any real sympathy with the restraints and aspirations of such a mode of life. Severe asceticism operates differently on different natures, and while there are some whom it does but discipline and refine there are more whom it tends to coarsen and to brutalize, even apart from the many whom it is apt to affect with morbidness, if not actual insanity. And it is unquestionable that vast numbers of those who entered on the monastic life came from the poorer classes, in search of some less toilsome mode of existence than they had previously led, preferring the contemplative societies, wherein almost no labour, certainly none of a severe and trying cast, was practised, to those where agriculture and other active employments, requiring more energy than mat and basket weaving, were enjoined. Such men, uneducated and undisciplined, were liable to be thrown entirely out of gear by the complete revolution in their mode of life,—especially when the community they joined was not only contemplative, but situated in some place where the ungrateful soil made tillage nearly impracticable, and the vast numbers crowded together were far too numerous for any tasks which could be assigned them. From the bosom of such societies came not only single examples of exaggerated spiritual pride, bitter fanaticism, avaricious greed of the scanty articles whose usufruct was permitted, fierce sensuality, and wild religious delusions, but they gave birth to companies like the *βοσκοί*, or "grazing monks," of Mesopotamia and Palestine, who roved about, shelterless and nearly naked, as Sozomen and Evagrius tell us, in the mountains and deserts, grovelling on the earth, and browsing like cattle on the herbs they casually found; and to those fierce bands of Nitrian and Syrian ascetics who, reared in the narrowest of schools, treated any divergence from their own standard of opinion as a crime which they were entitled to punish in their own riotous fashion, two instances of which have left an indelible brand on their history—the murder of Hypatia in Alexandria, and that of the patriarch Flavian at the Robber Synod of Ephesus. An equally singular, but more sporadic and temporary, form of asceticism was that of the Stylites or Pillar-hermits (*στυλῖται, κιονῖται*), who followed a fashion first set by Simeon, a Syrian monk who spent almost half of the 5th century on the summit of a column 60 feet in height. This unwonted kind of austerity at first gave rise to strong objections, even from hermits themselves, and a messenger was sent to Simeon, bidding him in the name of a synod of bishops to descend from his pillar, but with instructions to permit him to remain if he showed himself ready to comply. Such proved to be the case; and, having thus assured themselves that he was not influenced by spiritual pride, they left him to follow his own devices. And we have the direct personal testimony of the wise and temperate Theodoret that he exercised a strong and salutary influence over the nomadic Saracen tribes, converting many hundreds and even thousands to Christianity, besides being the shrewd and trusted adviser, not only of the peasants who flocked to him for counsel, but of Arab princes, Persian kings, and even Roman emperors. He cannot be judged, therefore, by ordinary standards, and it is more than likely that a less extraordinary mode of life would have given him less power for good; but he is the only eminent figure in the class to which he belongs, and the fashion he set may be said to have died out with his namesake, the younger Simeon, a century later. Even when the healthier side of monachism as it appeared in Egypt and Syria is dwelt upon, and the fullest weight is allowed to the contemporary pictures drawn by great Christian writers of the monasteries as schools of a philosophy truer and purer than that of the Porch or the Academy, as places where the equality and brotherhood, merely dreamed of as unrealizable fancies in the outer world, could be seen in living action—where children, deserted by their parents or otherwise orphaned, were carefully reared—where the sick were lovingly tended—where calmness, piety, and self-forgetfulness were the rule of all,—it must be confessed that the complaint of the Government, embodied in the hostile legislation of the emperor Valens in 373, subjecting monks to the conscription (which drew forth an indignant protest from Chrysostom), that monachism was injurious to society and to the healthy condition of civil life by draining off so large a fraction of the population into the backwater of the cloister, was perfectly well founded. And no small part of the overthrow of Christianity in Egypt and Syria by Islam is due to the practical withdrawal of all the devout from family and public life, leaving no spiritual energy to cope with the Koran in the towns and villages whither the conquering Arabs came to settle and proselytize.

The history of monachism in the West is far more varied, chequered, and interesting than in the East. It takes its beginning from the visit of Athanasius to Rome in 340, during his second term of exile, when he brought with him his *Life of St Anthony*, and pressed his example on the Roman Christians who mourned as patriots, not less than as devotees, over the lax and enervated habits of society. The popular imagination was caught at once, and not only was the basis of monachism successfully laid in Rome itself, but Eusebius of Vercelli introduced it

While the system won the admiration of all the most eminent Christian teachers of the age which saw its birth and early growth, and while we are met by a still more remarkable fact that from the time when monachism was fairly established till we enter on the Middle Ages there are but two or three names of distinction amongst the clergy, whether as writers or administrators, to be found outside the ranks of monachism, amongst whom the most famous are Ambrose and Leo the Great, nevertheless, there is a heavy account on the other side. Not only did the institute speedily find itself caricatured by the Messalians, Euchites, Gyrovagi, Sarabaites or Remoboth, Circumcelliones, and other companies of professed ascetics, wild in doctrine, vagrant in habits, and turbulent in conduct, but the more genuine societies had scarcely fewer faults in too many cases. And no small part of the overthrow of Christianity in Egypt and Syria by Islam is due to the practical withdrawal of all the devout from family and public life, leaving no spiritual energy to cope with the Koran in the towns and villages whither the conquering Arabs came to settle and proselytize.

The history of monachism in the West is far more varied, chequered, and interesting than in the East. It takes its beginning from the visit of Athanasius to Rome in 340, during his second term of exile, when he brought with him his *Life of St Anthony*, and pressed his example on the Roman Christians who mourned as patriots, not less than as devotees, over the lax and enervated habits of society. The popular imagination was caught at once, and not only was the basis of monachism successfully laid in Rome itself, but Eusebius of Vercelli introduced it

of the introduction of monachism there, all that is certain being that it had made its footing good before 380, the date of a council of Saragossa (Cæsaraugusta) which forbade priests to assume the monkish habit. Still more obscurity hangs over the first establishment of monachism in Britain, as to which no trustworthy records have come down to us, though all probability points to its importation from Gaul in some variety of the Pachomian rule; while Germany did not receive the institute till the following century.

It must not be supposed, however, that the principle of monachism met with no opposition in the course of its progress. Apart from the opposition of those who disliked it precisely for its merits, for its protest against the dissolute morals and enervated habits of a luxurious and rotting society, and for the manner in which it won to itself many of the noblest and most promising of the young and ardent of both sexes, and without taking into account the more reasonable objections of statesmen, there were not lacking warnings of the dangers attending exaggerations of the principle of monachism, uttered by some of its most eminent upholders. Augustine's sharp censures have been already mentioned, and to them may be added the decrees of the council of Gangra in 363, or thereabouts, which anathematize those who adopt a celibate life on the ground that marriage is evil, who wear a peculiar dress as a mark of holiness, condemning such as use ordinary clothing, or who desert their parents or children dependent on them under the plea of desiring to lead an ascetic life. So, too, the great Chrysostom, himself a warm advocate of monachism, found himself obliged to teach his flock the sanctity of Christian family life, and the truth that there was often as much selfishness as piety in retirement to a hermitage from the cares and duties of society. These arguments and decisions were, however, aimed only at abuses and exaggerations of the monastic idea. It remained for Jovinian and Vigilantius to assail the actual principle. Their writings have not survived, and we can judge of their arguments only from the account given of them by their chief opponent Jerome, whose eminent gifts, however, did not include either moderation or controversial fairness, so that it is not safe to assume that we have all their case before us. As regards Vigilantius, he accurately represents the Puritan type of mind protesting against the external part of the popular religion of his day, often with good reason, but also showing equal intolerance for harmless, if not useful, practices; so that his condemnation of monachism is only part of his general objection to the temper of his time. But Jovinian's objections seem to have gone deeper. He had been himself a monk (and indeed never resumed secular life), but he disputed absolutely the thesis that any merit lay in monachism, celibacy, fasting, and asceticism considered in themselves, save in so far as they contributed to foster the Christian temper and life, which might and did flourish equally, he urged, under quite different conditions, while it was by no means unfrequent for spiritual pride, if not Manichæan error, to lay hold of those who devoted themselves to the ascetic profession. This was, in fact, going very little further than Chrysostom had done, or than Nilus did a short time later. But Jovinian's divergence from the standard of his day was not confined to practical questions; it extended to theological doctrines also, and accordingly his strictures on monachism, probably more incisive and less qualified than those of its other critics, were involved in his condemnation as a heretic by synods at Rome and Milan in 390. The reaction, of which he may be regarded as the mouthpiece rather than as the sole representative, was thus effectually crushed, and that for centuries. And though Jovinian is undoubtedly more in accord than his opponents with the modern temper on the subject of monachism, and while it may be allowed that his teaching might have been a useful corrective in Eastern Christendom, where family life was all but overborne by asceticism, yet the impartial historian must admit that his success would have been an irreparable misfortune for civilization in the West. Such a dispassionate estimate of asceticism as his, if widely entertained, would have been fatal to the spread of monachism, and thus one of the most important conservative and statical forces in the preservation of the older culture, one of the most powerful dynamical forces in reducing the chaotic materials of early mediæval society to order and coherence, would have been lost to Europe; nor is it easy to conjecture what effectual substitute could have taken its place. As it was, the movement was not checked for a moment by this partial reaction; and not only did the older communities thrive and spread during the 5th and early 6th centuries, but new ones were established,—chief among which stand those of Cæsarius of Arles and of Donatus of Besançon in southern Gaul, that of Isidore of Seville in Spain, and the early Celtic code, of which only traditional fragments survive, but which seems in Britain to have been strongly affected by tribal influences, so that a monastery was often recruited from a single clan, and the abbacy became hereditary in the family of the chieftain, a fact which is noticeable even in the succession of the abbots of Iona, who for ten elections after Columba were of his family in the tribe of Conall Gulban.[1]

But, swiftly as monachism spread in Europe during the breaking-up of the Western empire, some of the causes which hastened its progress also tended to its rapid decay. The disturbed state of society, and, in particular, the prevalence of petty warfare, drove many thousands of persons to seek a quiet refuge in the cloister without any more directly religious motive. When once there, they found in every place some rule in force which was either imported directly from Egypt or Syria, or else, like that of Cæsarius, modelled on Eastern lines, and therefore ill suited to the severer climate of Europe and the more active habits of the people. The austerities were thus too oppressive for general observance, and the result was a widespread neglect of rules which continued nominally in force, while at the same time the very monks who had ceased to keep them laid claim to special sanctity on the pretence of their strict way of life. The time was ripe for a reform, or rather for a wholly new departure in the shape of a rule devised to meet Western needs, and not merely adapted more or less clumsily from Oriental asceticism. The fitting man to accomplish this difficult task appeared in the person of Benedict of Nursia, author of the most famous of all monastic codes. Born of a respectable family about 480, he adopted the ascetic life at fourteen in a cave near Subiaco, not far from Rome, where he remained for three years, at the expiration of which he was chosen abbot of a neighbouring convent, then in a very relaxed state. His rule proved too stern for his new subjects, who attempted to poison him, whereupon he resigned his office and returned to Subiaco, around which he soon erected twelve monasteries, each peopled by an abbot and twelve monks. Fresh attempts on his life and on the discipline of his society drove him out again in the year 528, when he fixed his dwelling at Monte Cassino, the place where his celebrated rule was drafted in the following year, and which has ever since prided itself on its rank as the cradle of the Benedictine Order and the premier abbey of Western Christendom. The famous institute which he devised

[1] Adamnan, *Vit. Columb.*, ed. Reeves.

of the introduction of monachism there, all that is certain being that it had made its footing good before 380, the date of a council of Saragossa (Cæsaraugusta) which forbade priests to assume the monkish habit. Still more obscurity hangs over the first establishment of monachism in Britain, as to which no trustworthy records have come down to us, though all probability points to its importation from Gaul in some variety of the Pachomian rule; while Germany did not receive the institute till the following century.

It must not be supposed, however, that the principle of monachism met with no opposition in the course of its progress. Apart from the opposition of those who disliked it precisely for its merits, for its protest against the dissolute morals and enervated habits of a luxurious and rotting society, and for the manner in which it won to itself many of the noblest and most promising of the young and ardent of both sexes, and without taking into account the more reasonable objections of statesmen, there were not lacking warnings of the dangers attending exaggerations of the principle of monachism, uttered by some of its most eminent upholders. Augustine's sharp censures have been already mentioned, and to them may be added the decrees of the council of Gangra in 363, or thereabouts, which anathematize those who adopt a celibate life on the ground that marriage is evil, who wear a peculiar dress as a mark of holiness, condemning such as use ordinary clothing, or who desert their parents or children dependent on them under the plea of desiring to lead an ascetic life. So, too, the great Chrysostom, himself a warm advocate of monachism, found himself obliged to teach his flock the sanctity of Christian family life, and the truth that there was often as much selfishness as piety in retirement to a hermitage from the cares and duties of society. These arguments and decisions were, however, aimed only at abuses and exaggerations of the monastic idea. It remained for Jovinian and Vigilantius to assail the actual principle. Their writings have not survived, and we can judge of their arguments only from the account given of them by their chief opponent Jerome, whose eminent gifts, however, did not include either moderation or controversial fairness, so that it is not safe to assume that we have all their case before us. As regards Vigilantius, he accurately represents the Puritan type of mind protesting against the external part of the popular religion of his day, often with good reason, but also showing equal intolerance for harmless, if not useful, practices; so that his condemnation of monachism is only part of his general objection to the temper of his time. But Jovinian's objections seem to have gone deeper. He had been himself a monk (and indeed never resumed secular life), but he disputed absolutely the thesis that any merit lay in monachism, celibacy, fasting, and asceticism considered in themselves, save in so far as they contributed to foster the Christian temper and life, which might and did flourish equally, he urged, under quite different conditions, while it was by no means unfrequent for spiritual pride, if not Manichæan error, to lay hold of those who devoted themselves to the ascetic profession. This was, in fact, going very little further than Chrysostom had done, or than Nilus did a short time later. But Jovinian's divergence from the standard of his day was not confined to practical questions; it extended to theological doctrines also, and accordingly his strictures on monachism, probably more incisive and less qualified than those of its other critics, were involved in his condemnation as a heretic by synods at Rome and Milan in 390. The reaction, of which he may be regarded as the mouthpiece rather than as the sole representative, was thus effectually crushed, and that for centuries. And though Jovinian is undoubtedly more in accord than his opponents with the modern temper on the subject of monachism, and while it may be allowed that his teaching might have been a useful corrective in Eastern Christendom, where family life was all but overborne by asceticism, yet the impartial historian must admit that his success would have been an irreparable misfortune for civilization in the West. Such a dispassionate estimate of asceticism as his, if widely entertained, would have been fatal to the spread of monachism, and thus one of the most important conservative and statical forces in the preservation of the older culture, one of the most powerful dynamical forces in reducing the chaotic materials of early mediæval society to order and coherence, would have been lost to Europe; nor is it easy to conjecture what effectual substitute could have taken its place. As it was, the movement was not checked for a moment by this partial reaction; and not only did the older communities thrive and spread during the 5th and early 6th centuries, but new ones were established,—chief among which stand those of Cæsarius of Arles and of Donatus of Besançon in southern Gaul, that of Isidore of Seville in Spain, and the early Celtic code, of which only traditional fragments survive, but which seems in Britain to have been strongly affected by tribal influences, so that a monastery was often recruited from a single clan, and the abbacy became hereditary in the family of the chieftain, a fact which is noticeable even in the succession of the abbots of Iona, who for ten elections after Columba were of his family in the tribe of Conall Gulban.[1]

But, swiftly as monachism spread in Europe during the breaking-up of the Western empire, some of the causes which hastened its progress also tended to its rapid decay. The disturbed state of society, and, in particular, the prevalence of petty warfare, drove many thousands of persons to seek a quiet refuge in the cloister without any more directly religious motive. When once there, they found in every place some rule in force which was either imported directly from Egypt or Syria, or else, like that of Cæsarius, modelled on Eastern lines, and therefore ill suited to the severer climate of Europe and the more active habits of the people. The austerities were thus too oppressive for general observance, and the result was a widespread neglect of rules which continued nominally in force, while at the same time the very monks who had ceased to keep them laid claim to special sanctity on the pretence of their strict way of life. The time was ripe for a reform, or rather for a wholly new departure in the shape of a rule devised to meet Western needs, and not merely adapted more or less clumsily from Oriental asceticism. The fitting man to accomplish this difficult task appeared in the person of Benedict of Nursia, author of the most famous of all monastic codes. Born of a respectable family about 480, he adopted the ascetic life at fourteen in a cave near Subiaco, not far from Rome, where he remained for three years, at the expiration of which he was chosen abbot of a neighbouring convent, then in a very relaxed state. His rule proved too stern for his new subjects, who attempted to poison him, whereupon he resigned his office and returned to Subiaco, around which he soon erected twelve monasteries, each peopled by an abbot and twelve monks. Fresh attempts on his life and on the discipline of his society drove him out again in the year 528, when he fixed his dwelling at Monte Cassino, the place where his celebrated rule was drafted in the following year, and which has ever since prided itself on its rank as the cradle of the Benedictine Order and the premier abbey of Western Christendom. The famous institute which he devised

[1] Adamnan, *Vit. Columb.*, ed. Reeves.

merely ruling that in temperate places a cowl and tunic, thick in winter and thin in summer, with a scapular (a sleeveless woollen garment passed over the head, and falling down over the breast and back) for work hours, as also shoes and stockings, all of the ordinary country make and cheapest kind, shall suffice. Each monk is to have a change of these garments, to allow of washing, and yet another for use when sent on a journey, to be of rather better materials, and to be kept in the general wardrobe when not in actual wear. The old clothes are to be given up when new ones are served out, and are to be laid by in the wardrobe for the poor. A straw mattress, blanket, quilt, and pillow are to be furnished for each bed; and in addition the abbot is to give every monk a knife, a pen, a needle, a handkerchief, and tablets. Chapter lvi. rules that the abbot is to take his meals with the guests and strangers, with the privilege, if guests be few, of inviting any of the brethren he chooses, so long as some seniors are left in charge. Chapter lvii. prescribes that craftsmen amongst the brethren are to work with the abbot's permission, and if their work is to be for sale, those who are entrusted with making the bargains are to deal honestly with purchasers, and to sell rather below the current trade price. Chapter lviii. lays down the rules for the admission of new members. It is not to be made too easy. The postulant is to be allowed to knock for entrance in vain for four or five days, then to be brought into the guest-room for a few days more, and so be transferred to the novice-house, where he is to remain under the charge of a senior monk for two months. If he persevere at the end of this time, the rule is to be read over to him, and the option of departing or remaining is to be offered. If he persevere, he is returned to the novice-house for six months' further probation, after which the rule is again read to him as before, and yet a third time after a further term of four months. Not till he has surmounted this final ordeal can he be admitted into the community, and before that is done he must divest himself of his property, either giving it to the poor, or making a deed of gift to the monastery. Then he is allowed to sign the act of profession, including the vow of stability, which he is to lay with his own hand on the altar. Chapter lix. provides for the dedication of young children, noble or poor, by their parents to the monastic life, and requires a promise from the latter never to endow the oblate with any property, directly or in trust, though they may give to the monastery if they please and reserve the life-income to themselves. Chapter lx. regulates the position of priests who desire to live in the monastery. They are to enjoy no relaxations or priority in virtue of their ecclesiastical rank, though the abbot may assign clerical functions to them; and a somewhat like rule is laid down for clerks in minor orders. Chapter lxi. provides for the reception of strange monks as guests, and for their admission if desiring to join the community. The abbot is enjoined to listen to any criticisms such a guest may offer, and is empowered to give him, if accepted as a new member, higher standing than that of his entrance, but is forbidden so to admit a monk of any known monastery without the consent or letters commendatory of its abbot. Chapter lxii. rules that the abbot may choose a monk for ordination as priest or deacon; but the ordinee is to rank in the house from the date of his admission, except when officiating, or if the community and the abbot single him out for promotion by merit. If he misbehave, he is to be reported to the bishop, and if continuing to misconduct himself, shall be expelled,—only, however, in case of obstinate disobedience to the rule. Chapter lxiii. lays down rules for the gradation of rank in the community, and warns the abbot against arbitrary government. Chapter lxiv. allows the abbot to be chosen either by the common consent of the whole community, or by a select electoral committee; and the lowest in standing may be chosen, if fit. In the event of a bad choice, the bishop of the diocese, the neighbouring abbots, or even the neighbouring laity, if having reason to think the election made for the purpose of keeping up abuses, may annul it and appoint another superior. Chapter lxv. speaks of the mischief occasioned in many monasteries by the rivalry of the provost or prior with the abbot, and advises that no such officer be appointed; yet, if the circumstances of the place need one, the abbot may name a brother to the post, but he is to be as entirely subject to the abbot as any other monk, and may be admonished, deposed, or expelled for misconduct. Chapter lxvi. directs the appointment of a porter to answer at the gate, and further recommends that every house shall have its own well, mill, garden, bakery, and handicraftsmen, to avoid the need of intercourse with the outer world. Chapter lxvii. directs that no monk shall quit the cloister without leave of the abbot, and that, on the return of any from a journey, they are to beg the prayers of the community for any faults they have committed during their absence, and are forbidden to speak of what they have heard or seen outside. Chapter lxviii. bids a monk who has received a hard or impossible command to undertake it patiently and obediently. If he find it beyond his powers, he may mention the cause quietly to his superior; and, if the command is still persisted in, he must obey as best he can. Chapter lxix. forbids monks to uphold or defend one another in the monastery, even their nearest of kin. Chapter lxx. forbids striking or excommunicating another, without the abbot's authority, and provides that children, until fifteen, shall be subject to discipline from all the monks; but any who shall chastise those above fifteen without the abbot's leave, or be unduly severe towards the younger, shall be himself punishable by rule. Chapter lxxi. lays down that the principle of obedience is to prevail throughout the community, not only towards the abbot, or his officers, but from the juniors towards their seniors. Chapter lxxii. is a brief exhortation to zeal; and chapter lxxiii. a note to the effect that the Benedictine rule is not offered as an ideal of perfection, or even as equal to the teachings of Cassian and Basil, but for mere beginners in the spiritual life, who may thence proceed further.

It has been necessary to make this detailed analysis of the rule, because no mere summary of its general scope conveys an adequate notion of it; and it plays so important a part in the history of European civilization that it is expedient to obtain a clear idea of its details as well as of its main outlines. The first peculiarity in it meriting attention is the absence of any severe austerities. Plain and bare as the food and lodging appear if tested by modern notions, yet it is to be remembered that what is called "comfort" is a wholly recent idea, and even still scarcely familiar, it may almost be said, out of Great Britain and its colonies. The scale of living appointed by the rule secures a greater abundance of the necessaries of life, not only than was at all common amongst the Italian poor of the 6th century, but than is to be found amongst the humbler peasantry of any European country at the present day; while even the excluded superfluities entered but little into the habits of any save the very wealthy. Next, high thinking—the highest thought of the time—was united with this plain living, as the considerable stress laid upon reading attests. To this part of the code is due the great service performed by the Benedictines, both in the erection of schools, and in the preservation of almost all the remains of ancient Latin literature which have come down to us. It made it not only possible but easy for them to become a learned order, and it is a very imperfect estimate of the stride forward in this provision which Milman makes, when he views the injunctions as to reading in the mere light of expedients to fill up time somehow. If it were so, the hours for reading would have been fewer, shorter, and more occasional, merely rounding off the intervals between times of labour; but they are just as prominent and nearly as long as these. It is true that Benedict, whose own education had been abruptly broken off by his early retreat from Rome, did not specifically enjoin the pursuit of learning on his monks; but they borrowed the idea at once from his contemporary, the celebrated Cassiodorus, the real founder of monastic learning, of which his monastery of Viviers in Bruttium is the first known school. But the most valuable feature of the rule is the position of dignity which it assigns to work. It is scarcely possible to realize at the present day the dishonour into which toil of all kinds had sunk in the days of Benedict. Not only had the institution of slavery degraded many kinds of occupation, but the gradual disappearance from Italy of the yeoman class, ruined and exiled by the concentration of great estates (*latifundia*), or slain in the ceaseless battles of competitors for empire or of barbarian invaders, left few save serfs and bondsmen to till the soil, while the military habits of the invading tribes led them to contemn any life except that of a warrior. It is the special glory of Benedict that he taught the men of his day that work, sanctified by prayer, is the best thing which man can do, and the lesson has never been wholly lost sight of since.

Spread and influence of the Benedictine order.

The new institute spread with even more astonishing rapidity than the earlier monachism which it practically supplanted in the West, and its history thenceforward is, with one important exception, that of Western conventual life for some centuries. Moreover, besides marking the close of the first or tentative era of monachism, when all kinds of crude essays and experiments were being made,

merely ruling that in temperate places a cowl and tunic, thick in winter and thin in summer, with a scapular (a sleeveless woollen garment passed over the head, and falling down over the breast and back) for work hours, as also shoes and stockings, all of the ordinary country make and cheapest kind, shall suffice. Each monk is to have a change of these garments, to allow of washing, and yet another for use when sent on a journey, to be of rather better materials, and to be kept in the general wardrobe when not in actual wear. The old clothes are to be given up when new ones are served out, and are to be laid by in the wardrobe for the poor. A straw mattress, blanket, quilt, and pillow are to be furnished for each bed; and in addition the abbot is to give every monk a knife, a pen, a needle, a handkerchief, and tablets. Chapter lvi. rules that the abbot is to take his meals with the guests and strangers, with the privilege, if guests be few, of inviting any of the brethren he chooses, so long as some seniors are left in charge. Chapter lvii. prescribes that craftsmen amongst the brethren are to work with the abbot's permission, and if their work is to be for sale, those who are entrusted with making the bargains are to deal honestly with purchasers, and to sell rather below the current trade price. Chapter lviii. lays down the rules for the admission of new members. It is not to be made too easy. Chapter lxvii. directs that no monk shall quit the cloister without leave of the abbot, and that, on the return of any from a journey, they are to beg the prayers of the community for any faults they have committed during their absence, and are forbidden to speak of what they have heard or seen outside. Chapter lxviii. bids a monk who has received a hard or impossible command to undertake it patiently and obediently. If he find it beyond his powers, he may mention the cause quietly to his superior; and, if the command is still persisted in, he must obey as best he can. Chapter lxix. forbids monks to uphold or defend one another in the monastery, even their nearest of kin. Chapter lxx. forbids striking or excommunicating another, without the abbot's authority, and provides that children, until fifteen, shall be subject to discipline from all the monks; but any who shall chastise those above fifteen without the abbot's leave, or be unduly severe towards the younger, shall be himself punishable by rule. Chapter lxxi. lays down that the principle of obedience is to prevail throughout the community, not only towards the abbot, or his officers, but from the juniors towards their seniors. Chapter lxxii. is a brief exhortation to zeal; and chapter lxxiii. a note to the effect that the Benedictine rule is not offered as an ideal of perfection, or even as equal to the teachings of Cassian and Basil, but for mere beginners in the spiritual life, who may thence proceed further.

It has been necessary to make this detailed analysis of the rule, because no mere summary of its general scope conveys an adequate notion of it; and it plays so important a part in the history of European civilization that it is expedient to obtain a clear idea of its details as well as of its main outlines. The first peculiarity in it meriting attention is the absence of any severe austerities. Plain and bare as the food and lodging appear if tested by modern notions, yet it is to be remembered that what is called "comfort" is a wholly recent idea, and even still scarcely familiar, it may almost be said, out of Great Britain and its colonies. The scale of living appointed by the rule secures a greater abundance of the necessaries of life, not only than was at all common amongst the Italian poor of the 6th century, but than is to be found amongst the humbler peasantry of any European country at the present day; while even the excluded superfluities entered but little into the habits of any save the very wealthy. Next, high thinking—the highest thought of the time—was united with this plain living, as the considerable stress laid upon reading attests. To this part of the code is due the great service performed by the Benedictines, both in the erection of schools, and in the preservation of almost all the remains of ancient Latin literature which have come down to us. It made it not only possible but easy for them to become a learned order, and it is a very imperfect estimate of the stride forward in this provision which Milman makes, when he views the injunctions as to reading in the mere light of expedients to fill up time somehow. If it were so, the hours for reading would have been fewer, shorter, and more occasional, merely rounding off the intervals between times of labour; but they are just as prominent and nearly as long as these. It is true that Benedict, whose own education had been abruptly broken off by his early retreat from Rome, did not specifically enjoin the pursuit of learning on his monks; but they borrowed the idea at once from his contemporary, the celebrated Cassiodorus, the real founder of monastic learning, of which his monastery of Viviers in Bruttium is the first known school. But the most valuable feature of the rule is the position of dignity which it assigns to work. It is scarcely possible to realize at the present day the dishonour into which toil of all kinds had sunk in the days of Benedict. Not only had the institution of slavery degraded many kinds of occupation, but the gradual disappearance from Italy of the yeoman class, ruined and exiled by the concentration of great estates (*latifundia*), or slain in the ceaseless battles of competitors for empire or of barbarian invaders, left few save serfs and bondsmen to till the soil, while the military habits of the invading tribes led them to contemn any life except that of a warrior. It is the special glory of Benedict that he taught the men of his day that work, sanctified by prayer, is the best thing which man can do, and the lesson has never been wholly lost sight of since.

Spread and influence of the Benedictine order.

The new institute spread with even more astonishing rapidity than the earlier monachism which it practically supplanted in the West, and its history thenceforward is, with one important exception, that of Western conventual life for some centuries. Moreover, besides marking the close of the first or tentative era of monachism, when all kinds of crude essays and experiments were being made,

merely over his monks, as in other rules, but over bishops also, whose office was simply that of ordaining such as were to be promoted to holy orders;[1] they had no territorial jurisdiction as rulers, because the monastery, not the diocese, was the primary local unit in Celtic Christianity, and thus a great founder or abbot was of more account and power than a bishop. Another famous pupil of Irish monachism, Columbanus, trained at Benchor along with his companion Gallus, exercised a powerful influence on the religious life of his time (543-615), not only as the founder of important monasteries at Luxeuil, Fontenay, and Bobbio, and as scholar and missionary, but also as the author of a rule, more severe both in its provisions and in its penalties than the Benedictine, with which it disputed for a considerable time the first place, and which it might very probably have displaced, had not the Benedictine institute, as of Italian origin, found that favour at Rome which a Celtic code, bearing more than one trace of divergence from Latin usages, could scarcely expect. With the mention of another prominent name in the list of distinguished Celtic reformers and missionaries, that of Fursey, abbot of Lagny near Paris (*c.* 650), we close this sketch of the Celtic movement in the 6th and 7th centuries, merely adding that its extent and influence may be partly estimated from the number of monasteries founded in England and various parts of the Continent by Irish monks, and the list of Celtic saints recoverable from the different martyrologies and similar records. The former amount to more than one hundred; the latter to nearly three hundred.

Returning to the Benedictines, the most important event in their history after the consolidation of their institute was the favour they received from Gregory the Great, himself once a monk, who set himself to reform monastic discipline, then at a very low ebb save where the new foundation was at work. He enacted several regulations for the better government of monasteries, such as prohibiting the admission of any persons under eighteen, exacting two years' novitiate, enforcing inclosure, visiting relinquishment of monachism with imprisonment for life, and finally, in the Lateran synod of 601, exempting monasteries in all cases from the jurisdiction of bishops (a measure due, it appears, to episcopal misconduct and oppression rather than to monastic ambition), thereby abolishing the measure of control which the eighth canon of Chalcedon and the legislation of Justinian I. in 535 had left in the hands of the diocesan, and leaving only the still surviving check, that the bishop's consent was required for the erection of any new monastery. The mission of the monk Augustine to England in 596 was, however, destined to produce more immediate and fortunate results than this piece of legislation. It brought Latin monachism into a part of Britain whence Welsh monachism had been long extirpated, and though little success attended the original foundation at Canterbury, yet two other houses were destined to be the cradles of great things. Jarrow-on-Tyne, founded by Benedict Biscop, trained the illustrious Bede, to whom is due the monastic school of York, which in its turn sent out Alcuin to reconstitute European learning under the fostering hand of Charlemagne; Nutcell in Hampshire reared Boniface to be the apostle of Germany, and founder of one of the most celebrated and powerful monasteries of the Middle Ages, that of Fulda. Nevertheless, decline set in very soon, and the 8th century was a time of deterioration amongst both the seculars and the regulars. To amend the former, Chrodegang, bishop of Metz, instituted in 760 an order of Canons Regular, living by a rule carefully based on and adapted from the Benedictine, with the bishop as abbot, the archdeacon as prior, and with a general likeness in all the details of community life, except that there was no obligation to poverty, and the canons were allowed to enjoy any private property and such fees as they might receive for the performance of religious rites. This rule became extremely popular, was sanctioned by the council of Aix-la-Chapelle in 816, and was adopted in most cathedrals of France, Germany, and Italy within fifty years after, besides making some way in England also. It prevailed till the institute of the Austin Canons was substituted for it. And, as regards the laxity amongst regulars at this time, there is extant a very interesting letter from Bede addressed to Ecgberht, archbishop of York, calling his attention to the excessive number of monasteries in northern England which were conducted without a rule, and were often merely fictitious institutions, founded by laymen with the object of obtaining charters of privilege which would exempt them from civil and military burdens,—such laymen then assuming, without warrant, the title and powers of abbots, and filling their houses either with monks expelled from their own societies, or with lay retainers induced to receive the tonsure and promise obedience. Bede calls on the archbishop to convene a synod and institute a visitation for the correction of these abuses. The cause of the decline of the monasteries is to be sought in their popularity, which brought them great estates and other kinds of wealth, leading to the relaxation of the vow of poverty, which was interpreted as merely forbidding individual property; in the growth of pluralities; and in yet another cause which at first does not seem to lead in the same direction—the growing custom of ordaining monks, hitherto laymen, to fit them better for missionary work. But this led, not only to much more intercourse with the society of a lax and turbulent age than suited with claustral rules, but to ambition, as it became customary to fill several sees with monks from certain abbeys. The declension, notably in the habits of the superiors of wealthy houses, had become very marked, when a reformer arose in the person of a second Benedict, of Aniane in the modern department of the Hérault (750-821), who, in gratitude for an escape from drowning in the Ticino in 774, adopted the monastic life, and changed his name Witiza to that of the great Nursian monk. But he accounted the Benedictine rule too easy, and adopted instead the severest practices of Eastern monachism. He quitted the house of Seine, where he had been professed, and betook himself with a couple of companions to Aniane, where by 782 he had built a monastery for a thousand monks, with dependent cells, and collected a considerable library, paying special attention to the acquisition of the rules of the different monastic bodies both of East and West. He was transferred by his warm patron, the emperor Louis the Pious, to an abbey built for him near Aix-la-Chapelle, whence he acted as in some sense a superior-general and inspector of all the Benedictine houses, and drew up a harmony of all the rules he had collected to aid him in the task of reform. What he actually effected was the practical abolition of most of the competing codes, so as to leave the Benedictine in nearly sole possession, and to procure the enactment of a large body of canons in the council of Aix-la-Chapelle before mentioned, which laid down detailed provisions for the government of monasteries, whose very minuteness made them vexatious and ultimately intolerable, so that the reform lasted scarcely

[1] So Bede tells us: "Habere autem solet ipsa insula rectorem semper abbatem presbyterum, cujus juri et omnis provincia et ipsi etiam episcopi, ordine inusitato, debeant esse subjecti, juxta exemplum primi doctoris illius, qui non episcopus sed presbyter extitit et monachus" (*Hist. Eccl.*, iii. 4); though, after all, the principle is precisely that of the Benedictine rule as applied to priests.

merely over his monks, as in other rules, but over bishops also, whose office was simply that of ordaining such as were to be promoted to holy orders;[1] they had no territorial jurisdiction as rulers, because the monastery, not the diocese, was the primary local unit in Celtic Christianity, and thus a great founder or abbot was of more account and power than a bishop. Another famous pupil of Irish monachism, Columbanus, trained at Benchor along with his companion Gallus, exercised a powerful influence on the religious life of his time (543-615), not only as the founder of important monasteries at Luxeuil, Fontenay, and Bobbio, and as scholar and missionary, but also as the author of a rule, more severe both in its provisions and in its penalties than the Benedictine, with which it disputed for a considerable time the first place, and which it might very probably have displaced, had not the Benedictine institute, as of Italian origin, found that favour at Rome which a Celtic code, bearing more than one trace of divergence from Latin usages, could scarcely expect. With the mention of another prominent name in the list of distinguished Celtic reformers and missionaries, that of Fursey, abbot of Lagny near Paris (*c.* 650), we close this sketch of the Celtic movement in the 6th and 7th centuries, merely adding that its extent and influence may be partly estimated from the number of monasteries founded in England and various parts of the Continent by Irish monks, and the list of Celtic saints recoverable from the different martyrologies and similar records. The former amount to more than one hundred; the latter to nearly three hundred.

Returning to the Benedictines, the most important event in their history after the consolidation of their institute was the favour they received from Gregory the Great, himself once a monk, who set himself to reform monastic discipline, then at a very low ebb save where the new foundation was at work. He enacted several regulations for the better government of monasteries, such as prohibiting the admission of any persons under eighteen, exacting two years' novitiate, enforcing inclosure, visiting relinquishment of monachism with imprisonment for life, and finally, in the Lateran synod of 601, exempting monasteries in all cases from the jurisdiction of bishops (a measure due, it appears, to episcopal misconduct and oppression rather than to monastic ambition), thereby abolishing the measure of control which the eighth canon of Chalcedon and the legislation of Justinian I. in 535 had left in the hands of the diocesan, and leaving only the still surviving check, that the bishop's consent was required for the erection of any new monastery. The mission of the monk Augustine to England in 596 was, however, destined to produce more immediate and fortunate results than this piece of legislation. It brought Latin monachism into a part of Britain whence Welsh monachism had been long extirpated, and though little success attended the original foundation at Canterbury, yet two other houses were destined to be the cradles of great things. Jarrow-on-Tyne, founded by Benedict Biscop, trained the illustrious Bede, to whom is due the monastic school of York, which in its turn sent out Alcuin to reconstitute European learning under the fostering hand of Charlemagne; Nutcell in Hampshire reared Boniface to be the apostle of Germany, and founder of one of the most celebrated and powerful monasteries of the Middle Ages, that of Fulda. Nevertheless, decline set in very soon, and the 8th century was a time of deterioration amongst both the seculars and the regulars. To amend the former, Chrodegang, bishop of Metz, instituted in 760 an order of Canons Regular, living by a rule carefully based on and adapted from the Benedictine, with the bishop as abbot, the archdeacon as prior, and with a general likeness in all the details of community life, except that there was no obligation to poverty, and the canons were allowed to enjoy any private property and such fees as they might receive for the performance of religious rites. This rule became extremely popular, was sanctioned by the council of Aix-la-Chapelle in 816, and was adopted in most cathedrals of France, Germany, and Italy within fifty years after, besides making some way in England also. It prevailed till the institute of the Austin Canons was substituted for it. And, as regards the laxity amongst regulars at this time, there is extant a very interesting letter from Bede addressed to Ecgberht, archbishop of York, calling his attention to the excessive number of monasteries in northern England which were conducted without a rule, and were often merely fictitious institutions, founded by laymen with the object of obtaining charters of privilege which would exempt them from civil and military burdens,—such laymen then assuming, without warrant, the title and powers of abbots, and filling their houses either with monks expelled from their own societies, or with lay retainers induced to receive the tonsure and promise obedience. Bede calls on the archbishop to convene a synod and institute a visitation for the correction of these abuses. The cause of the decline of the monasteries is to be sought in their popularity, which brought them great estates and other kinds of wealth, leading to the relaxation of the vow of poverty, which was interpreted as merely forbidding individual property; in the growth of pluralities; and in yet another cause which at first does not seem to lead in the same direction—the growing custom of ordaining monks, hitherto laymen, to fit them better for missionary work. But this led, not only to much more intercourse with the society of a lax and turbulent age than suited with claustral rules, but to ambition, as it became customary to fill several sees with monks from certain abbeys. The declension, notably in the habits of the superiors of wealthy houses, had become very marked, when a reformer arose in the person of a second Benedict, of Aniane in the modern department of the Hérault (750-821), who, in gratitude for an escape from drowning in the Ticino in 774, adopted the monastic life, and changed his name Witiza to that of the great Nursian monk. But he accounted the Benedictine rule too easy, and adopted instead the severest practices of Eastern monachism. He quitted the house of Seine, where he had been professed, and betook himself with a couple of companions to Aniane, where by 782 he had built a monastery for a thousand monks, with dependent cells, and collected a considerable library, paying special attention to the acquisition of the rules of the different monastic bodies both of East and West. He was transferred by his warm patron, the emperor Louis the Pious, to an abbey built for him near Aix-la-Chapelle, whence he acted as in some sense a superior-general and inspector of all the Benedictine houses, and drew up a harmony of all the rules he had collected to aid him in the task of reform. What he actually effected was the practical abolition of most of the competing codes, so as to leave the Benedictine in nearly sole possession, and to procure the enactment of a large body of canons in the council of Aix-la-Chapelle before mentioned, which laid down detailed provisions for the government of monasteries, whose very minuteness made them vexatious and ultimately intolerable, so that the reform lasted scarcely [illegible]

[1] So Bede tells us: "Habere autem solet ipsa insula rectorem semper abbatem presbyterum, cujus juri et omnis provincia et ipsi etiam episcopi, ordine inusitato, debeant esse subjecti, juxta exemplum primi doctoris illius, qui non episcopus sed presbyter extitit et monachus" (*Hist. Eccl.*, iii. 4); though, after all, the principle is precisely that of the Benedictine rule as applied to priests.

community, established by Bruno at the Chartreuse, near Grenoble, in 1084, which still boasts that it is the only order which has never been reformed on the ground of deviation from its original institute; and the Order of Fontevraud, founded for both monks and nuns (more strictly, canons and canonesses) by Robert of Arbrissel in 1100. Regarding the last named two remarkable facts may be cited: that the founder in 1115 entrusted the superior-generalship of the whole institute to the abbess of the nuns; and that he provided that new abbesses should always be elected from secular women, as having more practical knowledge of affairs and capacity for administration than women trained in a cloister. There is yet one order more belonging to this period of new foundations, of higher note than most—that of the Cistercians, founded by Robert of Molesme in 1098 at Citeaux, near Dijon. This society, chiefly famous as that to which Bernard of Clairvaux belonged, carried its asceticism into a region whence the other monastic bodies had banished it, that of Divine service. The barest simplicity in buildings, church furniture, and worship was enjoined by the rule: plain linen or fustian vestments, iron chandeliers, brass or iron censers, no plate save a chalice and a tube (and those of silver rather than of gold), no pictures, stained glass, or images, and only a few crosses of painted wood, and the most rigid simplicity in chanting,—such was the ceremonial code with which they challenged the costly ritual of Cluny. A more durable innovation was the institution of "General Chapters," to which every abbot of a Cistercian house had a right to be summoned to share in the deliberations held at the chief establishment, and which he was even bound to attend, that, while each dependent house thus obtained a representation in the parliament of the order, it could be called on to render to the central authority an account of its own doings. The Austin Canons, already mentioned, were probably founded at Avignon about 1061, and the Order of Prémontré by Norbert in 1120. This society was simply a stricter body of Austin Canons, standing towards them much as Cluny did to the Benedictines. But there are yet two other institutes of this active period which differ from all previous foundations. So far, the new orders are merely modifications, more or less sweeping, of the original Egyptian system, but the crusades gave birth to two entirely unprecedented forms of monachism:—the Military Orders, of which the most celebrated are the Templars, the Hospitallers, and the Teutonic Knights; and convents of women, affiliated to these orders, who were appointed to serve in the lazar-houses, hospitals, and similar institutions attached to them, and whose rule, for the first time in monastic history, was drawn up on a distinctly active and not a contemplative basis. Work of the sort had been done long before, but only as a casual accident, not as the primary object of a community.

ilitary lers.

The military orders arose in a more accidental fashion than any other variety of monachism, being due to the desire felt to lessen the perils which attended pilgrimage to Jerusalem, then almost as much part of the religious craving of Christendom as the hajj to Mecca is with devout Moslems. The Templars were at first designed only as an armed escort to protect the visitors from attack, and the idea of permanent guardianship of the Holy Places did not shape itself till later; while the Hospitallers (afterwards famous as Knights of Rhodes and of Malta, as the main bulwark of Christendom against the Turks, and as maintaining the police of the Mediterranean against all pirates and rovers), borrowed the first idea of their institute from the knightly order of St Anthony of Vienne, founded in Dauphiné about 1095, and devoted themselves originally to tending sick pilgrims at Jerusalem. The Teutonic Knights date from the third crusade, and owe their foundation to the sufferings of the duke of Swabia's army at the siege of Acre, as it would seem that the Hospitallers were either unable or unwilling to supply the needed assistance. These knights, when at last the Eastern crusades were abandoned, turned their arms against the heathen of Prussia, which they conquered, as also Livonia, Courland, and Pomerania, besides keeping the Slavonic enemies of Germany in check by frequent raids into Lithuania and Poland, holding their ground as a sovereign order for three centuries, till the Reformation brought about their fall. The common characteristic of all these orders was the union of the seemingly incompatible qualities of the monk and the soldier in the same persons, of the convent and the barrack in the same house. But the contrast was not so sharp to mediæval eyes as it would be to modern ones; for while knighthood was surrounded with religious ceremonies and sanctions on the one hand, and on the other the feudal rank of bishops and abbots made them in some sense military chiefs, occasionally even taking the field in person, there was no great difficulty in accepting the permanent combination of what was often found casually united. The military orders passed away when their work was ended: the Templars, as the victims of a great crime, closed by a ghastly tragedy; the Hospitallers, and those Spanish and Portuguese orders which were enrolled as regiments against the Arab invaders of the Peninsula, though titularly still existing, yet really ceased to be more than a name when the Moslem power in Europe was finally broken. But the active organization of women was a more fruitful germ, and has never since ceased to put forth new developments, varying with the noticed wants of each period. To this epoch belongs also the beginning of that policy of the Roman see of utilizing the monastic orders, won over by special privileges and exemptions, as a body of supporters—almost a militia—more to be relied on than the secular clergy, and thereby the seed of conflict between seculars and regulars, destined to work much evil later, was sown, and also the beginning made of that denationalization of monachism which tended from the first to its unpopularity and decay.

It was found that a new order was the best safety-valve for enthusiasm which might become dangerous if discouraged, but which could be made a valuable ally if allowed to take shape in a fresh society, hoping to surpass all its precursors; and it is worth remarking that the one occasion when this wise policy was departed from, when Peter Waldo vainly sought in 1179 recognition and sanction from Pope Alexander III. for his proposed institute of mission preachers, gave rise to a sect (the Waldenses) which is still existing, and which has given trouble to the Roman Church quite disproportionate to its numbers and influence. The Carmelites, founded by Berthold of Calabria on Mount Carmel about 1180, and incorporated under rule by Albert, Latin patriarch of Jerusalem in 1209, were the last order of importance which sprang up at this time; for the Gilbertines, an English order founded at Sempringham in Lincolnshire in 1148, curious chiefly for their double monasteries for men and women; the Beguines, *c.* 1170 (who are, however, notable for their semi-secular and parochial organization, whence many later active bodies have borrowed hints); the Humiliati, *c.* 1196; and the Trinitarians, for the ransom of captives amongst the Moors and Saracens, founded by John de Matha and Felix de Valois in 1197, never rose to great influence or popularity, though the Servites, an order of the year 1223, became powerful in Italy. This period of rapid multiplication was quickly followed by one of equally rapid decay, the first to show clear tokens of degeneracy being the once rigid Cistercians, who never recovered their old moral footing, and who, it may be mentioned, were accountable for much of that hatred of the Church of the Pale in Ireland

community, established by Bruno at the Chartreuse, near Grenoble, in 1084, which still boasts that it is the only order which has never been reformed on the ground of deviation from its original institute; and the Order of Fontevraud, founded for both monks and nuns (more strictly, canons and canonesses) by Robert of Arbrissel in 1100. Work of the sort had been done long before, but only as a casual accident, not as the primary object of a community.

Military orders.

The military orders arose in a more accidental fashion than any other variety of monachism, being due to the desire felt to lessen the perils which attended pilgrimage to Jerusalem, then almost as much part of the religious craving of Christendom as the hajj to Mecca is with devout Moslems. The Templars were at first designed only as an armed escort to protect the visitors from attack, and the idea of permanent guardianship of the Holy Places did not shape itself till later; while the Hospitallers (afterwards famous as Knights of Rhodes and of Malta, as the main bulwark of Christendom against the Turks, and as maintaining the police of the Mediterranean against all pirates and rovers), borrowed the first idea of their institute from the knightly order of St Anthony of Vienne, founded in Dauphiné about 1095, and devoted themselves originally to tending sick pilgrims at Jerusalem. The Teutonic Knights date from the third crusade, and owe their foundation to the sufferings of the duke of Swabia's army at the siege of Acre, as it would seem that the Hospitallers were either unable or unwilling to supply the needed assistance. These knights, when at last the Eastern crusades were abandoned, turned their arms against the heathen of Prussia, which they conquered, as also Livonia, Courland, and Pomerania, besides keeping the Slavonic enemies of Germany in check by frequent raids into Lithuania and Poland, holding their ground as a sovereign order for three centuries, till the Reformation brought about their fall. The common characteristic of all these orders was the union of the seemingly incompatible qualities of the monk and the soldier in the same persons, of the convent and the barrack in the same house. But the contrast was not so sharp to mediæval eyes as it would be to modern ones; for while knighthood was surrounded with religious ceremonies and sanctions on the one hand, and on the other the feudal rank of bishops and abbots made them in some sense military chiefs, occasionally even taking the field in person, there was no great difficulty in accepting the permanent combination of what was often found casually united. The military orders passed away when their work was ended: the Templars, as the victims of a great crime, closed by a ghastly tragedy; the Hospitallers, and those Spanish and Portuguese orders which were enrolled as regiments against the Arab invaders of the Peninsula, though titularly still existing, yet really ceased to be more than a name when the Moslem power in Europe was finally broken. But the active organization of women was a more fruitful germ, and has never since ceased to put forth new developments, varying with the noticed wants of each period. To this epoch belongs also the beginning of that policy of the Roman see of utilizing the monastic orders, won over by special privileges and exemptions, as a body of supporters—almost a militia—more to be relied on than the secular clergy, and thereby the seed of conflict between seculars and regulars, destined to work much evil later, was sown, and also the beginning made of that denationalization of monachism which tended from the first to its unpopularity and decay.

It was found that a new order was the best safety-valve for enthusiasm which might become dangerous if discouraged, but which could be made a valuable ally if allowed to take shape in a fresh society, hoping to surpass all its precursors; and it is worth remarking that the one occasion when this wise policy was departed from, when Peter Waldo vainly sought in 1179 recognition and sanction from Pope Alexander III. for his proposed institute of mission preachers, gave rise to a sect (the Waldenses) which is still existing, and which has given trouble to the Roman Church quite disproportionate to its numbers and influence. The Carmelites, founded by Berthold of Calabria on Mount Carmel about 1180, and incorporated under rule by Albert, Latin patriarch of Jerusalem in 1209, were the last order of importance which sprang up at this time; for the Gilbertines, an English order founded at Sempringham in Lincolnshire in 1148, curious chiefly for their double monasteries for men and women; the Beguines, *c.* 1170 (who are, however, notable for their semi-secular and parochial organization, whence many later active bodies have borrowed hints); the Humiliati, *c.* 1196; and the Trinitarians, for the ransom of captives amongst the Moors and Saracens, founded by John de Matha and Felix de Valois in 1197, never rose to great influence or popularity, though the Servites, an order of the year 1223, became powerful in Italy. This period of rapid multiplication was quickly followed by one of equally rapid decay, the first to show clear tokens of degeneracy being the once rigid Cistercians, who never recovered their old moral footing, and who, it may be mentioned, were accountable for much of that hatred of the Church of the Pale in Ireland

a remarkable and widespread religious revival, a dead-lift to ministerial efficiency in every direction, repaid their early labours, while they had between them almost a monopoly of the popedom for nearly two hundred years. And one peculiarity of their organization gave them a degree of strength which no other orders possessed. Each monastery of the older societies was practically isolated and independent of all others, unless it were itself a dependent priory or cell belonging to a greater house. Some societies had, it is true, general chapters, but these were rare, and at best only effectual in establishing a certain uniformity of practice in all houses of the same rule. But the Friars, like the Templars and Hospitallers of an earlier day, and like the Jesuits of a later one, were enrolled in something of military fashion, under a superior-general, with wide powers, who directed and controlled their actions from one central point. Every group of neighbouring friaries was formed into a congregation, under a local head or provincial, and he was always in direct communication with the general, so that a common government united the whole body into a compact mass. But their very success was fatal to their character. The vow of poverty was the first part of their institute to break down. Even before they began to be counted amongst the richest orders of Christendom, there is indisputable evidence—that of Bonaventura, himself general of the Franciscans—that the mendicant system was working nothing but mischief. He tells us, writing while the order was still very young, and within fifty years of the founder's death, that it was even more entangled in money cares and business concerns than the endowed communities, precisely because there were no funds available to fall back on in emergencies; that the brethren, discouraged from work by mendicancy, were habitually idle; that they roamed about in disorderly fashion under pretext of questing; that they were such brazen and shameless beggars as to make a Franciscan as much dreaded by travellers as a highwayman; that they made undesirable acquaintances, thus giving rise to evil reports and scandal; that conventual offices had to be entrusted to untried, unspiritual, and incompetent brethren; that vast sums were lavished on costly buildings; and that the friars were greedy in the pursuit of burial fees and of legacies, so that they encroached upon the rights of the parochial clergy. If such were the mischiefs at work before the first zeal had begun to cool, it may readily be gathered how entire was the failure at a later time. Indeed, as regards the Franciscans, not only did they endeavour to evade the stringency of their institute even in their founder's lifetime, but the whole society was soon divided into two hostile camps, one of which desired to adhere closely to the original rule, while the other was content to fall in with the habits of the "possessioners," as they had been wont contemptuously to name the endowed orders. And what is very curious in this connexion is that the friars who were loyal to the principle of poverty broke away for the most part from the church, forming new sects, such as the Fratricelli, or attaching themselves to elder ones, like the Beghards and the Apostolici, which handed on in secret the Gnostic traditions of the third century, apparently stamped out in the crusade against the Albigenses, while those who openly disregarded the will of their founder remained steadfastly in the Latin church. No order, except the Benedictines, has had so many branches and reforms as the Franciscans; amongst which it will suffice to name the Capuchins, the Minims, the Observants, and the Recollects; while the Poor Clares, the nuns of the institute, have also divided into Clarissines and Urbanists. The institution of Tertiaries, seculars affiliated to the order as honorary members, while continuing to live in the world, and adopting a certain modified daily rule, was a powerful factor in the success and strength of the order, and was adopted, but with less conspicuous results, by the Dominicans. The rivalry of these two great bodies with each other, prolonged with much bitterness for centuries, and their disputes with the parochial clergy, whom they long displaced in general repute and influence, belong rather to general church history than to the annals of monachism, and may be passed by with this brief allusion; while it suffices to say that all the support they, and the other less important communities of the same kind, such as the Carmelite and Austin Friars, received from the popes, whose most effective allies they were in every country where their houses were found, was not able to avert their decline in general estimation; and there is no figure in later mediæval literature on which the vials of contempt and indignation are so freely poured as on the begging friar, and that, it must be said, deservedly.

Dec of .. ch: 14t: tu..

As the 13th century is the apogee of later monachism, so the decline begins steadily at the very outset of the 14th (which is also the date of ordination becoming the normal custom for choir-monks, instead of the exception, as formerly), continuing down to the crash of the Reformation.[1] The great schism of the West, the rise of the Wickliffites and Lollards in England, and of the body later known as Hussites in Bohemia, could not fail to act injuriously on the monastic orders; and, though the creation of fresh ones continued, none of those founded during this era were influential, and few durable. It will suffice to name some of the more prominent:—the Olivetans in 1313, who were rigid Benedictines; the nuns of Bridget of Sweden in 1363, who followed a rule compiled from those of Basil and Augustine; the Hieronymite monks in 1374; the Brethren of the Common Life, founded by Gerard Groot in 1376, who did much for education and in home mission work, but are chiefly famous now in virtue of one member of their society, Thomas a Kempis; the Hieronymite Hermits in 1373-1377; the Minims in 1435; the Barnabites, a preaching and educational order, in 1484; the Theatins (a body of Clerks Regular who aimed at little more than raising the tone of clerical life, made but slight pretension to austerity, and are, indeed, mainly noticeable as having suggested to Ignatius Loyola several points which he adopted in regulating the mode of life to be pursued by the members of his institute) in 1524; and the Capuchins in 1525.

In the Reformation era itself the monastic bodies had sunk so low in the estimation of even the rulers of the church that one clause in the report of the committee of cardinals appointed by Pope Paul III. (a body composed of Sadolet, Contarini, Reginald Pole, Giberti, Fregoso, Badia, Aleandro, and Caraffa, afterwards Paul IV.), delivered in 1538, was worded as follows:—

"Another abuse which needs correction is in the religious orders, because they have deteriorated to such an extent that they are a *grave scandal to seculars*, and do the greatest harm by their example. We are of opinion that they should be all abolished, not so as to injure [the vested interests of] any one, but by forbidding them to receive novices; for in this wise they can be quickly done

---

[1] The language of Nicolas de Clamenges (1360-1440)—rector of the university of Paris, known as the "Doctor Theologus"—in his treatise *De Corrupto Ecclesiæ Statu*, paints the moral decay of the monastic bodies, and especially of the Mendicants, in the very darkest colours. He not only charges them with waste, idleness, gluttony, drunkenness, and profligacy, but alleges the condition of convents of nuns to be such that there was little practical difference between allowing a girl to take the veil and openly consigning her to a life of public vice. And the *Revelations* of Bridget of Sweden (1302-1373), approved by the councils of Constance and Basel, and by Popes Urban VI., Martin V., and Paul V., fully confirm the darkest features of this testimony as regards the religious houses of the 14th century.

a remarkable and widespread religious revival, a dead-lift to ministerial efficiency in every direction, repaid their early labours, while they had between them almost a monopoly of the popedom for nearly two hundred years. And one peculiarity of their organization gave them a degree of strength which no other orders possessed. Each monastery of the older societies was practically isolated and independent of all others, unless it were itself a dependent priory or cell belonging to a greater house. Some societies had, it is true, general chapters, but these were rare, and at best only effectual in establishing a certain uniformity of practice in all houses of the same rule. But the Friars, like the Templars and Hospitallers of an earlier day, and like the Jesuits of a later one, were enrolled in something of military fashion, under a superior-general, with wide powers, who directed and controlled their actions from one central point. Every group of neighbouring friaries was formed into a congregation, under a local head or provincial, and he was always in direct communication with the general, so that a common government united the whole body into a compact mass. But their very success was fatal to their character. The vow of poverty was the first part of their institute to break down. Even before they began to be counted amongst the richest orders of Christendom, there is indisputable evidence — that of Bonaventura, himself general of the Franciscans—that the mendicant system was working nothing but mischief. He tells us, writing while the order was still very young, and within fifty years of the founder's death, that it was even more entangled in money cares and business concerns than the endowed communities, precisely because there were no funds available to fall back on in emergencies; that the brethren, discouraged from work by mendicancy, were habitually idle; that they roamed about in disorderly fashion under pretext of questing; that they were such brazen and shameless beggars as to make a Franciscan as much dreaded by travellers as a highwayman; that they made undesirable acquaintances, thus giving rise to evil reports and scandal; that conventual offices had to be entrusted to untried, unspiritual, and incompetent brethren; that vast sums were lavished on costly buildings; and that the friars were greedy in the pursuit of burial fees and of legacies, so that they encroached upon the rights of the parochial clergy. If such were the mischiefs at work before the first zeal had begun to cool, it may readily be gathered how entire was the failure at a later time. Indeed, as regards the Franciscans, not only did they endeavour to evade the stringency of their institute even in their founder's lifetime, but the whole society was soon divided into two hostile camps, one of which desired to adhere closely to the original rule, while the other was content to fall in with the habits of the "possessioners," as they had been wont contemptuously to name the endowed orders. And what is very curious in this connexion is that the friars who were loyal to the principle of poverty broke away for the most part from the church, forming new sects, such as the Fratricelli, or attaching themselves to elder ones, like the Beghards and the Apostolici, which handed on in secret the Gnostic traditions of the third century, apparently stamped out in the crusade against the Albigenses, while those who openly disregarded the will of their founder remained steadfastly in the Latin church. No order, except the Benedictines, has had so many branches and reforms as the Franciscans; amongst which it will suffice to name the Capuchins, the Minims, the Observants, and the Recollects; while the Poor Clares, the nuns of the institute, have also divided into Clarissines and Urbanists. The institution of Tertiaries, seculars affiliated to the order as honorary members, while continuing to live in the world, and adopting a certain modified daily rule, was a powerful factor in the success and strength of the order, and was adopted, but with less conspicuous results, by the Dominicans. The rivalry of these two great bodies with each other, prolonged with much bitterness for centuries, and their disputes with the parochial clergy, whom they long displaced in general repute and influence, belong rather to general church history than to the annals of monachism, and may be passed by with this brief allusion; while it suffices to say that all the support they, and the other less important communities of the same kind, such as the Carmelite and Austin Friars, received from the popes, whose most effective allies they were in every country where their houses were found, was not able to avert their decline in general estimation; and there is no figure in later mediæval literature on which the vials of contempt and indignation are so freely poured as on the begging friar, and that, it must be said, deservedly.

As the 13th century is the apogee of later monachism, so the decline begins steadily at the very outset of the 14th (which is also the date of ordination becoming the normal custom for choir-monks, instead of the exception, as formerly), continuing down to the crash of the Reformation.[1] The great schism of the West, the rise of the Wickliffites and Lollards in England, and of the body later known as Hussites in Bohemia, could not fail to act injuriously on the monastic orders; and, though the creation of fresh ones continued, none of those founded during this era were influential, and few durable. We are of opinion that they should be all abolished, not so as to injure [the vested interests of] any one, but by forbidding them to receive novices; for in this wise they can be quickly done

1 The language of Nicolas de Clamenges (1360-1440)—rector of the university of Paris, known as the "Doctor Theologus"—in his treatise *De Corrupto Ecclesiæ Statu*, paints the moral decay of the monastic bodies, and especially of the Mendicants, in the very darkest colours. He not only charges them with waste, idleness, gluttony, drunkenness, and profligacy, but alleges the condition of convents of nuns to be such that there was little practical difference between allowing a girl to take the veil and openly consigning her to a life of public vice. And the *Revelations* of Bridget of Sweden (1302-1373), approved by the councils of Constance and Basel, and by Popes Urban VI., Martin V., and Paul V., fully confirm the darkest features of this testimony as regards the religious houses of the 14th century.

first was the Oratory, founded by Philip Neri in 1558, but not approved by authority till 1577, and copied independently by Cardinal de Berulle at Paris in 1611. There were no vows imposed on the members of this society, though they lived under rule, and they employed themselves in doing all kinds of clerical work under episcopal supervision. The Italian house is chiefly celebrated as having included the famous Cardinal Baronius amongst its earliest recruits; but the French one held a high place in the religious revival of the 17th century, well-nigh rivalling the Benedictines of St Maur in learning (with such representatives as Simon, Thomassin, Morin, and Malebranche), and the reformed Cistercians of Port-Royal in piety, though sharing with the latter the reproach of Jansenism. But the second was far more influential, and has been fruitful ever since in the works of its copyists as well as in its own. It was the institute of the Sisters of Charity, established by Vincent de Paul in 1634, on the lines of the ancient community of the Hospitaller Nuns of St Augustine, but with some remarkable modifications, not only in respect of the vows, which were only yearly and inward, but in the spirit of their discipline, as formulated in his own memorable words,—"Your convent must be the houses of the sick; your cell, the chamber of suffering; your chapel, the parish church; your cloister, the streets of the city, or the wards of the hospital; your rule, the general vow of obedience; your grille, the fear of God; your veil to shut out the world, holy modesty." The original scheme of Francis de Sales for the Nuns of the Visitation, founded in 1610, was almost identical; but the opposition was then far too strong, and he was forced to make them a cloistered community. Vincent's order of Mission Priests, more commonly known as Lazarists, was also a successful and useful institute, though not vying in the extent of its influence with the other, which, as has been implied, has powerfully affected the organization of many of the active communities which have since been formed. No religious body did more to enable French monachism to bear up against the general obloquy it encountered during the 16th, 17th, and early 18th centuries,—a temper on the part of the public due to more than one cause. In the first place, the wars of religion had done much to harden and coarsen the feelings on both sides, and rigid adherence to the extreme positions of Catholics or Huguenots, as the case might be, was set far above any gentler and higher ideas. Next, the monasteries of both sexes had all but universally fallen into the patronage of the crown (in virtue of the concordat of Bologna, between Pope Leo X. and Francis I.), and were jobbed away as apanages for a dissolute nobility, who squandered the revenues, and suffered discipline to become relaxed, often to the generation of serious scandals. This malversation operated in two ways. It made the monasteries hard and bad landlords, grasping closely all the feudal privileges and monopolies which they continued to enjoy, a proceeding which bore hard on the tenants and labourers, so that the monks shared to the full the unpopularity of the nobles (precisely as was the case in Germany, during the Peasants' War of 1525); and the evil repute of the convents—of whose real character we get at least one trustworthy glimpse in the account of the abbey of Maubuisson which Angélique Arnauld reformed—came home to all the Huguenots and their friends, because both before and after the legal continuance of the edict of Nantes they were used (according to a very early application of monastic houses not yet obsolete) as prisons, where Huguenot women and girls were shut up in order to bring about their conversion, forcibly if necessary, but somehow in any case. And there is evidence to show that the Huguenots resented this policy most bitterly, not only on polemical grounds, but because they were firmly persuaded that the morals of their wives, daughters, and sisters were in no less peril than their faith in such places. When to this sentiment is added the hostility of the Jansenists to the school of opinion which had persecuted them, razed their famous house of Port-Royal, and literally flung the bones of its deceased members to the dogs, it will be easy to judge how powerful were the forces mustering for the overthrow of monachism, and how little even such stern reforms as De Rancé's at La Trappe, which has always had a marked attraction for soldiers, could do towards abating the danger. Nor were there wanting public scandals and cases before the law-courts which helped to fan the rising flames of hatred.[1] Another cause which contributed much to the decay of discipline and of practical religion in monasteries of both sexes was the custom which prevailed throughout the 16th, 17th, and 18th centuries, of disposing of the younger members of poor but noble families in the cloister as a safe and reputable provision, without any regard to the vocation of those so dedicated, and merely because the sum which sufficed to secure permanent admission was much smaller than that necessary to purchase a commission or public office for a son, or to provide an adequate dowry for a daughter.[2] At the Revolution, the religious houses, amounting (without reckoning various minor colleges and dependent establishments) to 820 abbeys of men and 255 of women, with aggregate revenues of 95,000,000 livres, were suppressed by the laws of 13th February 1790 and 18th August 1792. In Germany the storm had broken somewhat earlier, if not quite so violently. The Thirty Years' War had wrought much mischief to not a few of the religious houses, without taking into account the great number which had been destroyed in the territories of the Protestant princes; and when the death of Maria Theresa in 1780 left her son Joseph II. free to act as he pleased, he dissolved the Mendicant orders, and suppressed, in despite of the personal remonstrances of Pius VI., the greater number of monasteries and convents in his dominions. In Italy, despite the multiplication of new institutes, the process of decay continued throughout the 17th century, and one most remarkable testimony to the fact appears in the report of the Venetian ambassadors at Rome in 1650 to their government of an interview they had with Pope Alexander VII.

---

the rule and organization of the famous company, and taking the three usual vows, but, with a bold disregard of precedent, not only omitting the customary vow of inclosure, but actually sending the members of the society out as itinerant preachers. Their object was to train a body of emissaries for the Roman Catholic mission in England, who might obtain entrance and escape the incidence of the penal laws in a manner impracticable for men. They had considerable success for a time, and Mrs Ward, their projector, obtained some degree of papal approval, and became "mother-general" over more than 200 of these female preachers in the various colleges of the society. But after an existence of about eighty years it was suppressed by Pope Urban VIII. in 1630.

1 One of these is interesting, as settling a point which has been often disputed,—the existence of those monastic dungeons known by the name of "in-pace," familiar to the readers of *Marmion*. It is the condemnation of the abbot of Clairvaux by the parlement of Paris in 1763 to a fine of 40,000 crowns for causing the death of a prisoner in an "in-pace."

2 This worked much evil in France, but produced perhaps even greater mischief in Germany, where what were styled "Noble Abbeys" were *not* uncommon, entrance to which, save in the inferior capacity of lay-members, was barred against all who could not prove patrician descent and a certain number of armorial quarterings. A relic of this survives in a few secular *Stiftungen* (Protestant and Catholic) for noble canonesses in Germany; and the notion was at any rate as respectable as that which holds good in some communities even now, where women who can pay a certain sum at entrance are admitted as choir-sisters, while those who cannot do so must accept the humbler position of lay-sisters.

who house and tend aged invalids. As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "Congregation"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several congregations within itself (as the Benedictine order, for example, includes the congregations of Cluny and of St Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own. Another distinction drawn between the elder and younger societies is that the former are said to make "solemn vows," the latter only "simple vows." The difference here is not in the matter of the vows, which are usually the same in all cases, nor even in the ceremonies attending their utterance, which may also be alike, but in the superior binding efficacy of the solemn vows in Roman canon law, which rules that they so bind the member to his society, and the society to each member, that neither can sever the connexion, so that only the pope can dissolve it, and that in rare and exceptional cases alone. And it may be added that the term "religious" is restricted in the Latin Church to communities whose institute has been formally approved by the Roman see, and whose vows are for life, and not merely renewable,—a principle which excludes the Sisters of Charity, for example, from the use of this title. By the laws of France, and of some other countries, life-vows are invalid and even prohibited, but when they make part of the original institute, such disapproval by the civil power is not held to reduce them to the canonical level of temporary vows.

Returning to the history of Western monachism, the fall of the religious houses in Spain dates from the law of 21st June 1835, which suppressed nine hundred monasteries at a blow; and the remainder had but a short respite, as they were dissolved on 11th October of the same year. In Portugal, where a bias against the Roman Curia has been a traditional part of patriotism ever since the revolution of 1640, when the pope sided with Spain against the house of Braganza, there was little feeling to protect the monasteries when it happened that the crown wanted their possessions, and they were all suppressed by the decree of 28th May 1834. No European country had so many religious houses as Portugal in proportion to its population and area, and the number of the foundations dissolved in 1834 exceeded 500. In Switzerland, a considerable measure of suppression followed the war of the Sonderbund in 1847; while in Italy, the last country where monachism had remained almost unmolested, an Act was passed in the Sardinian Parliament on 7th July 1866 for the suppression of monasteries within the Piedmontese dominions, and for the confiscation of their property. The measure was extended to the whole of Italy after the unification of the kingdom; the orders were expropriated in 1873; their houses were declared national property, and were put to secular uses, no exception being made in favour of San Marco at Florence, of Assisi, of Vallombrosa, or even of Monte Cassino itself.[1]

On the other hand, several Roman Catholic societies have attained considerable success in the United States and Canada, thus in some degree recovering for the principle they represent part at least of the ground lost in Europe; while in three religious communions outside the pale of the Latin obedience—the Evangelicals of Germany, the Reformed of France, and the Church of England—the organization of women for charitable and religious work on the lines of various old institutes has been actively carried out. The Deaconesses of Kaiserswerth, founded by Pastor Fliedner in 1836, derive part of their rule, and even of their dress, from the Dames de St Augustine, themselves lineal descendants of the first Hospitallers of the crusades, and have ramified into several countries; the Strasburg and Mühlhausen Deaconesses derive theirs partly from the Flemish Beguines and partly from some points in the Moravian organization, itself handed down from those seceding Franciscans to whom the *Unitas Fratrum* really owes its origin; while the various Anglican communities, of which there are several, have borrowed freely from different sources, according to the preference and knowledge of each founder. Some attempts at reviving the common life for men also have likewise been made, but none on any large scale; only one has as yet exhibited any signs of vitality, a preaching order at Cowley, near Oxford, which has obtained some footing in England, and has even been able to spread to America.

Bibliography.—The bibliography of Monachism is excessively copious, and it is impracticable to indicate more than a few of the most important and trustworthy books. General:—Hospinianus, *De Monachis Libri Sex* (Geneva, 1659), bitterly hostile, but a copious and trustworthy record of facts; Helyot, *Histoire des Ordres Religieux* (8 vols., Paris, 1714-1721), and again (as *Dictionnaire des Ordres Religieux*), with continuation by Badiche (4 vols., Paris, Migne, 1860),—this book has itself a copious catalogue of works on its subject prefixed; Alteserra, *Asceticon, sive Originum Rei Monasticæ Libri Decem* (Paris, 1674); Holstenius, *Codex Regularum* (3 vols., Rome, 1661); Montalembert, *Moines d'Occident* (7 vols., Paris, 1860-1877); Dugdale, *Monasticon Anglicanum* (edited by Caley, Ellis, and Bandinel, 8 vols., London, 1846); Rosweyde, *Vita Patrum* (Lyons, 1617). Special:—Benedictines—Mabillon, *Acta SS Ordinis S. Benedicti* (9 vols., Venice, 1733); Cluniacs—Marrier, *Bibliotheca Cluniacensis* (Paris, 1614); Cistercians—Gaillardin, *Les Trappistes* (Paris, 1844); Besoigne, *Histoire de l'Abbaye de Port-Royal* (8 vols., Cologne, 1752-56); Dominicans—Touron, *Histoire des Hommes Illustres de l'Ordre de Saint Dominique* (6 vols., Paris, 1743-49); Franciscans—Sedulius, *Historia Seraphica* (Antwerp, 1613); Wadding, *Annales Minorum* (20 vols., Rome, 1731-94)

(R. F. L.)

[1] The total number of monasteries, &c., suppressed in Italy down to the close of 1882 was 2255, involving an enormous displacement of property and dispersion of inmates. And yet there is some reason to think that the state did but do roughly and harshly what the church should have done more gradually and wisely; for the judgment passed on the dissolution by Pius IX. himself, in speaking to an English Roman Catholic bishop, was: "It was the devil's work; but the good God will turn it into a blessing, since their destruction was the only reform possible to them." (Cited by Rev. R. R. Suffield in *Modern Review*, vol. ii. p. 359, April 1881.)

Chronological Table of Monastic Foundations.

The religious communities which have been formed at various times in the Western Church amount to many hundreds, and receive fresh accessions almost yearly, while some among them have been suppressed, absorbed, or suffered to die out. No official list of those actually in existence and recognized by authority is published; it is thus impracticable to enumerate them accurately, especially as many of them are only local varieties or branches of identical rules and institutes, and there are not a few cases where a once celebrated and powerful order has practically disappeared from view, though, as still lingering in one or two houses, not definitely extinct. The following table, however, gives the more remarkable foundations in chronological order, some of the earlier dates being only approximate, and even a few later ones uncertain, for the historians often vary as to the exact year, sometimes giving that of the first attempt at organization, and sometimes that of the final approval by authority.

Date.	Name.	Founder.	Place.	Date.	Name	Founder.	Place.
250	Monks of the Thebaid	Paul the Hermit	Upper Egypt.	395	Austin Canons (original)	Augustine	Hippo, [illegible] Africa
320	Tabennites	Pachomius	Tabennæ, in the Nile.	400	Acoemeti, or Sleepless Monks	Alexander .	[illegible]
363	Basilian Monks	Basil the Great ...	Mataza, Pontus

within the church, towards the end of the 2d century and during the 3d, opposed the doctrine of a hypostatic Logos (hypostasianism) or of an independent personal subsistence of the Divine Word. It is usual (and convenient) to speak of two kinds of monarchianism,—the dynamistic and the modalistic. By monarchians of the former class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely high degree in which he had been filled with Divine wisdom and power. This view was represented in Asia Minor about the year 170 by the anti-Montanistic Alógi, so called by Epiphanius on account of their rejection of the Fourth Gospel; it was also taught at Rome about the end of the 2d century by Theodotus of Byzantium, a currier, who was excommunicated by Bishop Victor, and at a later date by Artemon, excommunicated by Zephyrinus. About the year 260 it was again propounded within the church by Paul of Samosata (*q.v.*), who held that, by his unique excellency, the man Jesus gradually rose to the Divine dignity, so as to be worthy of the name of God. Modalistic monarchianism, conceiving that the whole fulness of the Godhead dwelt in Christ, took exception to the "subordinatianism" of some church writers, and maintained that the names Father and Son were only two different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son." It was first taught, in the interests of the "monarchia" of God, by Praxeas, a confessor from Asia Minor, in Rome about 190, and was opposed by Tertullian in his well-known controversial tract. The same view—the "patripassian" as it was also called, because it implied that God the Father had suffered on the cross—obtained fresh support in Rome about 215 from certain disciples of Noetus of Smyrna, who received a modified support from Bishop Callistus. It was on this account that Hippolytus, the champion of hypostasian subordinatianism, along with his adherents, withdrew from the obedience of Callistus, and formed a separate community. A new and conciliatory phase of patripassianism was expounded at a somewhat later date by Beryllus of Bostra, who, while holding the divinity of Christ not to be ἰδία, or proper to Himself, but πατρική (belonging to the Father), yet recognized in His personality a new πρόσωπον or form of manifestation on the part of God. Beryllus, however, was convinced of the wrongness of this view by Origen (*q.v.*), and recanted at the synod which had been called together in 244 to discuss it. For the subsequent history of modalistic monarchianism, see Sabellius.

MONASTICISM. See Monachism.

MONASTIR, Bitolia, or Toli Monastir, a city of Macedonia, now the chief town of the Turkish vilayet of Roumelia, is situated at a height of 1880 feet above the sea, in a western inlet of the beautiful, fertile, and many-villaged plain which, with a breadth of about 10 miles, stretches for 40 miles eastward from Mount Peristeri (7714 feet high) to the Babuna chain. It is embosomed in rich masses of foliage, and crossed by a rough-channeled mountain stream, the Drahor, which joins the Czerna or Karasu, a tributary of the Vardar. The military advantages of its position at the meeting-place of roads from Salonica, Durazzo, Uskiub, and Adrianople led the Turks about 1820 to make Monastir the headquarters of the Roumelian *corps d'armée*. Since then its general and commercial importance has greatly increased. A considerable amount of gold and silver work (especially clasps and filigree) is made by the local craftsmen. The population is about 40,000.

Monastir—so called from the monastery of Bukova (The Beeches), some hundred feet up the slope of Peristeri—is identified with the ancient Heraclea Lyncestis on the Egnatian Way; and its bishopric is still called the bishopric of Pelagonia from the ancient name of the plain. In 1833 the town was the scene of the massacre of the Albanian beys.

MONBODDO, James Burnett, Lord (1714-1799), author of works on the *Origin and Progress of Language* (published in 1773), and *Ancient Metaphysics* (1779), was one of the most marked characters in Scottish literary circles in the 18th century. He was born in 1714 at Monboddo in Kincardineshire, studied at Aberdeen and Groningen, and quickly took a leading position at the Edinburgh bar, being made one of the Lords of Session in 1767. Many of his eccentricities, both of conduct and opinion, appear less eccentric to the present generation than they did to his contemporaries; though he seems to have heightened the impression of them by his humorous sallies in their defence. He may have had other reasons than the practice of the ancients for dining late and performing his journeys on horseback instead of in a carriage. His views about the origin of society and language and the faculties by which man is distinguished from the brutes afforded endless matter for jest to the wags of his day; but readers of this generation are more likely to be surprised by the scientific character of his method and the acuteness of his conclusions than amused by his eccentricity. These conclusions have many curious points of contact with Darwinism and Neo-Kantism. His idea of studying man as one of the animals, and of collecting facts about savage tribes to throw light on the problems of civilization, bring him into contact with the one, and his intimate knowledge of Greek philosophy with the other. In both respects Monboddo was far in advance of his neighbours. His happy turn of Virgil's line—

"Tantæ molis erat *humanam* condere gentem"—

might be adopted as a motto by the Evolutionists; and Neo-Kantians would find it hard to believe that he published his criticism of Locke in 1773. His studied abstinence from fine writing—from "the rhetorical and poetical style fashionable among writers of the present day"—on such subjects as he handled confirmed the idea of his contemporaries that he was only an eccentric concocter of supremely absurd paradoxes. He died, 26th May 1799, at the advanced age of eighty-five.

MONCTON, a town of the Dominion of Canada, in Westmoreland, New Brunswick, 89 miles by rail north-east of St John, is a port at the head of navigation on the Petitcodiac, and the seat of the workshops and general offices of the Intercolonial Railway. The population, about 1200 in 1871, was 5032 in 1881; the growth of the place has been favoured by the establishment of sugar-refining factories, and factories for cotton and brass and iron wares since the Canadian Parliament in 1879 adopted a policy of protection. For the year 1881-82 the exports amounted to $64,817, and the imports to $252,571.

MONDOÑEDO, an ancient city of Spain, 27 miles north-north-east from Lugo, in the province of that name, is situated on the Sixto, a small tributary of the Masma, on the Atlantic side of the Cantabrian chain, in a sheltered site surrounded on all sides by considerable hills. The population in 1878 was 10,112. The principal buildings are the cathedral, a Corinthian structure of the 17th century, an ex-convent of Franciscan friars of Alcantara, which is now used for a theatre and a public school, and the civil hospital. The industries, which are unimportant, include lace-making, linen-weaving, and leather manufacture.

According to local tradition, the bishopric of Dumium, near Braga, was transferred to San Martin de Mondoñedo (three leagues from Mondoñedo) in the 8th century; it was brought to Mondoñedo itself by Doña Urraca in the beginning of the 12th century; for about sixty years prior to 1233 the see was at Ribadeo. After having

within the church, towards the end of the 2d century and during the 3d, opposed the doctrine of a hypostatic Logos (hypostasianism) or of an independent personal subsistence of the Divine Word. It is usual (and convenient) to speak of two kinds of monarchianism,—the dynamistic and the modalistic. By monarchians of the former class Christ was held to be a mere man, miraculously conceived indeed, but constituted the Son of God simply by the infinitely high degree in which he had been filled with Divine wisdom and power. This view was represented in Asia Minor about the year 170 by the anti-Montanistic Alógi, so called by Epiphanius on account of their rejection of the Fourth Gospel; it was also taught at Rome about the end of the 2d century by Theodotus of Byzantium, a currier, who was excommunicated by Bishop Victor, and at a later date by Artemon, excommunicated by Zephyrinus. About the year 260 it was again propounded within the church by PAUL of Samosata (*q.v.*), who held that, by his unique excellency, the man Jesus gradually rose to the Divine dignity, so as to be worthy of the name of God. Modalistic monarchianism, conceiving that the whole fulness of the Godhead dwelt in Christ, took exception to the "subordinatianism" of some church writers, and maintained that the names Father and Son were only two different designations of the same subject, the one God, who "with reference to the relations in which He had previously stood to the world is called the Father, but in reference to His appearance in humanity is called the Son." fusion. In mercantile phraseology the value of money means the interest charged for the use of loanable capital. Thus, when the market rate of interest is high money is said to be dear, when it is low money is regarded as cheap. Whatever may be the force of the reasons in favour of this use, it is only mentioned here for the purpose of excluding it. For our present subject, "the value of a thing is what it will exchange for; the value of money is what money will exchange for, or its purchasing power. If prices are low, money will buy much of other things, and is of high value; if prices are high, it will buy little of other things, and is of low value. The value of money is inversely as general prices, falling as they rise and rising as they fall."[1] Now in the general theory of value it appears that the *proximate* condition which determines it is the equation between supply and demand; and this is clearly the case with reference to money. These terms, supply and demand, need, however, some elucidation. Let us consider what is meant by the supply of, and demand for, money. The supply of a commodity means the quantity of it which is offered for sale. But in what shape does the sale of money take place? By being offered for goods. "The supply of money, then, is the quantity of it which people are wanting to lay out;" or, to put the point more concisely, it is "all the money *in circulation* at the time." Again, to take the case of demand,—the demand for a commodity is the purchasing power offered for it.[2] Demand in the special case of money consists of all the goods offered for sale. There is, however, a peculiar feature in the case of money which arises from its position as the medium of exchange, viz., that money is, so to say, in a "constant state of supply and demand," since its principal service is to act as the means of purchasing commodities.[3] From this it follows that the factors which determine the value of money within a given time are: (1) the amount of money in circulation, and (2) the amount of goods to be sold. On closer examination it will, however, appear that there are other elements to be taken into account. In the first place, the quantity of money is not by itself the sole element on the supply side. In some instances a coin will not circulate more than two or three times in a year, while another coin may make hundreds of purchases. In determining the value of money these varying rates of circulation have to be considered, and by taking an average we may establish the existence of a fresh element to be estimated, namely, the average rapidity with which money does its work, or, to use Mill's expression, "the efficiency of money." On the side of demand, again, it is not the quantity of commodities that is the determining element, but the amount of sales, and the same article may, and generally does, pass through several hands before it reaches the consumer. From this it follows that (if the consideration of credit in its various forms be omitted) the value of money is inversely as its quantity multiplied by its efficiency, the amount of transactions being assumed to be constant. This formula requires, however, some further explanations before it can be accepted as a full expression of the truth on the subject. It must be noticed that it is not commodities only that are exchanged for money. Services of all kinds constitute a large portion of the demand, while the payment of interest on the various forms of obligation requires a large amount of the circulating medium. The potent influence of credit also must be dwelt on. This latter force is the main element to be considered in dealing with variations of prices; but so far as it is based on a deposit of metallic money it may be looked on as a means of increasing the efficiency of money, and therefore as coming within the formula given above. In its other aspects it lies outside the range of this article. Some interesting conclusions may be deduced from the results we have arrived at. One of these is that the "increased development of trade," or "expansion of commerce," *of itself* tends to lower not to raise prices; for, by increasing the work which money has to do while the amount remains the same, it raises its value.[4] Another consequence is that a large addition may be made to the money in a country without any effect being produced on prices. This is evident, since money only acts on prices by being brought into circulation; therefore, if the money which is added to the national stock is not used in this way, prices will remain unaffected.

We have now sufficiently considered the proximate conditions which determine the value of money; the next step is to inquire: What is the ultimate regulator of its value? The value of freely-produced commodities is—according to the ordinary theory of economists—determined by their "cost of production," or, where the article is produced at different costs, by the cost of production of the most costly portion. We have now to consider how far this theory applies to the special case of money. Gold and silver, the principal materials of money, are the products of mines, and are produced at different costs; therefore the cost of the part produced at greatest cost ought to determine their value. This theory is, however, true only under certain conditions—namely, that competition is perfectly free, and that there are accurate data for computing the cost of production, and even then it is true only "in the long run." Moreover, cost only operates on value by affecting supply. "The latent influence," says Mill,[5] "by which the values of things are made to conform in the long run to the cost of production is the variation that would otherwise take place in the supply of the commodity." From these considerations it follows that cost of production does not so influentially affect the value of money as some writers have supposed. In former periods it was a common proceeding on the part of the state to either restrict or stimulate coinage and mining for the precious metals. At all times the working of gold and silver mines has been rather a hazardous speculation than a legitimate business. "When any person undertakes to work a new mine in Peru," says Adam Smith,[6] "he is universally looked upon as a man destined to bankruptcy and ruin, and is upon that account shunned and avoided by everybody. Mining, it seems, is considered there in the same light as here, as a lottery, in which the prizes do not compensate the blanks;" and all subsequent experience confirms this view. With regard to the adjustment of supply to meet an altered cost of production, the difficulties are, if possible, still greater. The supply of money is so large compared with the annual production, that any change can operate but slowly on its value. The total stoppage of fresh supplies from the mines would not be felt for some years in the increased value; and an increased amount of production, though more rapid in its operation, takes some time to produce an effect. "Hence the effects of all changes in the conditions of production of the precious metals are at first, and continue to be for many years, questions of quantity only, with little reference to cost of production." On these grounds it is apparent that cost of production is not, for short periods, the controlling force which governs the value of money, and even for long

[1] Mill, *Prin.*, B. iii. ch. 8, § 1.

[2] For a clear statement of this, see J. E. Cairnes, *Leading Principles*, part i. ch. 2.

[3] The leading exception to this is in the case of money which is hoarded for an indefinite period, and is therefore withdrawn from circulation.

[4] This view, which seems to most persons a paradox, is well put by Adam Smith, *Wealth of Nations*, p. 81 (ed. M'Culloch); also by J. E. Cairnes, *Essays on Political Economy*, p. 4.

reckoned equivalent to one ox. The recognition of these objects as universal legal representatives of value, or, in other words, as money, may be traced back to the epoch of a purely pastoral economy."[1] The Icelandic law bears witness to a similar state of things; while the various fines in the different Teutonic codes are estimated in cattle. The Latin word *pecunia* (*pecus*) is an evidence of the earliest Roman money being composed of cattle. The English *fee* and the famous term *feudal*, according to its most probable etymology, are derived from the same root. In a well-known passage of the *Iliad*[2] the value of two different sets of armour is estimated in terms of oxen. The Irish law tracts bear evidence as to the use of cattle as one of the measures of value in early Irish civilization.[3] Within the last few years it has been prominently brought before the public that oxen form the principal wealth and the circulating medium among the Zulus and Kaffres. On the testimony of an eye-witness we are assured that, "as cattle constitute the sole wealth of the people, so they are their only medium of such transactions as involve exchange, payment, or reward."[4] We find that cattle-rents are paid by the pastoral Indian tribes to the United States Government.[5] From the prominence of slavery in early societies it is natural to suppose that slaves would be adopted as a medium of exchange, and one of the measures of value in the Irish law tracts, *cumhal*, is said to have originally meant a female slave. They are at present applied to this purpose in Central Africa, and also in New Guinea. On passing to the agricultural stage a greater number of objects are found capable of being applied to currency purposes. Among these are corn—used even at present in Norway—maize, olive oil, cocoa-nuts, and tea. The most remarkable instance of an agricultural product being used as currency is to be found in the case of tobacco, which was adopted as legal tender by the English colonists in North America. Another class of articles used for money consists of ornaments, which among all uncivilized tribes serve this purpose. The haiqua-shells mentioned before are an instance, cowries in India, whales' teeth among the Fijians, red feathers among some South Sea Island tribes, and finally, any attractive kinds of stone which can be easily worked. Mineral products, so far as they do not come under the preceding head, furnish another class. Thus salt was used in Abyssinia and Mexico, while the metals—a phenomenon which will require a more careful examination—have succeeded in finally driving all their inferior competitors out of the field, and have become the sole substances for money at present.

4. *Metallic Forms of Money. Their Superiority over other Substances. Special Advantages of Silver and Gold.*—The use of metals as a form of money can be traced far back in the history of civilization, but, as it is not possible to ascertain the historical order of their respective adoptions for this purpose, we will take them in the order of their value, beginning with the lowest. Iron, judging from the statement of Aristotle, was extensively employed as currency. One remarkable instance of this which at once occurs to the mind is the Spartan money, which is clearly a survival of the older system that had died out among the other Greeks, though by modern writers it has been attributed to ascetic policy. In conjunction with copper, iron formed an early Chinese currency, and till recently it was a subsidiary coinage in Japan. Iron spikes are used in Central Africa, while Adam Smith notices the use of nails for money in Scotland.[6] Lead has also served as money, as it does at present in Burmah. Copper has been more widely employed than either of the previously-mentioned metals. Its use in China as a parallel standard with iron has just been mentioned. The early Hebrew coins were chiefly composed of it, while down to 269 B.C. the sole Roman coinage was an alloy of copper. Till a very recent period it formed the principal money of some poorer European states (as Sweden), and was the subsidiary coinage of the United Kingdom till the present bronze fractional currency was introduced. Tin was not so favourite a material for money as copper, but the early English coinages were composed of it, probably on account of the fertile tin mines of Cornwall, and in later times halfpence and farthings of tin have been struck. The next metal which comes into notice is silver, which up to the last few years was the principal form of money, and even still is able to dispute the field with its most formidable rival. It formed the main basis of Greek coins, and was introduced at Rome in 269 B.C. The mediæval money was principally composed of silver, and its position in recent times will have to be subsequently noticed more at length. Gold, which is the most valuable of the metals widely used for monetary purposes, has been steadily gaining ground with the growth of commerce. The earliest trace of its use in common with that of silver is to be found "in the pictures of the ancient Egyptians weighing in scales heaps of rings of gold and silver."[7] The only other metals used for money—platinum and nickel—may be easily disposed of. The former of these was coined for a short time by the Russian Government, and then given up as unsuitable. The latter is only used as an alloy.

The examination of the forms of currency, both metallic and non-metallic, in which we have been engaged leads to certain definite conclusions as to the course which the evolution of currency is pursuing. It appears (1) that the metals tend to supersede all other forms of money among progressive peoples, and (2) that certain metals tend to supersede the others. From this we are led to consider the qualities which are desirable in the material of money, and to conclude that the presence or absence of those qualities is the reason of the adoption or rejection of any given substance.

(1) In the first place, it is necessary that the material of money should be desirable, or, in other words, possess value; and to this condition all the commodities we have reviewed conform, for otherwise they would never have attained the position of being a medium of exchange. This quality, then, is not the reason for the preference of some forms over others. (2) The second requisite clearly is that the value of the article shall be high in proportion to its weight or bulk, or, to put the same truth in another way, it is requisite that it shall be portable. Want of this quality has been a fatal obstacle to many early forms of money retaining their place. Skins, corn, and tobacco were found very difficult to transfer from place to place. Iron and copper too suffered from the same defect, while sheep and oxen, though moving themselves, were expensive to transfer. (3) It is further desirable that the material of money shall be the same throughout, and that one unit shall be equal in value to another. This is a reason for rejecting the widespread currency composed of cattle, as the difference between one and another head is of course often considerable. The metals possess a particular advantage in this respect, as, after being refined, they are almost exactly homogeneous. (4) A fourth requisite is that the substance used as money can without damage be divided and, if needed, united again; here also the desired quality is peculiarly possessed by the metals, as they are easily fusible, while skins or precious stones suffer greatly in value by division, and it need hardly be added that the same is the case with regard to animals. (5) Money must also be durable. This at once removes from the articles suitable for money all animal and many vegetable substances. Eggs or oil will not keep, and consequently soon lose their value. Iron, too, is liable to rust, which, combined with its low value, is a reason for its disuse as currency. (6) Money should be easily distinguishable, and there should be no trouble in ascertaining its value. This condition is one of the reasons why precious stones have never been much used as money, their value being hard to estimate. The same objection applies to most non-metallic currencies, and is only obviated even in their case by the process of assaying. (7) The last condition which

reckoned equivalent to one ox. The recognition of these objects as universal legal representatives of value, or, in other words, as money, may be traced back to the epoch of a purely pastoral economy."[1] The Icelandic law bears witness to a similar state of things; while the various fines in the different Teutonic codes are estimated in cattle. The Latin word *pecunia* (*pecus*) is an evidence of the earliest Roman money being composed of cattle. The English *fee* and the famous term *feudal*, according to its most probable etymology, are derived from the same root. In a well-known passage of the *Iliad*[2] the value of two different sets of armour is estimated in terms of oxen. The Irish law tracts bear evidence as to the use of cattle as one of the measures of value in early Irish civilization.[3] Within the last few years it has been prominently brought before the public that oxen form the principal wealth and the circulating medium among the Zulus and Kaffres. On the testimony of an eye-witness we are assured that, "as cattle constitute the sole wealth of the people, so they are their only medium of such transactions as involve exchange, payment, or reward."[4] We find that cattle-rents are paid by the pastoral Indian tribes to the United States Government.[5] From the prominence of slavery in early societies it is natural to suppose that slaves would be adopted as a medium of exchange, and one of the measures of value in the Irish law tracts, *cumhal*, is said to have originally meant a female slave. They are at present applied to this purpose in Central Africa, and also in New Guinea. On passing to the agricultural stage a greater number of objects are found capable of being applied to currency purposes. Among these are corn—used even at present in Norway—maize, olive oil, cocoa-nuts, and tea. The most remarkable instance of an agricultural product being used as currency is to be found in the case of tobacco, which was adopted as legal tender by the English colonists in North America. Another class of articles used for money consists of ornaments, which among all uncivilized tribes serve this purpose. The haiqua-shells mentioned before are an instance, cowries in India, whales' teeth among the Fijians, red feathers among some South Sea Island tribes, and finally, any attractive kinds of stone which can be easily worked. Mineral products, so far as they do not come under the preceding head, furnish another class. Thus salt was used in Abyssinia and Mexico, while the metals—a phenomenon which will require a more careful examination—have succeeded in finally driving all their inferior competitors out of the field, and have become the sole substances for money at present.

4. *Metallic Forms of Money. Their Superiority over other Substances. Special Advantages of Silver and Gold.*—The use of metals as a form of money can be traced far back in the history of civilization, but, as it is not possible to ascertain the historical order of their respective adoptions for this purpose, we will take them in the order of their value, beginning with the lowest. Iron, judging from the statement of Aristotle, was extensively employed as currency. One remarkable instance of this which at once occurs to the mind is the Spartan money, which is clearly a survival of the older system that had died out among the other Greeks, though by modern writers it has been attributed to ascetic policy. In conjunction with copper, iron formed an early Chinese currency, and till recently it was a subsidiary coinage in Japan. Iron spikes are used in Central Africa, while Adam Smith notices the use of nails for money in Scotland.[6] Lead has also served as money, as it does at present in Burmah. Copper has been more widely employed than either of the previously-mentioned metals. Its use in China as a parallel standard with iron has just been mentioned. The early Hebrew coins were chiefly composed of it, while down to 269 B.C. the sole Roman coinage was an alloy of copper. Till a very recent period it formed the principal money of some poorer European states (as Sweden), and was the subsidiary coinage of the United Kingdom till the present bronze fractional currency was introduced. Tin was not so favourite a material for money as copper, but the early English coinages were composed of it, probably on account of the fertile tin mines of Cornwall, and in later times halfpence and farthings of tin have been struck. The next metal which comes into notice is silver, which up to the last few years was the principal form of money, and even still is able to dispute the field with its most formidable rival. It formed the main basis of Greek coins, and was introduced at Rome in 269 B.C. The mediæval money was principally composed of silver, and its position in recent times will have to be subsequently noticed more at length. Gold, which is the most valuable of the metals widely used for monetary purposes, has been steadily gaining ground with the growth of commerce. The earliest trace of its use in common with that of silver is to be found "in the pictures of the ancient Egyptians weighing in scales heaps of rings of gold and silver."[7] The only other metals used for money —platinum and nickel—may be easily disposed of. The former of these was coined for a short time by the Russian Government, and then given up as unsuitable. The latter is only used as an alloy.

The examination of the forms of currency, both metallic and non-metallic, in which we have been engaged leads to certain definite conclusions as to the course which the evolution of currency is pursuing. It appears (1) that the metals tend to supersede all other forms of money among progressive peoples, and (2) that certain metals tend to supersede the others. From this we are led to consider the qualities which are desirable in the material of money, and to conclude that the presence or absence of those qualities is the reason of the adoption or rejection of any given substance.

(1) In the first place, it is necessary that the material of money should be desirable, or, in other words, possess value; and to this condition all the commodities we have reviewed conform, for otherwise they would never have attained the position of being a medium of exchange. This quality, then, is not the reason for the preference of some forms over others. (2) The second requisite clearly is that the value of the article shall be high in proportion to its weight or bulk, or, to put the same truth in another way, it is requisite that it shall be portable. Want of this quality has been a fatal obstacle to many early forms of money retaining their place. Skins, corn, and tobacco were found very difficult to transfer from place to place. Iron and copper too suffered from the same defect, while sheep and oxen, though moving themselves, were expensive to transfer. (3) It is further desirable that the material of money shall be the same throughout, and that one unit shall be equal in value to another. This is a reason for rejecting the widespread currency composed of cattle, as the difference between one and another head is of course often considerable. The metals possess a particular advantage in this respect, as, after being refined, they are almost exactly homogeneous. (4) A fourth requisite is that the substance used as money can without damage be divided and, if needed, united again; here also the desired quality is peculiarly possessed by the metals, as they are easily fusible, while skins or precious stones suffer greatly in value by division, and it need hardly be added that the same is the case with regard to animals. (5) Money must also be durable. This at once removes from the articles suitable for money all animal and many vegetable substances. Eggs or oil will not keep, and consequently soon lose their value. Iron, too, is liable to rust, which, combined with its low value, is a reason for its disuse as currency. (6) Money should be easily distinguishable, and there should be no trouble in ascertaining its value. This condition is one of the reasons why precious stones have never been much used as money, their value being hard to estimate. The same objection applies to most non-metallic currencies, and is only obviated even in their case by the process of assaying. (7) The last condition which

is a matter requiring much care. The objects aimed at in imposing the stamp are (1) to prevent the coin being counterfeited, and (2) to prevent any of the metal being abstracted. The former of these objects can be best attained by making the device such as can be obtained only by powerful and expensive machinery. The most improved methods must be adopted, and the greatest pains taken to have the device perfectly executed. The latest improvement in the process of coining is the introduction of the knee-joint press. The latter difficulty is best obviated by using special care in marking the edges of the coins. Ancient coins were issued with unstamped edges which presented no impediment to clipping, but modern coins, at least those of any size, are protected by the edge being milled or by a legend being inscribed round it. The combination of milled edges with a raised legend would be a still more effectual means of protecting the coinage from interference.

Another matter of importance in the process of coining is the nature and proportion of alloy to be used. The necessity for some mixture arises from the fact that gold and silver are both naturally soft, and, to obviate this, copper has been mixed with them, so as to produce a harder substance. The Austrian ducat is the nearest approach to purity among the principal coins of Europe, being composed of seventy-one parts of pure gold to one of alloy. The English gold coins are eleven-twelfths pure gold, while the silver ones are thirty-seven-fortieths pure silver. The origin of the difference is purely historical. The general gold proportion is nine-tenths gold to one-tenth alloy, while in some coinages the proportion of silver to alloy is nearly five to one, the countries composing the Latin Union having adopted that proportion in order to reduce their smaller silver coins to tokens. Copper is the usual material for alloying, but the Melbourne mint used silver for some time. It is this silvery alloy that accounts for the yellow appearance of many Australian sovereigns. They, however, are rapidly disappearing, as it is profitable to melt them down. It has been mentioned above that the wear of small coins is greater than that of large ones, and it may be added here that the wear of coins in general is an important question in connexion with their legal circulation. The English sovereign is believed to remain above the least current weight for from fifteen to twenty years. For the technical processes of coining, &c., reference may be made to the article MINT.

The next topic to be considered is: Who should issue money? In the earlier stages of currency the question was not so prominent, but the establishment of coining brought it forward. In Greece each city being autonomous claimed and exercised the right of freely coining as it desired, the coins being, of course, received in other cities only at their real value. The consequences of this system were generally beneficial. The Greek coins were usually up to their nominal value, as debased coinage was unable to circulate beyond the place of issue, and therefore extremely inconvenient to the members of the state issuing it.[1] Under the Roman republic private persons were probably allowed to bring metal to be coined, though the coins seem generally to have had the name of one of the consuls for the year on them. Under the empire the doctrine became established that the right of coining belonged exclusively to the emperor, and till the fall of the Western empire this was acted on. After the establishment of the various barbarian kingdoms, each sovereign assumed the privilege of coining, a right which in France was extended to or rather usurped by the principal nobles.[2] In England the king alone coined silver.[3] At present the control of the operations of the mint is completely in the hands of the executive; and, until recently, no question on theoretical grounds as to the propriety of this method has ever been raised.[4]

In close connexion with the right of coining comes the consideration as to the proper persons to bear the expense of the process. At first sight the answer seems plain enough. Coins are a manufactured article quite as much as plate, and are rendered more valuable by being assayed, weighed, and certified. It appears therefore quite proper that those who bring metal to be coined should bear the expense of the coinage, or, in other words, should give up a part of the metal to the mint, thus paying for the service rendered to them in the same manner as those sending letters pay the postal department for their transmission. This course has been usually adopted. England, however, has taken a different line. In order to encourage the coining of the precious metals, no charge was made at the mint beyond that involved in the necessary delay in the operation; and this is at present the case with gold. Though this arrangement was originally introduced in obedience to the prejudices of the mercantile system which regarded gold and silver as being peculiarly wealth, it may be defended on reasonable grounds: for (1) the expense of the mint is very small compared with the amount of coin turned out, and (2) the coins produced are used by the nation, and therefore their expense may quite fairly be defrayed from the national revenue. Again, as the profit on the silver coinage (owing to circumstances to be subsequently discussed) is large, that may be set off against the free coinage of gold. The charge levied on coining, if confined to the expenses incurred, is called *brassage*; if it is anything above that cost it is known as *seigniorage*, which latter term is also used to denote both kinds of charge. The effect of seigniorage (using the term in its more extended sense) on the value of coins is to lower them, in fact, as Tooke has put it, seigniorage is always a kind of debasement, unless accompanied with limitation.[5] If the same quantity of metal be in circulation there will be a greater number of coins, and therefore nominal prices will be higher. It is, however, possible that the increased prices may check the production of the precious metals, thus making the value of the metal higher than it would otherwise be. Whether this will happen or not depends on the actual conditions of production, and is incapable of being predicted. One advantage which undoubtedly results from a charge on coinage is that it checks the tendency to melt coin when exported, for where a seigniorage is imposed coins are more valuable than the uncoined metal by the amount of the seigniorage. It therefore becomes the interest of the holder not to melt down the coins, as in doing so he loses the extra value given by the coining. Another factor in the expense of currency is the loss which arises from the wear and tear which money undergoes, and the consequent cost of replacing the light or missing pieces. The last and largest item is the interest on the total amount of money in use. To take the case of England, the value of the metallic currency is estimated at about £130,000,000. The interest

[5] Tooke, *Hist. of Prices*, i. 121 *sq.* It is impossible, however, to agree with Tooke that uncoined bullion would be higher in value than coin when a seigniorage is charged on the latter. He seems to ignore the fact that the value of the precious metals is partly dependent on their use as currency, and that the seigniorage represents a tax levied on the extra value resulting from the use of the metal as money.

prices given by any ancient writer, since the varying factors necessary to be estimated are so many, viz., (1) the weight of the coin, (2) its purity, (3) the value of the monetary metal at the time, (4) the value of the commodity sold in relation to other things, (5) the question whether the commodity was in its normal state as regards supply and demand; to all these may be added (6) the difficulty of determining whether the figures have not been altered.[1] After the fall of the Western empire, the various barbarian sovereigns adopted silver as their principal coinage, combined with the greatest diversity in the systems adopted. On the revival of the empire under Charlemagne an effort was made by him to establish a general system of currency, based on the silver pound as a unit, and thus corresponding to the unit of weight. This system was introduced into England, and thence into Scotland, but the rapid decay of the Carlovingian empire prevented any uniformity being preserved in these different countries, while the different debasements in each produced widely divergent systems, which will require separate notice.

English Depreciations.—The first debasement undergone by the English silver coinage was in 1300, when Edward I. reduced the amount of metal in the coins by $1\frac{1}{81}$ per cent., or, in other words, 20 shillings and 3 pence were coined out of the Tower pound instead of 20 shillings as previously.[2] This was the prelude to a series of changes which were carried out during the next three centuries, and which terminated in 1600, when the pound troy of silver was coined into 62 shillings; since that time the silver coinage has not been debased, the reduction carried out in 1816, by which 66 shillings were coined from the troy pound, being accompanied by a limitation of its use in discharging debts to a maximum amount of £2, as well as by the abolition of the public right of coining silver at the mint. The period extending from 34th Henry VIII. to 6th Edward VI. (1543-1552) has been specially noted by Lord Liverpool as a time of peculiar interference with the fineness of the metal.[3] The old proportion of 11 oz. 2 dwts. of metal to 18 dwts. of alloy, was altered to 10 oz. of metal per pound, then to 6 oz. or one-half, 4 oz. or one-third, and finally in 1551 to 3 oz. of pure metal and 9 oz. of alloy. A tendency to reformation began under Edward VI., and was finally carried out under Elizabeth in the recoinage of 1560, which has been fully described by Mr Froude.[4] Various proposals to depreciate the silver currency have been made since then, and one of these, as above mentioned, was accepted in 1600. The most remarkable of the unsuccessful schemes for debasing the standard was that of Lowndes, which was advanced in 1695, when the discussions preparatory to the recoinage of 1696 were being carried on. Lowndes's plan was to coin the pound troy of standard silver into 77s. 6d., thus debasing it 25 per cent. He was resisted by Locke, who, in his *Further Considerations concerning Raising the Value of Money*, contributed materially to the development of monetary theory; and the recoinage was, mainly in consequence of his efforts, in combination with those of Newton and Montague, based on thoroughly sound principles.[5] The first English *gold* coinage, so far as has been clearly proved, was that of 1257, in the reign of Henry III., when a small number of gold pennies were coined at the ratio of 10 to 1 to the existing silver coins. Previously to this date the need of gold for business transactions could not have been felt, as the commerce of the country was necessarily limited. It is probable that for the few transactions of foreign trade a species of gold coins issued by the Greek emperors at Constantinople, and thence called *byzants*, were used.[6] Another gold coin, known as a *florence*, from the place where it was first coined, was also used after 1250. The regular series of English gold coinage begins in 1344, when Edward III. coined, in imitation of the foreign coin just mentioned, a large number of florins at the rate of 50 to the Tower pound. The gold coinage was, however, for a long period a secondary part of the monetary system, and suffered a series of changes, the last of which took place in 1717.[7] The present English coinage system is regulated by the Coinage Act of 1870,[8] which amends and consolidates previous Acts on the subject. The schedule to that Act, which is reproduced at p. 484 of the present volume, gives full information as to existing coins, their weight, fineness, "remedy," &c.

Scotch Depreciations.—The coinage of Scotland was derived from the primitive Carlovingian system through the medium of England, and for a long period remained the same as at first. The pressure under which the resources of Scotland suffered during the constant wars with England, as well as perhaps the example of their close ally France, led the Scottish sovereigns to debase their coins out of all proportion to the English system. This was the reason for the prohibition of Scotch coins as currency *by tale* in England, the variation in course of time being so great that in 1600 the pound of silver, which contained about three pounds sterling English, was made into thirty-six pounds Scotch, the latter being thus twelve times as much debased. After the union of the crowns in 1603 no steps were taken to assimilate the two systems, which continued as before till the complete union of the two countries in 1707. At the latter date a complete recoinage on the basis of the English system was carried out, thus rendering the coinage of both countries exactly similar. This most valuable reform was at first viewed with suspicion by the Scotch people, and a large amount of the old Scotch currency was hoarded or exported.

Irish Depreciations.—No coined money existed in Ireland before the English invasion in 1170. The English colony, as a matter of course, used the same coinage as the mother-country, but on several occasions inferior money was introduced, as being good enough for a subject country. At the recoinage of 1560 it was proposed to send the bad coins that were called in to Ireland, but to this Elizabeth refused to assent. From 1689 to 1825 the nominal value of the coinage was $8\frac{1}{3}$ per cent. higher in Ireland than in England. In the latter year Irish money was reduced to the English standard,[9] from which time the United Kingdom has possessed a perfectly uniform system of metallic money.

French Depreciations.—The monetary system established by Charlemagne throughout his dominions soon disappeared in Italy and the German provinces. It continued to exist in France proper. The general state of confusion, however, and the weakness of the central authority, led to local issues by the various feudal lords. "At the accession of Hugh Capet as many as a hundred and fifty are said to have exercised this power."[10] The increase of the power of the Capetian kings enabled them to restrict this freedom of coinage, and to reserve to themselves this profitable function, the seigniorage on the process of coining being a special branch of the royal revenue. They were unfortunately not inclined to confine their gains to this legitimate source. The French coinage was recklessly debased during the many centuries from Philip I. (*ob* 1108) to Louis XV. (*ob.* 1774). The management of the mint under Louis IX. was always regarded as a model for imitation,[11] but even in his time the *livre*, originally a pound, was debased to less than one-fourth of its primitive value. The dealings with the currency were still more unscrupulous during the protracted wars with England, the result being that at the accession of Louis XI (1461), when the English had been finally expelled from France, the livre was only about one-fifteenth of its original value. Nor did the depreciation of the currency rest here. The period of something over a century, extending from 1497 to 1602, presents a remarkable series of changes in a downward direction, no less than nineteen depreciations having taken place, many of them consisting of changes in the fineness of the metal.[12] There is in this respect a remarkable analogy between this epoch of French coinage and the English period from 1543 to 1552.

The history of French depreciations did not terminate, as that of the English ones did, with the close of the 16th century; under Louis XIV. the livre was only one half of what it had been under Henry IV. The final result was that in 1789 the livre had come to be only one seventy-eighth of its weight in the time of Charlemagne. At the Revolution it was converted into the *franc*, at the rate of 81 livres to 80 francs.[13] It is not, however, to be supposed that the changes in the French currency were always towards debasement. The terrible evils arising from the debased coinage led to a general outcry, which in some cases was so strong as to force the king of the time to reform the monetary standard, one striking instance occurred in the reign of Philip IV.,[14] whose dealings with the currency led to his receiving the epithet of "le faux monnoyeur."

Depreciations in other Countries.—The very brief notice of the depreciations in the originally uniform currencies of England and France which has just been given is sufficient to establish the general tendency, and throws light enough on the resulting consequences; a similar course was followed in the other countries of Europe, but the details are too unconnected to be conveniently presented. A few facts will suffice. Thus, the German *florin* "was originally a gold coin of the value of about 10 shillings of our present money; it is now become a silver coin of the value of

1 As to the various elements requisite for a proper estimate of mediæval prices, see Cibrario, *Della Economia Politica del Medio Evo*, l. iii. c. 8.

2 The Tower pound, which was three quarters of an oz. troy less than the troy pound, was used in England until the 18th of Henry VIII. (1527), when it was replaced by the troy weight. This should be always remembered in considering the precise amount of depreciation at any given time.

prices given by any ancient writer, since the varying factors necessary to be estimated are so many, viz., (1) the weight of the coin, (2) its purity, (3) the value of the monetary metal at the time, (4) the value of the commodity sold in relation to other things, (5) the question whether the commodity was in its normal state as regards supply and demand; to all these may be added (6) the difficulty of determining whether the figures have not been altered.[1] After the fall of the Western empire, the various barbarian sovereigns adopted silver as their principal coinage, combined with the greatest diversity in the systems adopted. On the revival of the empire under Charlemagne an effort was made by him to establish a general system of currency, based on the silver pound as a unit, and thus corresponding to the unit of weight. This system was introduced into England, and thence into Scotland, but the rapid decay of the Carlovingian empire prevented any uniformity being preserved in these different countries, while the different debasements in each produced widely divergent systems, which will require separate notice.

English Depreciations.—The first debasement undergone by the English silver coinage was in 1300, when Edward I. reduced the amount of metal in the coins by $1\frac{19}{81}$ per cent., or, in other words, 20 shillings and 3 pence were coined out of the Tower pound instead of 20 shillings as previously.[2] This was the prelude to a series of changes which were carried out during the next three centuries, and which terminated in 1600, when the pound troy of silver was coined into 62 shillings; since that time the silver coinage has not been debased, the reduction carried out in 1816, by which 66 shillings were coined from the troy pound, being accompanied by a limitation of its use in discharging debts to a maximum amount of £2, as well as by the abolition of the public right of coining silver at the mint. The period extending from 34th Henry VIII. to 6th Edward VI. (1543-1552) has been specially noted by Lord Liverpool as a time of peculiar interference with the fineness of the metal.[3] The old proportion of 11 oz. 2 dwts. of metal to 18 dwts. of alloy, was altered to 10 oz. of metal per pound, then to 6 oz. or one-half, 4 oz. or one-third, and finally in 1551 to 3 oz. of pure metal and 9 oz. of alloy. A tendency to reformation began under Edward VI., and was finally carried out under Elizabeth in the recoinage of 1560, which has been fully described by Mr Froude.[4] Various proposals to depreciate the silver currency have been made since then, and one of these, as above mentioned, was accepted in 1600. The most remarkable of the unsuccessful schemes for debasing the standard was that of Lowndes, which was advanced in 1695, when the discussions preparatory to the recoinage of 1696 were being carried on. Lowndes's plan was to coin the pound troy of standard silver into 77s. 6d., thus debasing it 25 per cent. He was resisted by Locke, who, in his *Further Considerations concerning Raising the Value of Money*, contributed materially to the development of monetary theory; and the recoinage was, mainly in consequence of his efforts, in combination with those of Newton and Montague, based on thoroughly sound principles.[5] The first English gold coinage, so far as has been clearly proved, was that of 1257, in the reign of Henry III., when a small number of gold pennies were coined at the ratio of 10 to 1 to the existing silver coins. Previously to this date the need of gold for business transactions could not have been felt, as the commerce of the country was necessarily limited. It is probable that for the few transactions of foreign trade a species of gold coins issued by the Greek emperors at Constantinople, and thence called *byzants*, were used.[6] Another gold coin, known as a *florence*, from the place where it was first coined, was also used after 1250. The regular series of English gold coinage begins in 1344, when Edward III. coined, in imitation of the foreign coin just mentioned, a large number of florins at the rate of 50 to the Tower pound. The gold coinage was, however, for a long period a secondary part of the monetary system, and suffered a series of changes, the last of which took place in 1717.[7] The present English coinage system is regulated by the Coinage Act of 1870,[8] which amends and consolidates previous Acts on the subject. The schedule to that Act, which is reproduced at p. 484 of the present volume, gives full information as to existing coins, their weight, fineness, "remedy," &c.

Scotch Depreciations.—The coinage of Scotland was derived from the primitive Carlovingian system through the medium of England, and for a long period remained the same as at first. The pressure under which the resources of Scotland suffered during the constant wars with England, as well as perhaps the example of their close ally France, led the Scottish sovereigns to debase their coins out of all proportion to the English system. This was the reason for the prohibition of Scotch coins as currency *by tale* in England, the variation in course of time being so great that in 1600 the pound of silver, which contained about three pounds sterling English, was made into thirty-six pounds Scotch, the latter being thus twelve times as much debased. After the union of the crowns in 1603 no steps were taken to assimilate the two systems, which continued as before till the complete union of the two countries in 1707. At the latter date a complete recoinage on the basis of the English system was carried out, thus rendering the coinage of both countries exactly similar. This most valuable reform was at first viewed with suspicion by the Scotch people, and a large amount of the old Scotch currency was hoarded or exported.

Irish Depreciations.—No coined money existed in Ireland before the English invasion in 1170. The English colony, as a matter of course, used the same coinage as the mother-country, but on several occasions inferior money was introduced, as being good enough for a subject country. At the recoinage of 1560 it was proposed to send the bad coins that were called in to Ireland, but to this Elizabeth refused to assent. From 1689 to 1825 the nominal value of the coinage was $8\frac{1}{3}$ per cent. higher in Ireland than in England. In the latter year Irish money was reduced to the English standard,[9] from which time the United Kingdom has possessed a perfectly uniform system of metallic money.

French Depreciations.—The monetary system established by Charlemagne throughout his dominions soon disappeared in Italy and the German provinces. It continued to exist in France proper. The general state of confusion, however, and the weakness of the central authority, led to local issues by the various feudal lords. "At the accession of Hugh Capet as many as a hundred and fifty are said to have exercised this power."[10] The increase of the power of the Capetian kings enabled them to restrict this freedom of coinage, and to reserve to themselves this profitable function, the seigniorage on the process of coining being a special branch of the royal revenue. They were unfortunately not inclined to confine their gains to this legitimate source. The French coinage was recklessly debased during the many centuries from Philip I. (*ob* 1108) to Louis XV. (*ob.* 1774). The management of the mint under Louis IX. was always regarded as a model for imitation,[11] but even in his time the *livre*, originally a pound, was debased to less than one-fourth of its primitive value. The dealings with the currency were still more unscrupulous during the protracted wars with England, the result being that at the accession of Louis XI (1461), when the English had been finally expelled from France, the livre was only about one-fifteenth of its original value. Nor did the depreciation of the currency rest here. The period of something over a century, extending from 1497 to 1602, presents a remarkable series of changes in a downward direction, no less than nineteen depreciations having taken place, many of them consisting of changes in the fineness of the metal.[12] There is in this respect a remarkable analogy between this epoch of French coinage and the English period from 1543 to 1552.

The history of French depreciations did not terminate, as that of the English ones did, with the close of the 16th century; under Louis XIV. the livre was only one half of what it had been under Henry IV. The final result was that in 1789 the livre had come to be only one seventy-eighth of its weight in the time of Charlemagne. At the Revolution it was converted into the *franc*, at the rate of 81 livres to 80 francs.[13] It is not, however, to be supposed that the changes in the French currency were always towards debasement. The terrible evils arising from the debased coinage led to a general outcry, which in some cases was so strong as to force the king of the time to reform the monetary standard, one striking instance occurred in the reign of Philip IV.,[14] whose dealings with the currency led to his receiving the epithet of "le faux monnoyeur."

1493-1879	387	10,203,300	190,785,000	35,146	42,393	

as an influential factor in the matter,[2] and look upon the stock of money as increasing. The annual addition to the store of money has been estimated as £2,100,000 for the period from 1545 to 1600. At this date the Brazilian supply began. The course of distribution of these fresh masses of the precious metals is an interesting point, which has been studied by Mr Cliffe Leslie.[3] The flow of the new supplies was first towards Spain and Portugal, and from thence they passed to the larger commercial centres of the other European countries, the effect being that prices were raised in and about the chief towns, while the value of money in the country districts remained unaltered. The additions to the supply of both gold and silver during the two centuries 1600-1800 continued to be very considerable; but, if Adam Smith's view be correct, the full effect on prices was produced by 1640,[4] and the increased amount of money was from that time counterbalanced by the wider extension of trade.[5] At the commencement of this century, the annual production of gold has been estimated as being from £2,500,000 to £3,000,000. The year 1809 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-1849 the value of gold and silver rose to about two and a half times their former level, notwithstanding fresh discoveries in Asiatic Russia.[6] The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-1871 at £500,000,000, or an amount nearly equal to the former stock in existence. The problems raised by this phenomenon have received the most careful study by several distinguished economists,[7] to whose writings those desiring more extensive information may refer. The main features of interest may be briefly summed up. (1) The additional supply was almost entirely of *gold*, thus tending to produce a distinction between the two principal monetary metals and an alteration in the currency of bimetallic countries. Under this influence France, from being a silver-using, became a gold-using, country. (2) The contemporaneous development of the Continental railway systems, and the partial adoption of free trade, with the consequent facilities for freer circulation of commodities, led to the course of distribution being different from that of the 16th century. The more backward districts were the principal gainers, and a more general equalization of prices combined with a slight elevation in value was the outcome. (3) The increased supply of gold rendered a general currency reform possible, and made the use of a gold monometallic standard appear feasible. The movements for currency reform, as will be seen, all arose after these discoveries. (4) The change in the value of money, which may for the period 1849-1869 be fixed at 20 per cent., enabled a general increase of wages to be carried out, thus improving the condition of the classes living on manual labour. It may be added that the difficulty of tracing the effects of this great addition to the money stock is a most striking proof of the complexity of modern economic development. (5) The last point to be noticed is the very small influence exercised on the value of silver by the new gold.[8] Hardly had the gold discoveries of 1848-1851 ceased to produce a decided effect when new silver mines of unusual fertility came into working. During the period immediately succeeding the gold discoveries the production of silver remained at an annual amount of from £8,000,000 to £9,000,000. This amount suddenly, about 1870, increased to £15,000,000,[9] and remained at that amount for the next five years. More than half of the supply came from new mines opened in Nevada. This increased supply was accompanied by a marked depreciation in the gold price of silver, though the prices of commodities in countries having a silver standard did not rise. The result of the close investigations to which all aspects of the question were subjected was to show that the increased production of silver was only a minor element in causing its depreciation. The policy pursued by various states—viz., (1) Germany and the Scandinavian

as an influential factor in the matter,[2] and look upon the stock of money as increasing. The annual addition to the store of money has been estimated as £2,100,000 for the period from 1545 to 1600. At this date the Brazilian supply began. The course of distribution of these fresh masses of the precious metals is an interesting point, which has been studied by Mr Cliffe Leslie.[3] The flow of the new supplies was first towards Spain and Portugal, and from thence they passed to the larger commercial centres of the other European countries, the effect being that prices were raised in and about the chief towns, while the value of money in the country districts remained unaltered. The additions to the supply of both gold and silver during the two centuries 1600-1800 continued to be very considerable; but, if Adam Smith's view be correct, the full effect on prices was produced by 1640,[4] and the increased amount of money was from that time counterbalanced by the wider extension of trade.[5] At the commencement of this century, the annual production of gold has been estimated as being from £2,500,000 to £3,000,000. The year 1809 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-1849 the value of gold and silver rose to about two and a half times their former level, notwithstanding fresh discoveries in Asiatic Russia.[6] The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-1871 at £500,000,000, or an amount nearly equal to the former stock in existence. The problems raised by this phenomenon have received the most careful study by several distinguished economists,[7] to whose writings those desiring more extensive information may refer. The main features of interest may be briefly summed up. (1) The additional *supply was almost entirely of gold, thus tending to produce* a distinction between the two principal monetary metals and an alteration in the currency of bimetallic countries. Under this influence France, from being a silver-using, became a gold-using, country. (2) The contemporaneous development of the Continental railway systems, and the partial adoption of free trade, with the consequent facilities for freer circulation of commodities, led to the course of distribution being different from that of the 16th century. The more backward districts were the principal gainers, and a more general equalization of prices combined with a slight elevation in value was the outcome. (3) The increased supply of gold rendered a general currency reform possible, and made the use of a gold monometallic standard appear feasible. The movements for currency reform, as will be seen, all arose after these discoveries. (4) The change in the value of money, which may for the period 1849-1869 be fixed at 20 per cent., enabled a general increase of wages to be carried out, thus improving the condition of the classes living on manual labour. It may be added that the difficulty of tracing the effects of this great addition to the money stock is a most striking proof of the complexity of modern economic development. (5) The last point to be noticed is the very small influence exercised on the value of silver by the new gold.[8] Hardly had the gold discoveries of 1848-1851 ceased to produce a decided effect when new silver mines of unusual fertility came into working. During the period immediately succeeding the gold discoveries the production of silver remained at an annual amount of from £8,000,000 to £9,000,000. This amount suddenly, about 1870, increased to £15,000,000,[9] and remained at that amount for the next five years. More than half of the supply came from new mines opened in Nevada. This increased supply was accompanied by a marked depreciation in the gold price of silver, though the prices of commodities in countries having a silver standard did not rise. The result of the close investigations to which all aspects of the question were subjected was to show that the increased production of silver was only a minor element in causing its depreciation. The policy pursued by various states—viz., (1) Germany and the Scandinavian

owing to the habits of the people not having been attended to. Some writers have, however, misconceived the principles of currency and extended this influence to cases where it does not apply. Thus it has been sought to explain the adoption of gold as the principal English coinage after 1696 by assuming that the English deliberately preferred that metal.[1] The fact of different nations possessing different currencies, as the prevalence of gold in England and of silver in France during the 18th century, is to be otherwise accounted for. The great mass of a population, it is true, take and give money without particularly observing it. It is enough if the coin conforms to the usual type. There exists, however, in all mercantile communities a class of dealers in money[2] who make a profit by selecting the best coins for exportation, or, if two metals are in concurrent use, the coins of that metal which is undervalued in the proportion fixed. The mode in which self-interest thus operates produces an effect which may be briefly formulated by saying that *bad money drives out good money*. It is often now called "Gresham's law," from a former master of the English mint,[3] who observed it. The illustrations of its working are numerous. Under its action the gold which was overvalued relatively to silver in England in 1696 became the main English coinage, as above stated. And in order to meet the want of silver coins, Sir I. Newton advocated, and secured, the reduction of the guinea from 21s. 6d. to 21s. The exportation of metallic money when an over-issue of inconvertible paper takes place is another case of the theorem. By means of this principle we can easily explain the tendency of currency to depreciation, for when once, either by wear or by the issue of inferior coins, a currency has become debased, no reformation is possible unless the debased coins are removed from circulation, as otherwise they will be preferred for payments by dealers, and will not be melted down or exported. All demands for foreign trade will be met from the best part of the coinage. An argument in favour of state coinage has been founded on Gresham's law. It is argued that private coinage would lead to the issue of depreciated money.[4] It is, however, overlooked in this argument that the action of the law arises from the fact that the depreciated currency is legal tender; were it not so, coins less than the proper weight would be at once rejected. It may be added that Greek monetary history bears out this view.[5]

Having disposed of these elementary questions, the general groups into which all currency systems fall may now be stated. The simplest form of currency seems to be that in which the state coins ingots of different metals, and allows them to circulate freely, without any ratio being fixed. This, which is the lowest form of currency proper,[6] has arisen in many countries through the introduction of coins of various other nations. Turkey is a European example. Many of the South American republics possess a currency of this description. A theoretical form of this system has been advocated in France. It is proposed to issue coins of one, two, five, and ten grammes of gold, and to allow the present silver coins which are multiples of the gramme to circulate along with them. The difficulties of this plan are so obvious that there is no likelihood of its being adopted. The arguments in its favour are of little force, since it is hardly correct to contend that it is a natural system, when it has never been willingly adopted by any country. The next system to be noticed is that of a single metal being fixed as legal tender. This in early times is the really natural arrangement, and has been widely adopted. It is needless to recapitulate the instances which have already been given in dealing with other matters. There is, however, a difficulty which soon arises under this system. If the metal chosen is not very valuable, it is too cumbrous for large payments; if, on the other hand, it possesses a high value, it is hard to coin pieces suitable for small transactions. Thus, even silver would be too bulky for such payments as frequently occur. £100 in silver at its present value would weigh nearly 40 lb, while it would be impossible to coin gold pieces of the value of a penny or even a shilling. This system thus naturally leads to the use of other metals besides the standard one, and when the state fixes the ratio between these metals a new system has come into existence, which has been called the *multiple tender* system. In it the ratios between the metals are fixed, either once for all, or until changed by state authority. This system was in force in England from 1257 (or rather 1344) to 1664, the ratio between gold and silver being fixed from time to time by proclamation. France, too, adopted it during the Revolution, the ratio of 15½ to 1 being that fixed between gold and silver. The fluctuation of currencies arranged on this method, owing to the action of Gresham's law, has led in England and Germany to a modified system, which seeks to combine any advantages of the multiple standard with the principle of the single standard. By this method one metal is fixed as the principal legal tender, while the smaller coins are made of a less valuable material, and circulated at a nominal value somewhat above their real one, or, in other words, as token coins, but they are only legal tender to a limited amount. This has been called the *composite legal tender* system.[7]

For further details reference may be made to Tables II. and III., and the notes appended. Every currency system requires the existence of subsidiary coins, and, as stated before, this want is met by using a less valuable metal, generally silver, and for smaller payments copper or bronze. But, apart from the question of the material of the smaller coins, it is important to determine the best ratio between them. The simplest of all would be the *binary*. In it each coin would be the half of the next highest one, and double the one immediately below it. Nothing, apparently, is plainer or simpler than this scale, but the objection to it is the great number of coins that would be required, as well as the want of conformity with the general arithmetical scale. In a modified form it does prevail in many countries. Thus in England we have the *penny, half-penny*, and *farthing*. At a higher stage we have the *florin, shilling, sixpenny piece*, and *threepenny piece*, and, again, the *sovereign, half-sovereign, five-shilling piece*,[8] and *half-crown*. The coinages of the Latin and Scandinavian Unions, as also those of Germany and the United States, have several binary series in their coins.[9] There is, however, no completely binary system known. The old English scale was partly *duodecimal*, and the arguments in favour of this arrangement are by no means weak. At present the shilling is duodecimally divided. It is urged in favour of this scale that the main divisions of time (year and month, day and hour, are duodecimally related, and that time is one of the elements in all questions of value.[10] Another argument is that 12 is capable of being resolved into several factors (2 and 6, 3 and 4), and therefore

[10] See S. Laing, *Notes of a Traveller,* pp. 57-59.

termediate coins are introduced, *e.g.*, in France, 2-franc and 5-franc pieces. In fact, most modern currencies are a combination of the decimal and binary systems, England alone adhering to a modified duodecimal scale. A decimal coinage has for the last sixty years been proposed for England, and it is almost certain that if any one scheme could be pointed out as much preferable to any other it would be accepted. As it is, there are two or three proposals, each commanding some support, while many advocates of the decimal system prefer to wait till an international agreement for its adoption can be obtained. One of the schemes advanced takes the present *farthing* as its base; then 10 *farthings*=1 *doit* (2½d.); 10 *doits*=1 *florin* (2s. 1d.); 10 *florins*=1 *pound* (20s. 10d.). The advantages of this plan are: (1) that the smaller coins now in use could be preserved (the penny being 4 farthings), (2) retail prices, which are for the smaller articles estimated in pence, need not be altered, (3) nor need those which affect postage, tolls, and mileage charges. Against these may be set the loss of the unit of value, the pound, which should be raised to 20s. 10d., so that all accounts, and all large

* Inconvertible paper currency.

Remarks.—The currencies of such of the non-European States as were capable of being presented in tabular form have been given above, but a brief outline of the currencies of less-advanced countries where a settled coinage does not prevail may be here added. The systems of the various European colonies in America are, as a rule, similar to their mother-countries. Some of the English possessions acquired by conquest preserve their original currency. In Cayenne the pre-Revolution French money is retained. In Paraguay and Uruguay a much-depreciated paper currency circulates. The Central American states reckon in dollars. The Australian colonies have a currency identical with that of England; the same currency exists in South Africa. In Mauritius the Indian system has been recently introduced. The various Turkish vassal states possess peculiar coinages. In Egypt, the coins of various European nations form the chief money. The Asiatic currencies are generally composed of silver. Ceylon has the Indian rupees. The money of Java has since 1877 been assimilated to the latest form of the Dutch monetary system. In China the *cash* forms the unit, and is made of copper, iron, and tin; silver passes by weight—a *tael*, which varies from place to place, being the unit; while the silver *sycee* is the usual medium of exchange. The other Asiatic currencies do not require particular notice.

1 There is no currency issued in Canada; English and American coins circulate. The standard is gold (£1=$4·80). There were formerly different methods of counting, viz., English sterling, Halifax currency, and Canadian sterling, the respective ratios being 100 : 120 : 108.

2 The decimal coinage has existed in Mexico since 1867. The gold coins are practically commercial money, and command a premium.

3 The dollar was introduced in 1786 as the unit. In 1794 the ratio of gold to silver was fixed at 1 to 15. This valuation underrated gold, consequently silver became the standard. In 1834 the ratio was altered to 1 to 16, and it was again changed in 1837. In these changes gold was overrated, and silver was driven out of circulation. This led, in 1853, to the reduction of the metal in the silver coins, which therefore became a token-currency. The suspension of cash payments took place in 1861. In 1873 silver was demonetized, and gold became the standard. In 1878 the "Bland Bill" was passed, making the silver dollar a legal tender, but confining its coinage to the executive, and fixing the amount at from two to four million dollars per month. These silver dollars have not got into circulation. The United States coin a trade dollar of 420 grs. (27·212 grammes), to compete with the Mexican dollar. The old South American *onza* weighed 27 grammes, was 875· fine, and worth £3, 4s. 6d.

4 The Argentine Confederation professes to have a gold standard.

5 The Brazilian system is a depreciated form of the Portuguese.

6 Chili has nominally a double valuation at 1 to 16[illegible]. Gold coins are no longer struck.

7 The Colombian States have the Latin Union system, with a ratio of 1 to 15½.

8 When Peru returns to cash payments the system will be almost identical with that of Colombia.

9 British India has a single silver standard, as the gold coins are only commercial money. The price of the rupee varies; generally in recent years it has been about 1s. 8d. (=40 cents).

10 The old Japanese coinage consisted of gold cobangs and silver itzibus, with a ratio of 1 to 4. The system was recast in 1871, and the present decimal coinage adopted, the ratio being 1 to 16·17. The standard is now practically silver. In 1875 a trade dollar exactly similar to the American trade dollar was introduced.

termediate coins are introduced, *e.g.*, in France, 2-franc and 5-franc pieces. In fact, most modern currencies are a combination of the decimal and binary systems, England alone adhering to a modified duodecimal scale. A decimal coinage has for the last sixty years been proposed for England, and it is almost certain that if any one scheme could be pointed out as much preferable to any other it would be accepted. As it is, there are two or three proposals, each commanding some support, while many advocates of the decimal system prefer to wait till an international agreement for its adoption can be obtained. One of the schemes advanced takes the present *farthing* as its base; then 10 *farthings*=1 *doit* (2½d.); 10 *doits*=1 *florin* (2s. 1d.); 10 *florins*=1 *pound* (20s. 10d.). The advantages of this plan are: (1) that the smaller coins now in use could be preserved (the penny being 4 farthings), (2) retail prices, which are for the smaller articles estimated in pence, need not be altered, (3) nor need those which affect postage, tolls, and mileage charges. Against these may be set the loss of the unit of value, the pound, which should be raised to 20s. 10d., so that all accounts, and all large

* Inconvertible paper currency.

Remarks.—The currencies of such of the non-European States as were capable of being presented in tabular form have been given above, but a brief outline of the currencies of less-advanced countries where a settled coinage does not prevail may be here added. The systems of the various European colonies in America are, as a rule, similar to their mother-countries. Some of the English possessions acquired by conquest preserve their original currency. In Cayenne the pre-Revolution French money is retained. In Paraguay and Uruguay a much-depreciated paper currency circulates. The Central American states reckon in dollars. The Australian colonies have a currency identical with that of England; the same currency exists in South Africa. In Mauritius the Indian system has been recently introduced. The various Turkish vassal states possess peculiar coinages. In Egypt, the coins of various European nations form the chief money. The Asiatic currencies are generally composed of silver. Ceylon has the Indian rupees. The money of Java has since 1877 been assimilated to the latest form of the Dutch monetary system. In China the *cash* forms the unit, and is made of copper, iron, and tin; silver passes by weight—a *tael*, which varies from place to place, being the unit; while the silver *sycee* is the usual medium of exchange. The other Asiatic currencies do not require particular notice.

1 There is no currency issued in Canada; English and American coins circulate. The standard is gold (£1=$4·80). There were formerly different methods of counting, viz., English sterling, Halifax currency, and Canadian sterling, the respective ratios being 100:120:108.

2 The decimal coinage has existed in Mexico since 1867. The gold coins are practically commercial money, and command a premium.

3 The dollar was introduced in 1786 as the unit. In 1794 the ratio of gold to silver was fixed at 1 to 15. This valuation underrated gold, consequently silver became the standard. In 1834 the ratio was altered to 1 to 16, and it was again changed in 1837. In these changes gold was overrated, and silver was driven out of circulation. This led, in 1853, to the reduction of the metal in the silver coins, which therefore became a token-currency. The suspension of cash payments took place in 1861. In 1873 silver was demonetized, and gold became the standard. In 1878 the "Bland Bill" was passed, making the silver dollar a legal tender, but confining its coinage to the executive, and fixing the amount at from two to four million dollars per month. These silver dollars have not got into circulation. The United States coin a trade dollar of 420 grs. (27·212 grammes), to compete with the Mexican dollar. The old South American *onza* weighed 27 grammes, was 875· fine, and worth £3, 4s. 6d.

4 The Argentine Confederation professes to have a gold standard.

5 The Brazilian system is a depreciated form of the Portuguese.

6 Chili has nominally a double valuation at 1 to $16\frac{7}{81}$. Gold coins are no longer struck.

7 The Colombian States have the Latin Union system, with a ratio of 1 to 15½.

8 When Peru returns to cash payments the system will be almost identical with that of Colombia.

9 British India has a single silver standard, as the gold coins are only commercial money. The price of the rupee varies; generally in recent years it has been about 1s. 8d. (=40 cents).

10 The old Japanese coinage consisted of gold cobangs and silver itzibus, with a ratio of 1 to 4. The system was recast in 1871, and the present decimal coinage adopted, the ratio being 1 to 16·17. In 1875 a trade dollar exactly similar to the American trade dollar was introduced. The standard is now practically silver.

their special knowledge would be saved to ordinary traders. (3) The improvement of the currencies of backward states. Many countries still possess those mixed currencies which were once common all over Europe, and much confusion consequently arises. The commercial coins have been introduced for international circulation,[1] and a universal currency would perform their function more satisfactorily. (4) Greater facility in comparing price-lists, &c. This advantage, which is reserved for the last, has been regarded by competent judges as the greatest.[2] It has a practical and a theoretical interest: the former, since trade with foreign countries would be rendered easier and safer; the latter, since statistical inquiries would be very much facilitated. At present, it is quite impossible for an ordinary trader to understand a set of foreign price-lists, each perhaps expressed in terms of a different currency from the others,—a difficulty which is enhanced by the variations of gold and silver values, not to add the case of an inconvertible paper currency. The existence of a common monetary language would remove these difficulties, and the premium on gold could be allowed for in the case of depreciated paper. A much wider development of smaller trading transactions would become possible, and would add to the world's wealth. Nor would the greater ease of statistical inquiry be unimportant; the rates of wages in different countries, and the profits on different transactions, would be readily compared, and the movements of labour and capital to the most advantageous points rendered more rapid. Against these great gains can be set only a certain and a possible disadvantage—namely, the loss and trouble involved in change, which would, of course, for the time be considerable, but would soon be over, and the chance that some states might issue a depreciated currency, which would expel the other and better coins. In the case of a universal coinage this case would hardly arise, since there would be no field of employment for the purer coins, and they would consequently remain in circulation, but the whole currency would become depreciated. Proper mint regulations, however, would obviate this danger, and could surely be devised. It may be said that the principal hindrance to one coinage system for all civilized states is the as yet unsettled question of the standard to be employed. Till the debate on this problem is closed it is vain to expect monetary unification. The establishment of a universal system based on gold seemed quite feasible to the conference of 1867, but doubtful to that of 1878, while a double standard was the proposal discussed in 1881.

9. *Considerations on the Questions arising from the Conflict of Standards.*—In the preceding section the various possible monetary systems were set forth, but no discussion was entered into with respect to their comparative merits. Only three of these systems need be here examined, namely, the *single* standard system, the *multiple* standard system, and, lastly, the *composite* system. Nor even is there any need for examining the various possible single or multiple standards. The single silver standard is the only one of the former, as the double gold and silver standard is the only one of the latter, which need be taken into account. It is true, historical inquiry has shown that the problem of the proper proportion between two different metals when used together presented itself to the Chinese with regard to their iron and copper coinages; but the course of monetary evolution, as discussed in section 3, has resulted in the rejection of the less valuable metals and in confining the material of the principal coins to silver and gold. The use of silver as a principal coinage was, as we have seen, widely diffused. The Hellenic coins were composed of that metal, gold being afterwards introduced as a variable commercial money; and copper was brought in still later as a token currency. Though copper preceded silver as money in Rome, the latter, soon after its introduction, succeeded in displacing it, the ratio first fixed being 1 to 250. A regular gold coinage did not exist at Rome till the empire, but gold in bars passed, the legal ratio being 1 to 11·91. Still the questions connected with the use of a double standard do not seem to have arisen.[3] The various European monarchies had silver as their principal money (see p. 726 *sq.*, above), gold where it was used being, as in Greece, a commercial money. The advance of gold to a position parallel to silver was commenced in the 13th and continued in the 14th century, the method of regulating the mixed gold and silver currencies being by proclamation, which fixed the varying ratios from time to time. In England this course was followed from the first introduction of gold coins (1257) to 1663.[4] From 1663 to 1717 silver was the standard, and the gold coins passed at their market value. As the silver coins were very much debased, the gold guinea sometimes was deemed equivalent to 30s. After the recoinage of 1696 the guinea passed at 21s. 6d. At this ratio silver was underrated, and was accordingly exported to Continental Europe and to India. The loss of the silver coins aroused the public attention, and the matter was submitted to Sir I. Newton, whose answer was given in his *Third Representation*. He proposed to reduce the guinea from 21s. 6d. to 21s. as an experimental measure.[5] The proper reduction for the object in view would have been to 20s. 8d. The silver drain, therefore, continued, and England came to have a gold currency. An opposite arrangement gave France a silver coinage. The recent facts of French monetary history, as well as those of the United States, illustrate the same condition of affairs. The difficulty of constituting a double standard system on a secure basis is thus made clear, so far at least as regards a single country. For the continuance of the two metals in the currency depends on the market ratio and the legal ratio between gold and silver being the same. The slightest examination of the history of these metals will show how variable they have been. Without accepting the estimates which regard silver as being more valuable than gold,[6] the well-attested variations of the precious metals have been very considerable. Thus, Herodotus estimates the ratio as 1 to 13, Plato 1 to 12, Menander 1 to 10, and in Cæsar's time the ratio was 1 to 9.[7] Table I. contains the variations since the discovery of America. In the 14th century the value of gold rose remarkably, and the gradual movement has ever since been towards an appreciation of gold relatively to silver. Another point, previously noticed, is the tendency, as wealth increases, to adopt a more valuable form of currency. Greece, Rome, and England all afford illustrations of this movement. The experience of the evils of a mixed currency led the earlier writers on coinage in England to regard a single standard system as the best, and silver as the most suitable metal for the standard. Locke, Petty, and Harris all advocated this view. The earlier Italian writers proposed to combine gold and silver at a ratio of 1 to 12, which they conceived to be the actual proportion. The theory of a composite system was, as before mentioned, first given by Lord Liverpool.[8] This method

[1] The principal of these are—the Austrian Maria Theresa dollar, the Mexican dollar, and the United States trade dollar, which is $7\frac{1}{2}$ grs. heavier than the national coin of the same name. See also Tables II. and III.

[2] *E.g.*, Bagehot and Prof. Jevons. The former dwells on the commercial aspect; the latter naturally places the scientific side first.

[3] See Mommsen, *Hist. of Rome*, ii. p. 382 and iv. p. 553.

[4] The various changes made can be estimated from the Tables given in James's *Essays on Money*, &c.; see also *Ency. Brit.*, 8th ed., article "Money." A careful statement will be found in Lord Liverpool's work, ch. xi.

[5] Newton's report will be found in *Select Tracts on Money*, edited by J. R. M'Culloch for the Political Economy Club (1856). One passage is worth quoting. "The demand for exportation arises from the higher price of silver in other places than in England in proportion to gold, . . . and may therefore be diminished by lowering the value of gold in proportion to silver. If gold in England, or silver in East India, could be brought down so low as to bear the same proportion to one another in both places, there would be here no greater demand for silver than for gold to be exported to India. And if gold were lowered only so as to have the same proportion to the silver money in England which it hath to silver in the rest of Europe, there would be no *temptation to export silver rather than gold to any other part of* Europe" (p. 277). The italics are in the original passage, which has been much discussed in recent controversies.

[6] Del Mar, *Hist. of the Precious Metals*, p. 221. According to this writer, the variation has been 200 degrees—*i.e.*, from silver being 10 times as valuable as gold, gold has come to be 20 times more valuable than silver.

their special knowledge would be saved to ordinary traders. (3) The improvement of the currencies of backward states. Many countries still possess those mixed currencies which were once common all over Europe, and much confusion consequently arises. The commercial coins have been introduced for international circulation,[1] and a universal currency would perform their function more satisfactorily. (4) Greater facility in comparing price-lists, &c. This advantage, which is reserved for the last, has been regarded by competent judges as the greatest.[2] It has a practical and a theoretical interest: the former, since trade with foreign countries would be rendered easier and safer; the latter, since statistical inquiries would be very much facilitated. At present, it is quite impossible for an ordinary trader to understand a set of foreign price-lists, each perhaps expressed in terms of a different currency from the others,—a difficulty which is enhanced by the variations of gold and silver values, not to add the case of an inconvertible paper currency. The existence of a common monetary language would remove these difficulties, and the premium on gold could be allowed for in the case of depreciated paper. A much wider development of smaller trading transactions would become possible, and would add to the world's wealth. Nor would the greater ease of statistical inquiry be unimportant; the rates of wages in different countries, and the profits on different transactions, would be readily compared, and the movements of labour and capital to the most advantageous points rendered more rapid. Against these great gains can be set only a certain and a possible disadvantage—namely, the loss and trouble involved in change, which would, of course, for the time be considerable, but would soon be over, and the chance that some states might issue a depreciated currency, which would expel the other and better coins. In the case of a universal coinage this case would hardly arise, since there would be no field of employment for the purer coins, and they would consequently remain in circulation, but the whole currency would become depreciated. Proper mint regulations, however, would obviate this danger, and could surely be devised. It may be said that the principal hindrance to one coinage system for all civilized states is the as yet unsettled question of the standard to be employed. Till the debate on this problem is closed it is vain to expect monetary unification. The establishment of a universal system based on gold seemed quite feasible to the conference of 1867, but doubtful to that of 1878, while a double standard was the proposal discussed in 1881.

9. *Considerations on the Questions arising from the Conflict of Standards.*—In the preceding section the various possible monetary systems were set forth, but no discussion was entered into with respect to their comparative merits. Only three of these systems need be here examined, namely, the *single* standard system, the *multiple* standard system, and, lastly, the *composite* system. Nor even is there any need for examining the various possible single or multiple standards. The single silver standard is the only one of the former, as the double gold and silver standard is the only one of the latter, which need be taken into account. It is true, historical inquiry has shown that the problem of the proper proportion between two different metals when used together presented itself to the Chinese with regard to their iron and copper coinages; but the course of monetary evolution, as discussed in section 3, has resulted in the rejection of the less valuable metals and in confining the material of the principal coins to silver and gold. The use of silver as a principal coinage was, as we have seen, widely diffused. The Hellenic coins were composed of that metal, gold being afterwards introduced as a variable commercial money; and copper was brought in still later as a token currency. Though copper preceded silver as money in Rome, the latter, soon after its introduction, succeeded in displacing it, the ratio first fixed being 1 to 250. A regular gold coinage did not exist at Rome till the empire, but gold in bars passed, the legal ratio being 1 to 11·91. Still the questions connected with the use of a double standard do not seem to have arisen.[3] The various European monarchies had silver as their principal money (see p. 726 *sq.*, above), gold where it was used being, as in Greece, a commercial money. The advance of gold to a position parallel to silver was commenced in the 13th and continued in the 14th century, the method of regulating the mixed gold and silver currencies being by proclamation, which fixed the varying ratios from time to time. In England this course was followed from the first introduction of gold coins (1257) to 1663.[4] From 1663 to 1717 silver was the standard, and the gold coins passed at their market value. As the silver coins were very much debased, the gold guinea sometimes was deemed equivalent to 30s. After the recoinage of 1696 the guinea passed at 21s. 6d. At this ratio silver was underrated, and was accordingly exported to Continental Europe and to India. The loss of the silver coins aroused the public attention, and the matter was submitted to Sir I. Newton, whose answer was given in his *Third Representation.* He proposed to reduce the guinea from 21s. 6d. to 21s. as an experimental measure.[5] The proper reduction for the object in view would have been to 20s. 8d. The silver drain, therefore, continued, and England came to have a gold currency. An opposite arrangement gave France a silver coinage. The recent facts of French monetary history, as well as those of the United States, illustrate the same condition of affairs. The difficulty of constituting a double standard system on a secure basis is thus made clear, so far at least as regards a single country. For the continuance of the two metals in the currency depends on the market ratio and the legal ratio between gold and silver being the same. The slightest examination of the history of these metals will show how variable they have been. Without accepting the estimates which regard silver as being more valuable than gold,[6] the well-attested variations of the precious metals have been very considerable. Thus, Herodotus estimates the ratio as 1 to 13, Plato 1 to 12, Menander 1 to 10, and in Cæsar's time the ratio was 1 to 9.[7] Table I. contains the variations since the discovery of America. In the 14th century the value of gold rose remarkably, and the gradual movement has ever since been towards an appreciation of gold relatively to silver. Another point, previously noticed, is the tendency, as wealth increases, to adopt a more valuable form of currency. Greece, Rome, and England all afford illustrations of this movement. The experience of the evils of a mixed currency led the earlier writers on coinage in England to regard a single standard system as the best, and silver as the most suitable metal for the standard. Locke, Petty, and Harris all advocated this view. The earlier Italian writers proposed to combine gold and silver at a ratio of 1 to 12, which they conceived to be the actual proportion. The theory of a composite system was, as before mentioned, first given by Lord Liverpool.[8] This method

value of those substances shall be. They argue from history that several metals have been successively demonetized, that different ratios have been fixed between metals circulating together, that inconvertible paper currencies have been kept in circulation by the will of the state.[1] The doctrine of cost of production as determining the value of money is also assailed by them. They hold that it is the quantity of money which governs its value,[2] and that cost of production has little or no influence in the matter. The next step in the bimetallic argument is to contend that their proposed ratio for gold to silver (1 to 15½) can be maintained by the legal regulations to that effect. The common objection to bimetallism is, that whichever metal was undervalued would be exported. They answer that the same ratio existing over all, or a great part of, the world, there would be no inducement to export either metal, and in support of their argument they appeal to the passage from Newton quoted above, and claim him as the inventor of modern bimetallism.[3] Thirdly, a greater stability as regards value is claimed for the two metals combined than for either singly, since the fluctuations are distributed over a wider field, and, the conditions of production of gold and silver being somewhat different, fluctuations in them tend to counterbalance each other. A fourth point consists in the greater facilities which would exist for trade, since the fluctuations of the exchanges which arise from the existence of gold and silver currencies, and the variations of relative value of these metals, would under a bimetallic system disappear. The fifth argument for bimetallism is the advantages which would result from the increased prices caused by the greater abundance of money, or at all events from the check to any fall in prices which might arise from a diminution in the production of gold. The final argument is that a universal currency is desirable, and that, a single gold currency being by general consent practically impossible, this advantageous reform can be realized in no other way than by adopting a plan which permits the concurrent circulation of two metals. Most of these positions are contested by the monometallists, and even where any concession is made the value of the advantage to be reaped is estimated at a much smaller amount. The contention that the value of money is largely influenced by state demand is met by the assertion that cost of production is the ultimate regulator of value, and that any artificial regulation would stimulate the production of the cheaper metal, and thus flood the world with it. The fixing of a ratio different from the market one is derided by them as absurd, and an extreme case is instanced for this purpose. Is it possible, they ask, to make the value of silver equal to that of gold? If not, how can it be possible to alter the market ratio in even the slightest degree? Is there not a great demand for the precious metals in the various trades? And would not the ratio of this demand be affected by the fixing of a new ratio? The argument of bimetallists that their system would produce greater stability in the value of money is met by the answer that there is no proof of this. It is quite possible that a single metal may be steadier in value than two combined, and the evidence of history shows that silver is more liable to depreciation than gold. The argument derived from the advantages to exchange transactions is to a slight extent admitted, but it is pointed out that the factors which affect the foreign exchanges are so numerous, and are so rapidly eliminated in the course of trade, that a radical currency change need not be adopted for this purpose. It is also shown that, even when most European countries were bimetallic, fluctuations in the exchange price of silver took place; and still more that, where it is the less valuable metal that is in course of depreciation, bimetallism can afford no aid. The assumed tendency of the bimetallic scheme to produce a higher scale of prices than would otherwise prevail is dwelt on by opponents as a proof of its inherently vicious character. The claim to benefit the world by adding to its stock of money places bimetallists in the same class with the advocates of inconvertible paper money, and shows the absence of reason in their views. Their position becomes the same as that of the Birmingham currency school. The proposition that the quantity of money is of no consequence since prices vary in proportion to it is cited as conclusive, and the contempt so frequently expressed for bimetallists is accounted for by their advocacy of this principle of the beneficial effects of an increased amount of money. To the contention that bimetallism is the necessary condition for a universal coinage system the answer is, that the idea of universal coinage is premature, and that the *gradual* introduction of the gold standard is desirable as preparing the way for a future universal coinage based on gold monometallism. On the practical question as to the actual introduction of the system, the monometallists deny the possibility of forming a universal bimetallic league which would not be liable to be broken up by war, or impaired by some of the states which composed it issuing inconvertible paper. On the other hand, the various international conventions for postal purposes, extradition, commercial arrangements, and other matters of interest, are considered by bimetallists as evidences of the feasibility of their plan.[4]

The above summary gives the main arguments on each side of the discussion as given by the advocates of the contending principles. A short consideration will show that the controversy may be suitably divided into three heads, viz.—(1) the possibility of constructing a universal bimetallic system which shall be in accordance with sound economic principle; (2), if the first question be answered in the affirmative, the comparative merits of this system as opposed to the present variety of systems, or a future universal gold-standard system; and (3) the expediency under present circumstances of nations in general, and England in particular, joining in the proposed convention. Each of these topics calls for some remark. (1) The possibility of a bimetallic system can hardly be denied. Under all the difficulties attending its existence in a single country, it was retained in practical working in France during the early part of the 18th century, and it is plain that a widely-extended league would afford a better field for its action. It is quite possible that national preferences for one metal or the other would be displayed, but this would be no hindrance, since the exchanges would be regulated by the legal rate, and prices would depend on the total quantity of both metals (the amount of gold being multiplied by the legal ratio, and added to the amount of silver).[5] The objection which denies the power of Governments to fix the relative values of gold and silver, and which is supported by the instance of the extreme case of silver being made equal in value to gold, may be set aside by the consideration that the use of the precious metals takes two forms—(*a*) their use as commodities, (*b*) their use as money. Since the state can influence the demand for these metals as money, and since therefore it can raise the value of either of them by this increased demand, it follows that, within assignable limits, it can fix the ratios between them, and that these limits are "the ratio which would subsist between their values if gold were demonetized, and that which would subsist if silver were demonetized."[6] The possibility of bimetallism, if all nations were agreed, is allowed by some monometallists (*e.g.*, Professor Jevons), and an unconscious argument to this effect was given by the proposal of Chevalier, at the time of the Australian gold discoveries, to adopt silver as the standard and demonetize gold, which is a clear recognition of the force of law in monetary questions. It is therefore reasonable to answer in the bimetallists' favour the question first raised. (2) The considerations to be taken into account under the second head are far more complex, and do not admit of accurate determination. The present currency systems of England and the Scandinavian Union are based on the composite system, and afford the greatest satisfaction to the inhabitants of those countries. The bimetallic system of the Latin Union has been suspended, the introduction of silver as the principal money not being desired by the various peoples concerned. Germany has lost considerably by the sales of depreciated silver, and, were a gold standard once firmly established, it is not likely that any wish for change would be manifested. With silver countries the case is different. They have to receive masses of depreciated silver and to give commodities in exchange, while their purchasing power is reduced owing to the greater relative value of gold to silver. It would therefore be clearly advantageous for silver-using countries that a system should be adopted which would raise the value of their money, and save them from the necessity of importing large quantities of silver to produce a proper adjustment. The ultimate consequences of the complete demonetization of silver as regards silver-using countries are not so clear. The supply of gold might suffice for all wants, and might furnish a better currency than the heavier silver. The preservation of two separate monometallic systems, of gold for the more advanced countries of Europe and the United States, of silver for Russia and India, would, when the superfluous stock of silver had passed to the East, present little difficulty after equilibrium was attained. The new ratio between silver and gold would become established, and silver prices in silver-using countries would be higher in proportion to the fall in the value of silver. It is therefore plain that a suitable adjustment would be reached under any variety of currency systems, and it may therefore be concluded that the comparative merits of the competing standards are not capable of

[1] See Dana Horton's paper on the *Position of Law in the Doctrine of Money*, presented to the monetary conference of 1881 (Appendix iv. C)

[2] On p. 721, above, the theory of money value has been stated, and the objections to the cost of production theory given. It is strange to find Jevons arguing (in common with Bagehot and Prof. Price) that the value of money ultimately depends on cost of production, when his examination of that doctrine in general is considered. Compare *Contemp. Rev.* (May 1881) with Jevons's *Theory of Pol. Econ.*, p. 201 *sq.*

[3] Modern bimetallists freely admit that two different bimetallic systems—*i.e.*, having different ratios—could not exist, for each would drain the other of one metal.

[4] The principal sources for the above summary, besides works before cited, are the pamphlets of Seyd, Cernuschi, and De Laveleye, on the bimetallist side, as well as the articles of the latter in the *Fort* and *Contemp. Reviews*. The monometallist arguments are given by Prof. Jevons (*Contemp*, May 1881), Mr R. Giffen (*Essays in Finance*, pp. 286-310), and Lord Sherbrooke (*Nineteenth Century*, April 1882) See also the Report of the Paris conference, 1881, and Mr T. H. Farrer, *The State in its Relation to Trade*, pp. 49-52.

[5] It is assumed that the other factors which influence the value of money (see p. 722, above) remain constant.

[2] On p. 721, above, the theory of money value has been stated, and the objections to the cost of production theory given. It is strange to find Jevons arguing (in common with Bagehot and Prof. Price) that the value of money ultimately depends on cost of production, when his examination of that doctrine in general is considered. Compare *Contemp. Rev.* (May 1881) with Jevons's *Theory of Pol. Econ.*, p. 201 *sq.*

[3] Modern bimetallists freely admit that two different bimetallic systems—*i.e.*, having different ratios—could not exist, for each would drain the other of one metal.

[4] The principal sources for the above summary, besides works before cited, are the pamphlets of Seyd, Cernuschi, and De Laveleye, on the bimetallist side, as well as the articles of the latter in the *Fort.* and *Contemp. Reviews*. The monometallist arguments are given by Prof. Jevons (*Contemp.*, May 1881), Mr R. Giffen (*Essays in Finance*, pp. 286-310), and Lord Sherbrooke (*Nineteenth Century*, April 1882). See also the *Report* of the Paris conference, 1881, and Mr T. H. Farrer, *The State in its Relation to Trade*, pp. 49-52.

[5] It is assumed that the other factors which influence the value of money (see p. 722, above) remain constant.

[6] Mr J. J. Murphy in *Dublin Statistical Journal*, vol. viii. p. 282. See also M. Walras, *Journal des Économistes*, May 1881, "Théorie Mathématique du bimétallisme."

result so quickly that the commandant at first refused to receive it—the time necessary for the work had not been taken; but upon examination the value of the discovery was recognized, and the method was adopted. And Monge, continuing his researches, arrived at that general method of the application of geometry to the arts of construction which is now called descriptive geometry. But such was the system in France before the Revolution that the officers instructed in the method were strictly forbidden to communicate it even to those engaged in other branches of the public service; and it was not until many years afterwards that an account of it was published. The method consists, as is well known, in the use of the two halves of a sheet of paper to represent say the planes of xy and xz at right angles to each other, and the consequent representation of points, lines, and figures in space by means of their plan and elevation, placed in a determinate relative position.

In 1768 Monge became professor of mathematics, and in 1771 professor of physics, at Mézières; in 1778 he married Madame Horbon, a young widow whom he had previously defended in a very spirited manner from an unfounded charge; in 1780 he was appointed to a chair of hydraulics at the Lyceum in Paris (held by him together with his appointments at Mézières), and was received as a member of the Academy; his intimate friendship with Berthollet began at this time. In 1783, quitting Mézières, he was, on the death of Bezout, appointed examiner of naval candidates. Although pressed by the minister to prepare for them a complete course of mathematics, he declined to do so, on the ground that it would deprive Madame Bezout of her only income, arising from the sale of the works of her late husband; he wrote, however (1786), his *Traité élémentaire de la Statique*.

Monge contributed (1770-1790) to the *Memoirs* of the Academy of Turin, the *Mémoires des Savants Étrangers* of the Academy of Paris, the *Mémoires* of the same Academy, and the *Annales de Chimie*, various mathematical and physical papers. Among these may be noticed the memoir "Sur la théorie des déblais et des remblais" (*Mém. de l'Acad. de Paris*, 1781), which, while giving a remarkably elegant investigation in regard to the problem of earthwork referred to in the title, establishes in connexion with it his capital discovery of the curves of curvature of a surface. Euler, in his paper on curvature in the Berlin *Memoirs* for 1760, had considered, not the normals of the surface, but the normals of the plane sections through a particular normal, so that the question of the intersection of successive normals of the surface had never presented itself to him. Monge's memoir just referred to gives the ordinary differential equation of the curves of curvature, and establishes the general theory in a very satisfactory manner; but the application to the interesting particular case of the ellipsoid was first made by him in a later paper in 1795. A memoir in the volume for 1783 relates to the production of water by the combustion of hydrogen; but Monge's results in this matter had been anticipated by Watts and Cavendish.

In 1792, on the creation by the Legislative Assembly of an executive council, Monge accepted the office of minister of the marine, but retained it only until April 1793. When the Committee of Public Safety made an appeal to the savants to assist in producing the *matériel* required for the defence of the republic, he applied himself wholly to these operations, and distinguished himself by his indefatigable activity therein; he wrote at this time his *Description de l'art de fabriquer les canons*, and his *Avis aux ouvriers en fer sur la fabrication de l'acier*. He took a very active part in the measures for the establishment of the Normal School (which existed only during the first four months of the year 1795), and of the School for Public Works, afterwards the Polytechnic School, and was at each of them professor for descriptive geometry; his methods in that science were first published in the form in which the shorthand writers took down his lessons given at the Normal School in 1795, and again in 1798-99. In 1796 Monge was sent into Italy with Berthollet and some artists to receive the pictures and statues levied from several Italian towns, and made there the acquaintance of General Bonaparte. Two years afterwards he was sent to Rome on a political mission, which terminated in the establishment, under Massena, of the shortlived Roman republic; and he thence joined the expedition to Egypt, taking part with his friend Berthollet as well in various operations of the war as in the scientific labours of the Egyptian Institute of Sciences and Arts; they accompanied Bonaparte to Syria, and returned with him in 1798 to France. Monge was appointed president of the Egyptian commission, and he resumed his connexion with the Polytechnic School. His later mathematical papers are published (1794-1816) in the *Journal* and the *Correspondance* of the Polytechnic School. On the formation of the Senate he was appointed a member of that body, with an ample provision and the title of count of Pelusium; but on the fall of Napoleon he was deprived of all his honours, and even excluded from the list of members of the reconstituted Institute. He died at Paris on the 28th July 1818.

For further information see B. Brisson, *Notice historique sur Gaspard Monge*; Dupin, *Essai historique sur les services et les travaux scientifiques de Gaspard Monge*, Paris, 1819, which contains (pp. 162-166) a list of Monge's memoirs and works; and the biography by Arago (*Œuvres*, t. ii., 1854).

Monge's various mathematical papers are to a considerable extent reproduced in the *Application de l'Analyse à la Géométrie*, 4th edition (last revised by the author), Paris, 1819—the pure text of this is reproduced in the 5th edition (*revue, corrigée et annotée par M. Liouville*), Paris, 1850, which contains also Gauss's Memoir, "Disquisitiones generales circa superficies curvas," and some valuable notes by the editor. The other principal separate works are *Traité élémentaire de la Statique, 8e edition, conformee à la précédente, par M. Hachette, et suivie d'une Note etc., par M. Cauchy*, Paris, 1846; and the *Géométrie Descriptive* (originating, as mentioned above, in the lessons given at the Normal School). The 4th edition, published shortly after the author's death, seems to have been substantially the same as the 7th (*Géométrie Descriptive par G. Monge, suivie d'une théorie des Ombres et de la Perspective, extraite des papiers de l'auteur, par M. Brisson*, Paris, 1847). (A. CA.)

MONGHYR, or MUNGIR, a district in the lieutenant-governorship of Bengal, lying between 24° 22′ and 25° 49′ N. lat., and 85° 40′ and 86° 52′ E. long., is bounded on the N. by Darbhangah and Bhágalpur, on the E. by Bhágalpur, on the S. by the Santál Parganás and Hazáribágh, and on the W. by Gayá, Patná, and Darbhangah, with an area of 3922 square miles. The Ganges divides the district into two portions. The northern, intersected by the Burí Gandak and Tíljugá, two important tributaries of the Ganges, is always liable to inundation during the rainy season, and is a rich, flat, wheat and rice country, supporting a large population. A considerable area, immediately bordering the banks of the great rivers, is devoted to permanent pasture. Immense quantities of buffaloes are sent every hot season to graze on these marshy prairies; and the *ghí*, or clarified butter, made from their milk forms an important article of export to Calcutta. To the south of the Ganges the country is dry, much less fertile, and broken up by fragmentary ridges. The soil consists of quartz, mixed in varying proportions with mica. Ranges of hills intersect this part of the district, and in the extreme south form conical peaks, densely covered with jungle, but of no great height. Irrigation is necessary throughout the section lying on the south of the Ganges.

In 1872 the population of Monghyr was 1,812,986 (males, 897,074; females 915,912): Hindus, 1,613,546; Mohammedans,

advanced Mongol guards reached Amid (Diarbekr), whither Jelál al-dín had retreated, before that unfortunate sovereign had any idea of their approach. Accompanied by a few followers, Jelál al-dín fled to the Kurdish mountains, where he was basely murdered by a peasant. The primary object of the Mongol invasion was thus accomplished; but, with the instinct of their race, they made this conquest but a stepping-stone to another, and without a moment's delay pushed on still farther westward. Unchecked and almost unopposed, they overran the districts of Diarbekr, Mesopotamia, Erbíl, and Khelat, and then advanced upon Azerbijan. So great was the terror with which these fierce warriors inspired the people of the provinces they attacked that single Mongols are said to have slain the inhabitants of entire villages without a hand having been raised against them. In the following year (1236) they invaded Georgia and Great Armenia, committing frightful atrocities, sparing neither man nor woman, young nor old, with the exception of those whom they saved to minister to their wants or passions. Tiflis was among the cities captured by assault, and Kars was surrendered at their approach in the vain hope that submission would gain clemency from the victors. Meanwhile, in 1235, Ogdai, whose troops were as numerous as their thirst for conquest was devouring, despatched three armies in as many directions. One was directed against Corea, one against the Sung dynasty, which ruled over the provinces of China south of the Yang-tsze Keang, and the third was sent westward into eastern Europe. This last force was commanded by Batu, the son of Juchi, Ogdai's deceased eldest brother, who took with him the celebrated Sabutai Bahádur as his chief adviser. Bulgar, the capital city of the Bulgars, fell before the force under Sabutai, while Batu pushed on over the Volga. With irresistible vigour and astonishing speed the Mongols made their way through the forests of Penza and Tamboff, and appeared before the "beautiful city" of Riazan. For five days they discharged a ceaseless storm of shot from their balistas, and, having made a breach in the defences, carried the city by assault on the 21st of December 1237. "The prince, with his mother, wife, sons, the boyars, and the inhabitants, without regard to age or sex, were slaughtered with the savage cruelty of Mongol revenge; some were impaled, some shot at with arrows for sport, others were flayed or had nails or splinters of wood driven under their nails. Priests were roasted alive, and nuns and maidens ravished in the churches before their relatives. 'No eye remained open to weep for the dead.'" Moscow, at this time a place of little importance, next fell into the hands of the invaders, who then advanced against Vladimir. After having held out for several days against the Mongol attacks, the city at length succumbed, and the horrors of Riazan were repeated. The imperial family, with a vast crowd of fugitives, sought shelter in the cathedral, only to perish by the swords of the conquerors or by the flames which reduced it to ashes. If possible, a more dire fate overtook the inhabitants of Kozelsk, near Kaluga, where, in revenge for a partial defeat inflicted on a Mongol force, the followers of Batu held so terrible a "carnival of death" that the city was renamed by its captors Mobalig, "the city of woe." With the tide of victory thus strong in their favour the Mongols advanced against Kieff, "the mother of cities," and carried it by assault. The inevitable massacre followed, and the city was razed to the ground. While the scene of bloodshed was at its height a catastrophe occurred which at any other time would have been considered of supreme horror. Under the weight of a vast crowd of fugitives the flat roof of the metropolitan church fell in, burying all, young and old, in a vast hecatomb.

Victorious and always advancing, the Mongols, having desolated this portion of Russia, moved on in two divisions, one under Batu into Hungary, and the other under Baidar and Kaidu into Poland. Without a check, Batu marched to the neighbourhood of Pesth, where the whole force of the kingdom was arrayed to resist him. The Hungarian army was posted on the wide heath of Mohi, which is bounded by "the vine-clad hills of Tokay," the mountains of Lomnitz, and the woods of Diosgyor. To an army thus hemmed in on all sides defeat meant ruin, and Batu instantly recognized the dangerous position in which his enemies had placed themselves. To add to his chances of success he determined to deliver his attack by night, and while the careless Hungarians were sleeping he launched his battalions into their midst. Panic-stricken and helpless, they fled in all directions, followed by their merciless foes. Two archbishops, three bishops, and many of the nobility were among the slain, and the roads for two days' journey from the field of battle were strewn with corpses. The king, Béla IV., was saved by the fleetness of his horse, though closely pursued by a body of Mongols, who followed at his heels as far as the coast of the Adriatic, burning and destroying everything in their way. Meanwhile Batu captured Pesth, and on Christmas Day 1241, having crossed the Danube on the ice, took Gran by assault. While Batu had been thus triumphing, the force under Baidar and Kaidu had carried fire and sword into Poland. At their approach the inhabitants of Cracow deserted the city, after having given it over to the flames. Disappointed at the loss of their expected spoil, the Mongols advanced to Wahlstatt in the neighbourhood of Liegnitz, where the Polish army under Duke Henry II. of Silesia awaited their onslaught. With savage impetuosity, the troops of Baidar rushed to the attack, and completely defeated the Poles. As usual, no quarter was given. The massacre was frightful, and Duke Henry himself was amongst the slain. It was a Mongol habit to cut off an ear from each corpse of their slaughtered foes, and on this occasion it is said that they filled nine sacks with these ghastly trophies. Following the example of the inhabitants of Cracow, the people of Liegnitz left but the blackened walls of what had once been the town as a prey for the Mongols, who without delay pushed south-eastward into Moravia as far as the vicinity of Troppau. While laying waste the country in the neighbourhood of that town, they received the announcement of the death of Ogdai, and at the same time a summons for Batu to return eastwards into Mongolia.

While his lieutenants had been thus carrying his arms in all directions, Ogdai had been giving himself up to ignoble ease and licentiousness. Like many Mongols, he was much given to drink, and it was to a disease produced by this cause that he finally succumbed on the 11th of December 1241. He was succeeded by his son Kuyuk, who reigned only seven years. Little of his character is known, but it is noticeable that his two ministers to whom he left the entire conduct of affairs were Christians, as also were his doctors, and that a Christian chapel stood before his tent. This leaning towards Christianity, however, brought no peaceful tendencies with it. On the contrary, we hear of an advance against the sultan of Rúm (Asia Minor), and of an expedition into Syria, by which that country was made tributary to the Great Mongol empire, of a fresh campaign against Corea, and of another attack on the Sung dynasty of China. On the death of Kuyuk dissensions which had been for a long time smouldering between the houses of Ogdai and Jagatai broke out into open war, and after the short and disputed reigns of Kaidu and Chapai, grandsons of Ogdai, the lordship passed away from the house of Ogdai for ever.

On the 1st of July 1251 Mangu, the eldest son of Tulé, and nephew to Ogdai, was elected khakan. With

system of state granaries, which had fallen into disorder. His court was visited by Friar Odoric, who gives a minute description of the palace and its inhabitants. Speaking of the palace this writer says—

"Its basement was raised about two paces from the ground, and within there were twenty-four columns of gold, and all the walls were hung with skins of red leather, said to be the finest in the world. In the midst of the palace was a great jar more than two paces in height, made of a certain precious stone called merdacas (jade); its price exceeded the value of four large towns. . . . Into this vessel drink was conducted by certain conduits from the court of the palace, and beside it were many golden goblets, from which those drank who listed. . . . When the khakan sat on his throne, the queen was on his left hand, and a step lower two others of his women, while at the bottom of the steps stood the other ladies of his family. All those who were married wore upon their heads the foot of a man as it were a cubit and a half in length, and at the top of the foot there were certain cranes' feathers, the whole foot being set with great pearls, so that if there were in the whole world any fine and large pearls they were to be found in the decoration of those ladies."

The following years were years of great natural and political convulsions. Devastating floods swept over China, carrying death and ruin to thousands of homes; earthquakes made desolate whole districts; and in more than one part of the empire the banners of revolt were unfurled. The khakans who now successively occupied the throne, instead of striving to stem the tide of discontent and disorder, gave themselves up to every kind of debauchery. As a natural consequence, the conduct of affairs fell entirely into the hands of their ministers, who but too often reflected the vices of their sovereigns. A comet which appeared in the reign of Toghon Timur Khan, and which was believed to be the precursor of fresh disasters to the reigning house, justified the prediction by being almost immediately followed by an earthquake, which overthrew the temple of the Imperial Ancestors, from the altars of which, as if to complete the misfortune, the silver tablets of the emperors were in the consequent confusion stolen. It was not long before the popular discontent found vent. In order to prevent the recurrence of the periodical inundations caused by the overflow of the Yellow river, the emperor ordered a levy of 70,000 men to excavate a new channel for its dangerous stream, and imposed a heavy tax to meet the necessary expenses. These oppressive edicts overstrained the patience of the people, and they broke into open rebellion. Under various leaders the rebels captured a number of cities in the provinces of Keang-nan and Honan, and took possession of Hang-chow, the capital of the Sung emperors. At the same time pirates ravaged the coasts and swept the imperial vessels off the sea. While these combined disorders were disturbing the country, the emperor, under the guidance of Tibetan Lamas, was being initiated into the sensual enjoyments peculiar to the warmer climates of Asia.

Toghon Timur Khan.

In 1355 a Buddhist priest named Choo Yuen-chang became so impressed with the misery of his countrymen that he threw off his vestments and enrolled himself in the rebel army. His military genius soon raised him to the position of a leader, and with extraordinary success he overcame with his rude levies the trained legions of the Mongol emperor. While unable to defeat or check the rebels in the central provinces Toghon Timur was also called upon to face a rebellion in Corea. Nor were his arms more fortunate in the north than in the south. An army which was sent to suppress the revolt was cut to pieces almost to a man. These events made a dream which the emperor dreamt about this time of easy interpretation. He saw in his sleep "a wild boar with iron tusks rush into the city and wound the people, who were driven hither and thither without finding shelter. Meanwhile the sun and the moon rushed together and perished." "This dream," said the diviner, "is a prophecy that the khakan will lose his empire." The fulfilment followed closely on the prophecy. By a subterfuge, the rebels, after having gained possession of most of the central provinces of the empire, captured Peking. But Toghon Timur by a hasty flight escaped from his enemies, and sought safety on the shores of the Dolonor in Mongolia. For a time the western provinces of China continued to hold out against the rebels, but with the flight of Toghon Timur the Mongol troops lost heart, and in 1368 the ex-Buddhist priest ascended the throne as the first sovereign of the Ming or "Bright" dynasty, under the title of Hung-woo.

Thus ended the sovereignty of the house of Jenghiz Khan in China, nor need we look far to find the cause of its fall. Brave and hardy the Mongols have always shown themselves to be; but the capacity for consolidating the fruits of victory, for establishing a settled form of government, and for gaining the allegiance of the conquered peoples, have invariably been wanting in them. For a time their prowess and the exceptional ability of some of the first emperors of their line held the people of China in a bondage which was only outwardly peaceful, and, when the hands which held the reins lost their nervous power, and the troops, enervated by the softer climate of China, lost much of their hardihood, the long pent-up hatred of a foreign yoke broke out and with gathering strength drove the invaders back to their Mongolian pasture-grounds.

Not content with having recovered China, the emperor Hung-woo sent an army of 400,000 men into Mongolia in pursuit of the forces which yet remained to the khakan. Even on their own ground the disheartened Mongols failed in their resistance to the Chinese, and at all points suffered disaster. Meanwhile Toghon Timur, who did not long survive his defeat, was succeeded in the khakanate by Biliktu Khan, who again in 1379 was followed by Ussakhal Khan. During the reign of this last prince the Chinese again invaded Mongolia, and inflicted a crushing defeat on the khan's forces in the neighbourhood of Lake Buyur. Besides the slain, 2994 officers and 77,000 soldiers are said to have been taken prisoners, and an immense booty to have been secured. This defeat was the final ruin of the eastern branch of the Mongols, who from this time surrendered the supremacy to the western division of the tribe. At first the Keraits or Torgod, as in the early days before Jenghiz Khan rose to power, exercised lordship over the eastern Mongols, but from these before long the supremacy passed to the Oirad, who for fifty years treated them as vassals. Notwithstanding their subjection, however, the Keraits still preserved the imperial line, and khakan after khakan assumed the nominal sovereignty of the tribe, while the real power rested with the descendants of Toghon, the Oirad chief, who had originally attached them to his sceptre. Gradually, however, the Mongol tribes broke away from all governing centres, and established scattered communities with as many chiefs over the whole of eastern Mongolia. The discredit of having finally disintegrated the tribe is generally attached to Lingdan Khan (1604-1634), of whom, in reference to his arrogant and brutal character, has been quoted the Mongolian proverb: "A raging khakan disturbs the state, and a raging saghan (elephant) overthrows his keepers."

At this time the Mongols, though scattered and in isolated bodies, had recovered somewhat from the shock of the disaster which they suffered at the hand of the first Ming sovereign of China. When first driven northwards, they betook themselves to the banks of the Kerulon, from whence they had originally started on their victorious career; but gradually, as the Chinese power became weaker among the frontier tribes, they again pushed southwards,

system of state granaries, which had fallen into disorder. His court was visited by Friar Odoric, who gives a minute description of the palace and its inhabitants. Speaking of the palace this writer says—

"Its basement was raised about two paces from the ground, and within there were twenty-four columns of gold, and all the walls were hung with skins of red leather, said to be the finest in the world. In the midst of the palace was a great jar more than two paces in height, made of a certain precious stone called merdacas (jade); its price exceeded the value of four large towns. . . . Into this vessel drink was conducted by certain conduits from the court of the palace, and beside it were many golden goblets, from which those drank who listed. . . . When the khakan sat on his throne, the queen was on his left hand, and a step lower two others of his women, while at the bottom of the steps stood the other ladies of his family. All those who were married wore upon their heads the foot of a man as it were a cubit and a half in length, and at the top of the foot there were certain cranes' feathers, the whole foot being set with great pearls, so that if there were in the whole world any fine and large pearls they were to be found in the decoration of those ladies."

The following years were years of great natural and political convulsions. Devastating floods swept over China, carrying death and ruin to thousands of homes; earthquakes made desolate whole districts; and in more than one part of the empire the banners of revolt were unfurled. The khakans who now successively occupied the throne, instead of striving to stem the tide of discontent and disorder, gave themselves up to every kind of debauchery. As a natural consequence, the conduct of affairs fell entirely into the hands of their ministers, who but too often reflected the vices of their sovereigns. A comet which appeared in the reign of Toghon Timur Khan, and which was believed to be the precursor of fresh disasters to the reigning house, justified the prediction by being almost immediately followed by an earthquake, which overthrew the temple of the Imperial Ancestors, from the altars of which, as if to complete the misfortune, the silver tablets of the emperors were in the consequent confusion stolen. It was not long before the popular discontent found vent. In order to prevent the recurrence of the periodical inundations caused by the overflow of the Yellow river, the emperor ordered a levy of 70,000 men to excavate a new channel for its dangerous stream, and imposed a heavy tax to meet the necessary expenses. ten oxen, a hundred sheep, and a hundred sacks of kumiss. These last, however, instead of being filled with skins of the liquor which Mongolians love so well, contained armed men, who, when the Tatar was feasted, rushed from their concealment and killed him. A grandson of Merghus was the celebrated Wang Khan, who was sometimes the ally and sometimes the enemy of Jenghiz Khan, and has also been identified as the Prester John of early Western writers. In war he was almost invariably unfortunate, and it was with no great difficulty, therefore, that his brother Ki Wang detached the greater part of the Kerait tribes from his banner, and founded the Torgod chieftainship, named probably from the country where they settled themselves. The unrest peculiar to the dwellers in the Mongolian desert disturbed the Torgod as much as their neighbours. Their history for several centuries consists of nothing but a succession of wars with the tribes on either side of them, and it was not until 1672, when Ayuka Khan opened relations with the Russians, that the country obtained an even temporarily settled existence. Its position, indeed, at this time made it necessary that Ayuka should ally himself either with the Russians or with his southern neighbours the Turks, though at the same time it was obvious that his alliance with the one would bring him into collision with the other. His northern neighbours, the Cossacks of the Yaik and the Bashkirs, both subject to Russia, had the not uncommon propensity for invading his borders and harassing his subjects. This gave rise to complaints of the czar's government and a disposition to open friendly relations with the Krim khan. A rupture with Russia followed, and Ayuka carried his arms as far as Kasan, burning and laying waste the villages and towns on his route and carrying off prisoners and spoils. Satisfied with this vengeance, he advanced no farther, but made a peace with the Russians, which was confirmed in 1722 at an audience which Peter the Great gave him at Astrakhan. On Ayuka's death shortly after this event, he was succeeded by his son Cheren Donduk, who received from the Dalai Lama a patent to the throne. But this spiritual support availed him little against the plots of his nephew Donduk Ombo, who so completely gained the suffrages of the people that Cheren Donduk fled before him to St Petersburg, where he died, leaving his nephew in possession. With consummate impartiality the Russians, when they found that Donduk Ombo had not only seized the throne but was governing the country with vigour and wisdom, formally invested him with the khanate. At his death he was succeeded by Donduk Taishi, who, we are told, went to Moscow to attend the coronation of the empress Elizabeth, and to swear fealty to the Russians. After a short reign he died, and his throne was occupied by his son Ubasha. The position of the Torgod at this time, hemmed in as they were between the Russians and Turks, was rapidly becoming unbearable, and the question of migrating "bag and baggage" was very generally mooted. In the war between his two powerful neighbours in 1769 and 1770, Ubasha gave valuable assistance to the Russians. His troops took part in the siege of Otchakoff, and gained a decided victory on the Kalans. Flushed with these successes, he was in no mood to listen patiently to the taunts of the governor of Astrakhan, who likened him to a "bear fastened to a chain," and he made up his mind to break away once and for all from a tutelage which was as galling as it was oppressive. He determined, therefore, to migrate eastward with his people, and on the 5th of January 1771 he began his march with 70,000 families. In vain the Russians attempted to recall the fugitives, who, in spite of infinite hardships, after a journey of eight months reached the province of Ili, where they were welcomed by the Chinese authorities. Food for a year's consumption was supplied to each family; and land, money, and cattle were freely distributed. How many lost their lives on the toilsome march it is impossible to say, but it is believed that 300,000 persons survived to receive the hospitality of the Chinese. This migration is interesting as illustrating the many displacements of tribes and peoples which have taken place on the continent of Asia at different periods of history. Such another migration occurred between four and five thousand years ago, when the Chinese crossed from western Asia into their present empire; such, again, was the movement which carried the Osmanli Turks from north-eastern Asia into Asia Minor, and eventually across the Bosphorus. By this desperate venture the Torgod escaped, it is true, the oppression of the Russians, but they fell into the hands of other masters, who, if not so exacting, were equally determined to be supreme. The Chinese, flattered by the compliment implied by the transference of allegiance, settled them on lands in the province of Ili, in the neighbourhood of the Altai Mountains, and to the west of the desert of Gobi. But the price they were made to pay for this liberality was absorption in the Chinese empire. Like the other Chinese-subdued Mongols, the Torgod were divided into banners, and from that time forth they lost their individuality.

The Torgod.

Among the Mongol chiefs who rose to fame during the rule of the Ming dynasty of China was Toghon, the Kalmuk khan, who, taking advantage of the state of confusion which reigned among the tribes of Mongolia, established for himself an empire in north-western Asia. Death carried him off in 1444, and his throne devolved upon his son Ye-seen, who was no degenerate offspring. Being without individual foes in Mongolia for the same reason that Narvaez had no enemies—namely, that he had killed them all—he turned his arms against China, which through all history has been the happy hunting-ground of the northern tribes, and had the unexampled good fortune to take prisoner the Chinese emperor Ching-tung. But victory did not always decide in his favour, and, after having suffered reverses at the hands of the Chinese, he deemed it wise to open negotiations for the restoration of his imperial prisoner. Thus, after a captivity of seven years, Ching-tung re-entered his capital in 1457, not altogether to the general satisfaction of his subjects. On the death of Ye-seen, shortly after this event, the Kalmuks lost much of their power in eastern Asia, but retained enough in other portions of their territory to annoy the Russians by raids within the Russian frontier, and by constant acts of pillage. In the 17th century their authority was partly restored by Galdan, a Lama, who succeeded by the usual combination of wile and violence to the throne of his brother Senghé. Having been partly educated at Lhasa, he was well versed in Asiatic politics, and, taking advantage of a quarrel between the Black and White Mountaineers of Kashgar, he overran Little Bokhara, and left a viceroy to rule over the province with his capital at Yarkand. At the same time he opened relations with China, and exchanged presents with the emperor. Having thus secured his powerful southern neighbour, as he thought, he turned his arms against the Khalkhas, whose chief ground of offence was their attachment to the cause of his brothers. But his restless ambition created alarm at Peking, and the emperor K'ang-he determined to protect the Khalkhas against their enemy. Great preparations were made for the campaign. The emperor, in person commanding one of the two forces, marched into Mongolia. After enduring incredible hardships during the march through the desert of Gobi the imperial army encountered the Kalmuks at Chao-modo. The engagement was fiercely contested, but ended in the complete victory of the Chinese, who pursued the Kalmuks for 10 miles, and completely dispersed their forces. Immense

ten oxen, a hundred sheep, and a hundred sacks of kumiss. These last, however, instead of being filled with skins of the liquor which Mongolians love so well, contained armed men, who, when the Tatar was feasted, rushed from their concealment and killed him. But victory did not always decide in his favour, and, after having suffered reverses at the hands of the Chinese, he deemed it wise to open negotiations for the restoration of his imperial prisoner. Thus, after a captivity of seven years, Ching-tung re-entered his capital in 1457, not altogether to the general satisfaction of his subjects. On the death of Ye-seen, shortly after this event, the Kalmuks lost much of their power in eastern Asia, but retained enough in other portions of their territory to annoy the Russians by raids within the Russian frontier, and by constant acts of pillage. In the 17th century their authority was partly restored by Galdan, a Lama, who succeeded by the usual combination of wile and violence to the throne of his brother Senghé. Having been partly educated at Lhasa, he was well versed in Asiatic politics, and, taking advantage of a quarrel between the Black and White Mountaineers of Kashgar, he overran Little Bokhara, and left a viceroy to rule over the province with his capital at Yarkand. At the same time he opened relations with China, and exchanged presents with the emperor. Having thus secured his powerful southern neighbour, as he thought, he turned his arms against the Khalkhas, whose chief ground of offence was their attachment to the cause of his brothers. But his restless ambition created alarm at Peking, and the emperor K'ang-he determined to protect the Khalkhas against their enemy. Great preparations were made for the campaign. The emperor, in person commanding one of the two forces, marched into Mongolia. After enduring incredible hardships during the march through the desert of Gobi the imperial army encountered the Kalmuks at Chao-modo. The engagement was fiercely contested, but ended in the complete victory of the Chinese, who pursued the Kalmuks for 10 miles, and completely dispersed their forces. Immense

ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At first his request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of armour, changed the refusal into an acquiescence, and in October 1319 the princess landed at Alexandria in regal state. Her reception at Cairo was accompanied with feasting and rejoicing, and the members of her escort were sent back laden with presents. With that religious toleration common to his race, Uzbeg Khan, having married one princess to Násir, gave another in marriage to George the prince of Moscow, whose cause he espoused in a quarrel existing between that prince and his uncle, the grand-prince Michael. Assuming the attitude of a judge in the dispute, Uzbeg Khan summoned Michael to appear before him, and, having given his decision against him, ordered his execution. The sentence was carried out with aggravated cruelty in sight of his nephew and accuser. From this time Uzbeg's sympathies turned towards Christianity. He protected the Russian churches within his frontiers, and put his seal to his new religious views by marrying a daughter of the Greek emperor, Andronicus III. He died in 1340, after a reign of twenty-eight years. His coins were struck at Sarai, Kharezm, Mokshi, Bulgar, Azak, and Krim, and are dated from 1313 to 1340. His son and successor, Tinibeg Khan, after a reign of only a few months, was murdered by his brother Janibeg Khan, who usurped his throne, and, according to the historian Ibn Haidar, proved himself to be "just, God-fearing, and the patron of the meritorious." These excellent qualities did not, however, prevent his making a raid into Poland, which was conducted in the usual Mongol manner, nor did they save his countrymen from being decimated by the black plague, which for the first time in 1345 swept over Asia and Europe, from the confines of China to Paris and London. With all their love of war the Mongols had a keen eye to monetary advantage, and Janibeg, who was no exception to the rule, concluded treaties with the merchant-princes of Venice and Genoa, in which the minute acquaintance displayed with shipping dues and customs charges shows how great were the advances the Mongols had made in their knowledge of European commerce since the days of Jenghiz Khan. The throne Janibeg had seized by violence was, in 1357, snatched from him by violence. As he lay ill on his return from a successful expedition against Persia he was murdered by his son Berdibeg, who in his turn was, after a short reign, murdered by *his* son Kulpa. With the death of Berdibeg the fortunes of the Golden Horde began rapidly to decline. As the Uzbeg proverb says,—"The hump of the camel was cut off in the person of Berdibeg."

The White Horde, or Eastern Kipchak.

But while the power of the Golden Horde was dwindling away, the White Horde or Eastern Kipchak, which was the inheritance of the elder branch of the family of Juchi, remained prosperous and full of vitality. The descendants of Orda, Batu's elder brother, being far removed from the dangerous influences of European courts, maintained much of the simplicity and vigour of their nomad ancestors, and the throne descended from father to son with undiminished authority until the reign of Urus Khan (1360), when complications arose which changed the fortunes of the tribe. Like many other opponents of the Mongol rulers, Khan Tuli Khoja paid with his life for his temerity in opposing the political schemes of his connexion Urus Khan. Toktamish, the son of the murdered man, fled at the news of his father's death and sought refuge at the court of the famous Timur-i-leng (Tamerlane), who received him with honour and at once agreed to espouse his cause. With this intention he despatched a force against Urus Khan, and gained some advantage over him, but, while fitting out another army to make a fresh attack, news reached him of the death of Urus. Only at Sighnak are coins known to have been struck during the reign of Urus, and these bear date from 1372 to 1375.

Tok[...]

He was followed on the throne by his two sons, Tuktakia and Timur Malik, each in turn; the first reigned but for a few weeks, and the second was killed in a battle against Toktamish, the son of his father's enemy. Toktamish now seized the throne, not only of Eastern Kipchak but also of the Golden Horde, over which his arms had at the same time proved victorious. His demands for tribute from the Russian princes met with evasions from men who had grown accustomed to the diminished power of the later rulers of the Golden Horde, and Toktamish therefore at once marched an army into Russia. Having captured Serpukhoff, he advanced on Moscow. On the 23d August 1382 his troops appeared before the doomed city. For some days the inhabitants bravely withstood the constant attacks on the walls, but failed in their resistance to the stratagems which were so common a phase in Mongolian warfare. With astonishing credulity they opened the gates to the Mongols, who declared themselves the enemies of the grand-prince alone, and not of the people. The usual result followed. The Russian general, who was invited to Toktamish's tent, was there slain, and at the same time the signal was given for a general slaughter. Without discriminating age or sex, the Mongol troops butchered the wretched inhabitants without mercy, and, having made the streets desolate and the houses tenantless, they first plundered the city and then gave it over to the flames. The same pitiless fate overtook Vladimir, Zvenigorod, Yurieff, Mozhaisk, and Dimitroff. With better fortune, the inhabitants of Pereslavl and Kolomna escaped with their lives from the troops of Toktamish, but at the expense of their cities, which were burned to the ground. Satisfied with his conquests, the khan returned homewards, traversing and plundering the principality of Riazan on his way. Flushed with success, Toktamish demanded from his patron Timur the restoration of Kharezm, which had fallen into the hands of the latter at a period when disorder reigned in the Golden Horde. Such a request was not likely to be well received by Timur, and, in answer to his positive refusal to yield the city, Toktamish marched an army of 90,000 men against Tabriz. After a siege of eight days the city was taken by assault and ruthlessly ravaged. Meanwhile Timur was collecting forces to punish his rebellious *protégé*. When his plans were fully matured, he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A lull followed this victory, but in 1390 Timur again took the field. To each man was given "a bow, with thirty arrows, a quiver, and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with this were two spades, a pickaxe, a sickle, a saw, an axe, an awl, a hundred needles, $8\frac{1}{2}$ ℔ of cord, an ox's hide, and a strong pan." Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Here envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In face of innumerable difficulties, as well as of cold, hunger and weariness, Timur marched forward month after mor[...] through the Kipchak country in pursuit of Toktamish. A

ruler of Egypt, that he sent to demand in marriage a princess of the house of Jenghiz Khan. At first his request was refused by the proud Mongols, but the present of a million gold dinars, besides a number of horses and suits of armour, changed the refusal into an acquiescence, and in October 1319 the princess landed at Alexandria in regal state. Her reception at Cairo was accompanied with feasting and rejoicing, and the members of her escort were sent back laden with presents. With that religious toleration common to his race, Uzbeg Khan, having married one princess to Násir, gave another in marriage to George the prince of Moscow, whose cause he espoused in a quarrel existing between that prince and his uncle, the grand-prince Michael. Assuming the attitude of a judge in the dispute, Uzbeg Khan summoned Michael to appear before him, and, having given his decision against him, ordered his execution. The sentence was carried out with aggravated cruelty in sight of his nephew and accuser. From this time Uzbeg's sympathies turned towards Christianity. He protected the Russian churches within his frontiers, and put his seal to his new religious views by marrying a daughter of the Greek emperor, Andronicus III. He died in 1340, after a reign of twenty-eight years. His coins were struck at Sarai, Kharezm, Mokshi, Bulgar, Azak, and Krim, and are dated from 1313 to 1340. His son and successor, Tinibeg Khan, after a reign of only a few months, was murdered by his brother Janibeg Khan, who usurped his throne, and, according to the historian Ibn Haidar, proved himself to be "just, God-fearing, and the patron of the meritorious." These excellent qualities did not, however, prevent his making a raid into Poland, which was conducted in the usual Mongol manner, nor did they save his countrymen from being decimated by the black plague, which for the first time in 1345 swept over Asia and Europe, from the confines of China to Paris and London. With all their love of war the Mongols had a keen eye to monetary advantage, and Janibeg, who was no exception to the rule, concluded treaties with the merchant-princes of Venice and Genoa, in which the minute acquaintance displayed with shipping dues and customs charges shows how great were the advances the Mongols had made in their knowledge of European commerce since the days of Jenghiz Khan. The throne Janibeg had seized by violence was, in 1357, snatched from him by violence. As he lay ill on his return from a successful expedition against Persia he was murdered by his son Berdibeg, who in his turn was, after a short reign, murdered by *his* son Kulpa. With the death of Berdibeg the fortunes of the Golden Horde began rapidly to decline. As the Uzbeg proverb says,—"The hump of the camel was cut off in the person of Berdibeg."

The White Horde, or Eastern Kipchak.

But while the power of the Golden Horde was dwindling away, the White Horde or Eastern Kipchak, which was the inheritance of the elder branch of the family of Juchi, remained prosperous and full of vitality. The descendants of Orda, Batu's elder brother, being far removed from the dangerous influences of European courts, maintained much of the simplicity and vigour of their nomad ancestors, and the throne descended from father to son with undiminished authority until the reign of Urus Khan (1360), when complications arose which changed the fortunes of the tribe. Like many other opponents of the Mongol rulers, Khan Tuli Khoja paid with his life for his temerity in opposing the political schemes of his connexion Urus Khan. Toktamish, the son of the murdered man, fled at the news of his father's death and sought refuge at the court of the famous Timur-i-leng (Tamerlane), who received him with honour and at once agreed to espouse his cause. With this intention he despatched a force against Urus Khan, and gained some advantage over him, but, while fitting out another army to make a fresh attack, news reached him of the death of Urus. Only at Sighnak are coins known to have been struck during the reign of Urus, and these bear date from 1372 to 1375.

Tok-

He was followed on the throne by his two sons, Tuktakia and Timur Malik, each in turn; the first reigned but for a few weeks, and the second was killed in a battle against Toktamish, the son of his father's enemy. Toktamish now seized the throne, not only of Eastern Kipchak but also of the Golden Horde, over which his arms had at the same time proved victorious. His demands for tribute from the Russian princes met with evasions from men who had grown accustomed to the diminished power of the later rulers of the Golden Horde, and Toktamish therefore at once marched an army into Russia. Having captured Serpukhoff, he advanced on Moscow. On the 23d August 1382 his troops appeared before the doomed city. For some days the inhabitants bravely withstood the constant attacks on the walls, but failed in their resistance to the stratagems which were so common a phase in Mongolian warfare. With astonishing credulity they opened the gates to the Mongols, who declared themselves the enemies of the grand-prince alone, and not of the people. The usual result followed. The Russian general, who was invited to Toktamish's tent, was there slain, and at the same time the signal was given for a general slaughter. Without discriminating age or sex, the Mongol troops butchered the wretched inhabitants without mercy, and, having made the streets desolate and the houses tenantless, they first plundered the city and then gave it over to the flames. The same pitiless fate overtook Vladimir, Zvenigorod, Yurieff, Mozhaisk, and Dimitroff. With better fortune, the inhabitants of Pereslavl and Kolomna escaped with their lives from the troops of Toktamish, but at the expense of their cities, which were burned to the ground. Satisfied with his conquests, the khan returned homewards, traversing and plundering the principality of Riazan on his way. Flushed with success, Toktamish demanded from his patron Timur the restoration of Kharezm, which had fallen into the hands of the latter at a period when disorder reigned in the Golden Horde. Such a request was not likely to be well received by Timur, and, in answer to his positive refusal to yield the city, Toktamish marched an army of 90,000 men against Tabriz. After a siege of eight days the city was taken by assault and ruthlessly ravaged. Meanwhile Timur was collecting forces to punish his rebellious *protégé*. When his plans were fully matured, he advanced upon Old Urgenj and captured it. More merciful than Toktamish, he transported the inhabitants to Samarkand, but in order to mark his anger against the rebellious city he levelled it with the ground and sowed barley on the site where it had stood. On the banks of the Oxus he encountered his enemy, and after a bloody battle completely routed the Kipchaks, who fled in confusion. A lull followed this victory, but in 1390 Timur again took the field. To each man was given "a bow, with thirty arrows, a quiver, and a buckler. The army was mounted, and a spare horse was supplied to every two men, while a tent was furnished for every ten, and with this were two spades, a pickaxe, a sickle, a saw, an axe, an awl, a hundred needles, $8\frac{1}{2}$ ℔ of cord, an ox's hide, and a strong pan." Thus equipped the army set forth on its march. After a considerable delay owing to an illness which overtook Timur his troops arrived at Kara Saman. Here envoys arrived from Toktamish bearing presents and a message asking pardon for his past conduct; but Timur was inexorable, and, though he treated the messengers with consideration, he paid no attention to their prayer. In face of innumerable difficulties, as well as of cold, hunger and weariness, Timur marched forward month after mon[th] through the Kipchak country in pursuit of Toktamish. A

of six hours destroyed all the churches, palaces, and houses, with the exception of the Kremlin, within a compass of 30 miles. Thousands of the inhabitants perished in the flames. "The river and ditches about Moscow," says Horsey, "were stopped and filled with the multitudes of people, laden with gold, silver, jewels, chains, ear-rings, and treasures. So many thousands were there burned and drowned that the river could not be cleaned for twelve months afterwards." Satisfied with the destruction he had indirectly caused, and unwilling to attack the Kremlin, the khan withdrew to the Crimea, ravaging the country as he went. Another invasion of Russia, a few years later (1572), was not so fortunate for the Mongols, who suffered a severe defeat near Molody, 50 versts from Moscow. A campaign against Persia made a diversion in the wars which were constantly waged between the Krim khan and the Russians, Cossacks, and Poles. So hardly were these last pressed by their pertinacious enemies in 1649 that they bound themselves by treaty to pay an annual subsidy to the khan. But the fortunes of war were not always on the side of the Tatars, and with the advent of Peter the Great to the Russian throne the power of the Krim Mongols began to decline. In 1696 the czar, supported by a large Cossack force under Mazeppa, took the field against Selim Girai Khan, and gained such successes that the latter was compelled to cede Azoff to him. By a turn of the wheel of fortune the khan had the satisfaction in 1710 of having it restored to him by treaty; but this was the last real success that attended the Tatar arms. In 1735 the Russians in their turn invaded the Crimea, captured the celebrated lines of Perekop, and ravaged Baghchi Serai, the capital. The inevitable fate which was hanging over the Krim Tatars was now being rapidly accomplished. In 1783 the Krim, together with the eastern portion of the land of the Nogais, became absorbed into the Russian province of Taurida.

Another branch of the Mongol family which requires mention is that of the Kazaks (see KIRGHIZ, vol. xiv. pp. 95, 96), whose ancient capital was Sighnak, which, as we have seen, passed into the hands of the great Timur. It will now only be necessary to refer briefly to the Uzbegs, who, on the destruction of the Golden Horde, assumed an important position on the east of the Caspian Sea. The founder of their greatness was the khan Abulkhair, who reigned in the 15th century, and who, like another Jenghiz Khan, consolidated a power out of a number of small clans, and added lustre to it by his successful wars. Sheibani Khan, his grandson, proved himself a worthy successor, and a doughty antagonist of the great Moghul emperor Baber. In 1500 he inflicted a severe defeat on Baber's forces, and captured Samarkand, Herat, and Kandahar. By these and other conquests he became possessed of all the country between the Oxus and the Jaxartes, of Ferghana, Kharezm, and Hissar, as well as of the territory of Tashkend from Kashgar to the frontiers of China. In the following year, by a dashing exploit, Baber recovered Samarkand, but only to lose it again a few months later. During several succeeding years Sheibani's arms proved victorious in many fields of battle, and but for an indiscreet outrage on the territories of the shah of Persia he might have left behind him a powerful empire. The anger, however, of Shah Ismael roused against him a force before which he was destined to fall. The two armies met in the neighbourhood of Merv, where, after a desperate encounter, the Uzbegs were completely defeated. Sheibani, with a few followers, sought refuge in a cattle-pound. But, finding no exit on the farther side, the refugees tried to leap their horses over the wall. In this attempt Sheibani was killed. When his body was recognized by his exultant enemies they cut off the head and presented it to the shah, who caused the skull to be mounted in gold and to be converted into a drinking-cup. After this defeat the Uzbegs withdrew across the Oxus and abandoned Khorásán. Farther east the news aroused Baber to renewed activity, and before long he reoccupied Samarkand and the province "Beyond the River," which had been dominated by the Uzbegs for nine years. But though the Uzbegs were defeated, they were by no means crushed, and ere long we find their khans reigning, now at Samarkand, and now at Bokhara. As time advanced and European powers began to encroach more and more into Asia, the history of the khanates ceases to be confined to the internecine struggles of rival khans. Even Bokhara was not beyond the reach of Russian ambition and English diplomacy. Several European envoys found their way thither during the first half of the present century, and the murder of Stoddart and Connolly in 1842 forms a melancholy episode in British relations with that fanatical capital. With the absorption of the khanate of Bokhara and the capture of Khiva by the Russians the individual history of the Mongol tribes in Central Asia comes to an end, and their name has left its imprint only on the dreary stretch of Chinese-owned country from Manchuria to the Altai Mountains, and to the equally unattractive country in the neighbourhood of the Kökö-nōr. (R. K. D.)

Language and Literature.—The Mongol tongue is a member of the great stock which recent scholars designate as Finno-Tataric or Ural-Altaic, which comprehends also the languages of the Tungoos (Manchu), Turko-Tatars, Finns, and Samoyeds. The members of this group are not so closely related to one another as those of the Indo-European stock; but they are all bound together by the common principle of agglutinative formation, especially the so-called harmony of vowels, by their grammatical structure, and also by certain common elements in the stock of roots which run through them all, or through particular more closely-connected families within the group.[1]

The fatherland proper of the Mongols is the so-called Mongolia. It stretches from Siberia in the north towards the Great Wall of China in the south, from Dauria and Manchuria in the east to the Altai and the sources of the Irtish, Thian-shan (*i.e.*, heaven mountains), and East Turkestan in the west. In the centre of this country is the desert of Gobi (Chinese *Sha-mo, i.e.*, sand-sea). The Mongolian population, however, extends in the south over the Great Wall to the basin of the Kökö-nōr (blue lake), and thence extends due west over Tangut and the northern border of Tibet. Crossing the political frontier, we find Mongols in the Russian province Turkestan, in the territories of Semiryetshensk (land of the seven streams), Alatau, and Semipalatinsk in the west, in the south of the province of Tomsk, with a more populous region due north in Siberia, round the Baikal Lake. The country north of the Gobi, from the Altai, Tangnu, and the Saian mountains in the west to Manchuria in the east, is called Khalkha, with the chief districts Urga (Kürē), Uliassutai, Khobdo (Kobdo). In a north-westerly direction from Gobi, between Thian-shan and the Altai, is Sungaria. The sum total of the Mongol population under Chinese government is calculated at between two and three millions.

Generally the whole Mongol tribe may be divided into three branches: East Mongols, West Mongols, and Buriats.

(1) The East Mongols are divided into the Khalkhas in the borders just mentioned, the Shara Mongols south of the Gobi along the Great Wall north-eastward to Manchuria, and lastly the Shiraigol or Sharaigol in Tangut and in northern Tibet.

(2) On the signification and employment of the different names of the West Mongols (Kalmuks, Oelöd, Oirad or Dörbön Oirad = the four Oirad, Mongol Oirad), and also as regards the subdivision of the tribes, there is much uncertainty. The name Kalmuk, so generally employed among us, is in fact only used by the Volga Kalmuks (Khalimak), but even with them the name is not common, and almost a byname. It is of foreign origin, and most likely a Tatar word which has yet to be explained. *Oirad* means the "near ones," the "related." The usual explanation given is that the single tribes consider themselves as being related to each other, hence *Mongol Oirad*, "the Mongol related tribe." This is the favourite name among Kalmuks. Dörbön Oirad, or the four related tribes, comprise (1) Sungars, (2) Torgod, (3) Khoshod, (4) Dörböd

[1] Compare W. Schott, *Versuch über die tatarischen Sprachen* (Berl., 1836), *Ueber das altaïsche oder finnisch-tatarische Sprachengeschlecht* (Berl., 1849), *Altajische Studien*, Parts i.-v. (Berl., 1860-1870); A. Castrén, *Ethnologische Vorlesungen über die Altaïschen Völker*, edited by A. Schiefner (Petersb., 1857).

of six hours destroyed all the churches, palaces, and houses, with the exception of the Kremlin, within a compass of 30 miles. Thousands of the inhabitants perished in the flames. "The river and ditches about Moscow," says Horsey, "were stopped and filled with the multitudes of people, laden with gold, silver, jewels, chains, ear-rings, and treasures. [1] Compare W. Schott, *Versuch uber die tatarischen Sprachen* (Berl 1836), *Ueber das altai'sche oder finnisch-tatarische Sprachengeschlec.*

same endings in singular and plural. Gender is not indicated. The adjective is uninflected both as attribute and as predicate; there is no comparative form, this idea being expressed by the construction or by the use of certain particles. The personal pronouns are *bi*, I; *tchi*, thou; *bida*, we; *ta*, ye; their genitives serve as possessives. *The demonstratives are ene, tere (this, that)*, plural *ede, tede*; interrogative *ken*, who? The relative is lacking, and its place is supplied by circumlocutions. The numerals are: 1, *nigen*; 2, *khoyar*; 3, *gurban*; 4, *dorben*; 5, *tabun*; 6, *jirgugan*; 7, *dologan*; 8, *naiman*; 9, *yisun*; 10, *arban*; 100, *dsagon*; 1000, *minggan*. The ordinals are formed by appending *tugar, tuger*. The theme of the verb is seen in the imperative, as *bari*, grasp. The conjugation is rich in forms for tense and mood, but person and number are with few exceptions unexpressed. The present is formed from the theme by adding *mui* (*barimui*), the preterite by *bai* or *luga* (*baribai, bariluga*), the future by *ssugai* or *ssu* (*barissugai, barissu*). The preterite has also in the third person the terminations *dsugui* and *rua*; the future has in the third person *yu*, and in the first *ya*. The conditional ends in *bassu* (*baribassu*), the precative in *tugai, tugei*, the potential in *sa* (*barimuisa*), the imperative plural in *ktun*, the gerund in the present in *n*, *dsu* (*barin, baridsu*) or *tala*, "while, till" (*baritala*, "inter capiendum"), in the preterite it is formed in *gad* (*barigad*); the present part. has *ktchi* (*bariktchi*), the past part. *kssan* (*barikssan*); the supine ends in *ra*, the infinitive in *khu* (*barikhu*, or when used substantively *barikhui*). There is but one perfectly regular conjugation, and derivative forms, derived from the theme by infixes, are conjugated on the same scheme. Thus the passive has infixed *ta* or *kda* (*barikdakhu*, to be grasped), the causative *gul* (*barigulkhu*, to cause to grasp), the co-operative or sociative *ltsa* or *lda* (*bariltsakhu*, to grasp together).

There are no prepositions, only post-positions. Adverbs are either simple particles (affirmative, negative, interrogative, modal, &c.), or are formed by suffixes from other parts of speech. There are very few conjunctions; the relations of clauses and sentences are mainly indicated by the verbal forms (part., sup., conditional, but mainly by the gerund).

The order of words and sentences in construction is pretty much the opposite of that which we follow. In a simple sentence the indication of time and place, whether given by an adverb or a substantive with a post-position, always comes first; then comes the subject, always preceded by its adjective or genitive, then the object and other cases depending on the verb, last of all the verb itself preceded by any adverbs that belong to it. So in the structure of a period all causal, hypothetical, concessive clauses, which can be conceived as preceding the main predication in point of time, or even as contemporary with it, or as in any way modifying it, must come first; the finite verb appears only at the end of the main predication or apodosis. The periods are longer than in other languages; a single one may fill several pages.

Grammars and dictionaries may be divided according to the three dialects. For East Mongolian, I. J. Schmidt gave the first grammar (Petersb., 1831), and a Mongolian German-Russian dictionary (Petersb., 1835). Next Jos. Kowalewski published in Russian a Mongolian grammar (Kasan, 1835), a chrestomathy (2 vols., Kasan, 1836, 1837), and his great *Dictionnaire mongol russe-français* (3 vols., Kasan, 1844, 1846, 1849). We name also R. Yuille, *Short Mongolian Grammar* (*in Mongolian*), xylographed at the mission press near Sselenginsk beyond Lake Baikal (1838). A. Bobrownikow's Russian *Grammar of the Mongolian-Kalmuk Language* (Kasan, 1849) is also very good. An abridgment of Schmidt's work is C. Puini, *Elementi della grammatica mongolica* (Florence, 1878). A. Popow's *Mongolian Chrestomathy* appeared in 2 vols. at Kasan (1836). For the Kalmuk we have grammars by Popow (Kasan, 1847), Bobrownikow as above, and H. A. Zwick (*s. l. et a.*), autographed at Donaueschingen (1851). Zwick's autographed Kalmuk and German dictionary with a printed German index appeared (*s. l. et a.*) in 1852; B. Jülg's edition of the tales of Siddhi-kür (Leips., 1866) gives a complete glossary to these stories. There are small Russian and Kalmuk vocabularies by P. Smirnow (Kasan, 1857) and C. Golstunskyi (Petersb., 1860). For the Buriatic we have Castrén, *Versuch einer Burjätischen Sprachlehre*, edited by Schiefner (1857), and A. Orlow's Russian grammar of the Mongol Buriatic colloquial language (Kasan, 1878).

Literature.—A clear distinction must be drawn between the higher and nobler written or book-language and the common or conversational language of every day life. The difference between the two is very considerable, and may be fairly compared to that between the Modern High German book-language and the different dialects. All grammars and dictionaries as yet published treat only of the book-language; and so also, with a few exceptions, the published literary documents are written in this higher style. The exceptions are the *Gesser-Khan*, and the *Siddhi Kür* and *Djangariad* (the last two published by Golstunskyi). The popular or conversational language has only quite lately been fixed in writing by A. Pozdnyeyew in his Russian work, *Specimens of the Popular Literature of the Mongolian Tribes*, part i., "Popular Songs" (Petersb., 1880), which contains rich material for the study of the popular literature.

The literature known at present consists mostly of translations from the Tibetan, the holy language of Buddhism, which is still the language of the learned. The Tibetan Buddhist literature is itself translated from the Sanskrit, hence, now and then, through Mongols and Kalmuks we get acquainted with Indian works the originals of which are not known in Sanskrit. Such is the case, for instance, with the tales of Siddhi kür. Many books have also been translated from the Chinese. Most of the writings are of a religious, historical, philosophical, medical, astronomical, or astrological character. Favourite subjects are folk-lore and fairy tales. Among the religious books, perhaps the most important is that containing the legends entitled *uliger un dalai*, "ocean of comparisons" (edited by the late I. Jacob Schmidt under the title, *Der Weise und der Thor*, in Tibetan and German, Petersb., 1843). To this may be added the *boddhi mor*, or "the holy path," the *altan gerel*, "gleaming of gold," the *mani gambo*, and *yertuntchu yin toli*, "mirror of the world." What was known of poetical literature before Pozdnyeyew is scarcely worth mentioning. In some parts of the historical and narrative literature we find, wherever the narrative takes a higher flight, an admixture of poetical diction. The poetry appears in a certain parallelism of the phrases, with a return either of the same endings (rhyme) or of the same words (refrain). Frequently we find, besides the rhyme or refrain, alliteration. The essay of H. C. von der Gabelentz in *Z. f. d. Kunde des Morgenlandes*, vol. i. pp. 20-37, "Einiges über Mongolische Poesie," has been superseded by the work of Pozdnyeyew.

Among historical works a high place is due to that composed by the tribal prince, Ssanang Ssetsen, in the middle of the 17th century (*Geschichte der Ost-Mongolen und ihres Fürstenhauses*, Mong. and Germ., by I. J. Schmidt, Petersb., 1829), and to the *Altan tobtchi*, i.e., "Golden knob" or "precious contents" (text and Russian translation by the Lama Galsang Gomboyew, Petersb., 1858). Of folk lore and fairy tales, we have the legend of the hero *Gesser-Khan* (text ed. by I. J. Schmidt, Petersb., 1836, and German version, 1839, comp. Schott, *Ueber die Sage v. Geser-Khan*, Berl., 1851, and B. Jülg in the *Transactions* of the Würzburger Philol. Versam. of 1868, pp. 58 *sqq.*, Leips., 1869); and the tales about *Ardshi Bordshi* (Russian version by Galsang Gomboyew, Petersb., 1858, text and German trans. by B. Jülg, Innsbr., 1867, 1868). A favourite book is the tales of Siddhi-kür based on the Sanskrit *Vetâla panchavinçati* (Russian trans. by Galsang Gomboyew, Petersb., 1865, nine of the tales in Mongolian and German by B. Jülg, Innsbr., 1868). The fuller collection of these tales in Kalmuk first became known by the German trans. of B. Bergmann in vol. i. of his *Nomadische Streifereien unter d. Kalmuken* (4 vols., Riga, 1804, 1805); an autographed edition in the vulgar dialect was published by C. Golstunskyi (Petersb., 1864, text and German trans. with glossary by B. Jülg, Leips., 1866). *A poetic heroic story is the Djangariad, extracts from which were given by* Bergmann (*op. cit.*, iv. 181 *sqq.*), a complete Russian version by A. Bobrownikow (Petersb., 1854), a German version by F. v. Erdmann in *Z.D.M.G.*, 1857 (Kalmuk text by Golstunskyi, Petersb., 1864). A similar poem is the history of Ubashi Khuntaidshi and his war with the Oirad, Kalmuk text and Russian trans. by G. Gomboyew in his *Altan tobtchi* as above, and text alone autographed by Golstunskyi (Petersb., 1864). Some books of religion for the Christian Buriats (transcribed in Russian characters) represent the Buriatic dialect. The Russian and English Bible Societies have given us a translation of the whole Bible. I. J. Schmidt translated the Gospels and the Acts into Mongolian and Kalmuk for the Russian Bible Society (8 vols., Petersb., 1819-1821),—a masterly work. The English missionaries, E. Stallybrass and W. Swan, and afterwards R. Yuille, translated the whole Old Testament into Mongolian (1836-1840). This work was printed at a mission press erected at great cost for the purpose near Sselenginsk, beyond Lake Baikal in Siberia. In 1846 the New Testament by the same hands appeared at London.

The richest collections of Mongolian and Kalmuk printed books and MSS. are in the Asiatic museum of the Petersburg Academy, and in the libraries of Kasan and Irkutsk; there is also a good collection in the royal library at Dresden. Consult in general, besides the already cited works of Bergmann and Pozdnyeyew, P. S. Pallas, *Sammlungen historischer Nachrichten ü. d. Mongolischen Völkerschaften* (2 vols., Petersb., 1776-1801); I. J. Schmidt, *Forschungen im Gebiete der älteren . . . Bildungsgeschichte der Völker Mittelasiens, vorz. d. Mongolen und Tibeter* (Petersb. and Leips., 1824); B. Jülg, "On the Present State of Mongolian Researches," *Journ. R. As. Soc.*, xiv. (1882), pp. 42-65. (B. J.)

MONGOOS, or MUNGOOS. See ICHNEUMON.

MONITION, in the practice of the English ecclesiastical courts, is an order requiring or admonishing the person complained of to do something specified in the monition, "under pain of the law and penalty thereof." It is the lightest form of ecclesiastical censure, but disobedience to it, after it has been duly and regularly served, entails the penalties of contempt of court. See Phillimore, *Ecclesiastical Law* (London, 1873).

MONK, GEORGE (1608-1669), duke of Albemarle, the second son of Sir Thomas Monk, a gentleman of good family but in embarrassed circumstances, was born at *Potheridge*, near *Torrington in Devonshire, on 6th December* 1608. An exploit which brought him within the reach of the law compelled him to begin his career as a soldier of fortune at the age of seventeen. He acted under Sir R. Grenville as a volunteer in the expedition to Cadiz, and the next year did notable service at the Isle o Rhé.

In 1629 Monk went to the Low Countries, the trainin ground for military men, where in Oxford's and in Goring' regiments he obtained a high reputation for courage an for a thorough knowledge of his trade. In 1638 h threw up his commission in consequence of a quarrel wit the Dutch civil authorities, came to England, and obtaine the lieutenant-colonelcy of Newport's regiment during t operations on the Scottish border. Here he showed hi skill and coolness in the dispositions by which he save the English artillery at Newborn, though himself destitut of ammunition; and in the councils of war he confident voted with Strafford for fighting, and against retreat c composition. One of Monk's biographers relates that h now thought of joining the adventurers who propose t colonize Madagascar. The Irish rebellion, however, offere

same endings in singular and plural. Gender is not indicated. The adjective is uninflected both as attribute and as predicate; there is no comparative form, this idea being expressed by the construction or by the use of certain particles. The personal pronouns are *bi*, I; *tchi*, thou; *bida*, we; *ta*, ye; their genitives serve as possessives. The demonstratives are *ene*, *tere* (this, that), plural *ede*, *tede*; interrogative *ken*, who? The relative is lacking, and its place is supplied by circumlocutions. The numerals are: 1, *nigen*; 2, *khoyar*; 3, *gurban*; 4, *durben*; 5, *tabun*; 6, *jirgugan*; 7, *dologan*; 8, *naiman*; 9, *yisun*; 10, *arban*; 100, *dsagon*; 1000, *minggan*. The ordinals are formed by appending *tugar*, *tuger*. The theme of the verb is seen in the imperative, as *bari*, grasp. The conjugation is rich in forms for tense and mood, but person and number are with few exceptions unexpressed. The present is formed from the theme by adding *mui* (*barimui*), the preterite by *bai* or *luga* (*baribai*, *bariluga*), the future by *ssugai* or *ssu* (*barissugai*, *barissu*). The preterite has also in the third person the terminations *dsugui* and *run*; the future has in the third person *yu*, and in the first *ya*. The conditional ends in *bassu* (*baribassu*), the precative in *lugai*, *lugei*, the potential in *sa* (*barimuisa*), the imperative plural in *ktun*, the gerund in the present in *n*, *dsu* (*barin*, *baridsu*) or *tala*, "while, till" (*baritala*, "inter capiendum"), in the preterite it is formed in *gad* (*barigad*); the present part. has *ktchi* (*bariktchi*), the past part. *kssan* (*barikssan*); the supine ends in *ra*, the infinitive in *khu* (*barikhu*, or when used substantively *barikhui*). There is but one perfectly regular conjugation, and derivative forms, derived from the theme by infixes, are conjugated on the same scheme. Thus the passive has infixed *ta* or *kda* (*barikdakhu*, to be grasped), the causative *gul* (*barigulkhu*, to cause to grasp), the co-operative or sociative *ltsa* or *lda* (*bariltsakhu*, to grasp together).

There are no prepositions, only post-positions. Adverbs are either simple particles (affirmative, negative, interrogative, modal, &c.), or are formed by suffixes from other parts of speech. There are very few conjunctions; the relations of clauses and sentences are mainly indicated by the verbal forms (part., sup., conditional, but mainly by the gerund).

The order of words and sentences in construction is pretty much the opposite of that which we follow. In a simple sentence the indication of time and place, whether given by an adverb or a substantive with a post-position, always comes first; then comes the subject, always preceded by its adjective or genitive, then the object and other cases depending on the verb, last of all the verb itself preceded by any adverbs that belong to it. So in the structure of a period all causal, hypothetical, concessive clauses, which can be conceived as preceding the main predication in point of time, or even as contemporary with it, or as in any way modifying it, must come first; the finite verb appears only at the end of the main predication or apodosis. The periods are longer than in other languages; a single one may fill several pages.

Grammars and dictionaries may be divided according to the three dialects. For East Mongolian, I. J. Schmidt gave the first grammar (Petersb., 1831), and a Mongolian German-Russian dictionary (Petersb., 1835). Next Jos. Kowalewski published in Russian a Mongolian grammar (Kasan, 1835), a chrestomathy (2 vols., Kasan, 1836, 1837), and his great *Dictionnaire mongol russe-français* (3 vols., Kasan, 1844, 1846, 1849). We name also R. Yuille, *Short Mongolian Grammar* (*in Mongolian*), xylographed at the mission press near Sselenginsk beyond Lake Baikal (1838). A. Bobrownikow's Russian *Grammar of the Mongolian-Kalmuk Language* (Kasan, 1849) is also very good. An abridgment of Schmidt's work is C. Puini, *Elementi della grammatica mongolica* (Florence, 1878). A. Popow's *Mongolian Chrestomathy* appeared in 2 vols. at Kasan (1836). For the Kalmuk we have grammars by Popow (Kasan, 1847), Bobrownikow as above, and H. A. Zwick (*s. l. et a.*), autographed at Donaueschingen (1851). Zwick's autographed Kalmuk and German dictionary with a printed German index appeared (*s. l. et a.*) in 1852; B. Jülg's edition of the tales of Siddhi-kür (Leips., 1866) gives a complete glossary to these stories. There are small Russian and Kalmuk vocabularies by P. Smirnow (Kasan, 1857) and C. Golstunskyi (Petersb., 1860). For the Buriatic we have Castrén, *Versuch einer Burjätischen Sprachlehre*, edited by Schiefner (1857), and A. Orlow's Russian grammar of the Mongol Buriatic colloquial language (Kasan, 1878).

Literature.—A clear distinction must be drawn between the higher and nobler written or book-language and the common or conversational language of every day life. The difference between the two is very considerable, and may be fairly compared to that between the Modern High German book-language and the different dialects. All grammars and dictionaries as yet published treat only of the book-language; and so also, with a few exceptions, the published literary documents are written in this higher style. The exceptions are the *Gesser-Khan*, and the *Siddhi kür* and *Djangariad* (the last two published by Golstunskyi). The popular or conversational language has only quite lately been fixed in writing by A. Pozdnyeyew in his Russian work, *Specimens of the Popular Literature of the Mongolian Tribes*, part i., "Popular Songs" (Petersb., 1880), which contains rich material for the study of the popular literature.

The literature known at present consists mostly of translations from the Tibetan, the holy language of Buddhism, which is still the language of the learned. The Tibetan Buddhist literature is itself translated from the Sanskrit; hence, now and then, through Mongols and Kalmuks we get acquainted with Indian works the originals of which are not known in Sanskrit. Such is the case, for instance, with the tales of Siddhi kür. Many books have also been translated from the Chinese. Most of the writings are of a religious, historical, philosophical, medical, astronomical, or astrological character. Favourite subjects are folk-lore and fairy tales. Among the religious books, perhaps the most important is that containing the legends entitled *uliger un dalai*, "ocean of comparisons" (edited by the late I. MONGOOS, or MUNGOOS. See ICHNEUMON.

MONITION, in the practice of the English ecclesiastical courts, is an order requiring or admonishing the person complained of to do something specified in the monition, "under pain of the law and penalty thereof." It is the lightest form of ecclesiastical censure, but disobedience to it, after it has been duly and regularly served, entails the penalties of contempt of court. See Phillimore, *Ecclesiastical Law* (London, 1873).

MONK, GEORGE (1608-1669), duke of Albemarle, the second son of Sir Thomas Monk, a gentleman of good family but in embarrassed circumstances, was born at Potheridge, near Torrington in Devonshire, on 6th December 1608. An exploit which brought him within the reach of the law compelled him to begin his career as a soldier of fortune at the age of seventeen. He acted under Sir R. Grenville as a volunteer in the expedition to Cadiz, and the next year did notable service at the Isle o Rhé.

In 1629 Monk went to the Low Countries, the trainin ground for military men, where in Oxford's and in Goring' regiments he obtained a high reputation for courage an for a thorough knowledge of his trade. In 1638 h threw up his commission in consequence of a quarrel wit the Dutch civil authorities, came to England, and obtaine the lieutenant-colonelcy of Newport's regiment during t operations on the Scottish border. Here he showed hi skill and coolness in the dispositions by which he save the English artillery at Newborn, though himself destitut of ammunition; and in the councils of war he confident voted with Strafford for fighting, and against retreat c composition. One of Monk's biographers relates that h now thought of joining the adventurers who proposed t colonize Madagascar. The Irish rebellion, however, offere

ment, in accordance with his desire, had arranged for its dispersion that he would enter with his troops. Even now his intentions were strictly concealed; the spies set upon him by the various anxious parties were baffled by his impenetrable reserve. He was careful to appear only as the servant of parliament, but when he was desired to take the oath of abjuration he skilfully evaded the request. The city, always jealous of the Rump, now refused to pay taxes except at the orders of a free parliament. Monk, in consequence, was ordered to march his troops into the city, take down the chains and posts, and unhinge the gates. He obeyed these unpleasant orders to the letter on 10th February, thus permitting the hatred against the Rump to rise to the height, while he showed how unwilling an instrument of its will he was. On the 11th, however, he threw off the mask, and wrote to the Rump, peremptorily ordering them to admit the secluded members, and to arrange for the dissolution of parliament by 6th May. On 21st February he conducted the secluded members to their seats. At the same time he refused to restore the Lords, and issued an order disowning Charles Stuart to all officers commanding garrisons. Every day brought him fresh opportunities for tact or evasion. His partisans urged him to take the protectorate himself; another party pressed upon him to accomplish the restoration by the army alone; a body of his officers sent him a declaration expressing their fears that his action would lead to the restoration of monarchy; the parliament tried to make him their own by the offer of Hampton Court. His trained habits of dissimulation and evasion, assisted now and again by downright lying, carried him triumphantly through all these dangers, and at length the dissolution of parliament on 17th March removed his greatest difficulties.

It was now that, with the utmost secrecy, he gave an interview for the first time to the king's agent Grenvil, and by him sent to Charles the conditions of his restoration, afterwards embodied in the Declaration of Breda. For himself at present he would accept nothing but a royal commission as captain-general, which he carefully kept to himself. All parties were anxious to gain the credit of the now certain restoration. The Presbyterians in particular, fearful of the king being restored without terms, did their best to discredit Monk and to impose the old Isle of Wight conditions; but in vain. The new parliament was elected, and the House of Lords restored; an insurrection by Lambert, who had escaped from the Tower, was quelled by Monk's prompt measures, and on the 25th of April he received the solemn thanks of both Houses, and the title of captain-general of the land forces. Even yet the farce was kept up. Monk received with feigned surprise the king's official letter from Grenvil, denied all knowledge of its contents, and handed it over sealed to the council, who decided to defer opening it until the meeting of parliament on the 1st of May.

With the Restoration the historic interest of Monk's career ceases. The rude soldier of fortune had played the game with incomparable dexterity, and had won the stakes. He was made gentleman of the bedchamber, knight of the Garter, master of the horse, commander-in-chief, and duke of Albemarle, and had a pension of £7000 a year allotted him. His utmost desires were satisfied, and he made no attempt to compete further in a society in which neither he nor his vulgar wife could ever be at home, and which he heartily despised. As long as the army existed of which he was the idol, and of which the last service was to suppress Venner's revolt, he was a person not to be displeased. But he entirely concurred in the measure for disbanding it, and thenceforward his influence was small, though men's eyes turned naturally to him in emergency. In the trial of the regicides he was on the side of moderation, and his interposition saved Hazelrig's life; but his action at the time of Argyll's trial will always be regarded as the most dishonourable episode in his career. In 1664 he had charge of the admiralty when James was in command of the fleet, and when in 1665 London was deserted on account of the plague, Monk, with all the readiness of a man accustomed to obey without thinking of risk, remained in charge of the government of the city. Once more, at the end of this year, he was called upon to fight, having a joint commission with Prince Rupert against the Dutch. The whole burden of the preparations fell upon him. On 23d April 1666 the admirals joined the fleet, and on the 1st of June began a battle near Dunkirk which lasted four days, followed by another on 23d July, in which Monk showed all his old coolness and skill, and a reckless daring which had seemed hitherto foreign to his character. His last service was in 1667, when the Dutch fleet sailed up the Thames, and Monk, ill as he was, hastened to Chatham to oppose their further progress. From that time he lived much in privacy, and died of dropsy on the 3d of December 1669.

See the *Lives* of Monk by Dr Gumble, his chaplain (London, 1671), and Dr Skinner (London, 1724), and Guizot's *Essay*, which contain all necessary information concerning his life up to the Restoration. The numerous and amusing notices of him in the court of Charles in Pepys's *Diary* should on no account be omitted. (O. A.)

MONKEY. See Ape.

MONMOUTH, a maritime county of England. is bounded E. by Gloucester, N.E. by Hereford, N.W. by Brecknock, W. and S.W. by Glamorgan, and S. by the Bristol Channel. Its greatest length from north to south is about 35 miles, and its greatest breadth about 28 miles. The area is 368,399 acres, or about 572 square miles.

The surface of Monmouth is very varied, and in many districts picturesque, especially along the valley of the Wye, and between that river and the Usk. In the west and north the hills rise to a considerable height, and this mountain region encircles a finely undulating country. The highest summits are Sugar Loaf (1954 feet), Blorenge (1908), and Skyridd Vawr (1601). Along the shore on both sides of the Usk are two extensive tracts of marsh land, called the Caldicot and Wentllooge levels, stretching from Cardiff to Portskewett, and protected from inundations by strong embankments.

The principal rivers are: the Wye, which forms the eastern boundary of the county with Gloucester, and falls into the Severn; the Monnow, which forms a portion of its boundary with Hereford, and falls into the Wye at the town of Monmouth; the Usk, which rises in Brecknock, and flows southward through the centre of the county to the Bristol Channel; the Ebbw, which rises in the north-west, and enters the estuary of the Usk at Newport; and the Rumney, which rises in Brecknock, and, after forming the boundary between Monmouth and Glamorgan, enters the Bristol Channel a little to the east of Cardiff. Salmon abound especially in the Wye and the Usk, and trout are plentiful in all the streams. The Monmouthshire canal extends from Newport to Pontypool, where it is joined by the Brecknockshire canal, which enters the county near Abergavenny. The Crumlin canal also joins it a little north of Newport.

Geology and Minerals.—The geological formation is principally Old Red Sandstone and Carboniferous,—the Old Red forming the larger and eastern half of the county, from a line drawn between Abergavenny and Newport, and varying in thickness from between 8000 and 10,000 feet in the north to about 4000 feet in the south. In the centre of the county adjoining the Usk there is an outcrop of Silurian rocks, extending to a distance of about 8 miles north and south and 4 miles east and west, with a thickness of 1500 feet. Towards the east the Old Sandstone rocks dip beneath the Mountain Limestone, which enters the county from the Forest of Dean coal-field, and gives its peculiar character to the fine scenery along the banks of the Wye. The formation varies in thickness from

ment, in accordance with his desire, had arranged for its dispersion that he would enter with his troops. Even now his intentions were strictly concealed; the spies set upon him by the various anxious parties were baffled by his impenetrable reserve. He was careful to appear only as the servant of parliament, but when he was desired to take the oath of abjuration he skilfully evaded the request. The city, always jealous of the Rump, now refused to pay taxes except at the orders of a free parliament. Monk, in consequence, was ordered to march his troops into the city, take down the chains and posts, and unhinge the gates. He obeyed these unpleasant orders to the letter on 10th February, thus permitting the hatred against the Rump to rise to the height, while he showed how unwilling an instrument of its will he was. On the 11th, however, he threw off the mask, and wrote to the Rump, peremptorily ordering them to admit the secluded members, and to arrange for the dissolution of parliament by 6th May. On 21st February he conducted the secluded members to their seats. At the same time he refused to restore the Lords, and issued an order disowning Charles Stuart to all officers commanding garrisons. Every day brought him fresh opportunities for tact or evasion. His partisans urged him to take the protectorate himself; another party pressed upon him to accomplish the restoration by the army alone; a body of his officers sent him a declaration expressing their fears that his action would lead to the restoration of monarchy; the parliament tried to make him their own by the offer of Hampton Court. His trained habits of dissimulation and evasion, assisted now and again by downright lying, carried him triumphantly through all these dangers, and at length the dissolution of parliament on 17th March removed his greatest difficulties.

It was now that, with the utmost secrecy, he gave an interview for the first time to the king's agent Grenvil, and by him sent to Charles the conditions of his restoration, afterwards embodied in the Declaration of Breda. For himself at present he would accept nothing but a royal commission as captain-general, which he carefully kept to himself. All parties were anxious to gain the credit of the now certain restoration. The Presbyterians in particular, fearful of the king being restored without terms, did their best to discredit Monk and to impose the old Isle of Wight conditions; but in vain. The new parliament was elected, and the House of Lords restored; an insurrection by Lambert, who had escaped from the Tower, was quelled by Monk's prompt measures, and on the 25th of April he received the solemn thanks of both Houses, and the title of captain-general of the land forces. Even yet the farce was kept up. Monk received with feigned surprise the king's official letter from Grenvil, denied all knowledge of its contents, and handed it over sealed to the council, who decided to defer opening it until the meeting of parliament on the 1st of May.

With the Restoration the historic interest of Monk's career ceases. The rude soldier of fortune had played the game with incomparable dexterity, and had won the stakes. He was made gentleman of the bedchamber, knight of the Garter, master of the horse, commander-in-chief, and duke of Albemarle, and had a pension of £7000 a year allotted him. His utmost desires were satisfied, and he made no attempt to compete further in a society in which neither he nor his vulgar wife could ever be at home, and which he heartily despised. As long as the army existed of which he was the idol, and of which the last service was to suppress Venner's revolt, he was a person not to be displeased. But he entirely concurred in the measure for disbanding it, and thenceforward his influence was small, though men's eyes turned naturally to him in emergency. In the trial of the regicides he was on the side of moderation, and his interposition saved Hazelrig's life; but his action at the time of Argyll's trial will always be regarded as the most dishonourable episode in his career. In 1664 he had charge of the admiralty when James was in command of the fleet, and when in 1665 London was deserted on account of the plague, Monk, with all the readiness of a man accustomed to obey without thinking of risk, remained in charge of the government of the city. Once more, at the end of this year, he was called upon to fight, having a joint commission with Prince Rupert against the Dutch. The whole burden of the preparations fell upon him. On 23d April 1666 the admirals joined the fleet, and on the 1st of June began a battle near Dunkirk which lasted four days, followed by another on 23d July, in which Monk showed all his old coolness and skill, and a reckless daring which had seemed hitherto foreign to his character. His last service was in 1667, when the Dutch fleet sailed up the Thames, and Monk, ill as he was, hastened to Chatham to oppose their further progress. From that time he lived much in privacy, and died of dropsy on the 3d of December 1669.

See the *Lives* of Monk by Dr Gumble, his chaplain (London, 1671), and Dr Skinner (London, 1724), and Guizot's *Essay*, which contain all necessary information concerning his life up to the Restoration. The numerous and amusing notices of him in the court of Charles in Pepys's *Diary* should on no account be omitted. (O. A.)

MONKEY. See Ape.

MONMOUTH, a maritime county of England, is bounded E. by Gloucester, N.E. by Hereford, N.W. by Brecknock, W. and S.W. by Glamorgan, and S. by the Bristol Channel. Its greatest length from north to south is about 35 miles, and its greatest breadth about 28 miles. The area is 368,399 acres, or about 572 square miles.

The surface of Monmouth is very varied, and in many districts picturesque, especially along the valley of the Wye, and between that river and the Usk. In the west and north the hills rise to a considerable height, and this mountain region encircles a finely undulating country. The highest summits are Sugar Loaf (1954 feet), Blorenge (1908), and Skyridd Vawr (1601). Along the shore on both sides of the Usk are two extensive tracts of marsh land, called the Caldicot and Wentllooge levels, stretching from Cardiff to Portskewett, and protected from inundations by strong embankments.

The principal rivers are: the Wye, which forms the eastern boundary of the county with Gloucester, and falls into the Severn; the Monnow, which forms a portion of its boundary with Hereford, and falls into the Wye at the town of Monmouth; the Usk, which rises in Brecknock, and flows southward through the centre of the county to the Bristol Channel; the Ebbw, which rises in the north-west, and enters the estuary of the Usk at Newport; and the Rumney, which rises in Brecknock, and, after forming the boundary between Monmouth and Glamorgan, enters the Bristol Channel a little to the east of Cardiff. Salmon abound especially in the Wye and the Usk, and trout are plentiful in all the streams. The Monmouthshire canal extends from Newport to Pontypool, where it is joined by the Brecknockshire canal, which enters the county near Abergavenny. The Crumlin canal also joins it a little north of Newport.

Geology and Minerals.—The geological formation is principally Old Red Sandstone and Carboniferous,—the Old Red forming the larger and eastern half of the county, from a line drawn between Abergavenny and Newport, and varying in thickness from between 8000 and 10,000 feet in the north to about 4000 feet in the south. In the centre of the county adjoining the Usk there is an outcrop of Silurian rocks, extending to a distance of about 8 miles north and south and 4 miles east and west, with a thickness of 1500 feet. Towards the east the Old Sandstone rocks dip beneath the Mountain Limestone, which enters the county from the Forest of Dean coal-field, and gives its peculiar character to the fine scenery along the banks of the Wye. The formation varies in thickness from

forces. Besides the churches—the new church of St Mary, completed in 1882, and the church of St Thomas, an Old Norman structure—the principal public buildings are the market-house, the town-hall, and Jones's free grammar school in the Tudor style, which dates from 1614. The manufactures of the town are unimportant. The fine scenery of the Wye attracts a large number of tourists.

Monmouth was one of the strongholds of the Saxons; and under the name of Blestium formed one of the stations of the Romans. It was incorporated by Edward VI., and received additional privileges from Queen Mary, James I., and Charles II. It has sent members to parliament since the 27th of Henry VIII., and, along with Newport and Usk, forms the Monmouth district of boroughs. The area of the municipal and parliamentary borough is 4983 acres, with a population in 1871 of 5879, and in 1881 of 6111.

MONMOUTH, a small manufacturing city of the United States, in Warren county, Illinois, 180 miles south-west of Chicago by the main line of the Chicago, Burlington, and Quincy Railroad, and 182 miles north of St Louis, by the St Louis division of the same railway. The Iowa Central Railway passes through the city. An opera-house and Monmouth College are among the principal buildings. The population increased from 4662 in 1870 to 5000 in 1880. The city charter dates from 1852.

MONMOUTH, JAMES, DUKE OF (1649-1685), was the son of Lucy Walters, "a brown, beautiful, bold, but insipid creature," who became the mistress of Charles II. during his exile at the Hague. He was born at Rotterdam on 9th April 1649. That Charles was his father is more than doubtful, for Lucy Walters had previously lived with Robert Sidney, brother of Algernon, and the boy resembled him very closely. Charles, however, always recognized him as his son, and lavished on him an almost doting affection. Until the Restoration he was placed under the care, first of Lord Crofts, and then of the queen-dowager, receiving his education to the age of nine from Roman Catholics, but thenceforward from Protestant tutors. In July 1662 he was sent for by Charles, and at thirteen was placed under the protection of Lady Castlemaine and in the full tide of the worst influences of the court. No formal acknowledgment of his relation to the king was made until his betrothal to Anne Scott, daughter of the earl of Buccleuch, and the wealthiest heiress of Scotland, whom he married in 1665. During 1663 he was made duke of Orkney, duke of Monmouth, and knight of the Garter, and received honorary degrees at both universities. At court he was treated as a prince of the blood. In 1665 he served with credit under the duke of York in the sanguinary naval battle off Lowestoft. A captaincy in the Life Guards was given him, and in 1670, on the death of Monk, he was made captain-general of the king's forces. Offices of wealth also were showered upon him, and he was admitted to the privy council. In 1670 Monmouth was with the court at Dover, and it is affirmed by Reresby that the mysterious death of Charles's sister, the duchess of Orleans, was due to her husband's revenge on the discovery of her intrigue with the duke. It is certain, from an entry by Pepys, that as early as 1666 he had established a character for vice and profligacy. He was the direct author of the attack in December 1670 on Sir John Coventry, and only a few months later received the royal pardon for his share in the wanton murder of a street watchman. De Gramont, in his vivid sketch of Monmouth, after describing the beauty and bodily prowess for which he was celebrated, notices the fatal emptiness and poverty of his mind: "Tous les avantages du corps parloient pour lui; mais son esprit ne disait pas un petit mot en sa faveur. Il n'avait de sentimens que ce qu'on lui en inspirait."

Hitherto Monmouth had been but the spoiled child of a wicked court. Now, however, by no act or will of his own, he began to be a person politically important. As early as 1662 the king's excessive fondness for him had caused anxiety. Even then the fear of a "difference" between Monmouth and James, duke of York, exercised men's minds; and every caress or promotion kept the fear alive. Who could tell but that, in default of legitimate issue from his queen, Charles might declare Monmouth himself his lawful son? A civil war would be the certain consequence. Soon after 1670 the matter took a more serious aspect. The anti-popery spirit was rapidly becoming a frenzy, and the succession of James a probability and a terror. Charles was urged to legitimize Monmouth by a declaration of his marriage with Lucy Walters. He returned answer that, much as he loved the duke, he would rather see him hanged at Tyburn than own him for his legitimate son. Every attempt, however, was henceforth made, especially by Shaftesbury, to accustom people to this idea. He was taught to regard himself as the representative of the Protestant interest, and his position was emphasized by James's second marriage with the Roman Catholic princess Mary of Modena. From this time his popular title was "the Protestant duke." Charles was induced to confer many prominent employments upon him. The influence of James, however, was strong enough to prevent his obtaining the lord-lieutenancy of Ireland; but he received the command of the 6000 troops who assisted the French in the second Dutch war, and, though without any claims to generalship, behaved with courage in the field. In 1674 he was made "commander-in-chief;" and, in connexion with this, another unsuccessful attempt, graphically described in Clarke's *Life of James*, was made to gain from Charles a tacit admission of his legitimacy. At Shaftesbury's instance he was placed in command of the army employed in 1675 against the Scottish Covenanters, and was present at Bothwell Bridge (22d June 1679). He was also, at the king's request, elected chancellor of the university of Cambridge. In 1678, when Charles was driven into war with Louis, Monmouth took the command of the English contingent, and again gained credit for personal courage at the battle of St Denis. On his return to London England was in the throes of the popish terror. The idea of securing the Protestant succession by legitimizing Monmouth again took shape and was eagerly pressed on by Shaftesbury; at the time it seemed possible that success would wait on the audacity.

The Pensionary parliament was dissolved in January 1678-79, and was succeeded by one still more determined in its anti-popery spirit. To avoid the storm, and to save, if possible, his brother's interests, Charles instructed him to leave the country. James retired to Brussels, the king having previously signed a declaration that he "never was married, nor gave contract to any woman whatsoever but to my wife Queen Catherine." In spite of this, Monmouth might naturally now nourish ambitious views. His rival was off the stage; Shaftesbury, his chief supporter, was president of the remodelled privy council; and he himself was the favourite of the city. In the summer of 1679 the king suddenly fell ill, and the dangers of a disputed succession became terribly apparent. The party opposed to Monmouth, or rather to Shaftesbury, easily prevailed upon Charles to consent to his brother's temporary return. When, after the king's recovery, James went back to Brussels, he received a promise that Monmouth too should be removed from favour and ordered to leave the country. Accordingly, in September 1679 the latter repaired to Utrecht, while shortly afterward James's friends so far gained ground as to obtain for [illegible] permission to reside at Edinburgh instead of at Brussels. Within two months of his arrival at Utrecht, Monmouth secretly returned to England, arriving in London on 27th

forces. On his return to London England was in the throes of the popish terror. The idea of securing the Protestant succession by legitimizing Monmouth again took shape and was eagerly pressed on by Shaftesbury; at the time it seemed possible that success would wait on the audacity.

The Pensionary parliament was dissolved in January 1678-79, and was succeeded by one still more determined in its anti-popery spirit. To avoid the storm, and to save, if possible, his brother's interests, Charles instructed him to leave the country. James retired to Brussels, the king having previously signed a declaration that he "never was married, nor gave contract to any woman whatsoever but to my wife Queen Catherine." In spite of this, Monmouth might naturally now nourish ambitious views. His rival was off the stage; Shaftesbury, his chief supporter, was president of the remodelled privy council; and he himself was the favourite of the city. In the summer of 1679 the king suddenly fell ill, and the dangers of a disputed succession became terribly apparent. The party opposed to Monmouth, or rather to Shaftesbury, easily prevailed upon Charles to consent to his brother's temporary return. When, after the king's recovery, James went back to Brussels, he received a promise that Monmouth too should be removed from favour and ordered to leave the country. Accordingly, in September 1679 the latter repaired to Utrecht, while shortly afterward James's friends so far gained ground as to obtain for [illegible] permission to reside at Edinburgh instead of at Brussel[illegible] Within two months of his arrival at Utrecht, Mo[illegible] secretly returned to England, arriving in London on 27[illegible]

guards. The attempt, however, miscarried; and, after summoning Bath in vain, Monmouth, with a disordered force, began his retrograde march through Philips-Norton and Frome, continually harassed by Feversham's soldiers. At the latter place he heard of Argyll's total rout in the western Highlands. He was now anxious to give up the enterprise, but was overruled by Grey, Wade, and others. On the 3d of July he reached Bridgwater again, with an army little better than a rabble, living at free quarters and behaving with reckless violence. On Sunday the 5th Feversham entered Sedgemoor in pursuit; Monmouth the same night attempted a surprise, but his troops were hopelessly routed. He himself, with Grey and a few others, fled over the Mendip Hills to the New Forest, hoping to reach the coast and escape by sea. The whole country, however, was on the alert, and at midnight on the 8th, within a month of their landing, James heard that the revolt, desperate from the first, was over, and that his rival had been captured close to Ringwood, in Hampshire.

The poor strain in Monmouth's character was now shown. On the day of his capture he wrote to James in terms of the most unmanly contrition, ascribing his wrongdoings to the action of others, and imploring an interview. On the 13th the prisoners reached the Tower, and on the next day Monmouth was allowed to see James. The accounts of this interview are difficult to reconcile in some points, but all agree that Monmouth's behaviour was unmanly in the extreme. No mercy was shown him, nor did he in the least deserve mercy; he had wantonly attacked the peace of the country, and had cruelly libelled James. The king had not, even in his own mind, any family tie to restrain him from exercising just severity, for he had never believed Monmouth to be the son of any one but Robert Sidney. Two painful interviews followed with the wife for whom he bore no love, and who for him could feel no respect; another imploring letter was sent to the king, and abject protestations and beseechings were made to all whom he saw. He offered, as the last hope, to become a Roman Catholic, and this might possibly have proved successful, but the priests sent by James to ascertain the sincerity of his "conversion" declared that he cared only for his life and not for his soul.

He met his death on the scaffold with calmness and dignity. In the paper which he left signed, and to which he referred in answer to the questions wherewith the busy bishops plied him, he expressed his sorrow for having assumed the royal style, and at the last moment confessed that Charles had denied to him privately, as he had publicly, that he was ever married to Lucy Walters. He died at the age of thirty-six, on the 15th of July 1685. "Thus ended," says Evelyn, "this quondam duke, darling of his father and the ladies, being extremely handsome and adroit; an excellent souldier and dancer, a favourite of the people, of an easy nature, debauched by lusts, seduced by crafty knaves, who would have set him up only to make a property, and took the opportunity of the king being of another religion to gather a party of discontented men. He failed and perished."

Authorities for Monmouth's career are, besides the known modern histories, Roberts's *Life* (1844), Evelyn's and Pepys's *Diaries*, Oldmixon's *History* (1724), James II.'s *Memoirs*, Clarke's *Life of James*, Reresby's *Memoirs*, Sidney's *Diary* (1843), Scott's notes to *Absalom and Achitophel*, and *The Heroic Life*, &c. (1683). For the rebellion, Lord Grey's *Secret History* should be consulted. (O. A.)

MONOPHYSITES. See Eutyches and Jacobite Church.

MONOPOLI, a city of Italy, in the province of Bari, is situated on the coast of the Adriatic, 25 miles by rail south-east of Bari. It is a bishop's see, is surrounded by ancient walls, and possesses a castle built by Charles V. in 1552, a cathedral, and a hospital dating from 1368. The harbour is neither large nor well protected, but a certain amount of trade is carried on in the export of local products. The population was about 12,000 in the 17th century; 12,377 in 1861; and 13,000 in 1871, that of the commune being 20,918. Monopoli probably grew up after the destruction of Egnatia (5th century), the ruins of which lie a few miles to the south.

MONOPOLY (μονοπωλία, *exclusive sale*). Though still used in the sense of the original Greek, the term is more accurately applied only to grants from the crown or from parliament, the private act of an individual whereby he obtains control over the supply of any particular article being properly defined as "engrossing." It was from the practice of the sovereign granting to a favourite, or as a reward for good service, a monopoly in the sale or manufacture of some particular class of goods that the system of protecting inventions arose, and this fact lends additional interest to the history of monopolies (see Patents). When the practice of making such grants first arose it does not appear easy to say. Sir Edward Coke laid it down that by the ancient common law the king could grant to an inventor, or to the importer of an invention from abroad, a temporary monopoly in his invention, but that grants in restraint of trade were illegal. Such, too, was the law laid down in the first recorded case, Darcy *v.* Allin (the case of monopolies, 1602), and this decision was never overruled, though the law was frequently evaded. The patent rolls of the Plantagenets show few instances of grants of monopolies (the earliest known is temp. Edw. III.), and we come down to the reign of Henry VIII. before we find much evidence of this exercise of the prerogative in the case of either new inventions or known articles of trade. Elizabeth, as is well known, granted patents of monopoly so freely that the practice became a grave abuse, and on several occasions gave rise to serious complaints in the House of Commons. Lists prepared at the time show that many of the commonest necessaries of life were the subjects of monopolies, by which their price was grievously enhanced. That the queen did not assume the right of making these grants entirely at her pleasure is shown, not only by her own statements in answer to addresses from the House, but by the fact that the preambles to the instruments conveying the grants always set forth some public benefit to be derived from their action. Thus a grant of a monopoly to sell playing-cards is made, because "divers subjects of able bodies, which might go to plough, did employ themselves in the art of making of cards"; and one for the sale of starch is justified on the ground that it would prevent wheat being wasted for the purpose. Accounts of the angry debates in 1565 and 1601 are given in Hume and elsewhere. The former debate produced a promise from the queen that she would be careful in exercising her privileges; the latter a proclamation which, received with great joy by the House, really had but little effect in stopping the abuses complained of. A few grants were cancelled, others limited, and others again left to the action of the ordinary law courts (instead of the privy council). In speaking of the results of the proclamation, previous writers seem to have been misled by the promises made in the queen's speech, promises by no means carried out in the text of the document itself, a copy of which still exists in the British Museum.

In the first parliament of James I. a "committee of grievances" was appointed, of which Sir Edward Coke w[illegible] chairman. Numerous monopoly patents were brought u[illegible] before them, and were cancelled. Many more, however were granted by the king, and there grew up a race [illegible] "purveyors," who made use of the privileges granted t[illegible]

guards. The attempt, however, miscarried; and, after summoning Bath in vain, Monmouth, with a disordered force, began his retrograde march through Philips-Norton and Frome, continually harassed by Feversham's soldiers. At the latter place he heard of Argyll's total rout in the western Highlands. He was now anxious to give up the enterprise, but was overruled by Grey, Wade, and others. On the 3d of July he reached Bridgwater again, with an army little better than a rabble, living at free quarters and behaving with reckless violence. On Sunday the 5th Feversham entered Sedgemoor in pursuit; Monmouth the same night attempted a surprise, but his troops were hopelessly routed. It is a bishop's see, is surrounded by ancient walls, and possesses a castle built by Charles V. in 1552, a cathedral, and a hospital dating from 1368. The harbour is neither large nor well protected, but a certain amount of trade is carried on in the export of local products. The population was about 12,000 in the 17th century; 12,377 in 1861; and 13,000 in 1871, that of the commune being 20,918. Monopoli probably grew up after the destruction of Egnatia (5th century), the ruins of which lie a few miles to the south.

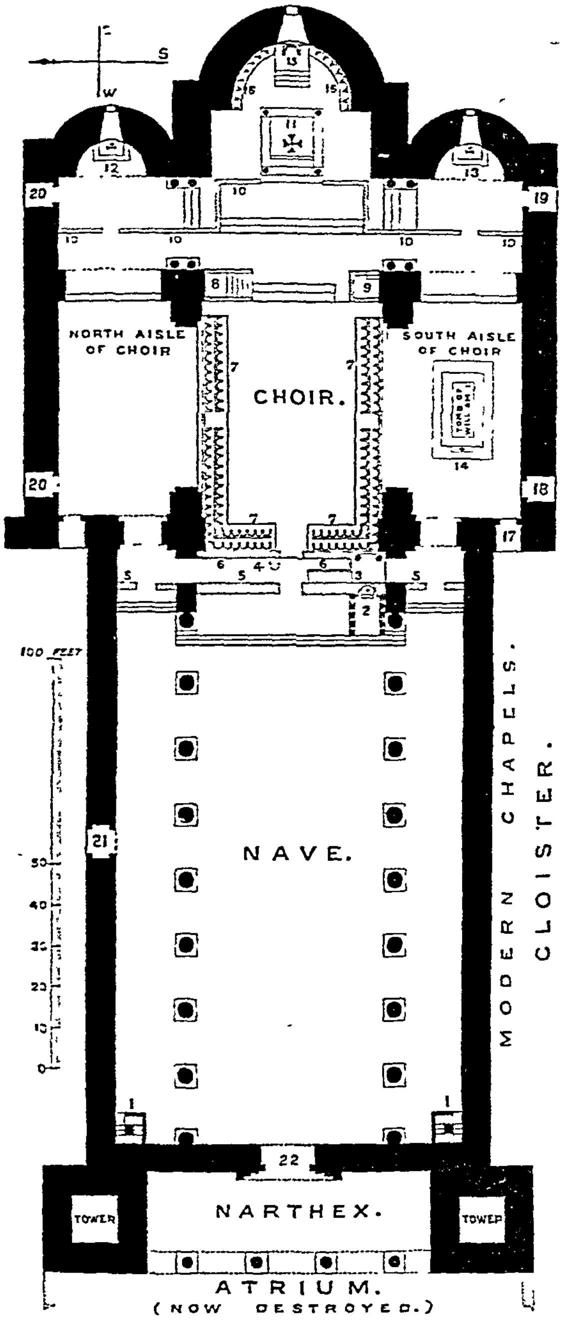
MONOPOLY (μονοπωλία, *exclusive sale*). Though still used in the sense of the original Greek, the term is more accurately applied only to grants from the crown or from parliament, the private act of an individual whereby he obtains control over the supply of any particular article being properly defined as "engrossing." It was from the practice of the sovereign granting to a favourite, or as a reward for good service, a monopoly in the sale or manufacture of some particular class of goods that the system of protecting inventions arose, and this fact lends additional interest to the history of monopolies (see PATENTS). When the practice of making such grants first arose it does not appear easy to say. Sir Edward Coke laid it down that by the ancient common law the king could grant to an inventor, or to the importer of an invention from abroad, a temporary monopoly in his invention, but that grants in restraint of trade were illegal. Such, too, was the law laid down in the first recorded case, Darcy *v.* Allin (the case of monopolies, 1602), and this decision was never overruled, though the law was frequently evaded. The patent rolls of the Plantagenets show few instances of grants of monopolies (the earliest known is temp. Edw. III.), and we come down to the reign of Henry VIII. before we find much evidence of this exercise of the prerogative in the case of either new inventions or known articles of trade. Elizabeth, as is well known, granted patents of monopoly so freely that the practice became a grave abuse, and on several occasions gave rise to serious complaints in the House of Commons. Lists prepared at the time show that many of the commonest necessaries of life were the subjects of monopolies, by which their price was grievously enhanced. That the queen did not assume the right of making these grants entirely at her pleasure is shown, not only by her own statements in answer to addresses from the House, but by the fact that the preambles to the instruments conveying the grants always set forth some public benefit to be derived from their action. Thus a grant of a monopoly to sell playing-cards is made, because "divers subjects of able bodies, which might go to plough, did employ themselves in the art of making of cards"; and one for the sale of starch is justified on the ground that it would prevent wheat being wasted for the purpose. Accounts of the angry debates in 1565 and 1601 are given in Hume and elsewhere. The former debate produced a promise from the queen that she would be careful in exercising her privileges; the latter a proclamation which, received with great joy by the House, really had but little effect in stopping the abuses complained of. A few grants were cancelled, others limited, and others again left to the action of the ordinary law courts (instead of the privy council). In speaking of the results of the proclamation, previous writers seem to have been misled by the promises made in the queen's speech, promises by no means carried out in the text of the document itself, a copy of which still exists in the British Museum.

In the first parliament of James I. a "committee of grievances" was appointed, of which Sir Edward Coke w[illegible] chairman. Numerous monopoly patents were brought u[illegible] before them, and were cancelled. Many more, however were granted by the king, and there grew up a race [illegible] "purveyors," who made use of the privileges granted t[illegible]

preserved, and is one of the finest cloisters both for size and beauty of detail that now exists anywhere. It is about 170 feet square, with pointed arches covered with marble inlay, supported on pairs of columns in white marble, 216



Plan of the cathedral of Monreale, as built in the 12th century, omitting later additions.

- 1, 1. Stairs to towers, now altered.
- 2. Chapel under the south ambo.
- 3. Stairs to ambo.
- 4. Holy-water stoup.
- 5, 5. "Pulpitum" or choir-screen, now destroyed.
- 6, 6. Screens behind stalls, now destroyed.
- 7, 7. Stalls, now destroyed.
- 8. King's throne.
- 9. Archbishop's throne.
- 10, 10. Sanctuary screen.
- 11. High altar and baldacchino.
- 12. Altar in northern apse.
- 13. Altar in southern apse.
- 14. Altar at tomb of William I.
- 15. Archbishop's throne.
- 16, 16. Seats for clergy.
- 17. Door to great cloister.
- 18. Door to chapter house.
- 19. Door to sacristy.
- 20, 20. Doors to royal palace.
- 21. Bronze door by Barisanos.
- 22. Bronze door by Bonannus.

in all, which are sumptuously decorated either by rich surface carving or by bands of patterns in gold, silver, and colours, made of glass tesseræ, arranged either spirally or vertically from end to end of each shaft. The marble caps are each richly carved with figures and foliage executed with great skill and wonderful fertility of invention—no two being alike. At one angle, a square pillared projection contains the marble fountain or monks' lavatory, evidently the work of Moslem sculptors.

The chief feature of the place—the church—like the main cloister, is fortunately well preserved. In plan it is a curious mixture of Eastern and Western arrangement (see fig.). The nave is like an Italian basilica, while the large triple-apsed choir is like one of the early three-apsed churches, of which so many examples still exist in Syria and other Eastern countries (see De Vogüé, *Syrie Centrale*). It is, in fact, like two quite different churches put together endwise. The basilican nave is wide, with narrow aisles. Monolithic columns of Oriental granite (except one, which is of cipollino), evidently the spoils of older buildings, on each side support eight pointed arches much stilted. There is no triforium, but a high clerestory with wide two-light windows, with simple tracery like those in the nave-aisles and throughout the church. The other half, Eastern in two senses, is both wider and higher than the nave. It also is divided into a central space with two aisles, each of the divisions ending at the east with an apse. The roofs throughout are of open woodwork very low in pitch, constructionally plain, but richly decorated with colour, now mostly restored. At the west end of the nave are two projecting towers, with narthex-entrance between them. A large open atrium, which once existed at the west, is now completely destroyed. The outside of the church is plain, except the aisle walls and three eastern apses, which are decorated with intersecting pointed arches and other ornaments inlaid in marble. The outsides of the principal doorways and their pointed arches are magnificently enriched with carving and inlay, a curious combination of three styles—Norman-French, Byzantine, and Arab.

It is, however, the enormous extent (80,630 square feet) and glittering splendour of the glass mosaics covering the interior, which make this church so marvellously splendid (see MOSAIC). With the exception of a high dado, itself very beautiful, made of marble slabs enriched with bands of mosaic, the whole interior surface of the walls, including soffits and jambs of all the arches, is covered with minute mosaic-pictures in brilliant colours on a gold ground. This gorgeous method of decoration takes the place of all purely architectural detail, such as mouldings and panelling. The mosaic covers even the edges of the arches and jambs, which are slightly rounded off, so as to allow them to be covered by the glass tesseræ. This device gives apparent softness to all the edges, and greatly enhances the richness of effect produced by the gleaming gold grounds. The only carving inside is on the sculptured caps of the nave arcade, mostly Corinthian in style. The mosaic pictures are arranged in tiers, divided by horizontal and vertical bands of elaborate flowing mosaic ornament. In parts of the choir there are five of these tiers of subjects or single figures one above another. The half dome of the central apse has a colossal half-length figure of Christ, with a seated Virgin and Child below; the other apses have full-length colossal figures of St Peter and St Paul. Inscriptions on each picture explain the subject or saint represented; these are in Latin, except some few which are in Greek. The subjects are partly from the *Old Testament* types of Christ and His scheme of redemption, with figures of those who prophesied and prepared for His coming. Towards the east are subjects from the New Testament, chiefly representing Christ's miracles and suffering, with apostles, evangelists, and other saints. The design, execution, and choice of subjects all appear to be of Byzantine origin, the subjects being selected from the *Menologium* drawn up by the emperor Basilius Porphyrogenitus in the 10th century.

No other mosaics perhaps so closely resemble the Mon

to succeed Rufus King, who had resigned. In 1804 he undertook a mission to Madrid, with the object of negotiating the purchase of the Floridas; but in this he was unsuccessful, and returned to London in 1805. The next year he was joined in a commission with William Pinkney to negotiate a treaty with England to take the place of the Jay treaty, which expired in that year. Lords Auckland and Howick having been appointed on the part of England, a treaty was concluded on the last day of the year, which was perhaps more favourable to the United States than the Jay treaty; but, like the latter, it contained no provision against the impressment of American seamen. For this reason President Jefferson refused to submit it to the Senate for ratification, but sent it back for revision. In the meantime Canning had become foreign secretary in place of Fox, and refused to reopen the negotiation. Monroe returned to the United States in 1807, and, as in the case of his first French mission, he drew up a defence of his diplomatic conduct in England. In 1808 certain disaffected Republicans attempted to put Monroe forward as the candidate for the presidency, but as Virginia declared in favour of Madison Monroe withdrew his name. In 1810 he was again in the legislature of his native State, and the next year its governor. But in this year he was called from the state to the national councils, superseding Robert Smith as secretary of state in Madison's cabinet, and took an active part in precipitating the war against England in 1812. On the retirement of Armstrong, after the capture of Washington in 1814, Monroe assumed the duties of the war department in addition to those of the state department, and by his energy and decision infused something of vigour into the conduct of the war. He was elected president in 1816, and was re-elected in 1820 without opposition. The period of his administration (1817-25) has been called "the era of good feeling," for the reason that the party issues of the past were mostly dead, and new issues had not yet arisen. In the formation of his cabinet Monroe showed the soundness of his judgment, selecting for the leading positions J. Q. Adams, J. C. Calhoun, W. H. Crawford, and William Wirt. With these able advisers he devoted himself to the economic development of the country, which had been so long retarded by foreign complications. As president, moreover, he was able to accomplish in 1819 the acquisition of the Floridas, which as minister to Spain he had failed to do in 1804, and to define the boundary of Louisiana, which he had been the agent in purchasing in 1803. But Monroe is best known to later generations as the author of the so-called "Monroe doctrine," a declaration inserted in his seventh annual message, 2d December 1823. It was the formulation of the sentiment, then beginning to prevail, that America was for Americans. One of the principles of the neutral policy of the country, which had been established with much difficulty, had been that the United States would not interfere in European politics; and now this policy was held to include the converse as a necessary corollary—that is, that Europe should not interfere in American politics, whether in North America or South America. The occasion of proclaiming this doctrine was the rumoured intervention of the Holy Alliance to aid Spain in the reconquest of her American colonies. President Monroe believed that such a policy entered upon by the allied continental powers of Europe would be dangerous to the peace and safety of the United States; he therefore declared that "we would not view any intervention for the purpose of oppressing them (the Spanish American states) or controlling in any manner their destiny, by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States." This declaration, together with the known hostility of England to such a project, was sufficient to prevent further action on the part of the Alliance.

On the expiration of his presidential term Monroe retired to Oak Hill, his residence in London county, Virginia; but at the time of his death, 4th July 1831, he was residing in New York. He was married about 1786, and left two daughters. He was a man of spotless character; and, though not possessing ability of the first order, he ranks high as a wise and prudent statesman. His *Life* has been written by D. C. Gilman. (F. SN.)

MONROE, a city of the United States, county seat of Monroe county, Michigan, lies 32 miles south-south-west of Detroit, on both banks of the Raisin river, 3 miles inland from Lake Erie, with which it has been connected by a ship-canal since 1843. It is a station on the Canada Southern, the Flint and Père Marquette, and the Detroit division of the Lake Shore and Michigan Southern Railways. Agricultural implement factories, a spoke and hub factory, foundries and engineering-works, carriage-works, grist-mills, paper-mills, and fruit-drying establishments are in operation. From 400 to 500 tons of grapes are shipped yearly from the neighbouring vineyards, and over 100,000 gallons of wine are made here. The population in 1880 was 4928. Settled as Frenchtown by a body of Canadians in 1784, Monroe received its present name, in honour of President Monroe, in 1817. Its city charter dates from 1837. It was the scene of the battle of the river Raisin, 22d January 1813.

MONROVIA. See LIBERIA, vol. xiv. p. 508.

MONS, a town of Belgium, the capital of the province of Hainault, on the rivers Haine and Trouille, and 31 miles south-west of Brussels. The population in 1880 was 25,600. Mons is divided by the river Trouille into an upper and lower town, the first built on rising ground in the shape of an amphitheatre, the second extending into the plain; four bridges connect the two. The place is pleasing and cheerful of aspect, having broad well-paved streets and handsome squares. The fortifications, once among the strongest of the Continent, have quite recently been razed, their site being now occupied by an extensive avenue or boulevard. Among the monuments worthy of mention are—the church of St Waudru, one of the best types of original architecture to be found in Belgium; the church of St Elizabeth, a combination of the Gothic style and the Corinthian; the town-hall, erected in 1458; and the belfry tower, next to which formerly rose the old castle of the counts of Hainault, the demolition of which led, a few years ago, to the discovery of some curious mural paintings belonging to the 12th century. Mons possesses a military arsenal, a school of engineering, and a public library of importance; the administration of law and government for the province is concentrated there. It contains manufactures of cotton, velvet, cloth, muslin, soap, and clay pipes; also brass-foundries, tan-yards, and breweries, and a market of some note for agricultural produce, cattle, horses, and tobacco. The main source of the wealth and prosperity of Mons is derived from th collieries which exist in its vicinity, and yield ann y between two and three million tons of first-class coal, greater part of which is carried into France; in the diate neighbourhood of the town are the large and import villages of Jemmapes, Quaregnon, Frameries, Paturag Wasmes, and Dour, each with a population of from ten twelve thousand inhabitants; these localities, together wit many others somewhat less peopled, form an agglomerati called the Borinage, rich in coal-mines, in iron-foundries, stone and marble quarries, and may be considered as o of the busiest centres in the world.

Mons is built on the site of a Roman camp erected by Jul

like the redundancy, it is apt to repeat itself in the same family. Meckel saw a girl who had an extra digit on each extremity, while a sister wanted four of the fingers of one hand. Where the supernumerary digits are more than one on each extremity, the whole set are apt to be rudimentary or stunted; they look as if two or more of the embryonic buds had been subject to cleavage down the middle, and to arrest of longitudinal growth. There are two or three authentic instances of a whole lower limb appearing at birth as two withered halves, as if from embryonic cleavage.[1] Other redundancies of the skeleton are extra vertebræ (sometimes the coccygeal, giving the appearance of a rudimentary tail), or an extra rib. A double row of teeth is occasionally met with; the most interesting case of this anomaly is that in which the rudiments of a double row exist from the first, but the phenomenon is sometimes produced by the milk teeth persisting along with the second set. One or more extra teeth are occasionally met with in line with the rest. Among redundancies of the soft parts, by far the most frequent is an extra nipple, or pair of nipples. It is only the nipple, or the most external mechanical adjunct of the mammary apparatus, that is repeated, and very seldom, if ever, the breast structure itself. The nipple, although it is the latest addition to the mechanism of lactation, is in the individual mammal developed on the skin before the gland is formed underneath; and that facility, which applies to the development of external characters generally, appears to be the reason why there may be one or more extra nipples but no redundant gland. In the same connexion, it is interesting to observe that the supernumerary nipple has been shown by statistics on a large scale to be twice as common in men as in women, although in the male the mammary function never comes to maturity, and even the structure retrogrades after puberty. Traces of an additional nipple, or pair of them, in more or less symmetrical position below the normal ones, are not very uncommon when carefully looked for. Among the sense organs there is a remarkable instance recorded of doubling of the appendages of the left eye, but not of the eyeball itself; the left half of the frontal bone is double, making two eye-sockets on that side, and the extra orbit has an eyebrow and eyelid.[2] The external ear (*pinna*) has also been found double on one side. Doubling of any of the internal organs is extremely rare, and is probably always traceable to a more or less complete fissuring or lobation. The ducts or vessels connected with organs, and playing a purely mechanical part, are not unfrequently doubled; thus each kidney may have two ureters, and a similar variation may occur in veins and arteries.

Monstrosities from Defective Closure in the Middle Line.—Under this head come some of the commonest congenital malformations, including slight deficiencies such as harelip, and serious defects such as a gap in the crown of the head with absence of the brain. The embryo is originally a circular flattened disc spread out on one pole of the yolk, and it is formed into a cylindrical body (with four appendages) by the free margins of the disc, or rather its ventral laminæ, folding inwards to meet in the middle line and so close in the pelvic, abdominal, thoracic, pharyngeal, and oral cavities. Meanwhile, and indeed rather earlier, two longitudinal parallel ridges on the top or along the back of the disc have grown up and united in the middle line to form the second barrel of the body—the neural canal—of small and uniform width in the lower three-fourths or spinal region, but expanding into a wide chamber for the brain. This division into neural (dorsal) and hæmal (ventral) canals underlies all vertebrate development. Imperfect closure along either of those embryonic lines of junction may produce various degrees of monstrosity. The simplest and commonest form, hardly to be reckoned in the present category, is harelip with or without cleft palate, which results from defective closure of the ventral laminæ at their extreme upper end. Another simple form, but of much more serious import, is a gap left in the neural canal at its lower end; usually the arches of the lumbar vertebræ are deficient, and the fluid that surrounds the spinal cord bulges out in its membranes, producing a soft tumour under the skin at the lower part of the back. This is the condition known as *hydrorhachis*, depending on the osseous defect known as *spina bifida*. Children born with this defect are difficult to rear, and are very likely to die in a few days or weeks. More rarely the gap in the arches of the vertebræ is in the region of the neck. If it extend all along the back, it will probably involve the skull also. Deficiency of the crown of the head, and in the spine as well, may be not always traceable to want of formative power to close the canal in the middle line; an over-distended condition of the central water-canal and water-spaces of the cord and brain may prevent the closure of the bones, and ultimately lead to the disruption of the nervous organs themselves; and injuries to the mother, with inflammation set up in the fœtus and its appendages, may be the more remote cause. But it is by defect in the middle line that the mischief manifests itself, and it is in that anatomical category that the malformations are included. The osseous deficiency at the crown of the head is usually accompanied by want of the scalp, as well as of the brain and membranes. The bones of the face may be well developed and the features regular, except that the eyeballs bulge forward under the closed lids; but there is an abrupt horizontal line above the orbits where the bones cease, the skin of the brow joining on to a spongy kind of tissue that occupies the sides and floor of the cranium. This is the commonest form of an *anencephalous* or brainless monster. There are generally mere traces of the brain, although, in some rare and curious instances, the hemispheres are developed in an exposed position on the back of the neck. The cranial nerves are usually perfect, with the exception sometimes of the optic (and retina). Vegetative existence is not impossible, and a brainless monster has been known to survive sixty-five days. The child is usually a very large one.

Closely allied, as we have seen, to the anencephalous condition is the condition of congenital *hydrocephalus*. The nervous system at its beginning is a neural canal, not only as regards its bony covering, but in its interior; a wide space lined by ciliated epithelium and filled with water extends along the axis of the spinal cord, and expands into a series of water-chambers in the brain. As development proceeds, the walls thicken at the expense of the internal water-spaces, the original tubular or chambered plan of the central nervous system is departed from, and those organs assume the practically solid form in which we familiarly know them. If, however, the water-spaces persist in their embryonic proportions notwithstanding the thickening of the nervous substance forming their walls, there results an enormous brain which is more than half occupied inside with water, contained in spaces tha[t] correspond on the whole to the ventricles of the brai[n] as normally bounded. A hydrocephalic fœtus may sur[-]vive its birth, and will be more apt to be affected in [its] nutrition than in its intelligence. In many cases t[he] hydrocephalic condition does not come on till after t[he] child is born. The *microcephalous* condition, where it [is] not a part of cretinism, is not usually a congenital de[fect] in the strict sense, but more often a consequence of t[he]

like the redundancy, it is apt to repeat itself in the same family. Meckel saw a girl who had an extra digit on each extremity, while a sister wanted four of the fingers of one hand. Where the supernumerary digits are more than one on each extremity, the whole set are apt to be rudimentary or stunted; they look as if two or more of the embryonic buds had been subject to cleavage down the middle, and to arrest of longitudinal growth. There are two or three authentic instances of a whole lower limb appearing at birth as two withered halves, as if from embryonic cleavage.[1] Other redundancies of the skeleton are extra vertebræ (sometimes the coccygeal, giving the appearance of a rudimentary tail), or an extra rib. A double row of teeth is occasionally met with; the most interesting case of this anomaly is that in which the rudiments of a double row exist from the first, but the phenomenon is sometimes produced by the milk teeth persisting along with the second set. One or more extra teeth are occasionally met with in line with the rest. Among redundancies of the soft parts, by far the most frequent is an extra nipple, or pair of nipples. It is only the nipple, or the most external mechanical adjunct of the mammary apparatus, that is repeated, and very seldom, if ever, the breast structure itself. The nipple, although it is the latest addition to the mechanism of lactation, is in the individual mammal developed on the skin before the gland is formed underneath; and that facility, which applies to the development of external characters generally, appears to be the reason why there may be one or more extra nipples but no redundant gland. In the same connexion, it is interesting to observe that the supernumerary nipple has been shown by statistics on a large scale to be twice as common in men as in women, although in the male the mammary function never comes to maturity, and even the structure retrogrades after puberty. Traces of an additional nipple, or pair of them, in more or less symmetrical position below the normal ones, are not very uncommon when carefully looked for. Among the sense organs there is a remarkable instance recorded of doubling of the appendages of the left eye, but not of the eyeball itself; the left half of the frontal bone is double, making two eye-sockets on that side, and the extra orbit has an eyebrow and eyelid.[2] The external ear (*pinna*) has also been found double on one side. Doubling of any of the internal organs is extremely rare, and is probably always traceable to a more or less complete fissuring or lobation. The ducts or vessels connected with organs, and playing a purely mechanical part, are not unfrequently doubled; thus each kidney may have two ureters, and a similar variation may occur in veins and arteries.

Monstrosities from Defective Closure in the Middle Line.—Under this head come some of the commonest congenital malformations, including slight deficiencies such as harelip, and serious defects such as a gap in the crown of the head with absence of the brain. The embryo is originally a circular flattened disc spread out on one pole of the yolk, and it is formed into a cylindrical body (with four appendages) by the free margins of the disc, or rather its ventral laminæ, folding inwards to meet in the middle line and so close in the pelvic, abdominal, thoracic, pharyngeal, and oral cavities. Meanwhile, and indeed rather earlier, two longitudinal parallel ridges on the top or along the back of the disc have grown up and united in the middle line to form the second barrel of the body—the neural canal—of small and uniform width in the lower three-fourths or spinal region, but expanding into a wide chamber for the brain. This division into neural (dorsal) and hæmal (ventral) canals underlies all vertebrate development. Imperfect closure along either of those embryonic lines of junction may produce various degrees of monstrosity. The simplest and commonest form, hardly to be reckoned in the present category, is harelip with or without cleft palate, which results from defective closure of the ventral laminæ at their extreme upper end. Another simple form, but of much more serious import, is a gap left in the neural canal at its lower end; usually the arches of the lumbar vertebræ are deficient, and the fluid that surrounds the spinal cord bulges out in its membranes, producing a soft tumour under the skin at the lower part of the back. This is the condition known as *hydrorhachis*, depending on the osseous defect known as *spina bifida*. Children born with this defect are difficult to rear, and are very likely to die in a few days or weeks. More rarely the gap in the arches of the vertebræ is in the region of the neck. If it extend all along the back, it will probably involve the skull also. Deficiency of the crown of the head, and in the spine as well, may be not always traceable to want of formative power to close the canal in the middle line; an over-distended condition of the central water-canal and water-spaces of the cord and brain may prevent the closure of the bones, and ultimately lead to the disruption of the nervous organs themselves; and injuries to the mother, with inflammation set up in the fœtus and its appendages, may be the more remote cause. But it is by defect in the middle line that the mischief manifests itself, and it is in that anatomical category that the malformations are included. The osseous deficiency at the crown of the head is usually accompanied by want of the scalp, as well as of the brain and membranes. The bones of the face may be well developed and the features regular, except that the eyeballs bulge forward under the closed lids; but there is an abrupt horizontal line above the orbits where the bones cease, the skin of the brow joining on to a spongy kind of tissue that occupies the sides and floor of the cranium. This is the commonest form of an *anencephalous* or brainless monster. There are generally mere traces of the brain, although, in some rare and curious instances, the hemispheres are developed in an exposed position on the back of the neck. The cranial nerves are usually perfect, with the exception sometimes of the optic (and retina). Vegetative existence is not impossible, and a brainless monster has been known to survive sixty-five days. The child is usually a very large one.

Closely allied, as we have seen, to the anencephalous condition is the condition of congenital *hydrocephalus*. The nervous system at its beginning is a neural canal, not only as regards its bony covering, but in its interior; a wide space lined by ciliated epithelium and filled with water extends along the axis of the spinal cord, and expands into a series of water-chambers in the brain. As development proceeds, the walls thicken at the expense of the internal water-spaces, the original tubular or chambered plan of the central nervous system is departed from, and those organs assume the practically solid form in which we familiarly know them. If, however, the water-spaces persist in their embryonic proportions notwithstanding the thickening of the nervous substance forming their walls, there results an enormous brain which is more than half occupied inside with water, contained in spaces tha[t] correspond on the whole to the ventricles of the brai[n] as normally bounded. A hydrocephalic fœtus may sur[-]vive its birth, and will be more apt to be affected in [its] nutrition than in its intelligence. In many cases th[e] hydrocephalic condition does not come on till after th[e] child is born. The *microcephalous* condition, where it [is] not a part of cretinism, is not usually a congenital de[fect] in the strict sense, but more often a consequence of t[he]

tions, there are others of them referable to the effects of mechanical pressure, and even to direct amputation of parts within the uterus.

Acardiac and Acranial Monsters.—It sometimes happens in a twin pregnancy that one of the embryos fails to develop a heart and a complete vascular system of its own, depending for its nourishment upon blood derived from the placenta of its well-formed twin by means of its umbilical vessels. It grows into a more or less shapeless mass, in which all traces of the human form may be lost. Other viscera besides the heart will be wanting, and no head distinguishable; the most likely parts to keep the line of development are the lumbar region (with the kidneys), the pelvis, and the lower limbs. The twin of this monster may be a healthy infant.

Reversed Position of the Viscera.—This is a developmental error depending on the retention of the right aortic arch as in birds, instead of the left as is usual in mammals. The position of all the unsymmetrical viscera is transposed, the spleen and cardiac end of the stomach going to the right side, the liver to the left, the cæcum resting on the left iliac fossa, and the sigmoid flexure of the colon being attached to the right. This condition of *situs inversus viscerum* need cause no inconvenience; and it will probably remain undetected until the occasion should arise for a physical diagnosis or *post-mortem* inspection. There are numerous other anomalies in the development of the great vessels. In the heart itself there may be an imperfect septum ventriculorum, and there is more frequently a patency of the fœtal communication between the auricles, permitting the venous blood to pass into the arterial system, and producing the livid appearance of the face known as *cyanosis*.

The causes of congenital anomalies are difficult to specify. There is no doubt that, in some cases, they are present in the sperm or germ of the parent; the same anomalies recur in several children of a family, and it has been found possible, through a variation of the circumstances, to trace the influence in some cases to the father alone, and in other cases to the mother alone. The remarkable thing in this parental influence is that the malformation in the child may not have been manifested in the body of either parent, or in the grandparents. More often the malformation is acquired by the embryo and fœtus in the course of development and growth, either through the mother or in itself independently. Maternal impressions during pregnancy have often been alleged as a cause, and this causation has been discussed at great length by the best authorities. The general opinion seems to be that it is impossible to set aside the influence of subjective states of the mother altogether. The doctrine of maternal impressions has often been resorted to when any other explanation was either difficult or inconvenient; thus, Hippocrates is said to have saved the virtue of a woman who gave birth to a black child by pointing out that there was a picture of a negro on the wall of her chamber. Injuries to the mother during pregnancy have been unquestionably the cause of certain malformations, especially of congenital hydrocephalus. The embryo itself and its membranes may become the subject of inflammations, atrophies, hypertrophies, and the like; this causation, to which Otto traced all malformations of the fœtus, is doubtless accountable for a good many of them. But a very large residue of malformations must still be referred to no more definite cause than the erratic spontaneity of the embryonic cells and cell-groups. The *nisus formativus* of the fertilized ovum is always made subject to morphological laws, but, just as in extra-uterine life, there may be deviations from the beaten track; and even a slight deviation at an early stage will carry with it far-reaching consequences. This is particularly noticeable in double monsters.

2. *Double Monsters.*—Twins are the physiological analogy of double monsters, and some of the latter have come very near to being two separate individuals. Triple monsters are too rare to dwell upon, but their analogy would be triplets. The Siamese twins, who died in 1874 at the age of sixty, were joined only by a thick fleshy ligament from the lower end of the breast-bone (xiphoid cartilage), having the common navel on its lower border; the anatomical examination showed, however, that a process of peritoneum extended through the ligament from one abdominal cavity to the other, and that the blood-vessels of the two livers were in free communication across the same bridge. There are one or two cases on record in which such a ligament has been cut at birth, one, at least, of the twins surviving. From the most intelligible form of double monstrosity, like the Siamese twins, there are all grades of fantastic fusion of two individuals into one down to the truly marvellous condition of a small body or fragment parasitic upon a well-grown infant,—the condition known as *fœtus in fœtu*. These monstrosities are deviations, not from the usual kind of twin gestation, but from a certain rarer physiological type of dual development. In by far the majority of cases twins have separate uterine appendages, and have probably been developed from distinct ova; but in a small proportion of (recorded) cases there is evidence, in the placental and enclosing structures, that the twins had been developed from two rudiments arising side by side on a single blastoderm. It is to the latter physiological category that double monsters almost certainly belong; and there is some direct embryological evidence for this opinion. Allen Thomson observed in the blastoderm of a hen's egg at the sixteenth or eighteenth hour of incubation two "primitive traces" or rudiments of the backbone forming side by side; and in a goose's egg incubated five days he found on one blastoderm two embryos, each with the rudiments of upper and lower extremities, crossing or cohering in the region of the future neck, and with only one heart between them. Somewhat similar observations had been previously published (four cases in all) by Wolff, Von Baer, and Reichert. Malformations in the earliest stages of the blastoderm have been more frequently observed of late, especially in the ova of the pike; and these point not so much to a symmetrical doubling of the primitive trace as to irregular budding from the margin of the germinal disc. In any case, the perfect physiological type appears to be two rudiments on one blastoderm, whose entirely separate development produces twins (under their rarer circumstances), whose nearly separate development produces such double monsters as the Siamese twins, and whose less separate development produces the various grotesque forms of two individuals in one body. There can be no question of a literal fusion of two embryos; either the individuality of each was at no time complete, or, if there were two distinct primitive traces, the uni-axial type was approximately reverted to in the process of development, as in the formation of the abdominal and thoracic viscera, limbs, pelvis, or head. Double monsters are divided in the first instance into those in which the doubling is symmetrical and equal on the two sides, and those in which a small or fragmentary fœtus is attached to or enclosed in a fœtus of average development,—the latter class being the so-called cases of "parasitism."

Symmetrical Double Monsters are subdivided according to the part or region of the body where the union or fusion exists—head, thorax, umbilicus, or pelvis. One of the simplest cases is a Janus head upon a single body, or there may be two pairs of arms with the two faces. Again, there may be one head with two necks and two complete trunk

tions, there are others of them referable to the effects of mechanical pressure, and even to direct amputation of parts within the uterus.

Acardiac and Acranial Monsters.—It sometimes happens in a twin pregnancy that one of the embryos fails to develop a heart and a complete vascular system of its own, depending for its nourishment upon blood derived from the placenta of its well-formed twin by means of its umbilical vessels. It grows into a more or less shapeless mass, in which all traces of the human form may be lost. Other viscera besides the heart will be wanting, and no head distinguishable; the most likely parts to keep the line of development are the lumbar region (with the kidneys), the pelvis, and the lower limbs. The twin of this monster may be a healthy infant.

Reversed Position of the Viscera.—This is a developmental error depending on the retention of the right aortic arch as in birds, instead of the left as is usual in mammals. The position of all the unsymmetrical viscera is transposed, the spleen and cardiac end of the stomach going to the right side, the liver to the left, the cæcum resting on the left iliac fossa, and the sigmoid flexure of the colon being attached to the right. This condition of *situs inversus viscerum* need cause no inconvenience; and it will probably remain undetected until the occasion should arise for a physical diagnosis or *post-mortem* inspection. There are numerous other anomalies in the development of the great vessels. In the heart itself there may be an imperfect septum ventriculorum, and there is more frequently a patency of the fœtal communication between the auricles, permitting the venous blood to pass into the arterial system, and producing the livid appearance of the face known as *cyanosis.*

The causes of congenital anomalies are difficult to specify. a noble family in the district of Boulogne. He held in 1436, and later, the office of lieutenant-gavenier (receiver of the *gave*, a kind of church rate) in the city of Cambray, and seems to have usually resided there. Besides this he was for some time bailiff of the chapter of that city, and later provost. He was married, and left children. But this almost exhausts the amount of our knowledge respecting him, except that he was present, not at the capture of the Maid of Orleans, but at her subsequent interview with the duke of Burgundy. As a subject of this latter prince he naturally takes the Burgundian side in his history, which extends in the genuine part of it to two books, and covers the period from 1400 to 1444. At this time, as another chronicler Matthieu de Coucy informs us, Monstrelet ceased writing. But, according to a habit by no means uncommon in the Middle Ages, a clumsy sequel, extending to a period long subsequent to his death, was formed out of various other chronicles and tacked on to his work. The genuine part of this, dealing with the last half of the Hundred Years War, is valuable because it contains a large number of documents which are certainly, and reported speeches which are probably, authentic. It has, however, little colour or narrative merit, is dully, though clearly enough, written, and is strongly tinged with the pedantry of its century,—the most pedantic in French history. The best edition is that published for the Société de l'Histoire de France by M. Douet d'Arcq in 1856.

MONTAGU, Lady Mary Wortley (1690-1762), one of the most brilliant letter-writers of the 18th century, was the eldest daughter of Evelyn Pierrepont, duke of Kingston, and Lady Mary Fielding, daughter of the earl of Denbigh. Her near relationship with Fielding the novelist is worth remarking. She was born at Thoresby in Nottinghamshire in 1690. Her mother died when she was a child, and by some chance she received or gave herself an unusually wide literary education, had the run of her father's library, was encouraged in her studies by Bishop Burnet, and while still a girl translated the *Enchiridion* of Epictetus. After a courtship in which she showed a singular power of thinking for herself, she was married in 1712, against her father's wish, to Mr. E. Wortley Montagu, an accomplished and scholarly friend of the Queen Anne wits. At the new court of George I. her beauty and wit brought her much homage; Pope was among her most devoted worshippers, and she even gained and kept the friendship of the great duchess of Marlborough. Her husband being appointed ambassador to the Porte in 1716, she accompanied him to Constantinople, and wrote to her friends at home brilliant descriptions of Eastern life and scenery. These letters were not published till 1763, the year after her death; but, copies being handed about in fashionable circles, their lively, witty style, graphic pictures of unfamiliar life, and shrewd and daring judgments gave the writer instant celebrity. In one of them she described the practice of inoculation for the smallpox, and announced her intention of trying it on her own son, and of introducing it in spite of the doctors into England. The most memorable incident in her life after her return from the East was her quarrel with Pope, caused, according to her account, by her laughing at him when he made love to her in earnest. He satirized her under the name of Sappho, and she teased him with superior ingenuity and hardly inferior wit. From 1739 to 1761 Lady Mary lived abroad, apart from her husband, maintaining an affectionate correspondence with her daughter Lady Bute, in which she set forth views of life largely coloured by the asceticism of her master Epictetus, and wearing an appearance of oddity and eccentricity from their contrast with conventional thought. The character of coldness and unwomanliness which Pope contrived to fasten on his enemy was far from being deserved; her letters show her to have been a very warm-hearted woman, though on principle she turned the hard side to the world. She died 21st August 1762. The best edition of her works is that of 1861, with a memoir by Moy Thomas.

MONTAIGNE, Michel de (1533-1592), essayist, was born, as he himself tells us, between eleven o'clock and noon on 28th February 1533. The patronymic of the Montaigne family, who derived their title from the chateau at which the essayist was born and which had been bought by his grandfather, was Eyquem. It was believed to be of English origin, and the long tenure of Gascony and Guienne by the English certainly provided abundant opportunity for the introduction of English colonists. But the elaborate researches of M. Malvézin have proved the existence of a family of Eyquems or Ayquems before the marriage of Eleanor of Aquitaine to Henry II. of England, though no connexion between this family, who were Sieurs de Lesparre, and the essayist's ancestors can be made out. Montaigne is not far from Bordeaux, and in Montaigne's time was in the province of Perigord. It is now in the arrondissement of Bergerac and the department of Dordogne. The Eyquem family had for some time been connected with Bordeaux. Indeed, though they possessed more than one estate in the district, they were of doubtful and certainly very recent nobility. Pierre Eyquem, Montaigne's father, had been engaged in commerce (a herring-merchant Scaliger calls him), had filled many municipal offices in Bordeaux, and had served under Francis I. in Italy as a soldier. The essayist was not the eldest son, but the third. By the death of his elder brothers, however, he became head of the family. He had also six younger brothers and sisters. His father appears, like many other men of the time, to have made a hobby of education. Michel was not a strong boy, indeed he was all his life a valetudinarian, and this may have especially prompted his father to take pains with him. At a time when the rod was the universal instrument of teaching it was almost entirely spared to Montaigne. He was, according to the French fashion common at all times, put out to nurse with a peasant woman. But Pierre Eyquem added to this the unusual fancy of choosing his son's sponsors from the same class, and of accustoming him to associate with it. He was taught Latin orally by servants who could speak no French, and many curious fancies were tried on him, as, for instance, that of waking him every morning by soft music. But he was by no means allowed to be idle. A plan of teaching him Greek, still more out of the common way than his Latin course, by some kind of mechanical arrangement, is not very intelligible, and was quite unsuccessful. These details of his education (which, like most else that is known about him, come from his own mouth) are not only interesting in themselves, but remind the reader how, not far from the same time, the other greatest writer of French during the Renaissance was also exercising himself, though not being exercised, in plans of education almost as fantastic. At six years old (for the father's reforming views in education do not seem to have disgusted him with the extremely early age at which it was then usual to begin school training) Montaigne was sent to the Collége de Guienne at Bordeaux, then at the height of its reputation, having more than double the number of scholars (two thousand) that even the largest English public school has usually boasted. Among its masters were Buchanan, afterwards the teacher of James I., and Muretus, one of the first scholars of the age. These, with their colleague Guérente, composed Latin plays for their pupils to act, and are held to have given no small impulse to the production of the classical French tragedy

a noble family in the district of Boulogne. He held in 1436, and later, the office of lieutenant-gavenier (receiver of the *gave*, a kind of church rate) in the city of Cambray, and seems to have usually resided there. Besides this he was for some time bailiff of the chapter of that city, and later provost. He was married, and left children. But this almost exhausts the amount of our knowledge respecting him, except that he was present, not at the capture of the Maid of Orleans, but at her subsequent interview with the duke of Burgundy. As a subject of this latter prince he naturally takes the Burgundian side in his history, which extends in the genuine part of it to two books, and covers the period from 1400 to 1444. At this time, as another chronicler Matthieu de Coucy informs us, Monstrelet ceased writing. But, according to a habit by no means uncommon in the Middle Ages, a clumsy sequel, extending to a period long subsequent to his death, was formed out of various other chronicles and tacked on to his work. MONTAGU, Lady Mary Wortley (1690-1762), one of the most brilliant letter-writers of the 18th century, was the eldest daughter of Evelyn Pierrepont, duke of Kingston, and Lady Mary Fielding, daughter of the earl of Denbigh. Her near relationship with Fielding the novelist is worth remarking. She was born at Thoresby in Nottinghamshire in 1690. Her mother died when she was a child, and by some chance she received or gave herself an unusually wide literary education, had the run of her father's library, was encouraged in her studies by Bishop Burnet, and while still a girl translated the *Enchiridion* of Epictetus. After a courtship in which she showed a singular power of thinking for herself, she was married in 1712, against her father's wish, to Mr. E. Wortley Montagu, an accomplished and scholarly friend of the Queen Anne wits. At the new court of George I. her beauty and wit brought her much homage; Pope was among her most devoted worshippers, and she even gained and kept the friendship of the great duchess of Marlborough. Her husband being appointed ambassador to the Porte in 1716, she accompanied him to Constantinople, and wrote to her friends at home brilliant descriptions of Eastern life and scenery. These letters were not published till 1763, the year after her death; but, copies being handed about in fashionable circles, their lively, witty style, graphic pictures of unfamiliar life, and shrewd and daring judgments gave the writer instant celebrity. In one of them she described the practice of inoculation for the smallpox, and announced her intention of trying it on her own son, and of introducing it in spite of the doctors into England. The most memorable incident in her life after her return from the East was her quarrel with Pope, caused, according to her account, by her laughing at him when he made love to her in earnest. He satirized her under the name of Sappho, and she teased him with superior ingenuity and hardly inferior wit. From 1739 to 1761 Lady Mary lived abroad, apart from her husband, maintaining an affectionate correspondence with her daughter Lady Bute, in which she set forth views of life largely coloured by the asceticism of her master Epictetus, and wearing an appearance of oddity and eccentricity from their contrast with conventional thought. The character of coldness and unwomanliness which Pope contrived to fasten on his enemy was far from being deserved; her letters show her to have been a very warm-hearted woman, though on principle she turned the hard side to the world. She died 21st August 1762. The best edition of her works is that of 1861, with a memoir by Moy Thomas.

MONTAIGNE, Michel de (1533-1592), essayist, was born, as he himself tells us, between eleven o'clock and noon on 28th February 1533. The patronymic of the Montaigne family, who derived their title from the chateau at which the essayist was born and which had been bought by his grandfather, was Eyquem. It was believed to be of English origin, and the long tenure of Gascony and Guienne by the English certainly provided abundant opportunity for the introduction of English colonists. But the elaborate researches of M. Malvézin have proved the existence of a family of Eyquems or Ayquems before the marriage of Eleanor of Aquitaine to Henry II. of England, though no connexion between this family, who were Sieurs de Lesparre, and the essayist's ancestors can be made out. Montaigne is not far from Bordeaux, and in Montaigne's time was in the province of Perigord. It is now in the arrondissement of Bergerac and the department of Dordogne. The Eyquem family had for some time been connected with Bordeaux. Indeed, though they possessed more than one estate in the district, they were of doubtful and certainly very recent nobility. Pierre Eyquem, Montaigne's father, had been engaged in commerce (a herring-merchant Scaliger calls him), had filled many municipal offices in Bordeaux, and had served under Francis I. in Italy as a soldier. The essayist was not the eldest son, but the third. By the death of his elder brothers, however, he became head of the family. He had also six younger brothers and sisters. His father appears, like many other men of the time, to have made a hobby of education. Michel was not a strong boy, indeed he was all his life a valetudinarian, and this may have especially prompted his father to take pains with him. At a time when the rod was the universal instrument of teaching it was almost entirely spared to Montaigne. He was, according to the French fashion common at all times, put out to nurse with a peasant woman. But Pierre Eyquem added to this the unusual fancy of choosing his son's sponsors from the same class, and of accustoming him to associate with it. He was taught Latin orally by servants who could speak no French, and many curious fancies were tried on him, as, for instance, that of waking him every morning by soft music. But he was by no means allowed to be idle. A plan of teaching him Greek, still more out of the common way than his Latin course, by some kind of mechanical arrangement, is not very intelligible, and was quite unsuccessful. These details of his education (which, like most else that is known about him, come from his own mouth) are not only interesting in themselves, but remind the reader how, not far from the same time, the other greatest writer of French during the Renaissance was also exercising himself, though not being exercised, in plans of education almost as fantastic. At six years old (for the father's reforming views in education do not seem to have disgusted him with the extremely early age at which it was then usual to begin school training) Montaigne was sent to the Collége de Guienne at Bordeaux, then at the height of its reputation, having more than double the number of scholars (two thousand) that even the largest English public school has usually boasted. Among its masters were Buchanan, afterwards the teacher of James I., and Muretus, one of the first scholars of the age. These, with their colleague Guérente, composed Latin plays for their pupils to act, and are held to have given no small impulse to the production of the classical French tragedy

edition hitherto, make it rather difficult to use it as a document. The freak of writing part of it in a strange dog-Italian is not uncharacteristic of Montaigne, but the words of his last and best editors, MM. Courbet and Royer, who speak of the letters as "l'unique complément des essais," seem to indicate that they are not of those who accept the published *Voyage* as authentic. Of the fact of the journey there is no doubt whatever.

Montaigne (as was not unnatural in a man of his temperament, who had for some years, if not for the greater part of his life, lived solely to please himself) was not altogether delighted at his election to the mayoralty, which promised him two years of responsible if not very hard work. The memory of his father, however, and the commands of the king, which seem to have been expressed in a manner rather stronger than a mere formal confirmation, induced him to accept it; and he seems to have discharged it neither better nor worse than an average magistrate. Indeed, he gave sufficient satisfaction to the citizens to be re-elected at the close of his term, and it may be suspected that the honour of the position, which was really one of considerable dignity and importance, was not altogether indifferent to him. Unfortunately, it cannot be said that nothing in his office became him like the leaving of it, for it was at the close of his second tenure that he gave the only sign of the demoralizing effect which is sometimes alleged by severe moralists to come of the half epicurean, half sceptical philosophy which he undoubtedly professed. It was his business, if not exactly his duty, to preside at the formal election of his successor, the maréchal de Matignon; but there was a severe pestilence in Bordeaux, and Montaigne writes to the jurats of that town, in one of the few undoubtedly authentic letters which we possess, to the effect that he will leave them to judge whether his presence at the election is so necessary as to make it worth his while to expose himself to the danger of going into the town in its then condition, "which is specially dangerous for men coming from a good air as he does." That is to say, the chief magistrate of one of the greatest towns in France not only declined to visit it because of sickness prevailing there, but had left it to itself at a time when nearly half the population perished, and when, according to the manners of the age, civil disturbance was almost sure to follow accordingly. Attempts have been made to justify Montaigne, and it may be at least said that he at no time pretended to unselfish heroism; but it is to be feared that the facts and the inference drawn from them admit of no dispute. At the least, Montaigne's conduct must be allowed to contrast very little to his advantage with that of Rotrou in the next century under somewhat similar circumstances though in a position of much less responsibility. It may, however, be urged in Montaigne's favour that the general circumstances of the time, where they did not produce reckless and foolhardy daring, almost necessarily produced a somewhat excessive caution. The League was on the point of attaining its greatest power; the extreme Calvinist and Navarrese party, on the other side, was (as may be seen in Agrippa d'Aubigné) no less fanatical than the League itself, and the salvation of France seemed to lie in the third party of *politiques*, or trimmers, to which Montaigne belonged. The capital motto of this party was that of the Scotch saying, "Jouk and let the jaw gang by," and the continual habit of parrying and avoiding political dangers might be apt to extend itself to dangers other than political. However this may be, Montaigne had difficulty enough during this turbulent period, all the more so from his neighbourhood to the chief haunts and possessions of Henry of Navarre. He was able, however, despite the occupations of his journey, his mayoralty, and the pressure of civil war and pestilence, which was not confined to the town, to continue his essay writing, and in 1588, after a visit of some length to Paris, the third book of the *Essays* was published, together with the former ones considerably revised. The new essays, as has been remarked, differ strikingly from the older ones in respect of length; there being only one which confines itself to the average of those in the first two books. The whimsical unexpectedness of the titles, moreover, reappears in but two of them: "Des coches" and "Des boiteux." They are, however, identical with the earlier ones in spirit, and make with them a harmonious whole—a book which has hardly been second in influence to any of the modern world.

This influence is almost equally remarkable in point of matter and in point of form, as regards the subsequent history of thought and as regards the subsequent history of literature. The latter aspect may be taken first. Montaigne is one of the few great writers who have not only perfected but have also invented a literary form. The essay as he gave it had no forerunner in modern literature, and no direct ancestor in the literature of classical times. It is indeed not improbable that it owes something to the body of tractates by different authors and of different dates, which goes under the name of Plutarch's *Morals*, and it also bears some resemblance to the miscellaneous work of Lucian. But the resemblance is in both cases at most that of suggestion. The peculiar desultoriness and tentative character of the essay proper were alien to the orderly character of the Greek mind, as were also its garrulity and the tendency which it has rather to reveal the idiosyncrasy of the writer than to deal in a systematic manner with the peculiarities of the subject. It has been suggested that the form which the essays assumed was in a way accidental, and this of itself precludes the idea of a definite model even if such a model could be found. Beginning with the throwing together of a few stray thoughts and quotations linked by a community of subject, the author by degrees acquires more and more certainty of hand, until he produces such masterpieces of apparent desultoriness and real unity as the essay "Sur des vers de Virgile." In matter of style and language Montaigne's position is equally important, but the ways which led him to it are more clearly traceable. His favourite author was beyond all doubt Plutarch, and his own explicit confession makes it undeniable that Plutarch's translator Amyot was his master in point of vocabulary, and (so far as he took any lessons in it) of style. Amyot [is] unquestionably one of the most remarkable writers of French in the 16th century, and to him more than to any one else is due the beauty of the prose style which marked the second half of that century, a style which, though unequal and requiring to be modified for general use, is at its best the very flower of the language. Montaigne, however, followed with the perfect independence that characterized him. He was a contemporary of Ronsard, and his first essays were published when the innovations of the Pléiade had fully established themselves. He adopted them to a great extent, but with much discrimination, and he used his own judgment in Latinizing when he pleased. In the same way he retained archaic and provincial words with a good deal of freedom, but by no means to excess. In the arrangement as in the selection of his language he is equally original. There is little or no trace in him of the interminable sentence which is the drawback of early prose in all languages when it has to deal with anything more difficult to manage than mere narrative. He has not the excessive classicism of style which mars even the fine prose of Calvin, and which makes that of some of Calvin's followers intolerably stiff. As a rule he [is] careless of definitely rhythmical cadence, though his sentences are always pleasant to the ear. But the principal characteristic [of] Montaigne's prose style is its remarkable ease and flexibility. The peculiarities, calculated in themselves to exercise a salutary influence on a language as yet somewhat undisciplined, acquired by accident an importance of an extraordinary kind. A few years after Montaigne's death a great revolution, as is generally known, passed over French. The criticism of Malherbe, followed by the establishment of the Academy, the minute grammatical censures of Vaugelas, and the severe literary censorship of Boileau turned French in less than three-quarters of a century from one of the freest languages in Europe to one of the most restricted. The Latinisms and Græcisms of the Pléiade were tabooed at the same time with the most picturesque expressions of the older tongue. The efforts of the reformers were directed above all things to weed and to refine, to impose additional difficulties in the way of writing exquisitely, at the same time that, by holding out a strictly-defined model, they assisted persons of little genius and imagination [to] write tolerably. During this revolution only two writers of older date held their ground, and those two were Rabelais and Montaigne, Montaigne being of his nature more generally readable than Rabelais. The *Essays*, the popularity of which no academic censorship could touch, thus kept before the eyes of the 17th and 18th centuries a treasury of French in which every generation could behold

edition hitherto, make it rather difficult to use it as a document. The freak of writing part of it in a strange dog-Italian is not uncharacteristic of Montaigne, but the words of his last and best editors, MM. Courbet and Royer, who speak of the letters as "l'unique complément des essais," seem to indicate that they are not of those who accept the published *Voyage* as authentic. Of the fact of the journey there is no doubt whatever.

The *Essays*, the popularity of which no academic censorship could touch, thus kept before the eyes of the 17th and 18th centuries a treasury of French in which every generation could behold

Not much is known of him in these later years, and indeed, despite the laborious researches of many biographers, of whom one, Dr Payen, has never been excelled in persevering devotion, it cannot be said that the amount of available information about Montaigne is large at any time of his life. It would seem that the essayist had returned to his old life of study and meditation and working up his *Essays*. No new ones were found after his death, but many alterations and insertions. His various maladies grew worse; yet they were not the direct cause of his death. He was attacked with quinsy, which rapidly brought about paralysis of the tongue, and he died on the 11th of September 1592, under circumstances which, as Pasquier reports them, completely disprove any intention, at least on his part, of displaying anti-Christian or anti-Catholic leanings. Feeling himself on the point of death, he summoned divers of his friends and neighbours to his chamber, had mass said before him, and endeavoured to raise himself and assume a devotional attitude at the elevation of the host, dying almost immediately afterwards. He was buried, though not till some months after his death, in a church in Bordeaux, which after some vicissitudes became the chapel of the Collége. During the Revolution the tomb and, as it was supposed, the coffin were transferred with much pomp to the town museum; but it was discovered that the wrong coffin had been taken, and the whole was afterwards restored to its old position. Montaigne's widow survived him, and his daughter left posterity which became merged in the noble houses of Ségur and Lur-Saluces. But it does not appear that any male representative of the family survived, and the chateau is not now in the possession of any descendant of it.

When Mademoiselle de Gournay heard of the death of Montaigne she undertook with her mother a visit of ceremony and condolence to the widow, which had important results for literature. Madame de Montaigne gave her a copy of the edition of 1588, annotated copiously; at the same time, apparently, she bestowed another copy, also annotated by the author, on the convent of the Feuillants in Bordeaux, to which the church in which his remains lay was attached. Mademoiselle de Gournay thereupon set to work to produce a new and final edition with a zeal and energy which would have done credit to any editor of any date. She herself worked with her own copy, inserting the additions, marking the alterations, and translating all the quotations. But when she had got this to press she sent the proofs to Bordeaux, where a poet of some note, Pierre de Brach, revised them with the other annotated copy. The edition thus produced has with justice passed as the standard even in preference to those which appeared in the author's lifetime. Unluckily, Mademoiselle de Gournay's original does not appear to exist, and her text was said, until the appearance of MM. Courbet and Royer's edition, to have been somewhat wantonly corrupted, especially in the important point of spelling. The Feuillants copy is in existence, being the only manuscript or partly manuscript authority for the text. It was edited in 1803 by Naigeon, the disciple of Diderot; but, according to later inquiries, considerable liberties were taken with it. The first edition of 1580, with the various readings of two others which appeared during the author's lifetime, was reprinted by MM. Dezeimeris and Burckhausen. Hitherto the edition of Le Clerc (3 vols., Paris, 1826-28) and in a more compact form that of Louandre (4 vols., Paris, 1854) have been the most useful. The edition, however, of MM. Courbet and Royer, which is based on that of 1595, will undoubtedly be the standard; but, though the text is complete (Paris, Lemerre, 1873-1877), the fifth volume, containing the biography and all the editorial apparatus, has unluckily yet (1883) to make its appearance. The editions of Montaigne in France and elsewhere, and the works upon him during the past three centuries, are innumerable. His influence upon his successors has already been hinted at, and cannot here be traced in detail. In one case, however,—that of Pascal—it is of sufficient importance to deserve mention. Pascal, who has left a special discourse on Montaigne, was evidently profoundly influenced by him, and the attitude towards his teacher is an interesting one. The sceptical method of the essayist is at once tempting and terrible to him. He accepts it in so far as it demolishes the claims of human reason and heathen philosophy, but evidently dreads it in so far as it is susceptible of being turned against religion itself. In England Montaigne was early popular. It was long supposed that the autograph of Shakespeare in a copy of Florio's translation showed his study of the *Essays*. The autograph has been disputed, but divers passages, and especially one in *The Tempest*, show that at first or second hand the poet was acquainted with the essayist. Towards the latter end of the 17th century, Cotton, the friend of Isaac Walton, executed a complete translation, which, though not extraordinarily faithful, possesses a good deal of rough vigour. It has been frequently reprinted with additions and alterations. The most noteworthy critical handling of the subject in English is unquestionably Emerson's in *Representative Men*. (G. SA.)

MONTALEMBERT, Charles Forbes de (1810-1870), historian, was born on 29th May 1810. The family was a very ancient one, belonging to Poitou, or rather to Angoumois. Direct descent is said to be provable to the 13th century, and charters and other documents carry the history of the house two centuries further back. For some generations before the historian the family had been distinguished, not merely in the army, but for scientific attainments. Montalembert's father, René, emigrated, fought under Condé, and subsequently served in the English army. He married a Miss Forbes, and his eldest son Charles was born at London. At the Restoration René de Montalembert returned to France, was raised to the peerage in 1819, and became ambassador to Sweden (where Charles received much of his education) in 1826. He died a year after the overthrow of the legitimate monarchy. Charles de Montalembert was too young to take his seat as a peer (twenty-five being the necessary age), but he retained other rights; and this, combined with his literary and intellectual activity, made him a person of some importance. He had eagerly entered into the somewhat undefined plans of Lamennais and Lacordaire for the establishment of a school of Liberal Catholicism, and he co-operated with them, both in the *Avenir* (see Lamennais, vol. xiv. pp. 239, 240) and in the practical endeavour, which absorbed some of the best energies of France at the time, to break through the trammels of the system of state education. This latter scheme first brought Montalembert into notice, as he was formally charged with unlicensed teaching. He claimed the right of trial by his peers, and made a notable defence, of course with a deliberate intention of protest. His next most remarkable act was his participation in the famous pilgrimage to Rome of his two friends. This step, as is well known, proved useless to mitigate the measures which private intrigues, and perhaps a not altogether injudicious instinct, prompted the Roman curia to take against the *Avenir* and the doctrines of its promoters. Montalembert, however, submitted dutifully to the encyclical of June 1835, and only devoted himself more assiduously to the work on which he was engaged, the *Life of St Elizabeth of Hungary*. This appeared in 1836. It displayed Montalembert's constant literary characteristics, and, though inferior to *Les Moines d'Occident* in research and labour, is perhaps superior to it as a work of art. The famous speech by which Montalembert is best known, —"Nous sommes les fils des croisés et jamais nous ne reculerons devant les fils de Voltaire", expresses, or at least indicates, his attitude not insufficiently. He was an ardent student of the Middle Ages, but his mediæval enthusiasm was strongly tinctured with religious sentiment, and at the same time by no means connected with any affection for despotism. Montalembert still clung to his early liberalism, and he made himself conspicuous during the reign of Louis Philippe by his protests against the restrictions imposed on the liberty of the press, besides struggling for freedom in national education. The party which he represented, or rather which he strove to found, was by no means wholly Legitimist at heart, and at the downfall of Louis Philippe Montalembert had no difficulty in accepting the republic and taking, when elected, a seat in the assembly. He had not a little to do with the support given by France to the pope. As he had accepted the republic, he was not disinclined to accept the empire; but the measures which

Not much is known of him in these later years, and indeed, despite the laborious researches of many biographers, of whom one, Dr Payen, has never been excelled in persevering devotion, it cannot be said that the amount of available information about Montaigne is large at any time of his life. The Feuillants copy is in existence, being the only manuscript or partly manuscript authority for the text. It was edited in 1803 by Naigeon, the disciple of Diderot; but, according to later inquiries, considerable liberties were taken with it. The first edition of 1580, with the various readings of two others which appeared during the author's lifetime, was reprinted by MM. Dezeimeris and Burckhausen. Hitherto the edition of Le Clerc (3 vols., Paris, 1826-28) and in a more compact form that of Louandre (4 vols., Paris, 1854) have been the most useful. The edition, however, of MM. Courbet and Royer, which is based on that of 1595, will undoubtedly be the standard; but, though the text is complete (Paris, Lemerre, 1873-1877), the fifth volume, containing the biography and all the editorial apparatus, has unluckily yet (1883) to make its appearance. The editions of Montaigne in France and elsewhere, and the works upon him during the past three centuries, are innumerable. His influence upon his successors has already been hinted at, and cannot here be traced in detail. In one case, however,—that of Pascal—it is of sufficient importance to deserve mention. Pascal, who has left a special discourse on Montaigne, was evidently profoundly influenced by him, and the attitude towards his teacher is an interesting one. The sceptical method of the essayist is at once tempting and terrible to him. He accepts it in so far as it demolishes the claims of human reason and heathen philosophy, but evidently dreads it in so far as it is susceptible of being turned against religion itself. In England Montaigne was early popular. It was long supposed that the autograph of Shakespeare in a copy of Florio's translation showed his study of the *Essays*. The autograph has been disputed, but divers passages, and especially one in *The Tempest*, show that at first or second hand the poet was acquainted with the essayist. Towards the latter end of the 17th century, Cotton, the friend of Isaac Walton, executed a complete translation, which, though not extraordinarily faithful, possesses a good deal of rough vigour. It has been frequently reprinted with additions and alterations. The most noteworthy critical handling of the subject in English is unquestionably Emerson's in *Representative Men*. (G. SA.)

MONTALEMBERT, Charles Forbes de (1810-1870), historian, was born on 29th May 1810. The family was a very ancient one, belonging to Poitou, or rather to Angoumois. Direct descent is said to be provable to the 13th century, and charters and other documents carry the history of the house two centuries further back. For some generations before the historian the family had been distinguished, not merely in the army, but for scientific attainments. Montalembert's father, René, emigrated, fought under Condé, and subsequently served in the English army. He married a Miss Forbes, and his eldest son Charles was born at London. At the Restoration René de Montalembert returned to France, was raised to the peerage in 1819, and became ambassador to Sweden (where Charles received much of his education) in 1826. He died a year after the overthrow of the legitimate monarchy. Charles de Montalembert was too young to take his seat as a peer (twenty-five being the necessary age), but he retained other rights; and this, combined with his literary and intellectual activity, made him a person of some importance. He had eagerly entered into the somewhat undefined plans of Lamennais and Lacordaire for the establishment of a school of Liberal Catholicism, and he co-operated with them, both in the *Avenir* (see Lamennais, vol. xiv. pp. 239, 240) and in the practical endeavour, which absorbed some of the best energies of France at the time, to break through the trammels of the system of state education. This latter scheme first brought Montalembert into notice, as he was formally charged with unlicensed teaching. He claimed the right of trial by his peers, and made a notable defence, of course with a deliberate intention of protest. His next most remarkable act was his participation in the famous pilgrimage to Rome of his two friends. This step, as is well known, proved useless to mitigate the measures which private intrigues, and perhaps a not altogether injudicious instinct, prompted the Roman curia to take against the *Avenir* and the doctrines of its promoters. Montalembert, however, submitted dutifully to the encyclical of June 1835, and only devoted himself more assiduously to the work on which he was engaged, the *Life of St Elizabeth of Hungary*. This appeared in 1836. It displayed Montalembert's constant literary characteristics, and, though inferior to *Les Moines d'Occident* in research and labour, is perhaps superior to it as a work of art. The famous speech by which Montalembert is best known,—"Nous sommes les fils des croisés et jamais nous ne reculerons devant les fils de Voltaire", expresses, or at least indicates, his attitude not insufficiently. He was an ardent student of the Middle Ages, but his mediæval enthusiasm was strongly tinctured with religious sentiment, and at the same time by no means connected with any affection for despotism. Montalembert still clung to his early liberalism, and he made himself conspicuous during the reign of Louis Philippe by his protests against the restrictions imposed on the liberty of the press, besides struggling for freedom in national education. The party which he represented, or rather which he strove to found, was by no means wholly Legitimist at heart, and at the downfall of Louis Philippe Montalembert had no difficulty in accepting the republic and taking, when elected, a seat in the assembly. He had not a little to do with the support given by France to the pope. As he had accepted the republic, he was not disinclined to accept the empire; but the measures which

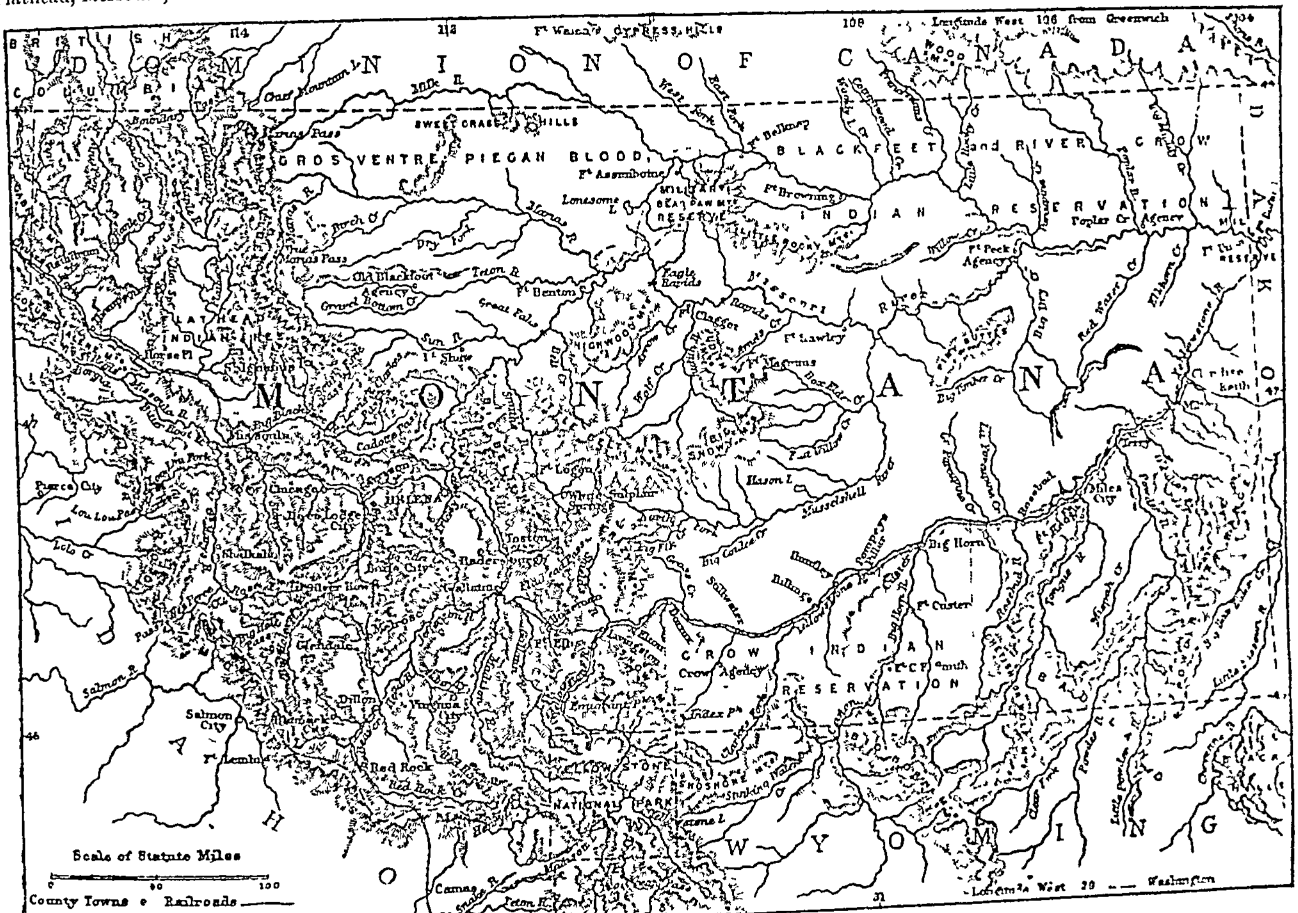
base of the Bitter-root Mountains into Idaho. This stream is very rapid, and is not navigable. Its course, as well as those of most of its tributaries, passes through narrow valleys, the surrounding country being well watered and covered with dense forests of *Coniferæ*.

Geology.—Most of the mountain area belongs to the Eozoic and Silurian formations. Along the base of the mountains is a Triassic belt of variable width. Succeeding this is a broad area of nearly horizontal Cretaceous beds, followed by the Tertiary formation, which covers nearly one-third of the Territory. These recent formations are interrupted here and there by volcanic upheavals.

Climate.—The climate of Montana differs almost as greatly in different parts of the Territory as that of California. In the north-west it resembles that of the Pacific coast. The westerly winds blowing off the Pacific do not meet with as formidable a barrier as farther south, and consequently are not chilled, or deprived of so large a proportion of their moisture. The result is that the north-western portion of Montana enjoys a mild temperature and a rainfall sufficient for the needs of agriculture. The valleys of the Kootenai, Flathead, Missoula, and Bitter-root can be cultivated without irrigation with little danger of loss from drought. Farther east and south the rainfall decreases. In the valleys of the upper Missouri, the Jefferson, Madison, Gallatin, and the upper Yellowstone irrigation is almost everywhere required, as well as over the broad extent of the plains. Over most of the Territory the rainfall ranges from 10 to 15 inches annually; in the north-western corner it rises to 25.

The general temperature is comparatively mild for the latitude, the elevation above the sea being decidedly less than that of the average of the Rocky Mountain region. The mean annual temperature ranges from 40° to 50° Fahr., but the variations are very great and violent. Frosts and snowstorms are possible during every month of the year, so that agriculture and stock-raising are more or less hazardous. On the other hand, the ordinary extremes of temperature are not so great as in more arid portions of the country.

Forests.—Throughout the Territory, as everywhere else in the Cordilleran region, forests follow rainfall. The plains are treeless; the mountain valleys about the heads of the Missouri are clothed only with grass and artemisia, many localities extending to a considerable height up the mountains, which are themselves timbered, though not heavily. In the north-western part, roughly defined as the drainage area of Clark's Fork, where the rainfall is somewhat greater, the forests become of importance. The mountains are forest-



Sketch Map of Montana Territory.

clad from summit to base; and the narrower valleys are also covered, while the timber is of larger size and of much greater commercial value than elsewhere in the Territory,—the valuable timber consisting entirely of the various species of *Coniferæ*, pine, fir, cedar, &c. Of the broad-leaved species, willow, aspen, and cotton-wood are abundant.

Fauna.—The native fauna is not sharply distinguished from that of neighbouring States and Territories. The higher latitude is, however, indicated by the relatively greater abundance of species favouring a colder climate. The moose and the Rocky Mountain goat, though by no means abundant, still frequent chosen haunts in the mountains,—the former in the cool marshy valleys, the latter upon the most rugged inaccessible elevations. The black-tailed and mule deer, the antelope, elk, and mountain sheep are abundant, and the bison still ranges the plains, though in sadly reduced numbers. Among *Carnivoræ*, the black and grizzly bears, mountain lion, lynx, wild cat, and several species of wolves are still plentiful.

Agriculture and Industry.—Agriculture is dependent in most parts of Montana upon the supply of water furnished by the streams. Owing to this fact it is probable that not more than 8 per cent. of the total area of the Territory can ever, even under the most economical distribution of the water-supply, be brought under cultivation. In the drainage area of Clark's Fork are several fine valleys containing a considerable extent of arable land, such as those of the Missoula, Bitter-root, Deer Lodge, Jocko, and Flathead. Upon the head-waters of the Missouri is also a large extent of arable land. The valleys of the Jefferson and Madison also deserve mention. Along the eastern base of the mountains, near the head-waters of the Sun, Teton, and Marias rivers, are considerable areas susceptible of irrigation. Below the Forks the Missouri flows for 75 miles through a broad valley, much of which can be irrigated; below Fort Benton, however, the bluffs become higher and close in on the river. The Yellowstone, also, after leaving the mountains, flows through a similar kind of valley, which extends with a few minor breaks down to the point where the river turns from an east to a north-east course, when it enters a country of *mauvaises terres*, which, except as a mausoleum of fossil remains, is utterly valueless.

Owing to the comparatively isolated position of the Territory, agricultural pursuits have been limited by the demands of home consumption. The census of 1880 reported the area in farms to consist of 405,683 acres, with an average of 267 acres to each farm. The whole is less than one-half per cent. of the entire area of the Territory. The improved land is reported as amounting to 262,611 acres. The following are the amounts of the principal agricultural products:—wheat, 469,688 bushels; maize, 5689 bushels; oats,

down there for a long career of activity, to Christianize the state along all its thoroughfares by imparting to it the word of the gospel, but at the same time leaving it everything except its gods. On the other hand, she furnished herself with everything of value that could be taken over from the world without overstraining the elastic structure of the organization which she now adopted. With the aid of its philosophy she created her new Christian theology; its polity furnished her with the most exact constitutional forms; its jurisprudence, its trade and commerce, its art and industry, were all taken into her service; and she contrived to borrow some hints even from its religious worship. Thus we find the church in the 3d century endowed with all the resources which the state and its culture had to offer, entering into all the relationships of life, and ready for any compromise which did not affect the confession of her faith. With this equipment she undertook, and carried through, a world-mission on a grand scale. But what of those believers of the old school who protested in the name of the gospel against this secular church, and who wished to gather together a people prepared for their God regardless alike of numbers and circumstances? Why, they joined an enthusiastic movement which had originated amongst a small circle in a remote province, and had at first a merely local importance. There, in Phrygia, the cry for a strict Christian life was reinforced by the belief in a new and final outpouring of the Spirit,—a coincidence which has been observed elsewhere in church history, as, for instance, in the Irvingite movement. The wish was, as usual, father to the thought; and thus societies of "spiritual" Christians were formed, which served, especially in times of persecution, as rallying-points for all those, far and near, who sighed for the end of the world and the *excessus e sæculo*, and who wished in these last days to lead a holy life. These zealots hailed the appearance of the Paraclete in Phrygia, and surrendered themselves to his guidance. In so doing, however, they had to withdraw from the church, to be known as "Montanists," or "Kataphrygians," and thus to assume the character of a sect. Their enthusiasm and their prophesyings were denounced as demoniacal; their expectation of a glorious earthly kingdom of Christ was stigmatized as Jewish, their passion for martyrdom as vainglorious, and their whole conduct as hypocritical. Nor did they escape the more serious imputation of heresy on important articles of faith; indeed, there was a disposition to put them on the same level with the Gnostics. The effect on themselves was what usually follows in such circumstances. After their separation from the church, they became narrower and pettier in their conception of Christianity. The strict rules of conduct which in a former age had been the genuine issue of high-strung religious emotion were now relied on as its source. Their asceticism degenerated into legalism, their claim to a monopoly of pure Christianity made them arrogant. As for the popular religion of the larger church, they scorned it as an adulterated, manipulated Christianity. But these views found very little acceptance in the 3d century, and in the course of the 4th they died out. Regardless of the scruples of her most conscientious members, and driving the most earnest Christians into secession and the conventicle, the church went on to prosecute her great mission in the world. And before she was able, as church of the state and of the empire, to call in the aid of the civil power to suppress her adversaries the Montanistic conventicles were almost extinct.

2. Such is, in brief, the position occupied by Montanism in the history of the ancient church. The rise and progress of the movement were as follows.

At the close of the reign of Antoninus Pius—probably in the year 156 (Epiphanius)—Montanus appeared at Ardaban in Phrygia, bringing revelations of the "Spirit to Christendom. It is unnecessary to seek an explanati of his appearance in the peculiarities of the Phrygi temperament. The Christian churches had always he that prophecy was to be continued till the return of C i although, as a matter of fact, prophets had not been pa cularly numerous. Montanus claimed to have a prophe calling in the very same sense as Agabus, Judas, Silas, t daughters of Philip, Quadratus, and Ammia, or as Herm at Rome. At a later time, when the validity of the M tanistic prophecy was called in question in the interest the church, the adherents of the new movement appe explicitly to a sort of prophetic succession, in which prophets had received the same gift which the daugh of Philip, for example, had exercised in that very co of Phrygia. The burden of the new prophecy was a exacting standard of moral obligations, especially w regard to marriage, fasting, and martyrdom. But M tanus had larger schemes in view. He wished to orga a special community of true Christians to wait for coming of their Lord. The small Phrygian towns Pepuza and Tymion were selected as the headquart —the Jerusalem, as the prophet called them—of church. He spared no effort to accomplish this union believers. Funds were raised for the new organiz and from these the leaders and missionaries, who we have nothing to do with worldly life, drew their pay. the ecstasy of the prophet did not prove so contagio his preaching. Only two women, Prisca and Maxim were moved by the Spirit; like Montanus, they utter a state of frenzy the commands of the Spirit, which s through them sometimes as God the Father, sometim the Son, and urged men to a strict and holy life. does not mean that visions and significant dreams may have been of frequent occurrence in Montanistic cir But, as chosen and permanent organs of the Paraclete, three persons were recognized—Montanus, Prisca, Maximilla; by their side, however, Alcibiades and T dotus, from a very early date, played an active pa missionaries and organizers.

For twenty years this agitation appears to have confined to Phrygia and the neighbouring provi How could it be otherwise? To assemble the whol Christendom at Pepuza was a rather impracticable posal. But after the year 177 a persecution of Christ from some unexplained causes, broke out simultane in many provinces of the empire. Now in these every persecution was regarded as the beginning of end. It quickened the conscience, and gave more stre to eschatological hopes; it was a call to observe the of the times and the intimations of God's presence. would seem that before this time Montanus had disapp from the scene; but Maximilla, and probably also P were working with redoubled energy. And now, thro out the provinces of Asia Minor, in Rome, and ev Gaul, amidst the raging of persecution, attention attracted to this remarkable movement. The desire sharper exercise of discipline, and a more decided ren tion of the world, combined with a craving for some indication of God's will in these last critical times, prepared many minds for an eager acceptance of tidings from Phrygia. There the Spirit, whom Christ promised to His disciples, had begun His work; the least, there were holy Christians and joyful martyrs. oracles of the Phrygian prophets became household in distant churches, and it was always the more minded who received them with undisguised symp And thus, within the large congregations where ther so much that was open to censure in doctrine and stitution and morals, conventicles were formed in

church at large was given over to worldliness, that she had forsaken the old paths and entered on a way that must lead to destruction. The writings of Tertullian afford the clearest demonstration that what is called Montanism was a reaction against secularism in the church, and an effort to conserve the privileges of primitive Christianity. At the same time, they show no less clearly that Montanism in Carthage was a very different thing from the Montanism of Montanus. Western Montanism, at the beginning of the 3d century, admitted the legitimacy of almost every point of the Catholic system. It allowed that the bishops were the successors of the apostles, that the Catholic rule of faith was a complete and authoritative exposition of Christianity, and that the New Testament was the supreme rule of the Christian life. How, then, one may well ask, was it possible to separate from the Catholic Church? On what ground could the separation be justified? How could it be said that a new era of the Spirit had come in when the Spirit had already given all necessary instructions in the Scriptures of the New Testament? And what claim could be thought to exceed the legitimate rights of the successors of the apostles? Montanus himself and his first disciples had been in quite a different position. In his time there was no fixed, divinely-instituted congregational organization, no canon of New Testament Scriptures, no anti-Gnostic theology, and no Catholic Church. There were simply certain communities of believers bound together by a common hope, and by a free organization, which might be modified to any required extent. When Montanus proposed to summon all true Christians to Pepuza, in order to live a holy life and prepare for the day of the Lord, there was nothing whatever to prevent the execution of his plan except the inertia and lukewarmness of Christendom. But this was not the case in the West at the beginning of the 3d century. At Rome and Carthage, and in all other places where sincere Montanists were found, they were confronted by the imposing edifice of the Catholic Church, and they had neither the courage nor the inclination to undermine her sacred foundations. This explains how the later Montanism never attained a position of influence. In accepting, with slight reservations, the results of the development which the church had undergone during the fifty years from 160 to 210 it reduced itself to the level of a sect. For, if the standpoint of the Catholic Church is once acknowledged, then Montanism is an innovation; and if the canon of the New Testament is accepted the doctrine of a new era of the Spirit is heresy. Tertullian exhausted the resources of dialectic in the endeavour to define and vindicate the relation of the spiritualists to the "psychic" Christians; but no one will say he has succeeded in clearing the Montanistic position of its fundamental inconsistency.

Of the later history of Montanism very little is known. But it is at least a significant fact that prophecy could not be resuscitated. Montanus, Prisca, and Maximilla were always recognized as the inspired authorities. At rare intervals a vision might perhaps be vouchsafed to some Montanistic old woman, or a brother might now and then have a dream that seemed to be of supernatural origin; but the overmastering power of religious enthusiasm was a thing of which the Montanists knew as little as the Catholics. Their discipline was attended with equally disappointing results. In place of an intense moral earnestness binding itself by its own strict laws, we find in Tertullian a legal casuistry, a finical morality, from which no good could ever come. It was only in the land of its nativity that Montanism held its ground till the 4th century. It maintained itself there in a number of close communities, probably in places where no Catholic congregation had been formed; and to these the Novatians at a later period attached themselves. In Carthage there existed down the year 400 a sect called Tertullianists; and in this comparatively late survival we have a striking test[...] to the influence of the great Carthaginian teacher. [...] doctrinal questions there was no real difference betw[een] the Catholics and the Montanists. The early Montan[ists] (the prophets themselves) used expressions which [...] to indicate a Monarchian conception of the person [of] Christ. After the close of the 2d century we find sections amongst the Western Montanists, just as [...] the Western Catholics,—there were some who adopted [the] Logos-Christology, and others who remained Monarch[ian].

Sources.—The materials for the history of Montanism, alt[hough] plentiful, are fragmentary, and require a good deal of sifting. They may be divided into four groups. (1) The utter[ances] of Montanus, Prisca, and Maximilla[1] are our most important [...] but unfortunately they consist of only twenty-one short sayi[ngs]. (2) The works written by Tertullian after he became a Mon[tanist] furnish the most copious information,—not, however, about [the] first stages of the movement, but only about its later phase, [after] the Catholic Church was established. (3) The oldest p[...] works of the 2d century, extracts from which have been pre[served] especially by Eusebius (*Hist. Eccles.*, bk. v.), form the next gr[oup]. These must be used with the utmost caution, because even [the] earliest orthodox writers give currency to many misconceptions [and] calumnies. (4) The later lists of heretics, and the casual not[ices] of church fathers from the 3d to the 5th century, though not [con]taining much that is of value, yet contain a little.[2]

Literature.—Ritschl's investigations, referred to above, s[uper]sede the older works of Tillemont, Wernsdorf, Mosheim, W[...], Neander, Baur, and Schwegler (*Der Montanismus und die ch[rist]liche Kirche des 2ten Jahrhunderts*, Tubingen, 1841). The later wo[rks], of which the best and most exhaustive is that of Bonwetsch, *Geschichte des Montanismus*, 1881, all follow the lines laid d[own by] Ritschl. See also, Gottwald, *De Montanismo Tertulliani*, 1[...]; Réville, "Tertullien et le Montanisme" in the *Revue des Deux Mo[ndes]*, 1st November 1864; Stroelin, *Essai sur le Montanisme*, 1870; Soyres, *Montanism and the Primitive Church*, London, 1878; Cunningham, *The Churches of Asia*, London, 1880; Renan, "Crises du Catholicisme Naissant" in *Rev. d. Deux Mondes*, 15th [Feb]ruary 1881; Möller, art. "Montanismus" in Herzog's *Th[eol.] Realencyklop.*, 2d ed. Special points of importance in the his[tory of] Montanism have been quite recently investigated by Lipsius, C[...]beck, Weizsäcker (*Theol. Lit.-Zeitung*, Nr. 4, 1882), and [...] (*Das Mönchthum, seine Ideale und seine Geschichte*, 2d ed., 1882, *Z. f. Kircheng.*, iii. pp. 369-408). Weizsäcker's short essays [are] extremely valuable, and have elucidated several important p[oints] hitherto overlooked. (A. HA.)

MONTARGIS, chief town of an arrondissement in [the] department of Loiret, France, lies 40 miles east-north-[east] of Orleans on the railway from Paris to Lyons. Trave[rsed] by the Loing, Montargis belongs to the basin of the Sei[ne], but it communicates with the Loire by the Orleans [and] the Briare canals. It has a fine church (Ste Magde[leine]), dating in part from the 12th century, a museum, an[d a] public library; and it still preserves portions of its [...] magnificent castle, which was capable of containing 60[00] men, and, previous to the erection of Fontainebleau, wa[s so] favourite a residence of the royal family that it acquired [the] title of "Berceau des Enfans de la France." Paper-mak[ing] (introduced in the beginning of the 18th century) [and] several other considerable industries are carried on. [The] population of both commune and town was 9175 in 18[...].

Montargis (*Mons Argi* or *Algi*, *M. Arginus*, *Montargium*) [was] formerly the capital of the Gâtinais (*Pagus Vastinensis*). Hav[ing] passed in 1188 from the Courtenai family to Philip August[us, it] long formed part of the royal domain. In 1528 Francis I. mortga[ged the] town, castle, and forest (this last a tract of great value) to Re[née] d'Este, daughter of Louis XII., the famous Huguenot princess; in 1570 Charles IX. gave them in full property to her daughter An[ne], through whom they descended to the dukes of Guise, but they w[ere] repurchased for the crown in 1612. Montargis was several ti[mes] taken or attacked by the English in the 15th century, and is par[ti]cularly proud of the successful defence it made in 1427. Both Cha[rles] VII. and Charles VIII. held court in the town; it was the latter w[ho] set the famous Dog of Montargis to fight a duel with his maste[r's] murderer whom he had tracked and captured.

church at large was given over to worldliness, that she had forsaken the old paths and entered on a way that must lead to destruction. The writings of Tertullian afford the clearest demonstration that what is called Montanism was a reaction against secularism in the church, and an effort to conserve the privileges of primitive Christianity. At the same time, they show no less clearly that Montanism in Carthage was a very different thing from the Montanism of Montanus. Western Montanism, at the beginning of the 3d century, admitted the legitimacy of almost every point of the Catholic system. It allowed that the bishops were the successors of the apostles, that the Catholic rule of faith was a complete and authoritative exposition of Christianity, and that the New Testament was the supreme rule of the Christian life. How, then, one may well ask, was it possible to separate from the Catholic Church? On what ground could the separation be justified? How could it be said that a new era of the Spirit had come in when the Spirit had already given all necessary instructions in the Scriptures of the New Testament? And what claim could be thought to exceed the legitimate rights of the successors of the apostles? Montanus himself and his first disciples had been in quite a different position. In his time there was no fixed, divinely-instituted congregational organization, no canon of New Testament Scriptures, no anti-Gnostic theology, and no Catholic Church. There were simply certain communities of believers bound together by a common hope, and by a free organization, which might be modified to any required extent. When Montanus proposed to summon all true Christians to Pepuza, in order to live a holy life and prepare for the day of the Lord, there was nothing whatever to prevent the execution of his plan except the inertia and lukewarmness of Christendom. But this was not the case in the West at the beginning of the 3d century. At Rome and Carthage, and in all other places where sincere Montanists were found, they were confronted by the imposing edifice of the Catholic Church, and they had neither the courage nor the inclination to undermine her sacred foundations. This explains how the later Montanism never attained a position of influence. In accepting, with slight reservations, the results of the development which the church had undergone during the fifty years from 160 to 210 it reduced itself to the level of a sect. For, if the standpoint of the Catholic Church is once acknowledged, then Montanism is an innovation; and if the canon of the New Testament is accepted the doctrine of a new era of the Spirit is heresy. Tertullian exhausted the resources of dialectic in the endeavour to define and vindicate the relation of the spiritualists to the "psychic" Christians; but no one will say he has succeeded in clearing the Montanistic position of its fundamental inconsistency.

Of the later history of Montanism very little is known. But it is at least a significant fact that prophecy could not be resuscitated. Montanus, Prisca, and Maximilla were always recognized as the inspired authorities. At rare intervals a vision might perhaps be vouchsafed to some Montanistic old woman, or a brother might now and then have a dream that seemed to be of supernatural origin; but the overmastering power of religious enthusiasm was a thing of which the Montanists knew as little as the Catholics. Their discipline was attended with equally disappointing results. In place of an intense moral earnestness binding itself by its own strict laws, we find in Tertullian a legal casuistry, a finical morality, from which no good could ever come. It was only in the land of its nativity that Montanism held its ground till the 4th century. It maintained itself there in a number of close communities, probably in places where no Catholic congregation had been formed; and to these the Novatians at a later period attached themselves. In Carthage there existed down the year 400 a sect called Tertullianists; and in comparatively late survival we have a striking test to the influence of the great Carthaginian teacher. doctrinal questions there was no real difference betw the Catholics and the Montanists. The early Montan (the prophets themselves) used expressions which to indicate a Monarchian conception of the person Christ. After the close of the 2d century we find sections amongst the Western Montanists, just as the Western Catholics,—there were some who adopted Logos-Christology, and others who remained Monarch

marked by extreme simplicity. Chastity is a national virtue, and in time of war the women and children of the Turks have often found their safest asylum among their hereditary foes. The main stock of the people is of Servian descent; and, though the purity of both blood and language has been to some extent affected by foreign elements, mostly Albanian and Turkish, the national unity has not been impaired. The curious Gipsy colony, which, though speaking Servian, never intermarries with the Montenegrins, is numerically of little importance.[1] The great mass of the people belong to the Orthodox Greek Church, only some 7000 being Roman Catholics, and 3000 Mohammedans. According to Kaptsevitch, the population was 10,700 in 1838, 120,000 in 1849, 124,000 in 1852, and 170,000 in 1877, but in 1879 it was found that, inclusive of the new territory, the number could not exceed 150,000; since then about 15,000 have been added with Dulcigno. The official returns for 1882 (not based on a census, however) give 236,000 as the total, of whom some 23,000 live in the so-called towns.

Fauna.—Bears are still found in the higher forests, and wolves, and especially foxes, over a much wider area. A few chamois roam on the loftiest summits, the roebuck is not infrequent in the backwoods, the wild boar may be met with in the same district, and the hare is abundant wherever the ground is covered with herbage. There are one or two species of snakes in the country, including the poisonous Illyrian viper. Esculent frogs, tree frogs, the common tortoise, and various kinds of lizards are all common. The list of birds observed by Baron Kaulbars includes golden eagles and vultures, 12 species of falcons, several species of owls, nightingales, larks, buntings, hoopoes, partridges, herons, pelicans, ducks (10 species), goatsuckers, &c. The abundance of fish in Lake Scutari and the lower course of the Ryeka is extraordinary, the shoals of bleak (scorantza, *Leuciscus alburnus*) that come up the river forming almost solid masses. Both trout and salmon are caught in the Moratcha.

Flora.—The flora of Montenegro is comparatively scanty. In the forest districts the beech is the prevailing tree up to a height of 5000 or 5500 feet, and then its place is taken by the pine. The chestnut forms little groves in the country between the sea and Lake Scutari, but never ascends more than 1000 feet, and the olive also is mainly confined to the neighbourhood of the Adriatic. Pomegranate bushes grow wild, and in many parts of the south cover the foot of the hills with dense thickets, the rich blossoms of which are one of the special charms of the spring landscape. Wheat, rye, barley, maize, capsicums, and a little tobacco are grown in the north, and in the south, vines, figs, peaches, apples, cherries, citrons, oranges, &c. The potato, introduced in 1786, is cultivated considerably beyond the local demand; the planting of mulberry trees and the rearing of silk-worms is of growing economical importance.

Towns.—CETTINYE (*q.v.*), with about 2000 inhabitants, is the capital of the country. Podgoritza (about 6000 or 7000 in 1879, since reduced to 4000) is the principal trading town; it lies at the foot of the mountains (as its name imports), at the junction of the Ruibnitza with the Moratcha, and in Turkish hands was one of the strongest of their fortresses towards Montenegro. Dulcigno (see vol. vii. p. 520) has 3000 inhabitants (before the transfer 5000 to 7000). Niksitch, a fortified place on a slight eminence in the midst of a plain, is about the same size. Antivari (see vol. ii. p. 138), so called from its position opposite Bari in Italy, suffered greatly in the war 1879-80, and lost half of its 5000 inhabitants. Danilovgrad, with 2000, lies on the north side of the Zeta valley; in the vicinity is Orialuka, the prince's palace with its mulberry nurseries, and the monasteries of Zhdrebanik (burnt by the Turks in 1877, but since rebuilt), while Tcheliya, Moratcha (the most ancient in the principality), and Ostrog (visited annually by about 10,000 pilgrims) are not far off. Spuzh (Spouge), a little lower on the same side of the stream, is a fortified post with about 1000 inhabitants. Nyegush or Nyegosh (1200), about three hours distant from Cettinye on the road to Cattaro, is the native seat of the reigning family, which originally came thither from Nyegush in Herzegovina. Zhabliak (1200) was once the "capital," and has been a fortified post since the time of the Venetian power. Ryeka (1500), on the river of that name, is next to Podgoritza in commercial importance; the prince has two residences in the town. Grahovo (2000) is famous for the great battles of 1851 and 1876.

Montenegro is an absolute hereditary monarchy, vested according to the principle of primogeniture in the family of Petrovitch Nyegush. The prince bears the title "Prince of Montenegro and the Berda (mountains)"—Montenegro here meaning the old Montenegrin nahias (provinces) of Katunska, Tzrmitza, Ryetchka, and Lyeshanska, and Berda the territory added in the 18th century, or the provinces Byelopavlitchska, Piperska, Moratchska, Vasoyevitchska, and Kutska. A responsible ministry was introduced in 1877, and there are now separate departments of justice, foreign affairs, war, and finance and education. The highest administrative body is the council of state, instituted in 1879, and consisting of eight members appointed by the prince. Justice in ordinary cases is rendered in primitive fashion. Formal codes were drawn up by Peter I. (1798) and by Danilo (1855), but the real statute book is national custom. A great court, consisting of the minister of justice, and five members named by the prince, is held in the capital, and there are inferior courts in each of the captaincies (86 in 1879). While formerly the very president of the senate, Mirko Petrovitch (*ob.* 1865), whose songs are the delight of his countrymen, could neither read nor write, primary education has been widely diffused during the reign of Prince Nicholas (Nikita) In 1851 there was only one school, but before the recent war they had increased to 58, nearly every clan having one for girls as well as for boys. The female Montenegrin Institute (founded and supported by the empress of Russia) attracts pupils from beyond the frontier. It was from the printing-presses of Cettinye and Ryeka that the first books in the Slavonic languages were issued between 1483 and 1493, under the patronage especially of Ivan Beg and George (IV.) Crnoyevitch, "waywodes of the Zeta," but this promise of literary productiveness was soon cut off by wars with the Turks. Peter Petrovitch Nyegush (1813-1851), who was called to rule in 1830, is recognized as perhaps the greatest of all Servian poets,—his *Gorski Vyyenac*, or "Mountain Wreath," giving dramatic expression to the "very soul of the Serbian people." Though the press which he established in 1834 was destroyed in the war of 1852-53, another was soon obtained, and under Prince Nicholas, himself a poet, his memory has proved a potent stimulus to intellectual culture. The first Montenegrin newspaper, *Crnogorac*, now *Glas Crnogorca*, began to appear in 1870; the first book-shop was opened in 1879.[2]

The Montenegrins, however, have had more to do with the sword than with the pen. "Every man, dressed in the picturesque costume of his tribe, carries his pistol and yataghan in his girdle." Nominally the age of military service is between sixteen and sixty-five, but when war breaks out schoolboy and superannuated veteran are equally eager for the fray. When Prince Nicholas tried to prevent an old man of eighty from joining his forces, the insulted warrior drew his pistol and shot himself. War with the Turks, indeed, is the essence of Montenegrin history. On the death of the Servian king Stephen Dushan, Prince Balsha became independent lord of the province of the Zeta; and when the Servian power was shattered by the Turks in the battle of Kossovo (1389) his territory formed the asylum of all those who determined to make another stand for freedom. In 1485 Ivan Crnoyevitch, finding Zhabliak untenable, fixed his "capital" at Cettinye. In 1516 his son George, who had succeeded him, left his country to its fate; but the people chose their bishop as their chief. Prince-bishops or vladykas, elected by the people, continued to lead them with success against the common foe of Christendom till 1697, when the authority was handed over to Petrovitch Nyegush, with the right of appointing his successors, subject to national approval. At length, in 1851, Danilo, nephew and nominee of the previous vladyka Peter II., prevailed on the "skuptchina" to declare Montenegro a secular state with the hereditary government of a prince. His nephew Nicholas succeeded to the throne in 1860, and at the close of the war 1876-78 Montenegro was declared a sovereign principality. For an account of the defeats and victories (the latter by far the more numerous) which have marked the national struggle for existence during its four centuries, the reader is referred to Denton's *Montenegro* (Lond., 1877).

(H. A. W.)

MONTEREY, a city of the United States, the capital of California up to 1847, is situated on Monterey Bay, 125 miles south from San Francisco by the southern division of the Southern Pacific Railroad. Originally founded in 1770 as a mission station and presidio (garrison) by Junipero Serra, it is still in the main a Spanish-looking town, with Spanish talked in its streets and painted on its signboards. At the meeting of the first constitutional convention of California Monterey was a port of entry with a flourishing trade and a promising future; but it soon suffered from the rivalry of San Francisco, and it is

Crnoyevitch, "waywodes of the Zeta," but this promise of literary productiveness was soon cut off by wars with the Turks. Peter Petrovitch Nyegush (1813-1851), who was called to rule in 1830, is recognized as perhaps the greatest of all Servian poets,—his *Gorski Vyenac*, or "Mountain Wreath," giving dramatic expression to the "very soul of the Serbian people." Though the press which he established in 1834 was destroyed in the war of 1852-53, another was soon obtained, and under Prince Nicholas, himself a poet, his memory has proved a potent stimulus to intellectual culture. The first Montenegrin newspaper, *Crnogorac*, now *Glas Crnogorca*, began to appear in 1870; the first book-shop was opened in 1879.[2]

The Montenegrins, however, have had more to do with the sword than with the pen. "Every man, dressed in the picturesque costume of his tribe, carries his pistol and yataghan in his girdle." Nominally the age of military service is between sixteen and sixty-five, but when war breaks out schoolboy and superannuated veteran are equally eager for the fray. When Prince Nicholas tried to prevent an old man of eighty from joining his forces, the insulted warrior drew his pistol and shot himself. War with the Turks, indeed, is the essence of Montenegrin history. On the death of the Servian king Stephen Dushan, Prince Balsha became independent lord of the province of the Zeta; and when the Servian power was shattered by the Turks in the battle of Kossovo (1389) his territory formed the asylum of all those who determined to make another stand for freedom. In 1485 Ivan Crnoyevitch, finding Zhabliak untenable, fixed his "capital" at Cettinye. In 1516 his son George, who had succeeded him, left his country to its fate; but the people chose their bishop as their chief. Prince-bishops or vladykas, elected by the people, continued to lead them with success against the common foe of Christendom till 1697, when the authority was handed over to Petrovitch Nyegush, with the right of appointing his successors, subject to national approval. At length, in 1851, Danilo, nephew and nominee of the previous vladyka Peter II., prevailed on the "skuptchina" to declare Montenegro a secular state with the hereditary government of a prince. His nephew Nicholas succeeded to the throne in 1860, and at the close of the war 1876-78 Montenegro was declared a sovereign principality. For an account of the defeats and victories (the latter by far the more numerous) which have marked the national struggle for existence during its four centuries, the reader is referred to Denton's *Montenegro* (Lond., 1877).

(H. A. W.)

MONTEREY, a city of the United States, the capital of California up to 1847, is situated on Monterey Bay, 125 miles south from San Francisco by the southern division of the Southern Pacific Railroad. Originally founded in 1770 as a mission station and presidio (garrison) by Junipero Serra, it is still in the main a Spanish-looking town, with Spanish talked in its streets and painted on its signboards. At the meeting of the first constitutional convention of California Monterey was a port of entry with a flourishing trade and a promising future; but it soon suffered from the rivalry of San Francisco, and it is

travelling in Europe, Montesquieu not only satirized unmercifully the social, political, ecclesiastical, and literary follies of his day in France, but indulged in a great deal of the free writing (so free as very nearly to deserve the term licentious) which was characteristic of the tale-tellers of the time. But what scandalized grave and precise readers naturally attracted the majority, and the *Lettres Persanes* were very popular, passing, it is said, through four editions within the year, besides piracies. Then the vogue suddenly ceased, or at least editions ceased for nearly nine years to appear. It is said that a formal ministerial prohibition was the cause of this, and it is not improbable; for, though the regent and Dubois must have enjoyed the book thoroughly, they were both shrewd enough to perceive that underneath its playful exterior there lay a spirit of very inconvenient criticism of abuses in church and state. The fact is that the *Lettres Persanes* is the first book of what is called the Philosophe movement. The criticism is scarcely yet aggressive, much less destructive, and in Montesquieu's hands it never became so; but what it might become in the hands of others was obvious enough. It is this precursorship in his own special line which in all probability made Voltaire so jealous of Montesquieu, as well as the advantage which a wealthy and well-born noble of high official position had over himself. It is amusing to find Voltaire describing the *Lettres* as a "trumpery book," a "book which anybody might have written easily." It is not certain that, in its peculiar mixture of light badinage with not merely serious purpose but gentlemanlike moderation, Voltaire could have written it himself, and it is certain that no one else at that time could. The reputation acquired by this book brought Montesquieu much into the literary society of the capital, and he composed for, or at any rate contributed to, one of the coteries of the day the clever but rather rhetorical *Dialogue de Sylla et d'Eucrate*, in which the dictator gives an apology for his conduct. For Mademoiselle de Clermont, a lady of royal blood, a great beauty and a favourite queen of society, he wrote the curious prose poem of the *Temple de Gnide*. This is half a narrative, half an allegory, in the semi-classical or rather pseudo-classical taste of the time, decidedly frivolous and dubiously moral, but of no small elegance in its peculiar style. A later *jeu d'esprit* of the same kind, which is almost but not quite certainly Montesquieu's, is the *Voyage à Paphos*, in which his warmest admirers have found little to praise. In 1725 Montesquieu was elected a member of the Academy, but an almost obsolete rule requiring residence in Paris was appealed to, and the election was annulled. It is doubtful whether a hankering after Parisian society, or an ambition to belong to the Academy, or a desire to devote himself to literary pursuits of greater importance, or simple weariness of not wholly congenial work determined him to give up his Bordeaux office; it is certain that he continued to hold it but a short time after this. It is tolerably clear that he had already begun his great work, and the character of some papers which, about this time, he read at the Bordeaux Academy is graver and less purely curious than his earlier contributions. In 1726 he sold the life tenure of his office, reserving the reversion for his son, and went to live in the capital, returning, however, for half of each year to La Brède. There was now no further formal obstacle to his reception in the Académie Française, but a new one arose. Ill-wishers had brought the *Lettres Persanes* specially under the minister Fleury's attention, and Fleury, a precisian in many ways, was shocked by them. There are various accounts of the way in which the difficulty was got over, but all seem to agree that Montesquieu made concessions which were more effectual than dignified. He was elected and received in January 1728. Almost immediately afterwards he started on a tour through Europe to observe men, things, and constitutions. He travelled through Austria to Hungary, but was unable to visit Turkey as he had proposed. Then he made for Italy, where he met Chesterfield. They sojourned together at Venice for some time, and a curious story is told of the way in which either a piece of mischief on Chesterfield's part, or Montesquieu's own nervousness and somewhat inordinate belief in his own importance, made the latter sacrifice his Venetian notes. At Venice, and elsewhere in Italy, he remained nearly a year, and then journeyed by way of Piedmont and the Rhine to England. Here he stayed for some eighteen months, and acquired an admiration for English character and polity which never afterwards deserted him. He returned, not to Paris, but to La Brède, and to outward appearance might have seemed to be settling down as a squire. He altered his park in the English fashion, made sedulous inquiries into his own genealogy, arranged an entail, asserted, though not harshly, his seignorial rights, kept poachers in awe, and so forth. Nor did he neglect his fortune, but, on the contrary, improved his estates in every way, though he met with much opposition, partly from the dislike of his tenants to new-fangled ways, and partly from the insane economic regulations of the time, which actually prohibited the planting of fresh vineyards.

Although, however, Montesquieu was enough of a *grand seigneur* to be laughed at, and enough of a careful steward of his goods to be reviled for avarice, by those of his contemporaries who did not like him, these matters by no means engrossed or even chiefly occupied his thoughts. In his great study at La Brède (a hall rather than a study, some 60 feet long by 40 wide) he was constantly dictating, making abstracts, revising essays, and in other ways preparing his great book. Like some other men of letters, though perhaps no other has had the experience in quite the same degree, he found himself a little hampered by his earlier work. He may have thought it wise to soften the transition from the *Lettres Persanes* to the *Esprit des Lois*, by interposing a publication graver than the former and less elaborate than the latter. He had always, as indeed was the case with most Frenchmen of his century, been interested in ancient Rome and her history; and he had composed not a few minor tractates on the subject, of which many titles and some examples remain, besides the already-mentioned dialogue on Sylla. All these now took form in the *Considérations sur les Causes de la Grandeur et la Décadence des Romains*, which appeared in 1734 at Amsterdam, without the author's name. This, however, was perfectly well known; indeed, Montesquieu formally presented a copy to the French Academy. Anonymity of title-pages was a fashion of the day which meant nothing. The book was not extraordinarily popular in France at the time. The author's reputation as a jester stuck to him, and the salons affected to consider the *Lettres Persanes* and the new book respectively as the "grandeur" and the "décadence de M. de Montesquieu;" but more serious readers at once perceived its extraordinary merit, and it was eagerly read abroad. A copy of it exists or existed which had the singular fortune to be annotated by Frederick the Great, and to be abstracted from the Potsdam library by Napoleon. It is said, moreover, by competent authorities to have been the most enduringly popular and the most widely read of all its author's works in his own country, and it has certainly been the most frequently and carefully edited. Its merits are indeed undeniable. Merely scholastic criticism may of course object to it, as to every other book of the time, the absence of the exactness of modern critical inquiry into the facts of history; but this is only a new example of a frequent *ignoratio elenchi*. The virtue of Montesquieu's book is not in its facts but in its views. It is (putting Bossuet and Vico aside) almost

The virtue of Montesquieu's book is not in its facts but in its views. It is (putting Bossuet and Vico aside) almost

nelle, he does not seem to have preserved in old age the passion for society which had marked his youth. A rather dubious description, published long after his death, represents him as "wandering in his woods from morn to night with a white cotton nightcap on his head, and a vine prop on his shoulder." This, in the florid language of its time (the Republican period), is probably only an imaginative expression of his known interest in managing his estate. But he certainly spent much of his later years in the country, though he sometimes visited Paris, and on one visit had the opportunity, which he is likely to have enjoyed, of procuring the release of his admirer La Beaumelle from an imprisonment which La Beaumelle had suffered at the instance of Voltaire. He is said also to have been instrumental in obtaining a pension for Piron. Indeed, indigent or unlucky men of letters found in him a constant protector, and that not merely at the royal expense. Nor did he by any means neglect literary composition. The curious little romance of *Arsace et Isménie*, a short and unfinished treatise on Taste, many of his published *Pensées*, and much unpublished matter date from the period subsequent to the *Esprit des Lois.* He did not, however, live many years after the appearance of his great work. At the end of 1754 he visited Paris, with the intention of getting rid of the lease of his house there and finally retiring to La Brède. He was shortly after taken ill with an attack of fever, which seems to have affected the lungs, and in less than a fortnight he died, on 10th February 1755, aged sixty-six. He was buried in the church of Saint Sulpice with little pomp, and the Revolution obliterated all trace of his remains.

The literary and philosophical merits of Montesquieu and his position, actual and historical, in the literature of France and of Europe, form a subject of rather unusual interest in its kind. At the beginning of this century the vicomte de Bonald classed him with Racine and Bossuet, as the object of a "religious veneration" among Frenchmen. But Bonald was not quite a suitable spokesman for France, and it may be doubted whether the author of the *Esprit des Lois* has ever really occupied any such position in his own country. For a generation after his death he remained indeed the idol and the great authority of the moderate reforming party in France, and at such times as that party recovered power during the revolutionary period Montesquieu recovered vogue with it. But the tendency of the century and a quarter which have passed since his death has been to reduce the numbers and position of this party ever more and more, and Montesquieu is not often quotable, or quoted, either by Republicans, Bonapartists, or Legitimists, at the present day. Again, his serious works contain citation of or allusion to a vast number of facts, and the exact (let it be hoped that posterity will not call it the pettifogging) criticism of our time challenges the accuracy of these facts. Although he was really the founder, or at least one of the founders, of the sciences of comparative politics and of the philosophy of history, his descendants and followers in these sciences think they have outgrown him. In France his popularity has always been dubious and contested. It is a singular thing that, until within the last decade, there has been no properly edited edition of his works, and nothing even approaching a complete biography of him, the place of the latter being occupied by the meagre and rhetorical *Éloges* of the last century. He is, his chief admirers assert, hardly read at all in France to-day, and a tolerable familiarity with modern French literature enables its possessor to corroborate this by first-hand knowledge, to the effect that no writer of equal eminence is so little quoted. The admirers just mentioned attempt to explain the fact by confessing that Montesquieu, great as he is, is not altogether great according to French principles. It is not only that he is an Anglo-maniac, but that he is rather English than French in style and thought. His work, at least the *Esprit*, is lacking in the proportion and the almost ostentatious lucidity of arrangement which a Frenchman demands. His sentences are often enigmatical, and suggestive rather than clear. He is almost entirely dispassionate in politics, but he lacks the unswerving deductive consistency which Frenchmen love in that science. His wit, it is said, is quaint and a little provincial, his style irregular and in no definite *genre*.

Some of these things may be allowed to exist and to be defects in Montesquieu, but they are balanced by merits which render them almost insignificant. Of the minor works, which are on the whole rather unworthy of their author, nothing need be said here. In the few *Pensées*, and in detached thoughts of the same kind scattered about the tolerably numerous letters which have reached us, there is much acuteness and point, as also in some of the best sentences of the *Considérations* and of the *Esprit*. But no one would put Montesquieu as a *pensée*, or maxim, writer beside La Rochefoucauld and Joubert, Pascal and Vauvenargues. It is on his three principal works that his fame does and must rest. Each one of these is a masterpiece in its kind. It is doubtful whether the *Lettres Persanes* yield at their best either in wit or in giving lively pictures of the time to the best of Voltaire's similar work, though they are more unequal. There is, moreover, the great difference between Montesquieu and Voltaire that the former is a rational reformer, and not a mere *persifleur* or *frondeur*, to whom fault-finding is more convenient for showing off his wit than acquiescence. Of course this last description does not fully or always describe Voltaire, but it often does. It is seldom or never applicable to Montesquieu. Only one of Voltaire's own charges against the book and its author must be fully allowed. He is said to have replied to a friend who urged him to give up his habit of sneering at Montesquieu, "il est coupable de lese-poésie," and this is true. Not only are Montesquieu's remarks on poetry (he himself occasionally wrote verses, and very bad ones) childish, but he is never happy in purely literary appreciation. The *Considérations* are noteworthy, not only for the complete change of style (which from the light and mocking tone of the *Lettres* becomes grave, weighty, and sustained, with abundance of striking expression), but for the profundity and originality of the views, and for the completeness with which the author carries out his plan. These words—except, perhaps, the last clause—apply with increasing force to the *Esprit des Lois*. The book has been accused of desultoriness, but this arises, in part at least, from a misapprehension of the author's design. At the same time, it is impossible to say that the equivocal meaning of the word "law," which has misled so many reasoners, has not sometimes misled Montesquieu himself. For the most part, however, he keeps the promise of his sub-title (given above) with fidelity, and applies it with exhaustive care. It is only in the last few books, which have been said to be a kind of appendix, that something of irrelevancy suggests itself. The real importance of the *Esprit des Lois*, however, is not that of a formal treatise on law, or even on polity. It is that of an assemblage of the most fertile, original, and inspiriting views on legal and political subjects, put in language of singular suggestiveness and vigour, illustrated by examples which are always apt and luminous, permeated by the spirit of temperate and tolerant desire for human improvement and happiness, and almost unique in its entire freedom at once from doctrinarianism, from visionary enthusiasm, from egotism, and from an undue spirit of system. As for the style, no one who does not mistake the definition of that much used and much misused word can deny it to Montesquieu. He has in the *Esprit* little ornament, but his composition is wholly admirable. Every now and then there are reminiscences, perhaps a little more close than is necessary, of the badinage of the *Lettres Persanes*, but these are rare, and the author's wit is for the most used only to lighten his pages. Yet another great peculiarity of this book, as well as of the *Considérations*, has to be noticed. The genius of the author for generalization is so great, his instinct in political science so sure, that even the falsity of his premises frequently fails to vitiate his conclusions. He has known wrong, but he has thought right.

The sole edition of Montesquieu which need be mentioned here is that of Édouard Laboulaye (7 vols., Paris, 1875-1879), the sole biography that of Louis Vian (Paris, second edition, 1879). From the latter the facts of the above notice are principally drawn. *The bibliography of Montesquieu's published works is not of any special interest, but in respect of anecdota he occupies a singular position.* There is known to exist at La Brède a great mass of MSS materials for the *Esprit des Lois*, additional *Lettres Persanes*, essays and fragments of all kinds, diaries, letters, notebooks, and so forth. *The present possessors,* however, who represent Montesquieu, though not in the direct male line, have hitherto refused permission to examine these to all editors and critics, though the publication of some of them has been vaguely promised. At present they are chiefly known by a paper contributed nearly *half a century ago to the Transactions* of the Academy of Agen (1834). (G. SA.)

MONTEVERDE, Claudio (1568-1643), the inventor of the "free style" of musical composition, was born at Cremona in 1568; he was engaged at an early age as violist to the duke of Mantua, and studied composition with some success under Ingegneri, the duke's "maestro di capella," though without thoroughly mastering the difficulties of musical science. His knowledge of counterpoint was limited, and his ear imperfect, but he was a bold experimenter, and his undisguised empiricism led to discoveries which exercised a lasting influence upon the progress of art. He was the first composer who ventured to use unprepared dissonances,—employing them first in his madrigals, the beauty of which they utterly destroyed, but afterwards introducing them into music of another kind with such excellent effect that their value was universally recognized, and all opposition to their use effectually silenced. In 1603 he succeeded

nelle, he does not seem to have preserved in old age the passion for society which had marked his youth. A rather dubious description, published long after his death, represents him as "wandering in his woods from morn to night with a white cotton nightcap on his head, and a vine prop on his shoulder." This, in the florid language of its time (the Republican period), is probably only an imaginative expression of his known interest in managing his estate. But he certainly spent much of his later years in the country, though he sometimes visited Paris, and on one visit had the opportunity, which he is likely to have enjoyed, of procuring the release of his admirer La Beaumelle from an imprisonment which La Beaumelle had suffered at the instance of Voltaire. He is said also to have been instrumental in obtaining a pension for Piron. Indeed, indigent or unlucky men of letters found in him a constant protector, and that not merely at the royal expense. Nor did he by any means neglect literary composition. The curious little romance of *Arsace et Isménie*, a short and unfinished treatise on Taste, many of his published *Pensées*, and much unpublished matter date from the period subsequent to the *Esprit des Lois*. He did not, however, live many years after the appearance of his great work. At the end of 1754 he visited Paris, with the intention of getting rid of the lease of his house there and finally retiring to La Brède. He was shortly after taken ill with an attack of fever, which seems to have affected the lungs, and in less than a fortnight he died, on 10th February 1755, aged sixty-six. He was buried in the church of Saint Sulpice with little pomp, and the Revolution obliterated all trace of his remains.

The literary and philosophical merits of Montesquieu and his position, actual and historical, in the literature of France and of Europe, form a subject of rather unusual interest in its kind. At the beginning of this century the vicomte de Bonald classed him with Racine and Bossuet, as the object of a "religious veneration" among Frenchmen. But Bonald was not quite a suitable spokesman for France, and it may be doubted whether the author of the *Esprit des Lois* has ever really occupied any such position in his own country. He is almost entirely dispassionate in politics, but he lacks the unswerving deductive consistency which Frenchmen love in that science. His wit, it is said, is quaint and a little provincial, his style irregular and in no definite *genre*.

Some of these things may be allowed to exist and to be defects in Montesquieu, but they are balanced by merits which render them almost insignificant. Of the minor works, which are on the whole rather unworthy of their author, nothing need be said here. In the few *Pensées*, and in detached thoughts of the same kind scattered about the tolerably numerous letters which have reached us, there is much acuteness and point, as also in some of the best sentences of the *Considérations* and of the *Esprit*. But no one would put Montesquieu as a *pensée*, or maxim, writer beside La Rochefoucauld and Joubert, Pascal and Vauvenargues. It is on his three principal works that his fame does and must rest. Each one of these is a masterpiece in its kind. It is doubtful whether the *Lettres Persanes* yield at their best either in wit or in giving lively pictures of the time to the best of Voltaire's similar work, though they are more unequal. There is, moreover, the great difference between Montesquieu and Voltaire that the former is a rational reformer, and not a mere *persifleur* or *frondeur*, to whom fault-finding is more convenient for showing off his wit than acquiescence. Of course this last description does not fully or always describe Voltaire, but it often does. It is seldom or never applicable to Montesquieu. Only one of Voltaire's own charges against the book and its author must be fully allowed. He is said to have replied to a friend who urged him to give up his habit of sneering at Montesquieu, "il est coupable de lese-poésie," and this is true. Not only are Montesquieu's remarks on poetry (he himself occasionally wrote verses, and very bad ones) childish, but he is never happy in purely literary appreciation. The *Considérations* are noteworthy, not only for the complete change of style (which from the light and mocking tone of the *Lettres* becomes grave, weighty, and sustained, with abundance of striking expression), but for the profundity and originality of the views, and for the completeness with which the author carries out his plan. These words—except, perhaps, the last clause—apply with increasing force to the *Esprit des Lois*. The book has been accused of desultoriness, but this arises, in part at least, from a misapprehension of the author's design. At the same time, it is impossible to say that the equivocal meaning of the word "law," which has misled so many reasoners, has not sometimes misled Montesquieu himself. For the most part, however, he keeps the promise of his sub-title (given above) with fidelity, and applies it with exhaustive care. It is only in the last few books, which have been said to be a kind of appendix, that something of irrelevancy suggests itself. The real importance of the *Esprit des Lois*, however, is not that of a formal treatise on law, or even on polity. It is that of an assemblage of the most fertile, original, and inspiriting views on legal and political subjects, put in language of singular suggestiveness and vigour, illustrated by examples which are always apt and luminous, permeated by the spirit of temperate and tolerant desire for human improvement and happiness, and almost unique in its entire freedom at once from doctrinarianism, from visionary enthusiasm, from egotism, and from an undue spirit of system. As for the style, no one who does not mistake the definition of that much used and much misused word can deny it to Montesquieu. He has in the *Esprit* little ornament, but his composition is wholly admirable. Every now and then there are reminiscences, perhaps a little more close than is necessary, of the badinage of the *Lettres Persanes*, but these are rare, and the author's wit is for the most used only to lighten his pages. Yet another great peculiarity of this book, as well as of the *Considérations*, has to be noticed. The genius of the author for generalization is so great, his instinct in political science so sure, that even the falsity of his premises frequently fails to vitiate his conclusions. He has known wrong, but he has thought right.

The sole edition of Montesquieu which need be mentioned here is that of Edouard Laboulaye (7 vols., Paris, 1875-1879), the sole biography that of Louis Vian (Paris, second edition, 1879). From the latter the facts of the above notice are principally drawn. *The bibliography of Montesquieu's published works is not of any special interest, but in respect of anecdota he occupies a singular position.* There is known to exist at La Brède a great mass of MSS. materials for the *Esprit des Lois*, additional *Lettres Persanes*, essays and fragments of all kinds, diaries, letters, notebooks, and so forth. *The present possessors*, however, who represent Montesquieu, though not in the direct male line, have hitherto refused permission to examine these to all editors and critics, though the publication of some of them has been vaguely promised. At present they are chiefly known by a paper contributed nearly *half a century ago to the Transactions* of the Academy of Agen (1834). (G. SA.)

MONTEVERDE, Claudio (1568-1643), the inventor of the "free style" of musical composition, was born at Cremona in 1568; he was engaged at an early age as violist to the duke of Mantua, and studied composition with some success under Ingegneri, the duke's "maestro di capella," though without thoroughly mastering the difficulties of musical science. His knowledge of counterpoint was limited, and his ear imperfect, but he was a bold experimenter, and his undisguised empiricism led to discoveries which exercised a lasting influence upon the progress of art. He was the first composer who ventured to use unprepared dissonances,—employing them first in his madrigals, the beauty of which they utterly destroyed, but afterwards introducing them into music of another kind with such excellent effect that their value was universally recognized, and all opposition to their use effectually silenced. In 1603 he succeeded

years passed before the settlement was declared a port; but by 1781 it had 6460 inhabitants, and by 1792 was importing to the value of 2,993,267 dollars, and exporting to the value of 4,150,523. In 1808 the governor of Montevideo was the first to revolt against the Spanish authorities, and to establish an independent junta; twenty years later, after much disastrous confusion and conflict, the city became the recognized capital of the newly-formed republic of Banda Oriental. Its population, which had been about 36,000 at the opening of the century, was reduced to 9000 by 1829; and it had hardly recovered its ground in this respect (31,189) when, in 1843, Rosas, dictator of Buenos Ayres, wishing to compel annexation to Buenos Ayres, commenced the siege which was irregularly maintained till 1852, and left the city and the country exhausted and almost ruined. By 1860, however, the population had increased to 49,518; and though the Brazilians blockaded the port in 1864-5 and reinstated ex-president Flores the prosperity of the place was but little impaired. During the Paraguayan war, which lasted till 1861, Montevideo grew rapidly rich, attracting a large share of the trade diverted from Buenos Ayres. Immigrants flocked from all quarters, and excessive investments were made in all kinds of real property. The valuation of the city and suburbs, which was 14,156,000 dollars in 1860, reached the sum of 74,000,000 dollars in 1872. Reckless speculation, political dissension, and the financial mismanagement of the Government have told heavily; the value of house property has greatly diminished, and commercial activity has been grievously restricted. Since 1881, however, Montevideo has been rapidly recovering, and its natural advantages are so great that, with better political circumstances, a future of yet higher prosperity may be anticipated.

Notices of Montevideo will be found in Bonelli, *Travels in Bolivia*, &c., 1854; Hadfield, *Brazil, the River Plate*, &c., 1854, and his supplemental volume, 1868; Mulhall, *Handbook of the River Plate Republics*, 1874; and Gallenga, *South America*, 1881. See also Brignardello, *Delle vicende dell' America merid. e specialm. di Montevideo nell' Uruguay*, Genoa, 1879; *The Republic of Uruguay*, 1883; the reports of the municipal junta, and Vaillant's statistical publications.

MONTEZUMA. See Cortes and Mexico.

MONTFAUCON, Bernard de (1655-1741), critic and scholar, was born of a noble and ancient family at the chateau of Soulage (now Soulatgé, in the department of Aube, France), on 13th January 1655. Though destined for the army, he passed most of his time in the library of the castle of Roquetaillade (the usual residence of his family), devouring books in different languages and on almost every variety of subject, his studies being directed by a learned friend of his father, Pavillon, bishop of Aleth. In 1672 he entered the army, and in the two following years served as a volunteer in Germany under Turenne. But ill-health and the death of his parents brought him back to his studious life, and in 1675 he entered the cloister of the Congregation of St Maur, at La Daurade, Toulouse, taking the vows there on 13th May 1676. Apart from his vast literary labours, the remainder of his life presents little to record. He lived successively at various abbeys—at Sorèze, where he specially studied Greek and examined the numerous MSS. of the convent library, at La Grasse, and at Bordeaux; and in 1687 he was removed to Saint Germain des Prés. From 1698 to 1701 he lived in Italy, chiefly in Rome. Returning to Saint Germain, he was made a member of the Académie des Inscriptions et Belles-Lettres in 1719. He died on 21st December 1741.

His first publication, in which he was assisted by Lopin and Pouget, was the first volume of a never completed series of previously unpublished *Analecta Græca* (1688). In 1690 appeared his defence of the literally historical character of the book of Judith. *Athanasii opera omnia*, still the best edition of that father, was issued with a biography and critical notes in 1698. The first-fruits of his visit to Italy were seen in his copious *Diarium Italicum, sive monumentorum veterum, bibliothecarum, musæorum, &c., notitiæ singulares in itinerario Italico collectæ* (1702). The *Palæographia Græca, sive de ortu et progressu literarum Græcarum, et de variis omnium sæculorum scriptionis Græcæ generibus* (1708) is a standard work, which has not yet been superseded; in its own field it is as original as the *De re diplomatica* of Mabillon. In 1713 Montfaucon edited *Hexaplorum Origenis quæ supersunt* (2 vols. fol.), only recently superseded by the work of Field; and between 1718 and 1738 he completed his edition of *Joannis Chrysostomi opera omnia* (13 vols. fol.), which is hardly an improvement upon that of H. Saville. His *L'Antiquité expliquée et représentée en figures* (10 vols. fol., 1719) would of itself suffice to establish a reputation for colossal diligence. It was continued by him in *Les Monumens de la Monarchie Françoise* (5 vols. fol., 1729-1733). A complete list of his literary labours, including his numerous contributions to the *Mémoires* of the Academy of Inscriptions, will be found in the *Nouvelle Biographie Générale*, s.v. "Montfaucon."

MONTFORT, Simon de, Earl of Leicester (c. 1200-1265), a great political leader, and sometimes even referred to as the "founder of the English House of Commons," born in France about the beginning of the 13th century, was the fourth and youngest son of Simon IV. de Montfort and of Alice de Montmorency. Of his early life and education nothing is known, the first definitely recorded fact about him being that in April 1230 he was in England and had attached himself to the service of Henry III., who granted him a temporary pension of 400 marks, with a promise of the earldom which his father had held.[1] In the following year he did homage for the honour of Leicester, and in 1232 the king confirmed to him all the land with appurtenances which had belonged to the late earl in England. But, though thus formally admitted to the ranks of the English baronage, he did not for several years succeed in making way against the strong dislike in which "aliens" were now held, and until 1236 most of his time was spent, in considerable poverty, abroad. In that year, however, he attended the king's marriage to Eleanor of Provence as lord high steward, and thenceforward began to take part in the business of the royal council. Handsome, talented, and brave, he gained the love of Eleanor, widow of the earl of Pembroke, and sister of the king, to whom he was privately married at Westminster on 7th January 1238, Henry himself giving away the bride. When the fact became known, the indignation of the baronage and of the people had almost broken out in open rebellion, and, after Simon had with difficulty averted this by propitiating his brother-in-law, Richard, earl of Cornwall, he found it necessary to go to Rome to meet the objections which the church had raised on the ground of an alleged previous vow made by Eleanor. Having succeeded in obtaining (by bribery, it would seem) the papal sanction to his marriage, he returned to England in October, and early next year, still in the enjoyment of the royal favour, he had the earldom of Leicester formally conferred upon him in presence of the assembled barons. In June (1239) he assisted as godfather and high steward at the baptism of Prince Edward; but the machinations of his enemies were soon afterwards successful in bringing about a change in the fickle humour of Henry, and when Simon came back to Westminster in August to attend the churching of the queen the king met him with the information that he was an excommunicated person, and ordered him to leave the church.[2] Along with his wife he forthwith went into voluntary exile in France; but in April 1240 he returned to England, and was received by the king on a footing of at least outward friendship. Of his private and public life during the

[1] Simon IV. de Montfort, the well-known Albigensian crusader, in right of his mother, Amicia de Beaumont, sister and co-heiress of Robert Fitz-Pernell, earl of Leicester, succeeded to that earldom in 1204, and in 1207 was confirmed in the high stewardship of England, hereditary in connexion with the title. Soon afterwards he was deprived of his English possessions under some pretext, the real reason doubtless being his position as captain-general of the French forces against the Albigenses (1208). He received them again towards the end of John's reign, their custody, however, being committed to his nephew, the earl of Chester. The long hostility between England and France during the early years of Henry III. made it practically impossible for the alien De Montforts to maintain any hold upon their English earldom on the death of Simon IV. in 1218; in 1231, after the peace, the eldest son Amaury (now constable of France) renounced all claim to it, thus leaving the field clear to his next surviving brother Simon.

[2] There is no evidence that Simon actually had been excommunicated, but it seems clear that certain payments he had agreed to make to the Roman curia had not been punctually attended to, and that some annoyance had been in this way caused to the king. The charge of immoral relations with Eleanor was probably only a conveniently coarse way of restating the ecclesiastical offence for which De Montfort had already purchased absolution.

years passed before the settlement was declared a port; but by 1781 it had 6460 inhabitants, and by 1792 was importing to the value of 2,993,267 dollars, and exporting to the value of 4,150,523. The long hostility between England and France during the early years of Henry III. made it practically impossible for the alien De Montforts to maintain any hold upon their English earldom on the death of Simon IV. in 1218; in 1231, after the peace, the eldest son Amaury (now constable of France) renounced all claim to it, thus leaving the field clear to his next surviving brother Simon.

[2] There is no evidence that Simon actually had been excommunicated, but it seems clear that certain payments he had agreed to make to the Roman curia had not been punctually attended to, and that some annoyance had been in this way caused to the king. The charge of immoral relations with Eleanor was probably only a conveniently coarse way of restating the ecclesiastical offence for which De Montfort had already purchased absolution.

remarkable of which is Corndon Hill, rising to a height of 1700 feet. In some places the sedimentary rocks have been penetrated by trap mingled with shale or schist. Along the lines of dislocation there are frequent deposits of metallic lodes, carried there by the heated water rising from below. The lead mines of Montgomeryshire are of considerable importance, and at present the metal is wrought at seven different places. In 1881 the amount of lead ore obtained in the various mines was 3432 tons, yielding 2693 tons of lead and 25,432 oz. of silver, the total value being £36,495. There were also obtained 1114 tons of zinc ore, yielding 610 tons of zinc, of a total value of £3231.

Agriculture.—The climate is mild and genial, and the soil in the valleys remarkably fertile, especially along the banks of the Severn. A considerable portion on the borders of Merioneth is, however, occupied chiefly by heath and moss. The number of holdings has been rather decreasing of late years, the decrease being chiefly in those below 50 acres in extent, which in 1880 (the latest year regarding which there is information) numbered 3572, while there were 1650 between 50 and 300 acres, and 45 above 300 acres, of which 2 were above 1000. According to the agricultural returns of 1882, the total area of arable land was 256,081 acres, or nearly one-half of the whole. Of this 53,538 were under corn crops, 163,111 were permanent pasture, 23,882 rotation grasses, and only 11,107 green crops; 157 acres were under orchards, 2 under market gardens, 37 under nursery grounds, and 22,711 under woods. Of the corn crops, wheat occupied 18,665 acres, and oats 23,937 acres. Cattle, which are chiefly Herefords and cross-breeds, though there are some Devons and a few of the old Montgomeryshire breed, numbered 62,033 in 1882, of which 21,912 were cows and heifers in milk or in calf. Horses in 1882 numbered 13,985, of which 7060 were used solely for agricultural purposes. The county was long famous for its hardy breed of small horses called *merlins*, which are still to be met with. Many good hunters and cart-horses are now bred. The number of sheep in 1882 was 305,641. On some of the heath lands in the centre and west of the county a diminutive breed of sheep called *cluns* is pastured, but those kept in the better cultivated regions are principally Shropshire Downs. According to the latest return, the land was divided among 3241 proprietors, possessing 387,342 acres, with a gross annual rental of £378,512. Of these, 1311, or 40 per cent., possessed less than one acre, 32 possessed between 1000 and 2000 acres, and 25 between 2000 and 5000; the following possessed upwards of 5000 acres, viz.—Earl Powis, 33,545; Sir W. W. Wynn, 32,963; Lord Sudeley, 17,158; J. Naylor, 9275; and marquis of Londonderry, 7100.

Manufactures.—In all the towns the manufacture of woollen cloth, especially Welsh flannel, is carried on, and although the industry was lately on the decline it is now reviving.

Administration and Population.—Montgomeryshire comprises nine hundreds, and the municipal boroughs of Llanidloes (3421) and Welshpool (7107). Llanfyllin, Llanidloes, Machynlleth, Montgomery, Newtown, and Welshpool form the Montgomery district of boroughs, with a total population in 1881 of 19,925, and return one member to parliament. One member is also returned for the county. Montgomeryshire is partly in the dioceses of Bangor, Hereford, and St Asaph, and contains sixty-eight civil parishes, townships, or places, as well as parts of other parishes in adjoining counties. From 65,700 in 1831 the population had increased in 1851 to 67,335, and in 1871 to 67,623, but in 1881 it had diminished to 65,718, of whom 33,004 were males and 32,714 females.

History.—At the time of the Roman invasion, Montgomery was possessed by a tribe of the Cymri called Ordovices. Traces of several of the old British camps still remain, the principal being those at Doladdyn, on Breidden Hill, and at Caereinion. There are also a large number of cairns and barrows. The county was traversed by the great Roman road, the *Via Devana*, which was joined by a number of others; but the remains of Roman camps or stations are unimportant. After being vacated by the Romans, little is known of the history of Montgomery, until Wales was subdivided into three districts at the death of Rhodri the Great. Montgomery was then included under Powys, and formed the chief portion of Powys Gwenwynwyn, sometimes called Upper Powys. Powys or Powis Castle, the seat of the rulers of Upper Powys, was founded in 1108. Baldwyn, from which the county takes its Welsh name, was lieutenant of the marches; and, for the purpose of holding the district in check, a castle was built about the end of the 11th century, which, after being captured by the natives, was retaken by Roger de Montgomery. He gave his name to the castle, and to the surrounding district of ancient Powys, which was made a county by Henry VIII. in 1533.

MONTGOMERY, the county town, is situated on the declivity of a well-wooded hill near the eastern bank of the Severn, 21½ miles south by west of Shrewsbury, and 187¾ by rail north-west by north of London. It is a clean and well-built town, but somewhat scattered and irregular. The principal buildings are the parish church of Saint Nicholas (an old cruciform structure) and the town-hall. The borough has returned members to parliament since the time of Henry VIII., but by the Reform Act of 1832 it was constituted one of the Montgomery district of boroughs, which together return one member. The population of the borough (area, 3323 acres) was 1194 in 1881.

There are only a few crumbling remains of the old fortress of Montgomery, originally founded in the time of William the Conqueror to overawe the Welsh, and held by Roger de Montgomery, from whom the town takes its name. The castle was greatly enlarged in the time of Henry III., when it was the scene of frequent contests between that monarch and Llewelyn the Great. In the 14th century it was held by the Mortimers, from whom it passed to the house of York. By the crown it was granted in the 15th century to the Herberts of Cherbury, but during the Civil War it was surrendered by Lord Herbert of Cherbury to the Parliamentary forces, by whom it was dismantled.

MONTGOMERY, a district in the lieutenant-governorship of the Punjab, lying between 29° 58′ and 31° 33′ N. lat., and between 72° 29′ and 74° 10′ E. long., is bounded on the N.E. by Lahore, on the S.E. by the river Sutlej, on the S.W. by Múltán, and on the N.W. by Jhang. The area is 5573 square miles. Montgomery district, formerly known as Gugaira, occupies a wide extent of the Bári Doáb, or wedge of land between the Sutlej and the Rávi, besides stretching across the latter river into the adjoining Rechna Doáb. In the former tract a fringe of cultivated lowland skirts the bank of either river, but the whole interior upland consists of a desert plateau partially overgrown with brushwood and coarse grass, and in places with impenetrable jungle. On the farther side of the Rávi, again, the country at once assumes the same desert aspect.

The census of 1868 returned the population at 359,437 (males 200,016, females 159,421), viz., Hindus, 69,805; Mohammedans, 277,291; Sikhs, 12,286; and "others," 55. The Játs, or pastoral tribe, form the most distinctive class in the district. They bear the name of "Great Rávi," in contradistinction to the purely agricultural classes, who are contemptuously styled "Little Rávi." They possess a fine physique, with handsome features, claim a Rájput ancestry, and despise all who handle the plough. In former days they exercised practical sovereignty over the agricultural tribes. Only two towns in the district contain over 5000 inhabitants, viz., Pak Pattan (6086) and Kamalia (5695). The town of Montgomery, the headquarters station, had a population of only 2416 in 1868.

Out of a total assessed area of 3,569,746 acres, only 538,240 are returned as under cultivation. In 1872-73 the *rabi* (or spring harvest) acreage was as follows:—wheat (the chief crop), 162,989 acres; barley, 30,134; gram, 21,416; mustard, 2077; and tobacco, 1303 acres. In the same year the *kharif* (or autumn harvest) acreage was:—*joár*, 20,509 acres; rice, 18,727; cotton, 16,916; *til*, 12,457; *kangni*, 9493; and sugar-cane, 498 acres. Irrigation is practised from rivers, canals, and wells; the total area irrigated by public works is 66,495 acres, and by private works, 158,709. The desert uplands afford after the rains a scanty pasturage for the scattered herds of the Great Rávi Játs, and yield an impure carbonate of soda (*sajji*) from the alkaline plants with which they abound. The commercial staples include wheat, rice, gram, millets, cotton, wool, *ghi*, hides, and *sajji*. Large numbers of camels are bred for exportation. The imports comprise sugar, salt, oil, English piece goods, metals, indigo, and fruits. The manufactures consist of country cloth, coarse striped silk, and lacquered wood-work. The Lahore and Múltán railway intersects the district, which is also traversed in every direction by good unmetalled highways. The revenue of the district in 1871-72 amounted to £47,951, of which £42,355 was derived from the land-tax. Education in 1871-72 was afforded by 59 aided and unaided schools, with a total of 1417 pupils. The average annual rainfall for the seven years ending 1872-73 was 9·6 inches.

From time immemorial the Rechna Doáb has formed the home of a wild race of pastoral Játs, who have constantly maintained a sturdy independence against the successive rulers of northern India. The historians of Alexander's invasion mention a tribe called the Cathæans, who probably had their capital at Sangala in the Jhang district, and the Malli with their metropolis at Múltán, as in possession of this part of the country. The sites of Kot Kamalia and Harappa in Montgomery contain large mounds of antique bricks and other ruins, while many other remains of ancient cities

remarkable of which is Corndon Hill, rising to a height of 1700 feet. In some places the sedimentary rocks have been penetrated by trap mingled with shale or schist. Along the lines of dislocation there are frequent deposits of metallic lodes, carried there by the heated water rising from below. The lead mines of Montgomeryshire are of considerable importance, and at present the metal is wrought at seven different places. In 1881 the amount of lead ore obtained in the various mines was 3432 tons, yielding 2693 tons of lead and 25,432 oz. of silver, the total value being £36,495. There were also obtained 1114 tons of zinc ore, yielding 610 tons of zinc, of a total value of £3231.

Agriculture.—The climate is mild and genial, and the soil in the valleys remarkably fertile, especially along the banks of the Severn. A considerable portion on the borders of Merioneth is, however, occupied chiefly by heath and moss. The number of holdings has been rather decreasing of late years, the decrease being chiefly in those below 50 acres in extent, which in 1880 (the latest year regarding which there is information) numbered 3572, while there were 1650 between 50 and 300 acres, and 45 above 300 acres, of which 2 were above 1000. According to the agricultural returns of 1882, the total area of arable land was 256,081 acres, or nearly one-half of the whole. Of this 53,538 were under corn crops, 163,111 were permanent pasture, 23,882 rotation grasses, and only 11,107 green crops; 157 acres were under orchards, 2 under market gardens, 37 under nursery grounds, and 22,711 under woods. Of the corn crops, wheat occupied 18,665 acres, and oats 23,937 acres. Cattle, which are chiefly Herefords and cross-breeds, though there are some Devons and a few of the old Montgomeryshire breed, numbered 62,033 in 1882, of which 21,912 were cows and heifers in milk or in calf. Horses in 1882 numbered 13,985, of which 7060 were used solely for agricultural purposes. The county was long famous for its hardy breed of small horses called *merlins*, which are still to be met with. Many good hunters and cart-horses are now bred. The number of sheep in 1882 was 305,641. On some of the heath lands in the centre and west of the county a diminutive breed of sheep called *cluns* is pastured, but those kept in the better cultivated regions are principally Shropshire Downs. According to the latest return, the land was divided among 3241 proprietors, possessing 387,342 acres, with a gross annual rental of £378,512. Of these, 1311, or 40 per cent., possessed less than one acre, 32 possessed between 1000 and 2000 acres, and 25 between 2000 and 5000; the following possessed upwards of 5000 acres, viz.—Earl Powis, 33,545; Sir W. W. Wynn, 32,963; Lord Sudeley, 17,158; J. Naylor, 9275; and marquis of Londonderry, 7100.

Manufactures.—In all the towns the manufacture of woollen cloth, especially Welsh flannel, is carried on, and although the industry was lately on the decline it is now reviving.

Administration and Population.—Montgomeryshire comprises nine hundreds, and the municipal boroughs of Llanidloes (3421) and Welshpool (7107). Llanfyllin, Llanidloes, Machynlleth, Montgomery, Newtown, and Welshpool form the Montgomery district of boroughs, with a total population in 1881 of 19,925, and return one member to parliament. One member is also returned for the county. Montgomeryshire is partly in the dioceses of Bangor, Hereford, and St Asaph, and contains sixty-eight civil parishes, townships, or places, as well as parts of other parishes in adjoining counties. From 65,700 in 1831 the population had increased in 1851 to 67,335, and in 1871 to 67,623, but in 1881 it had diminished to 65,718, of whom 33,004 were males and 32,714 females.

History.—At the time of the Roman invasion, Montgomery was possessed by a tribe of the Cymri called Ordovices. Traces of several of the old British camps still remain, the principal being those at Dolarddyn, on Breidden Hill, and at Caereinion. There are also a large number of cairns and barrows. The county was traversed by the great Roman road, the *Via Devana*, which was joined by a number of others; but the remains of Roman camps or stations are unimportant. After being vacated by the Romans, little is known of the history of Montgomery, until Wales was subdivided into three districts at the death of Rhodri the Great. Montgomery was then included under Powys, and formed the chief portion of Powys Gwenwynwyn, sometimes called Upper Powys. Powys or Powis Castle, the seat of the rulers of Upper Powys, was founded in 1108. Baldwyn, from which the county takes its Welsh name, was lieutenant of the marches; and, for the purpose of holding the district in check, a castle was built about the end of the 11th century, which, after being captured by the natives, was retaken by Roger de Montgomery. He gave his name to the castle, and to the surrounding district of ancient Powys, which was made a county by Henry VIII. in 1533.

MONTGOMERY, the county town, is situated on the declivity of a well-wooded hill near the eastern bank of the Severn, 21½ miles south by west of Shrewsbury, and 187¾ by rail north-west by north of London. It is a clean and well-built town, but somewhat scattered and irregular. The principal buildings are the parish church of Saint Nicholas (an old cruciform structure) and the town-hall. The borough has returned members to parliament since the time of Henry VIII., but by the Reform Act of 1832 it was constituted one of the Montgomery district of boroughs, which together return one member. The population of the borough (area, 3323 acres) was 1194 in 1881.

There are only a few crumbling remains of the old fortress of Montgomery, originally founded in the time of William the Conqueror to overawe the Welsh, and held by Roger de Montgomery, from whom the town takes its name. The castle was greatly enlarged in the time of Henry III., when it was the scene of frequent contests between that monarch and Llewelyn the Great. In the 14th century it was held by the Mortimers, from whom it passed to the house of York. By the crown it was granted in the 15th century to the Herberts of Cherbury, but during the Civil War it was surrendered by Lord Herbert of Cherbury to the Parliamentary forces, by whom it was dismantled.

MONTGOMERY, a district in the lieutenant-governorship of the Punjab, lying between 29° 58′ and 31° 33′ N. lat., and between 72° 29′ and 74° 10′ E. long., is bounded on the N.E. by Lahore, on the S.E. by the river Sutlej, on the S.W. by Múltán, and on the N.W. by Jhang. The area is 5573 square miles. Montgomery district, formerly known as Gugaira, occupies a wide extent of the Bári Doáb, or wedge of land between the Sutlej and the Rávi, besides stretching across the latter river into the adjoining Rechna Doáb. In the former tract a fringe of cultivated lowland skirts the bank of either river, but the whole interior upland consists of a desert plateau partially overgrown with brushwood and coarse grass, and in places with impenetrable jungle. On the farther side of the Rávi, again, the country at once assumes the same desert aspect.

The census of 1868 returned the population at 359,437 (males 200,016, females 159,421), viz., Hindus, 69,805; Mohammedans, 277,291; Sikhs, 12,286; and "others," 55. The Játs, or pastoral tribe, form the most distinctive class in the district. The sites of Kot Kamalia and Harappa in Montgomery contain large mounds of antique bricks and other ruins, while many other remains of ancient cities

the province of Cordova, 32 miles to the south of the city of Cordova, on the Malaga railway, is strikingly situated on two hills which command a beautiful and extensive prospect of the surrounding country. The manufactures (principally weaving) are unimportant, and the trade of the place is chiefly in agricultural produce. The oil of the surrounding district is abundant and good; and it is the peculiar flavour of the pale dry light wine of Montilla that gives its name to the sherry known as Amontillado. The population in 1878 was 13,207. Montilla was the birthplace of "The Great Captain," and still shows the ruins of the castle of his father, Don Pedro Fernandez de Cordova.

MONTLUC, Blaise de Lasseran-Massencôme, Seigneur de (c. 1503-1577), marshal of France, was born about 1503, at the family seat near Condom in the modern department of Gers. He was the eldest son, and his family was a good one, but it was large and poor, and, like most gentlemen of Gascony, he had to trust for endowment to his sword. He served first as a private archer and man-at-arms in Italy, with Bayard for his captain, fought all through the wars of Francis I., and was knighted on the field of Cérisoles (1538). Having apparently enjoyed no patronage, he was by this time a man of middle age. Thenceforward, however, his merits were recognized by his appointment to various important posts. His chief feat was the famous defence of Siena (1555), which he has told so admirably. When the religious wars broke out in France, Montluc, a staunch royalist, held Guienne for the king, and exercised severe but impartial justice on Catholics and Protestants alike. He would have nothing to do with the Massacre of St Bartholomew. Henry III., however, made him marshal of France, an honour which he had earned by nearly half a century of service and by numerous wounds. He died at Estillac near Agen in 1577. Montluc's eminence above other soldiers of fortune in his day is due to his *Commentaires* (Bordeaux, 1592), in which he described his fifty years of service. This book, the "soldier's Bible" (or "breviary," according to others), as Henry IV. called it, is one of the most admirable of the many admirable books of memoirs produced by the unlearned gentry of France at that time. It is said to have been dictated, which may possibly account in some degree for the singular vivacity and picturesqueness of the style. Hardly any author excels Montluc in the clearness with which he brings military operations before the reader. As with most of his contemporaries, his work is didactic in purpose, and he often pauses to draw morals for the benefit of young commanders, but never tediously. The eloquence displayed in some of the speeches is remarkable. These *Commentaires* are to be found conveniently in the collection of Michaud and Poujoulat, but the standard edition is that of the *Société de l'Histoire de France*, edited by M. de Ruble (5 vols. 1865-72).

MONTLUÇON, the industrial capital of the centre of France, sometimes called the French Manchester, is the head of an arrondissement, and the largest town (26,079 inhabitants in 1881) of the department of Allier. The upper town consists of steep, narrow, winding streets, and preserves several buildings of the 15th and 16th centuries; the lower town, traversed by the river Cher (there converted into a canal communicating with that along the Loire), is the seat of the manufacturing industries, which embrace glass, steel, and iron works, lime-kilns, saw-mills, and a wool-spinning factory. The Commentry coal-mines are only a few miles distant. There is railway connexion with Moulins (50 miles to the east-north-east), Bourges, Limoges, and Clermont-Ferrand, and a new line is about to be opened to Tours *via* Chateauroux. Of the churches, Notre Dame is of the 15th century, St Pierre partly of the 12th, and St Paul modern. The town-hall, with a library, occupies the site of an old Ursuline convent, and two other convents now serve as college and hospital.

Montluçon, which existed as early as the 10th century, was taken by the English in 1171 and by Philippe Auguste in 1181; the English were beaten under its walls in the 14th century. The castle, rebuilt by Louis II., duke of Bourbon, was taken by Henry IV. during the religious wars; at present it is occupied as a barracks.

MONTMORENCY, the name of one of the oldest and most distinguished families in France, is derived from Montmorency, now in the department of Seine-et-Oise, in the immediate neighbourhood of Enghien and St Denis, and about 9 miles to the north-north-west of Paris. The family, since its first appearance in history in the person of Bouchard or Burchard I., sire de Montmorency in the 10th century, has furnished six constables and twelve marshals of France, several admirals and cardinals, numerous grand officers of the crown and grand masters of various knightly orders, and was declared by Henry IV. to be, after that of the Bourbons, the first house in Europe. Matthieu I., sire de Montmorency, received in 1138 the post of constable, and died in 1160. His first wife was Aline, the natural daughter of Henry I. of England; his second, Adelaide or Alice of Savoy, widow of Louis VI. and mother of Louis VII. According to Duchesne, he shared the regency of France with Suger, during the absence of the latter king on the second crusade. Matthieu II. had an important share in the victory of Bouvines (1214), and was made grand constable in 1218. During the reign of Louis VIII. (1223-1226) he distinguished himself chiefly in the south of France (Niort, Rochelle, Bordeaux). On the accession of Louis IX. he was one of the chief supports of the queen regent Blanche of Castile, and was successful in reducing all the vassals to obedience. He died in 1230. His younger son, Guy, in right of his mother, became head of the house of Montmorency-Laval. Anne de Montmorency (1493-1567), so named, it is said, after his godmother Anne of Brittany, was the first to attain the ducal title. He was born at Chantilly in 1493, and was brought up with the dauphin, afterwards Francis I., whom he followed into Italy in 1515, distinguishing himself especially at Marignano. In 1516 he became governor of Novara; in 1520 he was present at the Field of Cloth of Gold, and afterwards had charge of important negotiations in England. Successful in the defence of Mézières (1521), and as commander of the Swiss troops in the Italian campaign of the same year, he was made marshal of France in 1522, accompanied Francis into Italy in 1524, and was taken prisoner at Pavia in 1525. Released soon afterwards, he was one of the negotiators of the treaty of Madrid, and in 1530 reconducted the king's sons into France. On the renewal of the war by Charles V.'s invasion of France in 1536, Montmorency compelled the emperor to raise the siege of Marseilles; he afterwards accompanied the king of France into Picardy, and on the termination of the Netherlands campaign marched to the relief of Turin. In 1538, on the ratification of the ten years' truce, he was rewarded with the office of constable, but in 1541 he fell into disgrace, and did not return to public life until the accession of Henry II. in 1547. In 1548 he repressed the insurrections in the south-west, particularly at Bordeaux, with great severity, and in 1549-1550 conducted the war in the Boulonnais, negotiating the treaty for the surrender of Boulogne on 24th March 1550. In 1551 his barony was erected into a duchy. Soon afterwards his armies found employment in the north-east in connexion with the seizure of Metz, Toul, and Verdun by the French king. His attempt to relieve St Quentin issued in his defeat and captivity (10th August 1557), and he did not regain his liberty until the peace of Cateau-Cambrésis in 1559. Supplanted in the interval by the Guises, he was treated with coldness by the new king, Francis II., and compelled to give up his mastership of the royal house-

Supplanted in the interval by the Guises, he was treated with coldness by the new king, Francis II., and compelled to give up his mastership of the royal house-

thus of the blood-royal of France on both sides, and an heiress to immense property, she appeared to be very early destined to a splendid marriage. It was perhaps the greatest misfortune of her life that "Mademoiselle" (as her courtesy title went) was encouraged or thought herself encouraged to look forward to the throne of France as the result of a marriage with Louis XIV., who was, however, eleven years her junior. Ill-luck, or her own wilfulness, frustrated numerous plans for marrying her to various persons of more or less exalted station, including Charles II. of England, then Prince of Wales. She was just of age when the Fronde broke out, and, attributing as she did her disappointments to Mazarin, she sympathized with it not a little. It was not, however, till the new or second Fronde that she displayed in a very curious fashion a temper and courage as masculine and adventurous as those of her father Gaston had always been effeminate and timid. She not only took nominal command of one of the armies on the princes' side, but she literally and in her own person took Orleans by escalade, crossing the river, breaking a gate, and mounting the walls with the applause of the populace of the city, but in face of the refusal of the authorities to admit her. No good result, however, came to her party from this extraordinary act, and she had to retreat to Paris, where she practically commanded the Bastille and the adjoining part of the walls. On the 2d of July (1652) the battle of the Faubourg Saint Antoine, between the Frondeurs under Condé and the royal troops under Turenne, took place, and the former, being beaten, found themselves in an awkward situation, between their conquerors and the walls of a city, which, though not exactly hostile to them, was not nominally on their side, and had closed its gates against them. Mademoiselle saved them by giving orders not merely for the gates under her control to be opened but for the cannon of the Bastille to fire on the royalists, which was done. Her own residence (and indeed her property) was the Luxembourg, and here she found herself during the riots which followed the battle; but in the heat of the *émeute* she installed herself in the hôtel de ville, and played the part of mediatrix between the opposed parties. Her political importance lasted exactly six months, and did her little good, for it created a lifelong prejudice against her in the mind of her cousin, Louis XIV., who never forgave opposition to his sovereign power. Nor had she any support to look for from her pusillanimous father, who hastened to make terms for himself,—a matter the less difficult that his known faithlessness had prevented the chiefs of the Fronde from engaging him at all deeply in their schemes. Mademoiselle, on the other hand, was for some years in disgrace, and resided on her estates. It was not till 1657 that she reappeared at court, but, though projects for marrying her were once more set on foot, she was now past her first youth. Her incurable self-will, moreover, still stood in her way, and suitor after suitor was rejected for reasons good or bad. She was nearly forty, and had already corresponded seriously with Madame de Motteville on the project of establishing a ladies' society "sans mariage et sans amour," when a young Gascon gentleman named Puyguilhem, afterwards celebrated as M. de Lauzun, attracted her attention. It was some years before the affair came to a crisis, but at last, in 1670, Mademoiselle solemnly demanded the king's permission to marry Lauzun. Madame de Sévigné's letter on this occasion is one of the most famous of her collection. Louis, who liked Lauzun, and who had been educated by Mazarin in the idea that Mademoiselle ought not to be allowed to carry her vast estates and royal blood to any one who was himself of the blood-royal, or even to any foreign prince, gave his consent, but it was not immediately acted on. The pride of the other members of the royal family, and the spite of the king's brother, Monsieur, who had, after the death of Henrietta of England, made offers to his cousin, prevailed with Louis to rescind his permission. Not long afterwards Lauzun, for another cause, was imprisoned in Pignerol, and it was years before Mademoiselle was able to buy his release from the king by settling no small portion of her estates on Louis's bastards. The elderly lovers (for in 1681, when Lauzun was released, he was nearly fifty, and Mademoiselle was fifty-four) were then secretly married, if indeed they had not gone through the ceremony ten years previously. But Lauzun, a coarse and brutal adventurer, tyrannized over his wife, and her spirit, which was yet unbroken, at length got the better of her passion. It is said that on one occasion he addressed her thus, "Louise d'Orléans, tire-moi mes bottes," and that she at once and finally separated from him. She lived, however, for some years after he had achieved his last adventure (that of assisting the family of James II. to escape from England, and attempting to defend their cause in Ireland), gave herself to religious duties, and finished her *Mémoires*, which extend to within seven years of her death (9th April 1693), and which she had begun when she was in disgrace thirty years earlier. These *Mémoires* (Amsterdam, 1729) are of very considerable merit and interest, though, or perhaps because, they are extremely egotistical and often extremely desultory. Mademoiselle writes without art, but with the hereditary ability of her family, and the strongly personal view which she takes of public events is rather an advantage than a disadvantage. They are to be found in the great collection of Michaud and Poujoulat, and have been frequently edited apart. (G. SA.)

MONTREAL, the largest city in the Dominion of Canada, its chief seat of commerce and principal port of entry, is situated on an island of about 30 miles in length and 7 in breadth, at the confluence of the rivers Ottawa and St Lawrence, 45° 32′ N. lat. and 73° 32′ W. long. It stands at the head of ocean navigation, 160 miles above Quebec, and nearly 1000 miles (986) from the Atlantic Ocean, and lies at the foot of the great chain of river, lake, and canal navigation which extends westward through the great lakes. Montreal is built upon a series of terraces, the former levels of the river or of a more ancient sea. Behind those rises Mount Royal, a mass of trap-rock thrown up through the surrounding limestone strata to a height of 700 feet above the level of the river. From this rock the city derives its name, though its original founder, Paul de Chomedey, sire de Maisonneuve, in 1642, gave it the name of Ville-Marie, when it was dedicated with religious enthusiasm, not as a centre of commercial enterprise, but as the seat of a mission which aimed specially at the conversion of the native Indians. The modern city of Montreal occupies an area of about eight square miles,—its principal streets running parallel with the river. On the north side of the Mountain the Trenton limestone approaches the surface, and is there quarried for building purposes. Of this grey limestone most of the public edifices and many of the better class of private dwellings are built. But both brick and wood are largely used for workshops and private houses of a humbler class. The western slope of the Mountain is occupied by the Côte des Neiges (Roman Catholic) cemetery, and the Mount Royal (Protestant) cemetery. The upper portion of the Mountain, embracing an area of 430 acres, is now laid out as a public park, with fine drives shaded by well-grown trees. From its commanding site, and the wide expanse of the valley of the St Lawrence, the views on all sides are of great variety and beauty. A well-cultivated and wooded country, watered by the Ottawa and the St Lawrence, stretches away on either hand, being bounded on the west by the lakes of St Louis and the Two Mountains, and on the distant horizon by

thus of the blood-royal of France on both sides, and an heiress to immense property, she appeared to be very early destined to a splendid marriage. It was perhaps the greatest misfortune of her life that "Mademoiselle" (as her courtesy title went) was encouraged or thought herself encouraged to look forward to the throne of France as the result of a marriage with Louis XIV., who was, however, eleven years her junior. Ill-luck, or her own wilfulness, frustrated numerous plans for marrying her to various persons of more or less exalted station, including Charles II. of England, then Prince of Wales. She was just of age when the Fronde broke out, and, attributing as she did her disappointments to Mazarin, she sympathized with it not a little. It was not, however, till the new or second Fronde that she displayed in a very curious fashion a temper and courage as masculine and adventurous as those of her father Gaston had always been effeminate and timid. She not only took nominal command of one of the armies on the princes' side, but she literally and in her own person took Orleans by escalade, crossing the river, breaking a gate, and mounting the walls with the applause of the populace of the city, but in face of the refusal of the authorities to admit her. and ultimately became one of the leading merchants in Montreal. At his death in 1813 he left his property for the founding of a college. The most recent and liberal addition to it is the Peter Redpath Museum, valued at upwards of $100,000, the gift of a wealthy citizen. The university embraces the faculties of arts, law, and medicine, and has also a department of practical science. The college buildings stand in a pleasant park fronting on Sherbrooke Street, at the base of the Mountain. Theological colleges in connection with the Church of England, the Presbyterian, Methodist, and Congregational Churches, occupy buildings in the vicinity, and their students attend the classes at M'Gill College for secular instruction. The Seminary of St Sulpice is a theological training school for priests, where the larger portion of the Roman Catholic clergy of the province of Quebec have received their training, and also a college where a large number of the French Canadian youth obtain their education. This seminary is held in high esteem, and attracts many Roman Catholic students from the United States. Laval University, which has its chief seat at Quebec, has also a branch at Montreal, with a large staff of professors, chiefly in theology, law, and medicine. The M'Gill and the Jacques Cartier Normal Schools for training teachers for the Protestant and Roman Catholic public schools are conducted under the Protestant and Roman Catholic boards of public instruction; and model schools attached to them afford the requisite practical training for teachers. The principal public monuments are the column erected in honour of Lord Nelson, and a bronze statue of Queen Victoria, by the late Marshall Wood, which occupies a good site in Victoria Square.

The commerce of Montreal is well represented by the architectural character of its banking establishments and many of the large mercantile houses. It is also the seat of a large manufacturing industry. But the most substantial evidence of its importance as a commercial centre is its harbour. The solidly-built basins, wharves, quays, and canal locks extend for upwards of a mile and a half along the river-side. In 1849, at a period of depression, the total value of the imports and exports amounted to £2,013,478 sterling. In 1882 they had risen to £15,633,657 sterling. The business of the port at the same date is thus expressed in Canadian currency:—total value of exports $26,334,312, of imports $49,749,461; customs duties collected estimated at $8,100,366. The number of sea-going vessels in port was 648, of which fully one-half were ocean steamers, in addition to which the inland vessels arriving at the port numbered 6543. The estimated value of real estate in Montreal is $65,978,930. The population in 1851 numbered 57,715; in 1881 it had increased to 140,747, of whom 78,684 were of French and 28,995 of Irish origin, and of the whole number, 103,579 were Roman Catholic.

The city returns three members to the *Canadian House of Commons*, and the same number to the provincial legislature of Quebec.

When the first French explorers landed on the island of Montreal under the leadership of Jacques Cartier in 1535, a large Indian palisaded town existed a little to the west of Mount Royal, and not far from the present English cathedral. To this fortified town the Indians gave the name of Hochelaga, and Jacques Cartier describes it as surrounded by fields of grain and other evidences of a settled native population. The name is now applied to the eastern suburb of the modern city. Sixty years later, when Samuel de Champlain made his way up the St Lawrence, and climbed to the summit of Mount Royal, the populous native town had disappeared, and only two Indians were found from whom some obscure hints were derived of war between rival tribes, followed by the destruction of the town and the extermination or flight of its former occupants. The enmity thus established between the Wyandotts or Hurons of Canada and the Iroquois settled in the valley of the Hudson and south of Lake Ontario was perpetuated throughout the whole period of French occupation. Champlain took the side of the Hurons, while the Iroquois allied themselves with the Dutch and English settlers on the Hudson. Thus the early history of Montreal is largely occupied with incidents of Indian warfare. In 1665 the marquis de Tracy arrived from France, bringing with him a regiment of French soldiers, with whose aid the Indian assailants were driven off, and forts erected and garrisoned to repel their incursions; thus protected, Montreal became the centre of the fur trade with the west, and entered on its history as a commercial city. In 1722 it was fortified with a bastioned wall and ditch, under the directions of De Lery; and the citadel was erected on a height now laid out as Dalhousie Square. The taking of Quebec by the English under General Wolfe in 1759 was followed ere long by the surrender of Montreal. Since that date it has rapidly developed as an important centre of commercial and manufacturing enterprise. (D. W.)

MONTROSE, a royal and parliamentary borough and seaport of Forfarshire, Scotland, is situated on the German Ocean at the mouth of the South Esk, on a branch of the Caledonian Railway, 30 miles east-north-east of Dundee, and 38 south-south-west of Aberdeen. Its harbour basin, formed by the estuary of the South Esk, has an area of about 4 square miles, and is dry at ebb-tide, but at high water there is a depth of about 18 feet at the bar. The length of the quays and docks is about $1\frac{1}{2}$ miles. The South Esk is crossed by a suspension bridge erected in 1829 at a cost of £20,000, and having a length from the points of suspension of 422 feet (with its approaches 800 feet). On the links to the east of the town is one of the finest golfing greens in Scotland. In the High Street, which is of considerable width, and contains several very lofty houses, there are monuments to Sir Robert Peel and to Joseph Hume, formerly member for the Montrose boroughs. The principal buildings are the parish church—one of the largest churches in Scotland—the town-house, the infirmary, and the academy. There is a public library with 19,000 volumes, and a mechanics' library with 7000 volumes. Besides the staple industry of flax-spinning, there are manufactures of linen, sail-cloth, sheetings, starch, and soap. Iron-founding, tanning, and brewing are also carried on. The export trade is chiefly in manufactured goods, agricultural produce, and fish; the principal imports are timber and coal. In 1881 the number of ships that entered coastwise was 373 of 48,828 tons, the number that cleared 250 of 21,877 tons; the number engaged in the foreign and colonial trade in the same year was—entered 108 of 34,868 tons, cleared 42 of 10,359 tons. Montrose is also one of the principal fishing-stations in Scotland, the number of registered boats in 1881 being 342 of 4168 tons, giving constant employment to 697 persons, and occasional employment to 300. Montrose joins with Arbroath, Brechin, Forfar, and Inverbervie in returning one member to parliament. The population of the royal burgh in 1871 was 15,720, and 16,280 in 1881; the population of the parliamentary burgh in the same years was 14,452 and 14,975.

Montrose received a charter from David I. in the 12th century, and was made a royal burgh by David II. in 1352. The town was destroyed by fire in 1244. It was from the port of Montrose that Sir James Douglas in 1330 embarked for the Holy Land with the heart of Bruce, and that Prince James Stuart, "the Old Pretender," set sail in 1716 for France, after the failure of his cause in Scotland. The town is the birthplace of Andrew Melville, of the great marquis of Montrose, and of Joseph Hume.

MONTROSE, James Graham, Marquis of (1612-1650), born in 1612, became the fifth earl of Montrose by his father's death in 1626. He was educated at St Andrews; and in 1629, at the early age of seventeen, he married Magdalene Carnegie, daughter of the earl of Southesk. In 1636, on his way home from a prolonged visit to the Continent, he sought an introduction to Charles I., but, as it is said, was frustrated in his hope of obtaining the king's favour by an intrigue of the marquis of Hamilton. Not long after the outbreak of the Scottish troubles in 1637 he joined the party of resistance, and was for some time its most energetic champion. He had nothing puritanical in his nature, but he shared in the ill feeling aroused in the Scottish nobility by the political authority given by Charles to the bishops, and in the general indignation at the king's ill-judged scheme of imposing upon Scotland a liturgy which had been drawn up at the instigation of the English court, and which had been corrected in England by that Archbishop Laud who now became known in Scotland under the nickname of "the pope of Canterbury." Montrose's chivalrous enthusiasm eminently qualified him to be the champion of a national cause, and the resistance of Scotland was quite as much national as it was religious. He signed the Covenant, and became one of the foremost Covenanters. The part assigned to him was the suppression of the opposition to the popular cause which arose around Aberdeen and in the country of the Gordons. Three times, in July 1638, and in March and June 1639, Montrose

and ultimately became one of the leading merchants in Montreal. At his death in 1813 he left his property for the founding of a college. The most recent and liberal addition to it is the Peter Redpath Museum, valued at upwards of $100,000, the gift of a wealthy citizen. The part assigned to him was the suppression of the opposition to the popular cause which arose around Aberdeen and in the country of the Gordons. Three times, in July 1638, and in March and June 1639, Montrose

of a mass of granite about 3000 feet in compass and 165 feet in height, rises at a distance of nearly a mile from the shore in the bay of St Michel, near the mouth of the Couësnon, at the vertex of the angle formed by the coasts of Brittany and Normandy. The quicksands by which it is surrounded, and which stretch far to seaward, are exposed at low water, and highly dangerous to those who venture on them without a guide. Recently efforts at reclamation have been made, and amongst other works a causeway has been constructed connecting Mont St Michel with the nearest point of the mainland (near Moidrey); an unfortunate consequence of these operations has been that some portions of the ramparts of the island have been sapped by the altered tidal currents. The fortress-abbey, to which the rock owes its fame, stands upon the more precipitous side towards the north and west; the sloping portion towards the east and south is occupied by dwelling-houses. The strong machicolated and turreted wall by which the whole is surrounded is pierced only by a single gateway. The northward wall of the abbey (La Merveille), dating from the 13th century, is of remarkable boldness; it is 246 feet in length and 108 feet in height, is supported by twenty buttresses, and is pierced by a variety of openings. The single street of the island, leading from the one gateway up to the donjon of the fortress, is lined with houses, most of them used as lodging-houses by visitors and pilgrims; it contains an old parish church, and the house of Du Guesclin is also pointed out. The abbey consists principally of two parallel buildings of three stories each, that on the east containing hospitium, refectory, and dormitory, and that on the west the cellar, knights' hall, and cloister. The knights' hall is a superb piece of Gothic architecture, measuring 85 feet by 59, with three rows of richly-ornamented pillars. The cloister is one of the purest and most graceful works of the 13th century (1228). The church has a number of imperfect turrets, and is surmounted by a square tower of the 17th century, with a statue of St Michael, which was crowned in 1877. The nave, which dates from the 11th century, is Norman; but the choir, which collapsed in 1421, has been rebuilt in the flamboyant style. Beneath is a fine crypt.

Mont St Michel was a sacred place even in the time of the Druids. It became a seat of Christian worship in the 8th century, when a monastery was founded upon it (with the usual miraculous accompaniments) by St Aubert, bishop of Avranches. It soon became a favourite resort of pilgrims, not only from all parts of France, but also from Great Britain and Ireland, and even from Italy. It was plundered by the Normans; but Rollo, on his conversion, made restitution. At the time of the Conquest it supplied William of Normandy with six ships, and received a considerable share of the English spoils. About this time the monks began to give themselves to learning and to collect a large library, and in the 12th century the establishment reached its highest prosperity. It was burnt by the troops of Philip Augustus, who afterwards furnished large sums for its restoration (La Merveille). St Louis (Louis IX.) made a pilgrimage to Mont St Michel, and was afterwards very liberal to it. During the hundred years' war it offered a memorable resistance to the English; and here, on 1st August 1469, Louis XI. instituted the order of St Michel, and held a brilliant chapter. A similar celebration was held by Francis I. During the religious wars the Huguenots made repeated unsuccessful attempts to seize the fortress; it opened its gates to Henry IV. after his abjuration. About 1615 the Benedictine monks of Mont St Michel were replaced by monks of the Congregation of St Maur; after the Revolution the abbey was used as a prison for political offenders. It is now an historical monument; it contains an orphanage, and is undergoing repairs.

MONTSERRAT, one of the Leeward Islands in the West Indies, situated 16° 45′ N. lat. and 62° 7′ W. long., is 12 miles long and 8 broad in its widest part, and has an area of 32 square miles. The uneven and rugged surface suggests possibly volcanic origin. Its general appearance is very picturesque, the most interesting natural feature being the Souffrière. The island was discovered by Columbus in 1493, and received its name either because of its broken appearance or after the mountain in Spain. It was colonized by the English under Sir Thomas Warner in 1632, and was taken by the French in 1664. Restored to the English in 1668, it capitulated to the French in 1782, but was again restored in 1784. It is now a presidency under the general government at Antigua, and has a legislative council, composed of officials and crown nominees. The climate is the most healthy in the West Indies. The population (10,087) consists principally of negroes, with several hundred whites. The revenue and expenditure average £5600 per annum. Sugar exports range from 1200 to occasionally 2000 tons. An important industry is the cultivation of limes and the manufacture of juice. About 700 puncheons of raw lime juice, 300 hogsheads of concentrated juice, and an increasing quantity of fresh green limes are exported annually. For the three years ending 1880 the average value of imports was £26,390, of exports £32,963. The principal town is Plymouth, lying midway along the south-west coast.

MONTSERRAT. Thirty miles to the north-west of Barcelona in Spain there rises a very remarkable mountain of grey conglomerate, 24 miles in circumference, and at its loftiest point (San Geronimo) a little more than 4000 feet in height. From the comparative lowness of the surrounding district, and from its extraordinary configuration, it is a conspicuous object for many miles around. The mountain consists of jagged pinnacles and spires rising abruptly from the base of the mass, which is cloven with many clefts, and abounds with steep precipices. It is the *Mons Serratus* of the Romans, the *Monte Serrado* of the Spaniards, and is thus named either in allusion to its jagged appearance, like the teeth of a saw, or because the eastern face is split, as if sawn,—which occurred, say the Spanish legends, at the time of the crucifixion, when the rocks were rent. The arms of the monastery represent a mountain with a saw resting upon it and penetrating some distance into its mass. Its pinnacles and pyramids and sharp angular masses resemble a mountain of hard crystalline volcanic tuff which occurs between Akureyri and Kalmanstunga in Iceland. The effect of Montserrat may be realized faintly if we place ourselves upon the roof of Milan cathedral, and imagine the forest of spires magnified a thousandfold. The central spire will represent San Geronimo. The result of this varied contour in the case of Montserrat is to make it one of the most picturesque places in Europe. Paths wind along the faces of the precipices, ascending to bare grey summits, descending to sheltered valleys filled with evergreens and flowers. The Pyrenees are seen in one direction, the sea in another, while the Llobregat winds at the foot of the mountain through the village of Monistrol. Manresa and other villages are seen scattered over the plain; and hills covered with a warm red soil alternate with rich valleys. Street says of Montserrat,—"After much experience of mountains, it strikes me more each time that I see it as among the very noblest of rocks."

The monastery, a great pile of buildings, stands upon a narrow platform on the edge of a vast chasm in the eastern face of the mountain. It owes its existence to an image of the Virgin, said to have been carved by St Luke, and brought to Barcelona by St Peter in 50 A.D. When the Moors invaded the province in 717, the image was taken to Montserrat and hidden in a cave. In 880 Gondemar, bishop of Vich, was attracted to the cave by sweet sounds and smells, and there found the image, which he determined to take to Manresa. But at a certain spot on the mountain the image refused to proceed farther; there it was consequently deposited, and a chapel was erected to contain it. A stone cross near the walls of the monastery still marks the spot where the image refused to move. Round the chapel a nunnery was built, and in 976 this was enlarged

This state of things arises from the inherent difficulties and complexities of the subject, and from the fact that no one method or system has yet been discovered by which all the difficulties can be surmounted and all the complexities disentangled. Hence each investigator, when he has desired to make any substantial advance beyond his predecessors, has been obliged to take up the subject from a new point of view, and to devise such method as might seem to him most suitable to the special object in hand. The historical treatment is therefore that best adapted to give a clear idea of the results of these investigations. The ancient and modern histories of the subject are quite distinct, the modern epoch commencing with Newton. The great epoch made by Copernicus did not extend to the case of the moon at all, because in every investigation of the moon's motion, modern as well as ancient, the motion is referred to the earth as a centre. Hence the heliocentric system introduced no new conception of this motion, except that of taking place round a moving earth instead of round a fixed one. This change did not affect the consideration of the relative motion of the earth and moon, with which alone the lunar theory is concerned. The two stages of the lunar theory are therefore—(1) that in which the treatment was purely empirical, (2) that in which it was founded rationally on the law of gravitation.

It is in the investigation of the moon's motion that the merits of ancient astronomy are seen to the best advantage. In the hands of Hipparchus (see ASTRONOMY, vol. ii. p. 749) the theory was brought to a degree of precision which is really marvellous when we compare it, either with other branches of physical science in that age, or with the remarks and speculations of contemporary non-scientific writers. Whether this was wholly the work of Hipparchus, or whether he simply perfected a system already devised by his predecessors, it is now impossible to say; but, so far as certain knowledge extends, the works of his predecessors did not embrace more than the determination of the mean motion of the moon and its nodes. Although the general fact of a varying motion may have been ascertained, the circumstances of the variation had probably never been thoroughly investigated. The discoveries of Hipparchus were:—

1. *The Eccentricity of the Moon's Orbit.*—He found that the moon moved most rapidly near a certain point of its orbit, and most slowly near the opposite point. The law of this motion was such that the phenomena could be represented by supposing the motion to be actually circular and uniform, the apparent variations being explained by the hypothesis that the earth was not situated in the centre of the orbit, but was displaced by an amount about equal to one-twentieth of the radius of the orbit. Then, by a well-known law of kinematics, the angular motion round the earth would be most rapid at the point nearest the earth—that is, at *perigee*—and slowest at the point most distant from the earth—that is, at *apogee*. Thus the apogee and perigee became two definite points of the orbit, indicated by the variations in the angular motion of the moon.

2. *The Motion of the Perigee and Apogee.*—As already defined, the perigee and apogee are at the ends of that diameter of the orbit which passes through the eccentrically situated earth, or, in other words, they are on that line which passes through the centre of the earth and the centre of the orbit. This line was called the *line of apsides*. On comparing observations made at different times, it was found that the line of apsides was not fixed, but made a complete revolution in the heavens, in the order of the signs of the zodiac, in about nine years.

3. *The Numerical Determination of the Elements of the Moon's Motion.*—In order that the two capital discoveries just mentioned should have the highest scientific value it was essential that the numerical values of the elements involved in these complicated motions should be fixed with precision. This Hipparchus was enabled to do by lunar eclipses. Each eclipse gave a moment at which the longitude of the moon was 180° different from that of the sun, and the latter admitted of ready calculation. Assuming the mean motion of the moon to be known and the perigee to be fixed, three eclipses observed in different points of the orbit would give as many true longitudes of the moon, which longitudes could be employed to determine three unknown quantities—the mean longitude at a given epoch, the eccentricity, and the position of the perigee. By taking three eclipses separated at short intervals, both the mean motion and the motion of the perigee would be known beforehand, from other data, with sufficient accuracy to reduce all the observations to the same epoch, and thus to leave only the three elements already mentioned unknown. In the hands of a modern calculator the problem would be a very simple one, requiring little more than the solution of a system of three equations with as many unknown quantities. But without algebra the solution was long and troublesome, and not entirely satisfactory. Still, it was probably correct within the necessary limits of the errors of the observations. The same three elements being again determined from a second triplet of eclipses at as remote an epoch as possible, the difference in the longitude of the perigee at the two epochs gave the annual motion of that element, and the difference of mean longitudes gave the mean motion. Such was the method of determining the elements of the moon's motion down to the time of Copernicus.

The determination of the eccentricity from eclipses, as above described, leads to an important error in the resulting value of the eccentricity, owing to the effect of the neglected evection. We know from our modern theory that the two principal inequalities in the moon's true longitude are—

$$\begin{array}{ll} 6^\circ{\cdot}29 \sin g & \text{(Equation of centre)} \\ +1^\circ{\cdot}27 \sin (2D-g) & \text{(Evection),} \end{array}$$

where g = mean anomaly, and D = mean angular distance of the moon from the sun. Now during a lunar eclipse we always have $D = 180°$ very nearly, and $2D = 360°$. Hence the evection is then $-1^\circ{\cdot}27 \sin g$, and so has the same argument, g, as the equation of centre, and so is confounded with it. The value of the equation of centre derived from eclipses is thus $(6^\circ{\cdot}29 - 1^\circ{\cdot}27 = 5^\circ 02) \sin g$. Therefore the eccentricity found by Hipparchus and Ptolemy was only 5°, and was more than a degree less than its true value.

The next important step in advance was the discovery of the "evection," which is described by Ptolemy (see ASTRONOMY, vol. ii. p. 750) as if made by himself. In view of the bad habit which Ptolemy had of making his own observations verify results previously arrived at, which were sometimes in error, we must view such a discovery by him as quite exceptional, and as best explainable by the large magnitude of the outstanding error. Although, as just shown, the erroneous eccentricity found by Hipparchus would always represent eclipses, so that the error could never be detected by eclipses, the case was entirely different when the moon was in quadratures. Comparing the inequalities already written with that found by Hipparchus, we see that the latter required the correction—

$$1^\circ{\cdot}27 \{\sin g + \sin (2D-g)\} =$$
$$1^\circ{\cdot}27 \{(1-\cos 2D) \sin g + \sin 2D \cos g\}.$$

At quadratures we have $D = \pm 90°$, $2D = 180°$, and hence $\cos 2D = -1$ and $\sin 2D = 0$. The omitted inequalities at these points of the orbit have therefore the value $2^\circ{\cdot}54 \sin g$, a quantity so large that it could not fail to be detected by careful observations with the astrolabe. Such an inequality as this, superposed upon the eccentric motion of the moon, was very troublesome to astronomers who had no way of representing the celestial motions except by geometrical construction. The construction proposed by Ptolemy was so different from those employed for the

This state of things arises from the inherent difficulties and complexities of the subject, and from the fact that no one method or system has yet been discovered by which all the difficulties can be surmounted and all the complexities disentangled. Hence each investigator, when he has desired to make any substantial advance beyond his predecessors, has been obliged to take up the subject from a new point of view, and to devise such method as might seem to him most suitable to the special object in hand. The historical treatment is therefore that best adapted to give a clear idea of the results of these investigations. The great epoch made by Copernicus did not extend to the case of the moon at all, because in every investigation of the moon's motion, modern as well as ancient, the motion is referred to the earth as a centre. Hence the heliocentric system introduced no new conception of this motion, except that of taking place round a moving earth instead of round a fixed one. This change did not affect the consideration of the relative motion of the earth and moon, with which alone the lunar theory is concerned. The two stages of the lunar theory are therefore—(1) that in which the treatment was purely empirical, (2) that in which it was founded rationally on the law of gravitation.

It is in the investigation of the moon's motion that the merits of ancient astronomy are seen to the best advantage. In the hands of Hipparchus (see ASTRONOMY, vol. ii. p. 749) the theory was brought to a degree of precision which is really marvellous when we compare it, either with other branches of physical science in that age, or with the remarks and speculations of contemporary non-scientific writers. Whether this was wholly the work of Hipparchus, or whether he simply perfected a system already devised by his predecessors, it is now impossible to say; but, so far as certain knowledge extends, the works of his predecessors did not embrace more than the determination of the mean motion of the moon and its nodes. Although the general fact of a varying motion may have been ascertained, the circumstances of the variation had probably never been thoroughly investigated. The discoveries of Hipparchus were:—

1. *The Eccentricity of the Moon's Orbit.*—He found that the moon moved most rapidly near a certain point of its orbit, and most slowly near the opposite point. The law of this motion was such that the phenomena could be represented by supposing the motion to be actually circular and uniform, the apparent variations being explained by the hypothesis that the earth was not situated in the centre of the orbit, but was displaced by an amount about equal to one-twentieth of the radius of the orbit. Then, by a well-known law of kinematics, the angular motion round the earth would be most rapid at the point nearest the earth—that is, at *perigee*—and slowest at the point most distant from the earth—that is, at *apogee*. Thus the apogee and perigee became two definite points of the orbit, indicated by the variations in the angular motion of the moon.

2. *The Motion of the Perigee and Apogee.*—As already defined, the perigee and apogee are at the ends of that diameter of the orbit which passes through the eccentrically situated earth, or, in other words, they are on that line which passes through the centre of the earth and the centre of the orbit. This line was called the *line of apsides*. On comparing observations made at different times, it was found that the line of apsides was not fixed, but made a complete revolution in the heavens, in the order of the signs of the zodiac, in about nine years.

3. *The Numerical Determination of the Elements of the Moon's Motion.*—In order that the two capital discoveries just mentioned should have the highest scientific value it was essential that the numerical values of the elements involved in these complicated motions should be fixed with precision. This Hipparchus was enabled to do by lunar eclipses. Each eclipse gave a moment at which the longitude of the moon was 180° different from that of the sun, and the latter admitted of ready calculation. Assuming the mean motion of the moon to be known and the perigee to be fixed, three eclipses observed in different points of the orbit would give as many true longitudes of the moon, which longitudes could be employed to determine three unknown quantities—the mean longitude at a given epoch, the eccentricity, and the position of the perigee. By taking three eclipses separated at short intervals, both the mean motion and the motion of the perigee would be known beforehand, from other data, with sufficient accuracy to reduce all the observations to the same epoch, and thus to leave only the three elements already mentioned unknown. In the hands of a modern calculator the problem would be a very simple one, requiring little more than the solution of a system of three equations with as many unknown quantities. But without algebra the solution was long and troublesome, and not entirely satisfactory. Still, it was probably correct within the necessary limits of the errors of the observations. The same three elements being again determined from a second triplet of eclipses at as remote an epoch as possible, the difference in the longitude of the perigee at the two epochs gave the annual motion of that element, and the difference of mean longitudes gave the mean motion. Such was the method of determining the elements of the moon's motion down to the time of Copernicus.

The determination of the eccentricity from eclipses, as above described, leads to an important error in the resulting value of the eccentricity, owing to the effect of the neglected evection. We know from our modern theory that the two principal inequalities in the moon's true longitude are—

$$\begin{array}{ll} 6^\circ{\cdot}29 \sin g & \text{(Equation of centre)} \\ +1^\circ{\cdot}27 \sin (2D-g) & \textit{(Evection)}, \end{array}$$

where g = mean anomaly, and D = mean angular distance of the moon from the sun. Now during a lunar eclipse we always have $D = 180°$ very nearly, and $2D = 360°$. Hence the evection is then $-1^\circ{\cdot}27 \sin g$, and so has the same *argument*, g, as the equation of centre, and so is confounded with it. The value of the equation of centre derived from eclipses is thus $(6^\circ{\cdot}29 - 1^\circ{\cdot}27 = 5^\circ\,02) \sin g$. Therefore the eccentricity found by Hipparchus and Ptolemy was only 5°, and was more than a degree less than its true value.

The next important step in advance was the discovery of the "evection," which is described by Ptolemy (see ASTRONOMY, vol. ii. p. 750) as if made by himself. In view of the bad habit which Ptolemy had of making his own observations verify results previously arrived at, which were sometimes in error, we must view such a discovery by him as quite exceptional, and as best explainable by the large magnitude of the outstanding error. Although, as just shown, the erroneous eccentricity found by Hipparchus would always represent eclipses, so that the error could never be detected by eclipses, the case was entirely different when the moon was in quadratures. Comparing the inequalities already written with that found by Hipparchus, we see that the latter required the correction—

$$1^\circ{\cdot}27\ \{\sin g + \sin (2D-g)\} =$$
$$1^\circ{\cdot}27\ \{(1-\cos 2D) \sin g + \sin 2D \cos g\}.$$

At quadratures we have $D = \pm 90°$, $2D = 180°$, and hence $\cos 2D = -1$ and $\sin 2D = 0$. The omitted inequalities at these points of the orbit have therefore the value $2^\circ{\cdot}54 \sin g$, a quantity so large that it could not fail to be detected by careful observations with the astrolabe. Such an inequality as this, superposed upon the eccentric motion of the moon, was very troublesome to astronomers who had no way of representing the celestial motions except by geometrical construction. The construction proposed by Ptolemy was so different from those employed for the

$aa' \cos A \sin A'$. But we have $\cos A \sin A' = \frac{1}{2} \sin (A'+A) + \frac{1}{2} \sin (A'-A)$. Hence the product XY will be of the form

$$XY = \tfrac{1}{2} aa' \sin(A'+A) + \tfrac{1}{2} aa' \sin(A'-A) + \tfrac{1}{2} ab' \sin(A+B'+), \text{\&c.},$$

which is another series of the same general form. Moreover, if we suppose the angles A, B, &c., to increase uniformly with the time—that is, to admit of expression in the form

$$A = \alpha + mt,\ A' = \alpha' + m't, \text{\&c}—$$

we shall have, by integrating,

$$2\int XY\,dt = -\frac{aa'}{m+m'} \cos (A'+A) - \frac{aa'}{m'-m} \cos (A'-A), \text{\&c.},$$

which, again, is a trigonometric series of the same general form, which admits of being manipulated at pleasure in the same way as the original expressions X and Y. This property does not belong to the elliptic functions, and in consequence, notwithstanding the great length of the trigonometric series, no attempt to supersede them has been successful.

The efforts to express the moon's motion by integrating the differential equations of the dynamical theory may be divided into three classes. (1) Laplace and his immediate successors found the problem so complex that they sought to simplify it by reversing its form; instead of trying from the beginning to express the moon's coordinates in terms of the time, they effected the integration by expressing the time in terms of the moon's true longitude. Then, by a reversal of the series, the longitude was expressed in terms of the time. Although it would be hazardous to say that this method is unworthy of further consideration, we must admit that its essential inelegance is such as to repel rather than attract study, and that it holds out no promise of further development. (2) By the second general method the moon's coordinates are obtained in terms of the time by the direct integration of the differential equations of motion, retaining the algebraic symbols which express the values of the various elements. Most of the elements are small numerical fractions: e, the eccentricity of the moon's orbit, about 0·055; e', the eccentricity of the earth's orbit, about 0·017; γ, *the sine of half the inclination of the moon's* orbit, about 0·046; m, the ratio of the mean motions of the moon and earth, about 0·075; and the expressions for the longitude, latitude, and parallax appear as an infinite trigonometric series, in which the coefficients of the sines and cosines are themselves infinite series proceeding according to the powers of the above small numbers. This method was applied with success by Pontécoulant and Sir John W. Lubbock, and afterwards by Delaunay. It should be remarked that the solution by the first method appears in the same form as by this one after the true longitude is expressed in terms of the mean longitude. (3) By the method just mentioned the series converge so slowly, and the final expressions for the moon's longitude are so long and complicated, that the series has never been carried far enough to insure the accuracy of all the terms. This is especially the case with the development in powers of m, the convergence of which has often been questioned. Hence, when numerical precision alone is aimed at, it has been found best to avoid this difficulty by using the numerical values of the elements instead of their algebraic symbols. This method has the advantage of leading to the more rapid and certain determination of the numerical values of the several coefficients of sines and cosines. It has the disadvantage of giving the solution of the problem only for a particular case, and of being inapplicable in researches in which the general equations of dynamics have to be applied. It has been employed by Damoiseau, Hansen, and Airy.

The methods of the second general class are those most worthy of study. And among these we must assign the first rank to the method of Delaunay, developed in his *Théorie du Mouvement de la Lune*, because it contains a germ which may yet develop into the great desideratum of a general method in celestial mechanics. To explain it, we must call to mind the general method of "variation of elements," due to Lagrange. This method is applicable to cases in which a problem of dynamics can be completely solved when any small forces which come into play are left out, but which does not admit of direct solution when these forces are included. Omitting the small forces, commonly called "disturbing forces," let us suppose the problem of the motion of a body under the influence of the "principal forces" completely solved. This will mean that we have found algebraic expressions for the coordinates which determine the position of the body in terms of the time, and (in the case of a material point) of six constant quantities, to which we may assign values at pleasure. Then Lagrange showed how, by supposing these constant quantities to become variable, the same expressions could be used for the case in which the effect of the disturbing forces was included. In other words, the effect of the disturbing forces could be determined by assuming them to change the constants of the first approximate solution into very slowly varying elements.

In the researches on the lunar theory before Delaunay the principal force was taken to be the attraction of the earth upon the moon, and the disturbing force was that due to the sun's attraction. When the action of the earth alone was included the moon would move in an ellipse, in accordance with Kepler's laws. The effect of the sun's action could be allowed for by supposing this ellipse to be movable and variable. But when it was required to express this variation the problem became excessively complicated, owing to the great number of terms required to express the sun's disturbing force. Now, instead of passing from the elliptic to the disturbed motion by one single difficult step, Delaunay effected the passage by a great number of easy steps. Out of several hundred periodic terms, the sum of which expressed the disturbing force of the sun, *he first took one only, and determined the variations of* the Keplerian ellipse on the supposition that this term was the only one. In the solution the variable elements of the ellipse would be expressed in terms of six new constants. He then showed how these new constants could be taken as variables instead of the elements of the original ellipse. Taking a second term of the disturbing force, he expressed the new constants in terms of a third set of constants, and so repeated the process until all the terms of the disturbing force were disposed of.

Among applications of the third or numerical method, the most successful yet completed is that of Hansen. His first work appeared in 1838, under the title *Fundamenta nova investigationis orbitæ veræ quam luna perlustrat*, and contained an exposition of his ingenious and peculiar methods of computation. During the twenty years following he devoted a large part of his energies to the numerical computation of the lunar inequalities, the re-determination of the elements of motion, and the preparation of new tables for computing the moon's position. In the latter branch of the work, he received material aid from the British Government which published his tables on their completion in 1857. The computations of Hansen were published some seven years later by the Saxon Royal Society of Sciences.

It is found on comparing the results of Hansen and Delaunay that there are some outstanding discrepancies, which, though too small to be of great practical importance, are of sufficient magnitude to demand the attention of those interested in the mathematical theory of the subject. It is therefore desirable that the numerical inequalities should be again determined by an entirely different method. This is the object of Sir G. B. Airy's *Numerical Lunar Theory*, which is not yet completely published, but is sufficiently far advanced to give hopes of an early completion. The essence of Sir George's method consists in

$aa' \cos A \sin A'$. But we have $\cos A \sin A' = \frac{1}{2} \sin (A'+A) + \frac{1}{2} \sin (A'-A)$. Hence the product XY will be of the form

$$XY = \tfrac{1}{2} aa' \sin (A'+A) + \tfrac{1}{2} aa' \sin (A'-A) + \tfrac{1}{2} ab' \sin (A+B'+), \text{\&c.},$$

which is another series of the same general form. Moreover, if we suppose the angles A, B, &c., to increase uniformly with the time—that is, to admit of expression in the form

$$A = \alpha + mt,\ A' = \alpha' + m't, \text{ \&c}—$$

we shall have, by integrating,

$$2\int XY\,dt = -\frac{aa'}{m+m'} \cos (A'+A) - \frac{aa'}{m'-m} \cos (A'-A), \text{ \&c.},$$

which, again, is a trigonometric series of the same general form, which admits of being manipulated at pleasure in the same way as the original expressions X and Y. This property does not belong to the elliptic functions, and in consequence, notwithstanding the great length of the trigonometric series, no attempt to supersede them has been successful.

The efforts to express the moon's motion by integrating the differential equations of the dynamical theory may be divided into three classes. (1) Laplace and his immediate successors found the problem so complex that they sought to simplify it by reversing its form; instead of trying from the beginning to express the moon's coordinates in terms of the time, they effected the integration by expressing the time in terms of the moon's true longitude. Then, by a reversal of the series, the longitude was expressed in terms of the time. Although it would be hazardous to say that this method is unworthy of further consideration, we must admit that its essential inelegance is such as to repel rather than attract study, and that it holds out no promise of further development. (2) By the second general method the moon's coordinates are obtained in terms of the time by the direct integration of the differential equations of motion, retaining the algebraic symbols which express the values of the various elements. Most of the elements are small numerical fractions; e, the eccentricity of the moon's orbit, about 0·055; e', the eccentricity of the earth's orbit, about 0·017; γ, the sine of half the inclination of the moon's orbit, about 0·046; m, the ratio of the mean motions of the moon and earth, about 0·075; and the expressions for the longitude, latitude, and parallax appear as an infinite trigonometric series, in which the coefficients of the sines and cosines are themselves infinite series proceeding according to the powers of the above small numbers. This method was applied with success by Pontécoulant and Sir John W. Lubbock, and afterwards by Delaunay. It should be remarked that the solution by the first method appears in the same form as by this one after the true longitude is expressed in terms of the mean longitude. (3) By the method just mentioned the series converge so slowly, and the final expressions for the moon's longitude are so long and complicated, that the series has never been carried far enough to insure the accuracy of all the terms. This is especially the case with the development in powers of m, the convergence of which has often been questioned. Hence, when numerical precision alone is aimed at, it has been found best to avoid this difficulty by using the numerical values of the elements instead of their algebraic symbols. The computations of Hansen were published some seven years later by the Saxon Royal Society of Sciences.

It is found on comparing the results of Hansen and Delaunay that there are some outstanding discrepancies, which, though too small to be of great practical importance, are of sufficient magnitude to demand the attention of those interested in the mathematical theory of the subject. It is therefore desirable that the numerical inequalities should be again determined by an entirely different method. This is the object of Sir G. B. Airy's *Numerical Lunar Theory*, which is not yet completely published, but is sufficiently far advanced to give hopes of an early completion. The essence of Sir George's method consists in

is the most difficult and intricate of celestial mechanics, and no satisfactory general method of attacking it has yet been found. The sources of difficulty are two in number. First, the disturbing action of the planets is modified by that of the sun in such a way that the ordinary equations of disturbed elliptic motion are no longer rigorous, and hence new and more complicated ones must be constructed. And, secondly, the combination of the four bodies —moon, earth, sun, and planet—leads to terms so numerous and intricate that it has hardly been found possible to isolate them. The question has, indeed, been raised whether the rotation of the earth on its axis, and hence the unit of time, may not be subject to slow and irregular changes of a nature to produce apparent corresponding changes in the motion of the moon. But it has recently been found, from a discussion of the observed transits of Mercury since 1677, that, although such inequalities may exist, they cannot have the magnitude necessary to account for the observed changes of long period in the moon's motion.

The following is a summary of the present state of the various branches of the lunar theory. (1) The numerical solution of the problem of the sun's action on the moon may be regarded as quite satisfactory, at least when Hansen's results shall have been verified by an independent method. (2) The analytic theory needs to be perfected by finding some remedy for the slow convergence of the series by which it is expressed, but its general form may be regarded as quite satisfactory. (3) Except in one or two special cases, the action of the planets on the moon, when treated with the necessary rigour, is so intricate that no approach to a satisfactory solution has yet been attained. When this desideratum is reached, the mathematical theory will be complete. (4) The general discussion of ancient and modern observations with a view to finding what real or apparent inequalities of long period in the mean motion may exist is still to be finished. With it the astronomical theory will be complete. (S. N.)

MOORCROFT, William (c. 1770-1825), traveller in Asia, was born in Lancashire, about 1770. He was educated as a surgeon in Liverpool, but on completing his course he resolved to devote himself to veterinary surgery, and, after studying the subject in France, began its practice in London. In 1795 he published a pamphlet of directions for the medical treatment of horses, with special reference to India, and in 1800 a *Cursory Account of the Methods of Shoeing Horses*. Having been offered by the East India Company the inspectorship of their Bengal stud, Moorcroft left England for India in 1808. Under his care the stud rapidly improved; in order to perfect the breed, he resolved to undertake a journey into Central Asia to obtain a stock of Turcoman horses. In company with Captain William Hearsay, and encumbered with a stock of merchandise for the purpose of establishing trade relations between India and Central Asia, Moorcroft left Josimath, well within the mountains, on 26th May 1812. Proceeding along the valley of the Dauli, they reached the summit of the frontier pass of Niti on 1st July. Descending by the towns of Daba and Ghortope, Moorcroft struck the main upper branch of the Indus near its source, and on 5th August arrived at the sacred lake of Manasarowara. Returning by Bhután, he was detained some time by the Gúrkhas, and reached Calcutta in November. This journey only served to whet Moorcroft's appetite for more extensive travel, for which he prepared the way by sending out a young Hindustani, who succeeded in making very extensive explorations. In company with this young man and George Trebeck, Moorcroft set out on his second journey in October 1819. His enterprise was looked upon rather coldly by the directors, who merely allowed him his pay for a time, all the expenses being borne by Moorcroft himself. By way of Almorá and Srínagar, Lahore was reached on 6th May 1820. On 14th August the source of the Biyah (Hyphasis) was discovered, and subsequently that of the Chenáb. Leh, the capital of Ladák, was reached on 24th September, and here several months were spent in exploring the surrounding country. A commercial treaty was concluded with the Government of Ladák, by which the whole of Central Asia was virtually opened to British trade. Kashmir was reached on 3d November 1822, and by the Pír Panjál mountains Jalálábád on 4th June 1824, Cabul on 20th June, and by Khulm, Kunduz, and Balkh Moorcroft arrived at Bokhara on 25th February 1825. Everywhere he bought horses for the company, and endeavoured to establish trade relations. At Andkho in Cabul Moorcroft was seized with fever, of which he died on 27th August 1825, Trebeck surviving him only a few days. It was not till several years afterwards that his papers were obtained by the Asiatic Society, and published under the editorship of Horace Hayman Wilson in 1841 under the title of *Travels in the Himalayan Provinces of Hindustan and the Punjáb, in Ladakh and Kashmir, in Peshawur, Kabul, Kunduz, and Bokhara, from 1819 to 1825*. Though published so long after the traveller's death, the narrative was a valuable contribution to a knowledge of Central Asia, and still remains a classic. In vol. xii. of *Asiatic Researches* will be found an account by Moorcroft of his first journey, and in the *Transactions of the Royal Asiatic Society*, vol. i., a paper on the Purik sheep.

MOORE, Edward (1712-1757), minor poet, dramatist, and miscellaneous writer, was the son of a dissenting minister of Abingdon, where he was born in 1712. He was the author of the thrilling domestic tragedy of *The Gamester*, originally produced in 1753 with Garrick in the leading character, and still in the repertory of acting plays. It is perhaps the strongest lesson against gambling ever preached from stage or pulpit. The literary merit of the play is not great, but it is powerfully constructed and full of impressive incident, and the career of Beverley the gambler (a character modelled on Fielding's Captain Booth) affords great scope for the actor. Moore also wrote two comedies. As a poet he produced clever imitations of Gay and Gray, and with the assistance of Lyttelton, Chesterfield, and Horace Walpole conducted *The World* (1753-57) during the great decade of the revival of periodical essay-writing. *The World* followed Johnson's *Rambler*, and was followed by *The Idler*; it had as rivals *The Adventurer* and *The Connoisseur*. Moore died at London in 1757.

MOORE, Dr John (1730-1802), born at Stirling in 1730, was one of the most prominent writers of travels and novels in the latter part of the 18th century. His novel *Zeluco* (published in 1789) produced a powerful impression at the time, and indirectly, through the poetry of Byron, has left an abiding mark on literature. The novel would in these days be called a psychological novel; it is a close analysis of the motives of a headstrong, passionate, thoroughly selfish and unprincipled profligate. It is full of incident, and the analysis is never prolonged into tedious reflexions, nor suffered to intercept the progress of the story, while the main plot is diversified with many interesting episodes. The character took a great hold of Byron's imagination, and probably influenced his life in some of its many moods, as well as his poetry. It is not too much to say that the common opinion that Byron intended *Childe Harold* as a reflexion of himself cannot be cleared of its large mixture of falsehood without a study of Moore's *Zeluco*. Byron said that he intended the Childe to be "a poetical Zeluco," and the most striking features of the portrait were undoubtedly taken from that character. At the same time it is obvious to everybody acquainted with Moore's novel and Byron's life that the moody and impressionable poet often adopted the character of Zeluco, fancied himself and felt himself to be a Zeluco, although he was at heart a very different man. Moore's other works have a less marked individuality, but his sketches of society and manners in France, Germany, Switzerland, Italy, and England furnish valuable materials for the social historian. Like his countrymen Burnett and Boswell, he was a sagacious, penetrating, and in the main unprejudiced observer, with something of a natural historian's interest in the human species; and he had exceptional opportunities of observation.

It is not too much to say that the common opinion that Byron intended *Childe Harold* as a reflexion of himself cannot be cleared of its large mixture of falsehood without a study of Moore's *Zeluco*. Byron said that he intended the Childe to be "a poetical Zeluco," and the most striking features of the portrait were undoubtedly taken from that character. At the same time it is obvious to everybody acquainted with Moore's novel and Byron's life that the moody and impressionable poet often adopted the character of Zeluco, fancied himself and felt himself to be a Zeluco, although he was at heart a very different man. Moore's other works have a less marked individuality, but his sketches of society and manners in France, Germany, Switzerland, Italy, and England furnish valuable materials for the social historian. Like his countrymen Burnett and Boswell, he was a sagacious, penetrating, and in the main unprejudiced observer, with something of a natural historian's interest in the human species; and he had exceptional opportunities of observation.

manca, where he waited to see what would happen. He heard that a subsidiary force under Sir David Baird had arrived at Corunna, and ordered it up to join him. At Salamanca he remained a whole month watching the triumphant successes of Napoleon and his lieutenants, and learning how little Spanish reports or Spanish valour were to be relied on. Though irritated by the menaces and abuse of Frere, the English minister to the junta, he waited till the 13th December, hearing daily of Spanish defeats, and then he determined to draw off upon his own small force the weight of Napoleon's power, and thus give Andalucia the winter in which to organize an army and prepare for another Baylen. With this intention he advanced through Toro and Mayorga, where Baird joined him, to Sahagun. He judged rightly that Napoleon would never advance into Andalucia and leave the English behind him, but that he would turn all his power against them. Having once drawn Napoleon's attention to himself, he began his famous retreat and fell back quickly, fighting every day and invariably with success. He now could test the military spirit he had taught at Shorncliffe, for the reserve under Sir Edward Paget consisted entirely of his own light regiments. To detail each step of the retreat and every skirmish would be but to rewrite Napier; suffice it to say that, with great loss of life and material, Moore reached Corunna on 12th January 1809. But the fleet to take the army home was not there; and the English would have to fight Soult, whose army was even more weakened and demoralized than Moore's, before they could embark. It was on 16th January that Moore fought his last battle; he fell early in the day, and knew at once that his wound was mortal. His last hours were cheered with the knowledge of victory, but were spent in recommending his old friends, such as Graham and Colborne, to the notice of the Government. Sir H. Hardinge's description of these hours is in its way inimitable, and in it must be studied how a modern Bayard should die in battle, every thought being for others, none for himself.

It may be possible in the face of his heroic death to exaggerate Moore's actual military services, but his influence on the British army cannot be overrated. The true military spirit of discipline and of valour, both in officers and men, had become nearly extinct during the American war. Abercromby, who looked back to the traditions of Minden, was the first to attempt to revive it, and his work was carried on by Moore. The formation of the light regiments at Shorncliffe was the answer to the new French tactics, and it was left to Wellington to show the success of the experiment. Moore's powers as a statesman are shown in his despatches written at Salamanca, and he had the truest gift of a great man, that of judging men. It may be noticed that, while Wellington perpetually grumbled at the bad qualities of his officers and formed no school, Moore's name is associated with the career of all who made their mark. Among generals, Hope, Graham, Sir E. Paget, Hill, and Craufurd, all felt and submitted to his ascendency, and of younger officers it was ever the proud boast of the Napiers, Colborne, the Beckwiths, and Barnard that they were the pupils of Moore, not of Wellington. Nay more, he inspired an historian. The description of Moore's retreat in Napier is perhaps the finest piece of military history in the English language, not only because the author was present, but because his heart was with the leader of that retreat; and, if Napier felt towards Wellington as the soldiers of the tenth legion felt towards Cæsar, he felt towards Moore the personal love and devotion of a cavalier towards Montrose.

The great authority for Moore's life is the *Life of Sir John Moore*, by his brother, J. C. Moore (1833); see also *Narrative of the Campaign of Sir John Moore in Spain*, by his brother, J. C. Moore (4to, with plans, 1809); Napier, *Peninsular War*, Bk. iv., and his *Life of Sir Charles Napier*. For views adverse to Moore's retreat, see Charmilly, *Narrative* (1810), and Sir Bartle Frere, *Life of the Rt. Hon. J. H. Frere* (published in vol. i. of his works). Consult also Wilson, *Campaign in Egypt*, for Moore's services there, and the *Life of Gilbert Elliot, First Lord Minto*, for the squabble in Corsica. (H. M. S.)

MOORE, Thomas (1779-1852), born at Dublin on 28th May 1779, fairly shares with Lord Byron the honour of being the most popular poet of his generation. Whatever may be thought now of the intrinsic qualities of his verse, this much cannot be denied. The most trustworthy of all measures of popularity is the price put upon a writer's work in the publishing market, and when Moore's friend Perry, in negotiating the sale of the unwritten *Lalla Rookh*, claimed for the poet the highest price that had up to that time been paid for a poem the publisher at once assented. Moore was then in the heyday of his reputation, but twenty years later publishers were still willing to risk their thousands on his promise to produce. Much of Moore's success was due to his personal charm. This at least gave him the start on his road to popularity. There is not a more extraordinary incident in the history of our literature than the instantaneousness with which the son of a humble Dublin grocer just out of his teens, on his first visit to London, captivated the fashionable world and established himself in the course of a few months as one of its prime favourites. The youth crossed St George's Channel in 1799 to keep terms at the Middle Temple, carrying with him a translation of the *Odes of Anacreon*, which he wished to publish by subscription. In a very short time he had enrolled half the fashionable world among his subscribers, and had obtained the permission of the prince of Wales to dedicate the work to him. The mere power of writing graceful and fluent amatory verses would not alone have enabled the poet to work this miracle. Moore's social gifts were of the most engaging kind. He charmed all whom he met, and charmed them, though he was not a trained musician, with nothing more than with his singing of his own songs. The piano, and not the harp, was his instrument, but he came nearer than anybody else in modern times to Bishop Percy's romantic conception of the minstrel. To find a parallel to him we must go back to the palmy days of Provençal song, to such *troubadours* and *jongleurs* as Arnaud Daniel and Perdigon, whose varied powers of entertainment made them welcome guests wherever they went. It was not merely the fashionable world that the young adventurer captivated; the landlady of his lodgings in London, a countrywoman of his own, offered to place at his disposal all the money of which she had the command.

The fragment of autobiography in which Moore draws a softly-coloured picture of his early life in Dublin lets us into the secret of the seeming miracle of his social conquest. Externals apart, the spirit of his social surroundings in Little Aungier Street had much in common with the society to which he was introduced in London. He was born in the proscribed sect of Catholics, whose exclusion from the society of the Castle produced a closer union among their various ranks, and thus, from the first, Moore was no stranger to the more refined gaieties of social intercourse. It was, upon the whole, a gay life in Catholic society, though the conspiracy of the United Irishmen was being quietly formed beneath the surface. Amateur theatricals was one of their favourite diversions, and gifts of reciting and singing were not likely to die for want of applause. Moore's schoolmaster was a leader in these entertainments, a writer of prologues and epilogues and incidental songs; and at a very early age Master Thomas Moore was one of his show-boys, ardently encouraged in all his exercises by a very affectionate mother at home. Before he left school he had acquired fame in his own circle as a song-writer, and had published, in the *Anthologia Hibernica*, verses "to Zelia on her charging the author with writing too much on love." This was in 1793. In that year the prohibition against Catholics entering Trinity College was removed, and next year Moore took advantage of the new freedom. As one of the first Catholic entrants, he had an exceptional stimulus to work, and there industriously acquired that classical scholarship with which he won the hearts of such learned Whigs as Lansdowne and Holland, while he charmed fashionable ladies with the grace of his songs. Young Moore's social atmosphere was, of course, strongly charged with patriotism and hatred of the excesses of

manca, where he waited to see what would happen. He heard that a subsidiary force under Sir David Baird had arrived at Corunna, and ordered it up to join him. At Salamanca he remained a whole month watching the triumphant successes of Napoleon and his lieutenants, and learning how little Spanish reports or Spanish valour were to be relied on. Though irritated by the menaces and abuse of Frere, the English minister to the junta, he waited till the 13th December, hearing daily of Spanish defeats, and then he determined to draw off upon his own small force the weight of Napoleon's power, and thus give Andalucia the winter in which to organize an army and prepare for another Baylen. With this intention he advanced through Toro and Mayorga, where Baird joined him, to Sahagun. He judged rightly that Napoleon would never advance into Andalucia and leave the English behind him, but that he would turn all his power against them. Having once drawn Napoleon's attention to himself, he began his famous retreat and fell back quickly, fighting every day and invariably with success. He now could test the military spirit he had taught at Shorncliffe, for the reserve under Sir Edward Paget consisted entirely of his own light regiments. To detail each step of the retreat and every skirmish would be but to rewrite Napier; suffice it to say that, with great loss of life and material, Moore reached Corunna on 12th January 1809. But the fleet to take the army home was not there; and the English would have to fight Soult, whose army was even more weakened and demoralized than Moore's, before they could embark. It was on 16th January that Moore fought his last battle; he fell early in the day, and knew at once that his wound was mortal. His last hours were cheered with the knowledge of victory, but were spent in recommending his old friends, such as Graham and Colborne, to the notice of the Government. Sir H. Hardinge's description of these hours is in its way inimitable, and in it must be studied how a modern Bayard should die in battle, every thought being for others, none for himself.

It may be possible in the face of his heroic death to exaggerate Moore's actual military services, but his influence on the British army cannot be overrated. The true military spirit of discipline and of valour, both in officers and men, had become nearly extinct during the American war. Abercromby, who looked back to the traditions of Minden, was the first to attempt to revive it, and his work was carried on by Moore. The formation of the light regiments at Shorncliffe was the answer to the new French tactics, and it was left to Wellington to show the success of the experiment. Moore's powers as a statesman are shown in his despatches written at Salamanca, and he had the truest gift of a great man, that of judging men. It may be noticed that, while Wellington perpetually grumbled at the bad qualities of his officers and formed no school, Moore's name is associated with the career of all who made their mark. Among generals, Hope, Graham, Sir E. Paget, Hill, and Craufurd, all felt and submitted to his ascendency, and of younger officers it was ever the proud boast of the Napiers, Colborne, the Beckwiths, and Barnard that they were the pupils of Moore, not of Wellington. Nay more, he inspired an historian. The description of Moore's retreat in Napier is perhaps the finest piece of military history in the English language, not only because the author was present, but because his heart was with the leader of that retreat; and, if Napier felt towards Wellington as the soldiers of the tenth legion felt towards Cæsar, he felt towards Moore the personal love and devotion of a cavalier towards Montrose.

The great authority for Moore's life is the *Life of Sir John Moore*, by his brother, J. C. Moore (1833); see also *Narrative of the Campaign of Sir John Moore in Spain*, by his brother, J. C. MOORE, Thomas (1779-1852), born at Dublin on 28th May 1779, fairly shares with Lord Byron the honour of being the most popular poet of his generation. Whatever may be thought now of the intrinsic qualities of his verse, this much cannot be denied. The most trustworthy of all measures of popularity is the price put upon a writer's work in the publishing market, and when Moore's friend Perry, in negotiating the sale of the unwritten *Lalla Rookh*, claimed for the poet the highest price that had up to that time been paid for a poem the publisher at once assented. Moore was then in the heyday of his reputation, but twenty years later publishers were still willing to risk their thousands on his promise to produce. Much of Moore's success was due to his personal charm. This at least gave him the start on his road to popularity. There is not a more extraordinary incident in the history of our literature than the instantaneousness with which the son of a humble Dublin grocer just out of his teens, on his first visit to London, captivated the fashionable world and established himself in the course of a few months as one of its prime favourites. The youth crossed St George's Channel in 1799 to keep terms at the Middle Temple, carrying with him a translation of the *Odes of Anacreon*, which he wished to publish by subscription. In a very short time he had enrolled half the fashionable world among his subscribers, and had obtained the permission of the prince of Wales to dedicate the work to him. The mere power of writing graceful and fluent amatory verses would not alone have enabled the poet to work this miracle. Moore's social gifts were of the most engaging kind. He charmed all whom he met, and charmed them, though he was not a trained musician, with nothing more than with his singing of his own songs. The piano, and not the harp, was his instrument, but he came nearer than anybody else in modern times to Bishop Percy's romantic conception of the minstrel. To find a parallel to him we must go back to the palmy days of Provençal song, to such *troubadours* and *jongleurs* as Arnaud Daniel and Perdigon, whose varied powers of entertainment made them welcome guests wherever they went. It was not merely the fashionable world that the young adventurer captivated; the landlady of his lodgings in London, a countrywoman of his own, offered to place at his disposal all the money of which she had the command.

The fragment of autobiography in which Moore draws a softly-coloured picture of his early life in Dublin lets us into the secret of the seeming miracle of his social conquest. Externals apart, the spirit of his social surroundings in Little Aungier Street had much in common with the society to which he was introduced in London. He was born in the proscribed sect of Catholics, whose exclusion from the society of the Castle produced a closer union among their various ranks, and thus, from the first, Moore was no stranger to the more refined gaieties of social intercourse. It was, upon the whole, a gay life in Catholic society, though the conspiracy of the United Irishmen was being quietly formed beneath the surface. Amateur theatricals was one of their favourite diversions, and gifts of reciting and singing were not likely to die for want of applause. Moore's schoolmaster was a leader in these entertainments, a writer of prologues and epilogues and incidental songs; and at a very early age Master Thomas Moore was one of his show-boys, ardently encouraged in all his exercises by a very affectionate mother at home. Before he left school he had acquired fame in his own circle as a song-writer, and had published, in the *Anthologia Hibernica*, verses "to Zelia on her charging the author with writing too much on love." This was in 1793. In that year the prohibition against Catholics entering Trinity College was removed, and next year Moore took advantage of the new freedom. As one of the first Catholic entrants, he had an exceptional stimulus to work, and there industriously acquired that classical scholarship with which he won the hearts of such learned Whigs as Lansdowne and Holland, while he charmed fashionable ladies with the grace of his songs. Young Moore's social atmosphere was, of course, strongly charged with patriotism and hatred of the excesses of

spurious Anacreontic sentiment, namby-pamby when not prurient; he wrote with full inspiration, unreserved sincerity, and thoroughly roused faculty. Divorced from the music, many of them are insipid enough, but they were never meant to be divorced from the music; the music was meant, as Coleridge felt when he heard them sung by the poet himself, to twine round them and overtop them like the honeysuckle. Moore accomplished this with exquisite art. His most conspicuous failures may be traced to his habit of taking as his starting-point not an emotional incident but some unmanageable intellectual conceit. Hence arose intellectual discords, incongruous and imperfectly harmonized fancies, which even the music can hardly gloss over.

The regent's desertion of the Whigs in 1812 cut them off from all hope of office for many years to come, and Moore from his last hope of a snug sinecure, when Lord Moira also was practically "oblivious" of him. There was at once a marked increase in his literary fertility, and he broke ground in a new field, which he cultivated with pre-eminent success—political squib-writing. Moore was incapable of anything like rancour, but he felt the disappointment of his hopes enough to quicken his fancy and sharpen the edge of his wit. The prince regent, his old friend and patron, who was said to have begged all Lord Moira's appointments for personal favourites, was his first butt. The prince's defects and foibles, his fatness, his huge whiskers, his love for cutlets and curaçoa, for aged mistresses and practical jokes, were ridiculed with the lightest of clever hands. Moore opened fire in the *Morning Chronicle*, and crowned his success next year (1813) with a thin volume of "Intercepted Letters," *The Twopenny Post Bag*. A very little knowledge of the gossip of the time enables us to understand the delight with which Moore's sallies were received in the year which witnessed the imprisonment of Leigh Hunt for more outspoken attacks on the regent. Moore received every encouragement to work the new vein. He was at one time in receipt of a regular salary from the *Times*; and his little volumes of squibs published at intervals,—*The Fudge Family in Paris*, 1818; *The Journal of a Member of the Pococurante Society*, 1820; *Fables for the Holy Alliance*, 1823; *Odes on Cash, Corn, Catholics, and other Matters*, 1828; *The Fudges in England*, 1835—went through many editions. The prose *Memoirs of Captain Rock* (1824) may be added to the list. Moore's only failure was *Tom Cribb's Memorial to Congress* (1819), for which he had made an elaborate study of thieves' slang. It was of course on the side of the Whigs that Moore employed his pen, and his favourite topics were the system of repression in Ireland and the disabilities of the Catholics. He made rather too serious a claim for his pasquinades when he spoke of "laying the lash on the back of the bigot and the oppressor." It was not exactly a lash or a scourge that he wielded. It was in happy, airily malicious ridicule of personal foibles that his strength lay; he pricked and teased his victims with sharp and tiny arrows. But, light as his hand was, he was fairly entitled to the enthusiastic gratitude of his countrymen for his share in effecting Catholic emancipation.

The disappointment of 1812, which started Moore on his career as a squib-writer, nerved him also to a more sustained effort in serious verse than he had before attempted. *Lalla Rookh* would never have been written if the author's necessities had not compelled him to work. To keep himself at the oar, he contracted with the Longmans to supply a metrical romance on an Eastern subject, which should contain at least as many lines as Scott's *Rokeby*, and for which the publishers bound themselves to pay three thousand guineas on delivery. The poem was not published till May 1817. Moore, as was his habit, made most laborious preparation, reading himself slowly into familiarity with Eastern scenery and manners. He retired to a cottage in Derbyshire, near Lord Moira's library at Donington Park, that he might work uninterruptedly, safe from the distractions of London society; and there, "amid the snows of a Derbyshire winter" as he put it, he patiently elaborated his voluptuous pictures of flower-scented valleys, gorgeous gardens, tents, and palaces, and houris of ravishing beauty. The confidence of the publishers was fully justified. Moore's contemporaries were dazzled and enchanted with *Lalla Rookh*. It was indeed a wonderful *tour de force*. There was not a single image or allusion in it that an ordinary Englishman could understand without a foot-note. High testimonies were borne to the correctness of the local colouring, and the usual stories were circulated of Oriental natives who would not believe that Moore had never travelled in the East. Moore was less successful in realizing Oriental character than he was in details of dress and vegetation. His fire-worshipper is an Irish patriot betrayed by an informer, his Zelica a piously nurtured Catholic maiden brooding over unpardoned sin, his Mokanna a melodramatic stage monster,—though they are so thickly covered with Oriental trappings that their identity is considerably disguised. Of the four tales put into the mouth of Feramorz, the "Veiled Prophet" was the least suited to Moore's Turkey-carpet treatment. We can understand the enthusiasm with which Moore's Orientalism was received as "the best that we have had yet," and we can honour the honest labour with which he achieved this success; but such artificial finery, as the poet himself had the sense to suspect, could have only a temporary reputation. He deliberately sacrificed the higher qualities of poetry for accuracy of costume and soft melody of rhyme and rhythm, and he had his reward. His next Orientalism, the *Loves of the Angels*, published in 1822, was hardly less popular than *Lalla Rookh*. The artificiality of the manufacture was shown by the ease with which, after a few editions, he changed his angels from Jews into Turks, to evade a charge of impiety which was supposed to impede the sale of the work. Immediately after the completion of *Lalla Rookh* Moore changed his residence to Sloperton Cottage in Wiltshire, to be near Lord Lansdowne and the library at Bowood, his next literary project being a life of Sheridan. His plans were interrupted by the consequences of the rascality of his deputy at Bermuda, which has been already mentioned. To avoid arrest for the sum embezzled, Moore retired to the Continent, and fixed his residence at Paris. He could not return till November 1822, when the affair was compromised. His friends lamented that the attractions of Paris occupied so much of his time, but, though his diary contains almost daily records of visits to operas, fêtes, and fashionable entertainments, it shows also that he was busier than he seemed. He wrote a goodly number of squibs during his exile, besides composing the *Loves of the Angels* and accumulating materials for his prose tale of the *Epicurean*—a fair amount of production considering his slow and painstaking habits of composition. His alertness of mind, self-possession, and steadiness of purpose enabled him to work as few men could in the midst of diversions and distractions; and, although he himself took a brilliant part in conversation, we can see, from a comparison of his diary with his published writings, that he kept his ears open for facts and witticisms which he afterwards made his own. The darling of the drawing-room was as much bee as butterfly. On his return to England he resumed work steadily at his memoirs of Sheridan, writing *Captain Rock* as a *jeu d'esprit* by the way. The *Sheridan* triumphantly despatched in the autumn of 1825, Moore's next important work was the *Life of Byron*. The first

spurious Anacreontic sentiment, namby-pamby when not prurient; he wrote with full inspiration, unreserved sincerity, and thoroughly roused faculty. Divorced from the music, many of them are insipid enough, but they were never meant to be divorced from the music; the music was meant, as Coleridge felt when he heard them sung by the poet himself, to twine round them and overtop them like the honeysuckle. The darling of the drawing-room was as much bee as butterfly. On his return to England he resumed work steadily at his memoirs of Sheridan, writing *Captain Rock* as a *jeu d'esprit* by the way. The *Sheridan* triumphantly despatched in the autumn of 1825, Moore's next important work was the *Life of Byron*. The first

of the group; and their beauty is enhanced by their scarlet bill and legs. Two, *P. alleni* of the Ethiopian Region and the South-American *P. parva*, are of small size. Of the larger species, *P. cæruleus* is the "Porphyrio" of the ancients, and inhabits certain localities on both sides of the Mediterranean, while the rest are widely dispersed within the tropics, and even beyond them, as in Australia and New Zealand. But this last country has produced a more exaggerated form, *Notornis*, which has an interesting and perhaps unique history. First described from a fossil skull by Prof. Owen,[1] and then thought to be extinct, an example was soon after taken alive,[2] the skin of which (with that of another procured like the first by Mr Walter Mantell) may be seen in the British Museum. Other fossil remains were from time to time noted by Prof. Owen[3]; but it began to be feared that the bird had ceased to exist,[4] until a third example was taken about the year 1879, the skin and most of the bones of which, after undergoing examination in New Zealand by Dr Buller and Prof. T. J. Parker,[5] found their way to the museum of Dresden, where Dr A. B. Meyer discovered the recent remains to be specifically distinct from the fossil, and while keeping for the latter the name *N. mantelli* gives the former that of *N. hochstetteri*. What seems to have been a third species of *Notornis* formerly inhabited Lord Howe's Island, but is now extinct (see BIRDS, vol. iii. p. 732, note). Whether the genus *Aptornis*, of which Prof. Owen has described the remains from New Zealand, was most nearly allied to *Notornis* and *Porphyrio* cannot here be decided. Prof. T. J. Parker (*loc. cit.*) considers it a "development by degeneration of an ocydromine type" (see OCYDROME). (A. N.)

MORAL PHILOSOPHY. See ETHICS, vol. viii. p. 574.

MORATIN, LEANDRO FERNANDEZ DE (1760-1828), Spanish dramatist and poet, was the son of N. F. Moratin mentioned below, and was born at Madrid on 10th March 1760. His poetical and artistic tastes were early developed, but his father, keenly alive to the difficulties of the literary calling, caused him to be apprenticed to a jeweller. At the age of eighteen Moratin surprised his friends by winning the second prize of the Academy for a heroic poem on the conquest of Granada, and two years afterwards he attracted still more general attention by a similar success of his *Leccion Poetica*, a satire upon the popular poets of the day. Through Jovellanos he was now appointed secretary to Cabarrus on his special mission to France in 1787, and during his stay there he diligently improved his opportunities of becoming acquainted with the contemporary French drama, and of cultivating the acquaintance of men of letters. Of the literary friendships he then formed the most important was that with Goldoni; indeed, Moratin is much more correctly styled "the Spanish Goldoni" than "the Spanish Molière." On his return to Spain Florida Blanca presented him to a sinecure benefice in the diocese of Burgos; and in 1790 his first play, *El Viejo y la Niña* (The Old Husband and the Young Wife), a highly finished but somewhat dreary verse comedy in three acts, written in 1786, but delayed by objections of the actors, was at length produced at the Teatro del Principe. Its success was only moderate. *El Café* or *La Comedia Nueva*, on the other hand, given at the same theatre two years afterwards, at once became deservedly popular, and had considerable influence in modifying the public taste. It is a short prose comedy in two acts, avowedly intended to expose the follies and absurdities of the contemporary dramatists—the school of Lope de Vega run to seed—who commanded the support of the masses; and it is still read with pleasure for the simple ingenuity of its plot, the liveliness of its dialogue, and the easy grace of its style, while to the student of literature it throws much useful light on the contemporary state of the Spanish drama, and on the reforming aims of the author and his party. In the same year (1792) Florida Blanca was disgraced, but Moratin at once found another patron in Godoy, who provided him with a pension and the means for foreign travel; he accordingly passed through France into England, where he began the free and somewhat incorrect translation of *Hamlet* which was printed in 1798, but which has never been performed. From England he passed to the Low Countries, Germany, Switzerland, and Italy, and on his return to the Peninsula in 1796 he received a lucrative post at the Foreign Office. His next appearance in the drama did not take place until 1803, when *El Baron* was first publicly exhibited in its present form. It successfully weathered a determined attempt to damn it, and still keeps the stage. It was followed in 1804 by *La Mogigata* (The Female Hypocrite), of which imperfect manuscript copies had begun to circulate as early as 1791. It was favourably received, as on the whole it deserved to be, by a public which was now at one with the author as to the canons of his art, and an attempt to suppress it by means of the Inquisition on alleged religious grounds (*La Mogigata* being an imitation, a somewhat feeble one, of Molière's *Tartuffe*) was successfully frustrated. Moratin's last and crowning triumph in the department of original comedy was achieved in 1806, when *El Si de las Niñas* (A Girl's Yes) was performed night after night to crowded houses, ran through several Spanish editions in a year, and was soon translated into several foreign languages. In 1808, on the fall of the Prince of the Peace, Moratin found it necessary to leave Spain, but shortly afterwards he returned and consented to accept the office of royal librarian under Joseph Bonaparte—a false step, which, as the event proved, permanently alienated from him the sympathies of his country, and compelled him to spend almost all the rest of his life in exile. In 1812 his *Escuela de los Maridos*, a translation and adaptation to the more dignified and stately Spanish standard of Molière's *École des Maris*, was produced at Madrid, and in 1814 *El Medico a Palos* (from *Le Médecin Malgré Lui*) at Barcelona. From 1814 to 1828 Moratin lived in France, principally at Paris, and devoted himself to the preparation of a learned work on the history of the Spanish drama (*Origenes del Teatro Español*), which unfortunately stops short of the period of Lope de Vega. He died at Paris on 21st June 1828.

An edition of his *Obras Dramaticas y Liricas* in three vols. was published at Paris in 1825. The lyrical works, consisting of odes, sonnets, and ballads, are of comparatively little interest; they reflect the influence of his father and of the Italian Conti. The best edition of the *Obras* is that published by the Spanish Academy of History in four vols. at Madrid in 1830-1831; see also vol. ii. of *Biblioteca de Autores Españoles* (1846).

MORATIN, NICOLAS FERNANDEZ DE (1737-1780), Spanish poet, was descended from an old Biscayan family, and was born at Madrid in 1737. He was educated at the Jesuit college in Calatayud, and afterwards studied law at the university of Valladolid. He then received an appointment in the service of Queen Elizabeth, the widow of Philip V., which enabled him to see much of the society

1 *Proc. Zool. Society*, 1848, p. 7; *Trans.*, iii. p. 336, pl. lvi.

2 *Proc.*, 1850, pp. 209-214, pl. xxi.; *Trans.*, iv. pp. 69-74, pl. xxv.

3 Thus the leg-bones and what appeared to be the sternum were described and figured by him (*Trans.*, iv. pp. 12, 17, pls. ii. iv.), and the pelvis and another femur (vii. pp. 369, 373, pls. xlii. xliii.); but the supposed sternum subsequently proved not to be that of *Notornis*, and Professor Owen's attention being called to the fact he rectified the error (*Proc.*, 1882, p. 689) which he had previously been "inclined to believe" (*Trans.*, viii. p. 120) he had made.

4 Notwithstanding the evidence, which it must be allowed presented some incongruities, offered by Mr Mackay (*Ibis*, 1867, p. 144).

5 *Trans. N. Zeal. Inst.*, xiv. pp. 238-258.

of the group; and their beauty is enhanced by their scarlet bill and legs. Two, *P. alleni* of the Ethiopian Region and the South-American *P. parva*, are of small size. Of the larger species, *P. cæruleus* is the "Porphyrio" of the ancients, and inhabits certain localities on both sides of the Mediterranean, while the rest are widely dispersed within the tropics, and even beyond them, as in Australia and New Zealand. But this last country has produced a more exaggerated form, *Notornis*, which has an interesting and perhaps unique history. First described from a fossil skull by Prof. Owen,[1] and then thought to be extinct, an example was soon after taken alive,[2] the skin of which (with that of another procured like the first by Mr Walter Mantell) may be seen in the British Museum. Other fossil remains were from time to time noted by Prof. Owen[3]; but it began to be feared that the bird had ceased to exist,[4] until a third example was taken about the year 1879, the skin and most of the bones of which, after undergoing examination in New Zealand by Dr Buller and Prof. T. J. Parker,[5] found their way to the museum of Dresden, where Dr A. B. Meyer discovered the recent remains to be specifically distinct from the fossil, and while keeping for the latter the name *N. mantelli* gives the former that of *N. hochstetteri*. What seems to have been a third species of *Notornis* formerly inhabited Lord Howe's Island, but is now extinct (see BIRDS, vol. iii. p. 732, note). Whether the genus *Aptornis*, of which Prof. Owen has described the remains from New Zealand, was most nearly allied to *Notornis* and *Porphyrio* cannot here be decided. Prof. T. J. Parker (*loc. cit.*) considers it a "development by degeneration of an ocydromine type" (see OCYDROME). (A. N.)

MORAL PHILOSOPHY. See ETHICS, vol. viii. p. 574.

MORATIN, LEANDRO FERNANDEZ DE (1760-1828), Spanish dramatist and poet, was the son of N. F. Moratin mentioned below, and was born at Madrid on 10th March 1760. His poetical and artistic tastes were early developed, but his father, keenly alive to the difficulties of the literary calling, caused him to be apprenticed to a jeweller. At the age of eighteen Moratin surprised his friends by winning the second prize of the Academy for a heroic poem on the conquest of Granada, and two years afterwards he attracted still more general attention by a similar success of his *Leccion Poetica*, a satire upon the popular poets of the day. Through Jovellanos he was now appointed secretary to Cabarrus on his special mission to France in 1787, and during his stay there he diligently improved his opportunities of becoming acquainted with the contemporary French drama, and of cultivating the acquaintance of men of letters. Of the literary friendships he then formed the most important was that with Goldoni; indeed, Moratin is much more correctly styled "the Spanish Goldoni" than "the Spanish Molière." On his return to Spain Florida Blanca presented him to a sinecure benefice in the diocese of Burgos; and in 1790 his first play, *El Viejo y la Niña* (The Old Husband and the Young Wife), a highly finished but somewhat dreary verse comedy in three acts, written in 1786, but delayed by objections of the actors, was at length produced at the Teatro del Principe. Its success was only moderate. *El Café* or *La Comedia Nueva*, on the other hand, given at the same theatre two years afterwards, at once became deservedly popular, and had considerable influence in modifying the public taste. It is a short prose comedy in two acts, avowedly intended to expose the follies and absurdities of the contemporary dramatists—the school of Lope de Vega run to seed—who commanded the support of the masses; and it is still read with pleasure for the simple ingenuity of its plot, the liveliness of its dialogue, and the easy grace of its style, while to the student of literature it throws much useful light on the contemporary state of the Spanish drama, and on the reforming aims of the author and his party. In the same year (1792) Florida Blanca was disgraced, but Moratin at once found another patron in Godoy, who provided him with a pension and the means for foreign travel; he accordingly passed through France into England, where he began the free and somewhat incorrect translation of *Hamlet* which was printed in 1798, but which has never been performed. From England he passed to the Low Countries, Germany, Switzerland, and Italy, and on his return to the Peninsula in 1796 he received a lucrative post at the Foreign Office. His next appearance in the drama did not take place until 1803, when *El Baron* was first publicly exhibited in its present form. It successfully weathered a determined attempt to damn it, and still keeps the stage. It was followed in 1804 by *La Mogigata* (The Female Hypocrite), of which imperfect manuscript copies had begun to circulate as early as 1791. It was favourably received, as on the whole it deserved to be, by a public which was now at one with the author as to the canons of his art, and an attempt to suppress it by means of the Inquisition on alleged religious grounds (*La Mogigata* being an imitation, a somewhat feeble one, of Molière's *Tartuffe*) was successfully frustrated. Provincial affairs are managed by the landtag, consisting of the Roman Catholic archbishop and bishop, 30 representatives of the landed gentry, 37 representatives of the towns and chambers of commerce, and 31 representatives of the country districts. There are six courts of justice of the first instance in Moravia, and one of the second instance (at Brünn), whence appeal lies to the supreme court at Vienna. For military and judicial purposes Moravia is united with Austrian Silesia.

Moravia belongs to the group of old Slavonic states which have preserved their nationality while losing their political independence. Upwards of 70 per cent. of the inhabitants are Slavs, who are scarcely distinguishable from their Bohemian neighbours. The differences in dialect between the two countries are very slight, and are being gradually lost in a common literary language. The name of Czech, however, is usually reserved for the Bohemians, while the Slavs of Moravia and West Hungary are called Moravians and Slovaks. The Czechs have lost sight of their ancient tribal names, but the Moravians are still divided into numerous secondary groups (Hovaks, Hanaks, &c.), differing slightly in costume and dialect. The peasants usually wear a national costume. In the south of Moravia are a few thousand Croats, still preserving their manners and language after three centuries' separation from their kinsmen in Croatia; and in the north-east are numerous Poles. The Germans form about 26 per cent. of the population, and are found mostly in the towns and in the border districts. The Jews are the best educated of the inhabitants, and in a few small towns form a full half of the population. Their sympathies generally lie with the Germans. In 1880 the population was 2,153,407, showing an increase of 136,133 since 1869. Moravia is one of the most densely-populated parts of Austria-Hungary, the proportion being 252 persons per square mile. About 12 per cent. of the births are illegitimate. The chief towns are Brünn, the capital and industrial centre (82,660 inhabitants), Olmütz, a strong fortress defending the "Moravian Gate" (20,176 inhabitants), Znaim, and Iglau.

History.—At the earliest period of which we have any record Moravia was occupied by the Boii, the Celtic race which has perpetuated its name in Bohemia. Afterwards it was inhabited by the Germanic Quadi, who accompanied the Vandals in their westward migration; and they were replaced in the 5th century by the Rugii and Heruli. The latter tribes were succeeded about the year 550 A.D. by the Lombards, and these in their turn were soon forced to retire before an overwhelming invasion of Slavs, who, on their settlement there, took the name of Moravians (German, *Mehraner* or *Mähren*) from the river Morava. These new colonists became the permanent inhabitants of this district, and in spite of the hostility of the Avars on the east founded the kingdom of Great Moravia, which was considerably more extensive than the province now bearing the name. Towards the end of the 8th century they aided Charlemagne in putting an end to the Avar kingdom, and were rewarded by receiving part of it, corresponding to North Hungary, as a fief of the German emperor, whose supremacy they also acknowledged more or less for their other possessions. After the death of Charlemagne the Moravian princes took advantage of the dissensions of his successors to enlarge their territories and assert their independence, and Rastislaus (*circa* 850) even formed an alliance with the Bulgarians and the Byzantine emperor. The chief result of the alliance with the latter was the conversion of the Moravians to Christianity by two Greek monks, Cyril and Methodius, despatched from Constantinople. Rastislaus finally fell into the hands of Louis the German, who blinded him, and forced him to end his days as a monk; but his successor, Suatopluk (*ob.* 890), was equally vigorous, and extended the kingdom of Great Moravia to the Oder on the west and the Gran on the east. At this period there seemed a strong probability of the junction of the north-western and south-eastern Slavs, and the formation of a great Slavonic power to the east of the German empire. This prospect, however, was dissipated by the invasions of the Magyar hordes in the 10th century, the brunt of which was borne by Moravia. The invaders were encouraged by the German monarchs and aided by the dissensions and mismanagement of the successors of Suatopluk, and in a short time completely subdued the eastern part of Great Moravia. The name of Moravia was henceforth confined to the district to which it now applies. For about a century the possession of this marchland was disputed by Hungary, Poland, and Bohemia, but in 1029 it was finally incorporated with Bohemia, and so became an integral part of the German empire. Towards the close of the 12th century Moravia was raised to the dignity of a margraviate, but with the proviso that it should be held as a fief of the crown of Bohemia. It henceforth shared the fortunes of this country, and was usually assigned as an apanage to younger members of the Bohemian royal house. In 1410 Jobst, margrave of Moravia, was made emperor of Germany, but died a few months after his election. In 1526, on the death of Louis II. of Hungary, Moravia came with the rest of that prince's possessions into the hands of the Austrian house. During the Thirty Years' War the depopulation of Moravia was so great that after the peace of Westphalia the states-general published an edict giving every man permission to take two wives, in order to "repeople the country." After the Seven Years' War Moravia was united in one province with the remnant of Silesia, but in 1849 it was made a separate and independent crownland. The most noticeable feature of recent Moravian history has been the active sympathy of its inhabitants with the anti-Teutonic home-rule agitation of the Bohemian Czechs (see BOHEMIA).

(J. F. M.)

MORAVIAN BRETHREN, THE, are a society of Christians whose history can be traced back to the year 1457 and their origin found among the religious movements in Bohemia which followed the martyrdom of John Huss by the council of Constance. The beginnings of the Bohemian Brethren (for that was their earlier name) are somewhat obscure. The followers of Huss broke up into two factions, one of which, the Calixtines, was willing to acknowledge allegiance to Rome, provided the "compacts" of the council of Basel permitting the Lord's Supper *sub utraque specie* were maintained, and in the end it became the national church of Bohemia; the other, the Taborites, refused all terms of reconciliation, and appealed to arms. Separate from both these were many pious people who were content to worship God in simple fashion, in quiet meetings for prayer and Scripture-reading, like the *Gottesfreunde* of Germany, and who called themselves *Brethren*. Bohemian historians have conclusively shown that the Brethren represent the religious kernel of the Hussite movement, and do not come either from the German Waldenses or from the Taborites. Before 1457 many of these quiet Christians were known as the Brethren of Chelcic, and were the followers of Peter Chelcicky, a Bohemian, whose religious influence, strongly Puritan in its character, seems to have been inferior only to that of Huss. In that year the Calixtine leader, Rokyzana, wishing to protect them, permitted his nephew Gregory to gather them together at Kunewald near Senftenberg, and form them into a community. This meeting was really the foundation of the Brethren or *Unitas Fratrum*, and its founder Gregory announced that he and his companions received and taught the rejection of oaths, of the military profession, of all official rank, titles, and endowments, and of a hierarchy. They did not profess communism, but they held that the rich should give of their riches to the poor, and that all Christians should live as nearly as possible in the fashion of the apostolic community at Jerusalem. At the synod of Lhota near Reichenau, in 1467, they constituted themselves into a church separate from the Calixtine or national church of Bohemia. They appointed ministers of their own election and with the guidance of the "lot," and had an organization and discipline of their own; at their head was a bishop, who, it is said, received ordination from the Austrian Waldenses, but apostolic succession among the Brethren is one of the most obscure parts of their history.

The constitution of the society was revised at a second synod held at Lhota under the direction of Luke of Prague, who may be regarded as their second founder. This re-

The constitution of the society was revised at a second synod held at Lhota under the direction of Luke of Prague, who may be regarded as their second founder. This re-

du Nord, and W. by Finistère. Its chief town, Vannes, is 248 miles west-south-west of Paris in a direct line and 310 by rail. From the Montagnes Noires on the northern frontier the western portion of Morbihan slopes southward towards Finistère, watered by the Quimperlé, the Blavet with its affluent the Scorff, and the Auray; the eastern portion, on the other hand, dips towards the south-east in the direction of the course of the Oust and its feeders, which fall into the Vilaine. Though the Montagnes Noires contain the highest point (975 feet) in the department, the most striking orographic feature of Morbihan is the dreary, treeless, streamless tract of moorland and marsh known as the Landes of Lanvaux, which extends (west-north-west to east-south-east) with a width of from 1 to 3 miles for a distance of 31 miles between the valley of the Claie and that of the Arz (affluents of the Oust). A striking contrast to this district is afforded by the various inlets of the sea, whose shores are clothed with vegetation of exceptional richness, large fig-trees, rose-laurels, and aloes growing as if in Algeria. The coast-line is exceedingly irregular: the mouth of the Vilaine (the longest river of the department), the peninsula of Ruis, the great gulf of Morbihan (Inner Sea), from which the department takes its name, and the mouth of the Auray, the long Quiberon peninsula attached to the mainland by the narrow isthmus of Fort Penthièvre, the deep-branching estuary of Etel, the mouths of the Blavet and the Scorff uniting to form the port of Lorient, and, finally, on the borders of Finistère the mouth of the Laita, follow each other in rapid succession. Off the coast lie the islands of Groix, Belle-isle, Houat, and Hoedik. Vessels drawing 13 feet can ascend the Vilaine as far as Redon; the Blavet is canalized throughout its course through the department; and the Oust, as part of the canal from Nantes to Brest, forms a great waterway by Redon, Josselin, Rohan, and Pontivy. The climate of Morbihan is characterized by great moisture and mildness, due to the influence of the Gulf Stream.

Of the 2625 square miles forming the department, nearly one half is occupied by moors (*landes*), arable soil forming little more than a third part of the whole, meadows a tenth, and woodlands a fifteenth. The horses number 36,000, horned cattle 285,000, sheep 92,000, pigs 60,000, goats 6000, and beehives 76,000. In 1882 the agricultural produce comprised 3,751,680 bushels of rye and 1,544,170 bushels of wheat; and considerable quantities of buckwheat, oats, potatoes, pease and beans, chestnuts, beetroot, hemp, colza, and flax are grown. A little wine also is made, but the usual liquor of the district is cider (manufactured to the extent of 11 to 13 million gallons per annum). The sea-ware gathered along the coast helps greatly to improve the soil. Outside of Lorient there is little industrial activity in Morbihan, though canvas, leather, preserved foods, paper, and chemical products derived from the sea are all manufactured. Salt marshes give employment to 400 hands, and yield on an average 9892 tons of salt; and slate, kaolin, iron-ore, and granite are also worked. The catching and curing of sardines and the breeding of oysters form the business of many of the inhabitants of the coast, who also fish for anchovies, lobsters, &c., for tinning. There are 154 miles of railway in the department, and it was intended (1883) that the line from Nantes to Brest should have branches from Auray to St Brieuc and to Quiberon, and from Questembert to Ploermel. Morbihan is divided into four arrondissements,—Vannes, Lorient, Ploermel, and Pontivy—37 cantons, and 249 communes. The population in 1881 was 521,614.

Few departments contain so many localities interesting for their historical associations. Besides the megalithic monuments of CARNAC (2800 inhabitants) (*q.v.*) and of Locmariaquer (2050), may be mentioned—Sarzeau (5720) with its castle of Sucinio, one of the ancient dukes of Brittany; Josselin (2710) with the tomb of Olivier de Clisson, constable of France, and of his second wife Marguerite de Rohan; the castle of the Rohans, and in the neighbourhood a column in memory of the "Combat of the Thirty;" Guémené (1570) and the château of the Rohan Guémené family; Le Palais (4885), the chief place in Belle-isle, containing the château of Fouquet (Louis XIV.'s superintendent of finance) and the hospital erected by his wife. Quiberon (2380) is associated with the disaster of the French émigrés; Hennebont (6050) has a magnificent railway viaduct over the Blavet, and La Roche Bernard (1230) a suspension bridge over the Vilaine, 646 feet long and 108 feet above spring tides.

MORDAUNT, CHARLES. See PETERBOROUGH, EARL OF.

MORDVINIANS, more correctly MORDVA or MORDVS, are a people numbering about one million, of Finnish origin, belonging to the Ural-Altaic family, who inhabit the middle Volga provinces of Russia and spread in small detached communities to the south and east of these. Their settlement in the basin of the Volga is of high antiquity. One of the two great branches into which they are divided, the Aorses (now Erzya), is mentioned by Ptolemy as dwelling between the Baltic Sea and the Ural mountains, whilst the Aorses of Asia occupied at the same time the country to the north-east of the Caspian between the Volga and the Jaxartes. Their king is said to have come with 200,000 horsemen to aid Mithradates in his wars. Strabo mentions also the Aorses as inhabitants of the country between the Don, the Caspian Sea, and the Caucasus. The name of Mordvs is mentioned for the first time by Jordanes, and they were known under the same name to the Russian annalist Nestor. The Russians made raids on the Mordvs in the 12th century, and after the fall of Kasan they rapidly invaded and colonized their abodes. The Mordvs now occupy the Russian provinces of Simbirsk, Penza, Samara, and Nijni-Novgorod, as well as those of Saratoff and Tamboff. But their villages are dispersed among those of the Russians, and they constitute only 10 to 12 per cent. of the population in the four first-named provinces, and from 5 to 6 per cent. in the last two. They are unequally distributed over this area in ethnographical islands, and constitute as much as 23 to 44 per cent. of the population of several districts of the governments of Tamboff, Simbirsk, Samara, and Saratoff, and only 2 or 3 per cent. in other districts of the same provinces. A small number of Mordvs are found also in the provinces of Ufa, Orenburg, Astrakhan, and even in Siberia as far east as the river Tom. They are divided into two great branches, the Erzya and the Moksha, differing in their ethnological features and in their language. The southern branch, or the Moksha, have a darker skin and darker eyes and hair than the northern. A third branch, the Karatays, is due to mixture with Tatars, whilst a fourth branch, mentioned by several authors, is, according to Mainoff, but a local name for pure Mordvs. Their language is considered by M. Ahlqvist as the third branch of the Western Finnish family, the two other branches being the Laponian and the Baltic Finnish, which last embodies now the languages of the Karelians, the Tavastes, the Wotes, the Wespes, the Esthes, and the Lives. The Mordvs are for the most part completely Russified,—even the Mokshas who consider themselves as the only pure Mordvs,—yet they have well maintained their ethnological features, and can be easily distinguished even when living completely as Russians. They have nearly quite forgotten their own language, only a few women remembering it among the Mokshas; but they have maintained a good deal of their old national dress, especially the women, whose profusely embroidered skirts, original hair-dress, large earrings which sometimes are merely hare-tails, and numerous necklaces covering all the chest and consisting of all possible ornaments easily distinguish them from Russian women. They have mostly dark hair, but blue eyes, generally small and rather narrow. The cephalic index of the Mordvs is very near to that of the Finns. They are brachycephalous, or sub-brachycephalous, and a few are mesaticephalous. They are finely built, rather tall and strong, and broad-chested. Their chief occupation is agriculture; they work harder and (in the basin of the Moksha) are more prosperous than their Russian neighbours. Their capacities as carpenters were well

du Nord, and W. by Finistère. Its chief town, Vannes, is 248 miles west-south-west of Paris in a direct line and 310 by rail. From the Montagnes Noires on the northern frontier the western portion of Morbihan slopes southward towards Finistère, watered by the Quimperlé, the Blavet with its affluent the Scorff, and the Auray; the eastern portion, on the other hand, dips towards the south-east in the direction of the course of the Oust and its feeders, which fall into the Vilaine. Though the Montagnes Noires contain the highest point (975 feet) in the department, the most striking orographic feature of Morbihan is the dreary, treeless, streamless tract of moorland and marsh known as the Landes of Lanvaux, which extends (west-north-west to east-south-east) with a width of from 1 to 3 miles for a distance of 31 miles between the valley of the Claie and that of the Arz (affluents of the Oust). A striking contrast to this district is afforded by the various inlets of the sea, whose shores are clothed with vegetation of exceptional richness, large fig-trees, rose-laurels, and aloes growing as if in Algeria. The coast-line is exceedingly irregular: the mouth of the Vilaine (the longest river of the department), the peninsula of Ruis, the great gulf of Morbihan (Inner Sea), from which the department takes its name, and the mouth of the Auray, the long Quiberon peninsula attached to the mainland by the narrow isthmus of Fort Penthièvre, the deep-branching estuary of Etel, the mouths of the Blavet and the Scorff uniting to form the port of Lorient, and, finally, on the borders of Finistère the mouth of the Laita, follow each other in rapid succession. Off the coast lie the islands of Groix, Belle-isle, Houat, and Hoedik. Vessels drawing 13 feet can ascend the Vilaine as far as Redon; the Blavet is canalized throughout its course through the department; and the Oust, as part of the canal from Nantes to Brest, forms a great waterway by Redon, Josselin, Rohan, and Pontivy. The climate of Morbihan is characterized by great moisture and mildness, due to the influence of the Gulf Stream.

Of the 2625 square miles forming the department, nearly one half is occupied by moors (*landes*), arable soil forming little more than a third part of the whole, meadows a tenth, and woodlands a fifteenth. The horses number 36,000, horned cattle 285,000, sheep 92,000, pigs 60,000, goats 6000, and beehives 76,000. In 1882 the agricultural produce comprised 3,751,680 bushels of rye and 1,544,170 bushels of wheat; and considerable quantities of buckwheat, oats, potatoes, pease and beans, chestnuts, beetroot, hemp, colza, and flax are grown. A little wine also is made, but the usual liquor of the district is cider (manufactured to the extent of 11 to 13 million gallons per annum). The sea-ware gathered along the coast helps greatly to improve the soil. Outside of Lorient there is little industrial activity in Morbihan, though canvas, leather, preserved foods, paper, and chemical products derived from the sea are all manufactured. Salt marshes give employment to 400 hands, and yield on an average 9892 tons of salt; and slate, kaolin, iron-ore, and granite are also worked. The catching and curing of sardines and the breeding of oysters form the business of many of the inhabitants of the coast, who also fish for anchovies, lobsters, &c., for tinning. There are 154 miles of railway in the department, and it was intended (1883) that the line from Nantes to Brest should have branches from Auray to St Brieuc and to Quiberon, and from Questembert to Ploermel. Morbihan is divided into four arrondissements,—Vannes, Lorient, Ploermel, and Pontivy—37 cantons, and 249 communes. The population in 1881 was 521,614.

Their chief occupation is agriculture; they work harder and (in the basin of the Moksha) are more prosperous than their Russian neighbours. Their capacities as carpenters were well

interesting manner.[1] His communings and ecstasies have no morbid taint; they are the natural carriage of a strangely gifted spirit. "From the beginning all things in a manner came flowing to him," and his mind, according to his own saying, "was enlightened with a sense of the noblest theories in the morning of his days." In 1631 he went to Cambridge, and was admitted at Christ's College about the time Milton was leaving it. He immersed himself "over head and ears in the study of philosophy," and fell for a time into a sort of scepticism, from which, however, he was delivered by a study of the "Platonic writers." He was fascinated especially by Neo-Platonism, and this fascination never left him. The *Theologia Germanica* also exerted a great and permanent influence over him. He entered upon a course of spiritual self-discipline which made all his previous studies seem of comparatively no value; and gradually light as well as peace came to him. He got "into a most joyous and lucid state of mind," which he described in a Greek epigram, as he had formerly described his state of mental and spiritual darkness in the same manner. He took his bachelor's degree in 1635, his master's degree in 1639, and immediately afterwards was chosen fellow of his college. In this position he may be said to have remained all his life. Many offers of preferment were made to him, but he refused them all, with one exception. Fifteen years after the Restoration, he accepted a prebend in Gloucester cathedral, but only to resign it in favour of his friend Dr. Edward Fowler, afterwards the well-known bishop of Gloucester. He had no ambition, and steadily declined all attempts to draw him towards public life. He would not even accept the mastership of his college, to which, it is understood, he would have been preferred in 1654, when Cudworth was appointed. He drew many young men of a refined and thoughtful turn of mind around him, but among all his pupils the most interesting was a young lady of noble family, a "heroine pupil," as his biographer (Ward) says, "of an extraordinary nature." This lady is supposed to have been a sister of Lord Finch, afterwards earl of Nottingham, a well-known statesman of the Restoration. She afterwards became Lady Conway, and at her country seat at Ragley in Warwickshire More continued at intervals to spend "a considerable part of his time." She and her husband both greatly appreciated him, and amidst the woods of this pleasant retreat he composed several of his books. There is reason to think that the spiritual enthusiasm of Lady Conway was a considerable factor in some of More's speculations, none the less that she at length passed from his religious pupilage into the ranks of the Quakers. Susceptible to all the excited impulses of her time, this lady became the friend not only of More and Penn but of Baron van Helmont and Valentine Greatrakes, mystical thaumaturgists who played a considerable part amid the teeming enthusiasms of the 17th century. Ragley became a centre not only of devotion but of wonder-working spiritualism.[2] "Many happy days," More says, he spent in this "paradise," and its fantastic mysticism had more allurements for him than he himself realized. His genius suffered in consequence, and the play of rationality which distinguishes his earlier is much less conspicuous in his later works. He was a voluminous writer both in verse and prose, and the mere list of his works would occupy more space than we can give to it. Many of his productions are now unreadable; but the *Divine Dialogues*, published in 1668, may be still read with pleasure. It is animated and sometimes even brilliant, with less prolixity and digression than his other productions, while it has also the advantage for modern readers that it condenses his general view of philosophy and religion. Most of his characteristic principles may in fact be gathered from it.

The year in which he composed the *Divine Dialogues* may be said to mark the highest point of his intellectual activity. His *Manual of Metaphysics* and elaborate treatises on Jacob Boehme and Spinoza were subsequent to this; but the elasticity and freshness of his philosophical genius are less buoyant in these efforts, and the prophetico-mystical elements which were a weakness in his mental constitution from the first grew as his years advanced. He represents more than any other member of the school the mystical and theosophic side of the Cambridge movement. Its lofty rationality, the rationality of which he himself had spoken earlier in noble language, at length evaporates in him in intellectual reverie and dreams. The Neo-Platonic extravagances which lay hidden in the school from the first came in his writings to a head, and merged in pure phantasy,—a set of favourite ideas which not merely guided but dominated the reason. Withal Henry More can never be spoken of save as a spiritual genius and significant figure in the history of British philosophy, less robust and manly and in some respects less learned than Cudworth but more interesting and fertile in thought, and more sweet, singular, and genial in character. From youth to age he describes himself as gifted with a most happy and buoyant temper. The presence of nature filled him with rapture; he wished he could be always *sub dio*. "Walking abroad after his studies his sallies towards nature would be often inexpressibly ravishing, beyond what he could convey to others." His own thoughts were to him a never-ending source of pleasurable excitement. His mind moved with great rapidity and at a lofty elevation, so that, as he says, he seemed "all the while to be in the air." This mystical glow and elevation were the chief features of his mind and character, a certain transport and radiancy of thought which carried him beyond the common life without raising him to any false or artificial height, for his humility and charity were not less conspicuous than his piety. The last ten years of his life are without any special record, and he died on the morning of 1st September 1687, and was buried in the chapel of the college he loved so well, where within less than a year his friend Cudworth was laid beside him.

Before his death More issued complete editions of his works, his *Opera Theologica* in 1675, and his *Opera Philosophica* in 1678. The chief authorities for his life are Ward's *Life*, 1710; the "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679; and also a general account of the manner and scope of his writings in an *Apology* published in 1664. The collection of his *Philosophical Poems*, 1647, in which he has "compared his chief speculations and experiences," should also be consulted. An elaborate analysis of his life and works is given in Principal Tulloch's *Rational Theology*, vol. ii., 1874. (J. T.)

MORE, THOMAS (1478-1535), lord chancellor, and one of the most illustrious Englishmen of his century, was born in Milk Street in the City of London, 7th February 1478. He received the rudiments of education at St Anthony's School in Threadneedle Street, at that time under Nicolas Holt held to be the best in the city. He was early placed in the household of Cardinal Morton, archbishop of Canterbury. Admission to the cardinal's family was esteemed a high privilege, and was sought as a school of manners and as an introduction to the world by the sons of the best families in the kingdom. Young Thomas More obtained admission through the influence of his father, Sir Thomas, then a rising barrister and afterwards a justice of the Court of King's Bench. The usual prognostication of future distinction is attributed in the case of More to Cardinal Morton, "who would often tell the nobles sitting at table with him, where young Thomas waited on him, whosoever liveth to trie it shall see this

[1] "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679.

[2] The place and its religious marvels are glanced at in the romance of *John Inglesant* (chap. xv.).

interesting manner.[1] His communings and ecstasies have no morbid taint; they are the natural carriage of a strangely gifted spirit. MORE, THOMAS (1478-1535), lord chancellor, and one of the most illustrious Englishmen of his century, was born in Milk Street in the City of London, 7th February 1478. He received the rudiments of education at St Anthony's School in Threadneedle Street, at that time under Nicolas Holt held to be the best in the city. He was early placed in the household of Cardinal Morton, archbishop of Canterbury. Admission to the cardinal's family was esteemed a high privilege, and was sought as a school of manners and as an introduction to the world by the sons of the best families in the kingdom. Young Thomas More obtained admission through the influence of his father, Sir Thomas, then a rising barrister and afterwards a justice of the Court of King's Bench. The usual prognostication of future distinction is attributed in the case of More to Cardinal Morton, "who would often tell the nobles sitting at table with him, where young Thomas waited on him, whosoever liveth to trie it shall see this

[1] "Prefatio Generalissima" prefixed to his *Opera Omnia*, 1679.

[2] The place and its religious marvels are glanced at in the romance of *John Inglesant* (chap. xv.).

More's father, whom upon some pretext he threw into the Tower, and he only released him upon payment of a fine of £100. Thomas More even found it advisable to withdraw from public life into obscurity. During this period of retirement the old dilemma recurred. One while he devoted himself to the sciences, "perfecting himself in music, arithmetic, geometry, and astronomy, learning the French tongue, and recreating his tired spirits on the viol,"[1] or translating epigrams from the Greek anthology; another while resolving to take priest's orders.

From dreams of clerical celibacy he was roused by making acquaintance with the family of John Colt of New Hall, in Essex. The "honest and sweet conversation" of the daughters attracted him, and though his inclination led him to prefer the second he married the eldest, not liking to put the affront upon her of passing her over in favour of her younger sister. The death of the old king in 1507 restored him to the practice of his profession, and to that public career for which his abilities specially fitted him. From this time there was scarce a cause of importance in which he was not engaged. His professional income amounted to £400 a year, equal to £4000 in present money, and, "considering the relative profits of the law and the value of money, probably indicated as high a station as £10,000 at the present day" (Campbell). It was not long before he attracted the attention of the young king and of Wolsey. The Latin verses which he presented to Henry on the occasion of his coronation did not deserve particular notice amid the crowd of congratulatory odes. But the spirit with which he pleaded before the Star Chamber in a case of the Crown *v.* the Pope recommended him to the royal favour, and marked him out for employment. More obtained in this case judgment against the crown. Henry, who was present in person at the trial, had the good sense not to resent the defeat, but took the counsel to whose advocacy it was due into his service. In 1514 More was made master of the requests, knighted, and sworn a member of the privy council. He was repeatedly employed on embassies to the Low Countries, and was for a long time stationed at Calais as agent in the shifty negotiations carried on by Wolsey with the court of France. In 1519 he was compelled to resign his post of undersheriff to the city and his private practice at the bar. In 1521 he was appointed treasurer of the exchequer, and in the parliament of 1523 he was elected speaker. The choice of this officer rested nominally with the House itself, but in practice was always dictated by the court. Sir Thomas More was pitched upon by the court on this occasion in order that his popularity with the Commons might be employed to carry the money grant for which Wolsey asked. To the great disappointment of the court More remained firm to the popular cause, and it was greatly owing to his influence that its demands were resisted. From this occurrence may be dated the jealousy which the cardinal began to exhibit towards More. Wolsey made an attempt to get him out of the way by sending him as ambassador to Spain. More defeated the design by a personal appeal to the king, alleging that the climate would be fatal to his health. Henry, who saw through the artifice, and was already looking round for a more popular successor to Wolsey, made the gracious answer that he would employ More otherwise. In 1525 More was appointed chancellor of the duchy of Lancaster, and no pains were spared to attach him to the court. The king frequently sent for him into his closet, and discoursed with him on astronomy, geometry, and points of divinity. This growing favour, by which many men would have been carried away, did not impose upon More. He discouraged the king's advances, showed reluctance to go to the palace, and seemed constrained when there. Then the king began to come himself to More's house at Chelsea, and would dine with him without previous notice. Roper mentions one of these visits, when the king after dinner walked in the garden by the space of an hour, holding his arm round More's neck. Roper afterwards congratulated his father-in-law on the distinguished honour which had been shown him. "I thank our Lord," was the reply, "I find his grace my very good lord indeed; and I believe he doth as singularly favour me as any subject within this realm. Howbeit, son Roper, I may tell thee I have no cause to be proud thereof, for if my head would win him a castle in France, it should not fail to go." As a last resource More tried the expedient of silence, dissembling his wit and affecting to be dull. This had the desired effect so far that he was less often sent for. But it did not alter the royal policy, and in 1529, when a successo had to be found for Wolsey, More was raised to the chancellorship. The selection was justified by More's high reputation, but it was also significant of the modification which the policy of the court was then undergoing. It was a concession to the rising popular party, to which it was supposed that More's politics inclined him. The public favour with which his appointment had been received was justified by his conduct as judge in the Court of Chancery. Having heard causes in the forenoon between eight and eleven, after dinner he sat again to receive petitions. The meaner the suppliant was th more affably he would speak to him, and the more speedi'y he would despatch his case. In this respect he formed a great contrast to his predecessor, whose arrears he soon cleared off. One morning being told by the officer th there was not another cause before the court, he ordere the fact to be entered on record, as it had never happene before. He not only refused all gifts, such as had bee usual, himself, but took measures to prevent any of hi connexions from interfering with the course of justic One of his sons-in-law, Heron, having a suit in the cha cellor's court, and refusing to agree to any reasonal accommodation, because the judge "was the most affec tionate father to his children that ever was in the world, More thereupon made a decree against him.

Unfortunately for Sir Thomas More, a lord chancell is not merely a judge, but has high political functions t perform. In raising More to that eminent position, th king had not merely considered his professional distinct.. but had counted upon his avowed liberal and reformin tendencies. In the *Utopia*, which, though written earli More had allowed to be printed as late as 1516, he ha spoken against the vices of power and declared for indit ference of religious creed with a breadth of philosophica view of which there is no other example in any English man of that age. At the same time, as he could not l suspected of any sympathy with Lutheran or Wickliffit heretics, he might fairly be regarded as qualified to lea the party which aimed at reform in state and churc within the limits of Catholic orthodoxy. But in the king' mind the public questions of reform were entirely sunk i the personal one of the divorce. The divorce was a poin upon which Sir Thomas would not yield. And, as he sa that the marriage with Anne Boleyn was determined upo he petitioned the king to be allowed to resign the grea seal, alleging failing health. With much reluctance, th royal permission was given and the resignation accepte 10th May 1532, with many gracious expressions of go will on the part of the king. The promise held out future bounty was never fulfilled, and More left office, he had entered it, a poor man. His necessitous conditic was so notorious that the clergy in convocation voted hi

[1] Roper, *Life*.

More's father, whom upon some pretext he threw into the Tower, and he only released him upon payment of a fine of £100. Thomas More even found it advisable to withdraw from public life into obscurity. During this period of retirement the old dilemma recurred. One while he devoted himself to the sciences, "perfecting himself in music, arithmetic, geometry, and astronomy, learning the French tongue, and recreating his tired spirits on the viol,"[1] or translating epigrams from the Greek anthology; another while resolving to take priest's orders.

From dreams of clerical celibacy he was roused by making acquaintance with the family of John Colt of New Hall, in Essex. The "honest and sweet conversation" of the daughters attracted him, and though his inclination led him to prefer the second he married the eldest, not liking to put the affront upon her of passing her over in favour of her younger sister. The death of the old king in 1507 restored him to the practice of his profession, and to that public career for which his abilities specially fitted him. From this time there was scarce a cause of importance in which he was not engaged. His professional income amounted to £400 a year, equal to £4000 in present money, and, "considering the relative profits of the law and the value of money, probably indicated as high a station as £10,000 at the present day" (Campbell). It was not long before he attracted the attention of the young king and of Wolsey. The Latin verses which he presented to Henry on the occasion of his coronation did not deserve particular notice amid the crowd of congratulatory odes. But the spirit with which he pleaded before the Star Chamber in a case of the Crown *v.* the Pope recommended him to the royal favour, and marked him out for employment. More obtained in this case judgment against the crown. Henry, who was present in person at the trial, had the good sense not to resent the defeat, but took the counsel to whose advocacy it was due into his service. In 1514 More was made master of the requests, knighted, and sworn a member of the privy council. He was repeatedly employed on embassies to the Low Countries, and was for a long time stationed at Calais as agent in the shifty negotiations carried on by Wolsey with the court of France. In 1519 he was compelled to resign his post of under-sheriff to the city and his private practice at the bar. In 1521 he was appointed treasurer of the exchequer, and in the parliament of 1523 he was elected speaker. The choice of this officer rested nominally with the House itself, but in practice was always dictated by the court. Sir Thomas More was pitched upon by the court on this occasion in order that his popularity with the Commons might be employed to carry the money grant for which Wolsey asked. To the great disappointment of the court More remained firm to the popular cause, and it was greatly owing to his influence that its demands were resisted. From this occurrence may be dated the jealousy which the cardinal began to exhibit towards More. Wolsey made an attempt to get him out of the way by sending him as ambassador to Spain. More defeated the design by a personal appeal to the king, alleging that the climate would be fatal to his health. Henry, who saw through the artifice, and was already looking round for a more popular successor to Wolsey, made the gracious answer that he would employ More otherwise. In 1525 More was appointed chancellor of the duchy of Lancaster, and no pains were spared to attach him to the court. The king frequently sent for him into his closet, and discoursed with him on astronomy, geometry, and points of divinity. This growing favour, by which many men would have been carried away, did not impose upon More. He discouraged the king's advances, showed reluctance to go to the palace, and seemed constrained when there. Then the king began to come himself to More's house at Chelsea, and would dine with him without previous notice. Roper mentions one of these visits, when the king after dinner walked in the garden by the space of an hour, holding his arm round More's neck. Roper afterwards congratulated his father-in-law on the distinguished honour which had been shown him. "I thank our Lord," was the reply, "I find his grace my very good lord indeed; and I believe he doth as singularly favour me as any subject within this realm. Howbeit, son Roper, I may tell thee I have no cause to be proud thereof, for if my head would win him a castle in France, it should not fail to go." As a last resource More tried the expedient of silence, dissembling his wit and affecting to be dull. This had the desired effect so far that he was less often sent for. But it did not alter the royal policy, and in 1529, when a successor had to be found for Wolsey, More was raised to the chancellorship. The selection was justified by More's high reputation, but it was also significant of the modification which the policy of the court was then undergoing. It was a concession to the rising popular party, to which it was supposed that More's politics inclined him. The public favour with which his appointment had been received was justified by his conduct as judge in the Court of Chancery. Having heard causes in the forenoon between eight and eleven, after dinner he sat again to receive petitions. The meaner the suppliant was the more affably he would speak to him, and the more speedily he would despatch his case. In this respect he formed a great contrast to his predecessor, whose arrears he soon cleared off. One morning being told by the officer that there was not another cause before the court, he ordered the fact to be entered on record, as it had never happened before. He not only refused all gifts, such as had been usual, himself, but took measures to prevent any of his connexions from interfering with the course of justice. One of his sons-in-law, Heron, having a suit in the chancellor's court, and refusing to agree to any reasonable accommodation, because the judge "was the most affectionate father to his children that ever was in the world," More thereupon made a decree against him.

Unfortunately for Sir Thomas More, a lord chancellor is not merely a judge, but has high political functions to perform. In raising More to that eminent position, the king had not merely considered his professional distinction, but had counted upon his avowed liberal and reforming tendencies. In the *Utopia*, which, though written earlier, More had allowed to be printed as late as 1516, he had spoken against the vices of power and declared for indifference of religious creed with a breadth of philosophical view of which there is no other example in any Englishman of that age. At the same time, as he could not be suspected of any sympathy with Lutheran or Wickliffite heretics, he might fairly be regarded as qualified to lead the party which aimed at reform in state and church within the limits of Catholic orthodoxy. But in the king's mind the public questions of reform were entirely sunk in the personal one of the divorce. The divorce was a point upon which Sir Thomas would not yield. And, as he saw that the marriage with Anne Boleyn was determined upon, he petitioned the king to be allowed to resign the great seal, alleging failing health. With much reluctance, the royal permission was given and the resignation accepted 10th May 1532, with many gracious expressions of goodwill on the part of the king. The promise held out of future bounty was never fulfilled, and More left office, as he had entered it, a poor man. His necessitous condition was so notorious that the clergy in convocation voted him

prisoner in the Tower. He affirmed that, having himself admitted in the course of this conversation "that there were things which no parliament could do,—*e.g.*, no parliament could make a law that God should not be God," Sir Thomas had replied, "No more could the parliament make the king supreme head of the church." By this act of perjury a verdict of "guilty" was procured from the jury. The execution of the sentence followed within the week, on 7th July 1535. The head was fixed upon London Bridge. The vengeance of Henry was not satisfied by this judicial murder of his friend and servant; he enforced the confiscation of what small property More had left, expelled Lady More from the house at Chelsea, and even set aside assignments which had been legally executed by More, who foresaw what would happen before the commission of the alleged treason. More's property was settled on Princess Elizabeth, afterwards queen, who kept possession of it till her death. At his death Sir Thomas More was in the fifty-eighth year of his age. He was twice married, but had children only by his first wife. His eldest daughter Margaret, married to William Roper, is one of the foremost women in the annals of the country for her virtues, high intelligence, and various accomplishments. She read Latin and Greek, was a proficient in music, and in the sciences, so far as they were then accessible. Her devotion to her father is historical; she gave him not only the tender affection of a daughter but the high-minded sympathy of a soul great as his own.

It is unfortunate for More's reputation that he has been adopted as a champion of a party and a cause which is arrayed in hostility to the liberties and constitution of his country. Apart from the partisan use which is made of his name, we must rank him among the noblest minds of England, as one who became the victim of a tyrant whose policy he disapproved and whose servile instruments he despised. If his language towards the tyrant is often more servile than became a freeman, we must remember that such was the court style of the period, and that we must not construe literally phrases of compliment. It is, however, impossible to deny that More's policy in later life did not bear out the more liberal convictions of his earlier years. His views and feelings contracted under the combined influences of his professional practice and of public employment. In the *Utopia*, published in 1516, he not only denounced the ordinary vices of power, but evinced an enlightenment of sentiment which went far beyond the most statesmanlike ideas to be found among his contemporaries, pronouncing not merely for toleration but rising even to the philosophical conception of the indifference of religious creed. It was to this superiority of view, and not merely to the satire on the administration of Henry VII., that we must ascribe the popularity of the work in the 16th century. For, as a romance, the *Utopia* has little interest either of incident or of character. It does not, as has been said, anticipate the economical doctrines of Adam Smith, and much of it is fanciful without being either witty or ingenious. Mackintosh says of it: "It intimates a variety of doctrines, and exhibits a multiplicity of projects, which the writer regards with almost every possible degree of approbation and shade of assent, from the frontiers of serious and entire belief, through gradations of descending plausibility, where the lowest are scarcely more than exercises of ingenuity, and to which some wild paradoxes are appended, either as a vehicle, or as an easy means, if necessary, of disavowing the serious intention of the whole of this Platonic fiction."

The *Epistola ad Dorpium* at a later date exhibits More emphatically on the side of the new learning. It contains a vindication of the study of Greek, and of the desirability of printing the text of the Greek Testament,—views which at that date required an enlightened understanding to enter into, and which were condemned by the party to which More afterwards attached himself. At the most, he can be doubtfully exculpated from the charge of having tortured men and children for heresy. It is admitted by himself that he inflicted punishment for religious opinion. Erasmus only ventures to say in his friend's defence "that while he was chancellor no man was put to death for these pestilent opinions, while so many suffered death in France and the Low Countries."

The *Life of Sir Thomas More* was written by his son-in-law Roper about the end of Mary's reign. It was preserved in MS. during the reign of Elizabeth, and handed about in copies, many of which were carelessly made. It was not given to the press till 1626, with the date of Paris. Reprints were made by Hearne (1716), by Lewis (1729, 1731), and by Singer (1817, 1822). Roper's life is the source of all the many subsequent biographies. More's *Life* in MS. (Harleian 6253), anonymous, but by Nicolas Harpsfield, was also written in Mary's reign. All that is material in this MS. is taken from Roper. Another anonymous *Life*, written in 1599, printed in Wordsworth's *Ecclesiastical Biography*, ii. 43-185, is chiefly compiled from Roper and Harpsfield. The preface is signed B. R.

Stapleton (*Tres Thomæ, s. res gestæ S. Thomæ apostoli, S. Thomæ archiepiscopi Cantuariensis, Thomæ Mori*, Douay, 1588, Cologne, 1612, and the *Vita Thomæ Mori* (separately), Gratz, 1689) translates Roper, interweaving what material he could find scattered through More's works and letters and the notices of him in the writings of his contemporaries. Cresacre More, great-grandson of Sir Thomas, compiled a new life about the year 1627. It was printed without date, but, according to the editor, Hunter, in 1631. The title of this edition is—*The Life of Sir Thos. More, Lord High Chancellour of England*, 4to, s. l. et a., and with new title-page, 1642, 1726, 1828. This life is cited by the subsequent biographers as an independent authority. But it is almost entirely borrowed from Roper and Stapleton. The additions made have sometimes the appearance of rhetorical amplifications of Roper's simple statements. At other times they are decorative miracles. The whole is couched in that strain of devotional exaggeration in which the lives of the saints are usually composed. The author seems to imply that he had received supernatural communications from the spirit of his ancestor. Already, only eighty years after More's execution, hagiography had taken possession of the facts, and was transmuting them into an edifying legend. Cresacre More's *Life* cannot be alleged as evidence for any facts which are not otherwise vouched. It has been remarked by Hunter that More's life and works have been all along manipulated for political purposes, and in the interest of the holy see. In Mary's reign, and in the tide of Catholic reaction, Roper and Harpsfield wrote lives of him; Ellis Heywood dedicated his *Il Moro* to Cardinal Pole, and Tottell reprinted the folio of his English works. Stapleton prepared his *Tres Thomæ* in 1588, when the recovery of England to the see of Rome was looked for by the Spanish invasion. In 1599, when there was a prospect of a disputed succession, the anonymous *Life* by B. R. was composed; and soon after Charles had allied himself with a Catholic, the *Life* by Cresacre More issued from the press. Hunter might have added that Stapleton was being reprinted at Gratz at the time when the conversion of England was expected from James II. The later lives of Sir Thomas More have been numerous, but the only one which has any critical value is that by G. T. Rudhart *Thomas Morus, aus den Quellen bearbeitet*, Nuremberg, 1829. Other lives are by J. Hoddesdon, London, 1652, 1662; by Cayley, 2 vols., London, 1808; by Mackintosh, *Lardner's Cab. Cyclop.*, London, 1831, 1844; and in More's *Works*, London, 1845; by Lord Campbell in *Lives of the Chancellors*, vol. i., 1848-50; by D. Nisard in *Renaissance et Réforme*; by Baumstark, Freiburg, 1879. A biographical study on More's Latin poems is *Philomorus* by J. H. Marsden, 2d ed., London, 1878.

More's writings are numerous, and a complete bibliography of them would occupy several columns. His English *Works* were collected and published in one vol. folio by Rastall, London, 1530, and reprinted by Tottell, London, 1557. His Latin *Works* were also separately collected in one vol., Basel, 1563; Louvain, 1566; and, most complete, Frankfort and Leipsic, 1689. The *Utopia* has had numerous editions, the first is Louv., 1516. There are two English translations of the *Utopia*, by R. Robynson, London, 1551, 1556, 1624, and by Gilb. Burnet, 1688. The Latin poems, *Progymnasmata*, appeared in 1518, 1520, 1563. This last edition contains the *Utopia* and other prose Latin pieces. (M. P.)

MOREAU, HÉGÉSIPPE, a minor lyric poet of disputed but considerable talent, was born at Paris on the 9th April 1810, and died in the hospital of La Charité on the 10th December 1838. In his early youth his parents, who were very ill-off, migrated to Provins, where the mother went into service and the father took the post of usher in a public school. Both died in the same refuge for the destitute which afterwards received their son. Hégésippe was fairly educated and was apprenticed to a printer, but he preferred the work (in France usually paid most miserably) of "maître d'études" in a school. He went to Paris before 1830, and appears to have practised both his occupations there, though for the most part he either adopted by choice or was driven by ill-fortune to adopt the singular life of alternate hardship and cheap dissipation which is dignified in France by the name of Bohemianism. In Moreau's case there is no doubt that the hardships exceeded the dissipation. He was habitually houseless, and is said to have exposed himself to the dangers of a cholera hospital in the great epidemic of 1832 simply to obtain shelter and food. Then he revisited Provins and published a kind of satirical serial called *Diogène*. Some years of this life entirely ruined his health, and it was only just before his death that he succeeded in getting his collected poems published, selling the copyright for £4 sterling and eighty copies of the book. It was received not unfavourably, but, as has happened in other cases, the author's death, which happened soon in the circumstances mentioned, was required to excite an interest which was proportionately excessive. Moreau's work, like that of many other young poets, has a strong note of imitation, his model being especially Béranger; and his character, both moral and literary, is not improved by obvious affectation in political, religious, and social matters. But some of his poems, such as *La Voulzie* and the charming *La Fermière*, have great sweetness, and he had a faculty of writing both in prose and poetry which seems to show that with better fortune, or, to speak honestly, with more intelligence and more perseverance he might easily have saved himself from the miserable destitution which was his lot.

prisoner in the Tower. He affirmed that, having himself admitted in the course of this conversation "that there were things which no parliament could do,—*e.g.*, no parliament could make a law that God should not be God," Sir Thomas had replied, "No more could the parliament make the king supreme head of the church." state of the country, and its manufactures are limited to the production, on a small scale, of cotton, woollen, and silk goods. A certain delicate sweetmeat called *guayabate* is a regular article of commerce to Mexico. In 1750 the city had about 18,000 inhabitants, in 1873 the municipality had 36,940 and the city proper about 30,000, and in 1880 the number is stated at 20,400.

In 1541 Mendoza chose the Guayangareo valley as the new site for the city of Michoacan, and in 1545 the place received the name of Valladolid. Iturbide and Morelos were both born within its precincts; and in 1828 the Government did this latter patriot the honour of renaming the city Morelia. In 1863 it was made the seat of an archbishop. See *Bol. Soc. de geogr. de la Rep. Mex.*, Mex., 1873.

MORELLET, ANDRÉ (1727-1819), economist and miscellaneous writer, was born at Lyons on the 7th of March 1727. He was long regarded as almost the last survivor of the Philosophe school; and in this character he figures in many memoirs,—for instance in Madame de Remusat's. He was educated by the Jesuits in his native town, then at a seminary in Paris, and finally at the Sorbonne; and he took holy orders, but his designation of abbé was the chief thing clerical about him. He early joined the Philosophe party, and was a frequenter of most of their *salons*, being something of a butt (especially to his fellow-abbé and rival in political economy, Galiani), but having the credit of a ready and biting pen. Voltaire called him "L'Abbé Mord-les." His work was chiefly occasional, and the most notable parts of it were a smart pamphlet in answer to Palissot's scurrilous play *Les Philosophes* (which procured him a short sojourn in the Bastille for an alleged libel on Palissot's patroness, the princesse de Robeck), and a reply to Galiani's *Commerce des Blés* (1770). Later, he made himself useful in quasi-diplomatic communications with English statesmen, and was pensioned, being, moreover, elected a member of the Academy in 1785. The outbreak of the Revolution (soon after which he was engaged in a controversy with Chamfort on the question of the advantages and deserts of the Academy) did not, as it did with many of his friends, drive him from the country or put his life in danger, but it put him in considerable straits of fortune. He maintained a kind of moderate liberal tone, and the return of something like order under the Consulate and the Empire restored him to prosperity and pensions. A year before his death, at the great age of ninety-two, on the 12th of January 1819 at Paris, he brought out a series of *Mélanges*, composed chiefly of selections from his former publications; and after his death appeared his memoirs, which are of value for the Philosophe period. Morellet, though not a man of extraordinary ability or of specially amiable or estimable character, was in both respects a fair specimen of the man of letters of all work of the time. He was, in fact, a journalist with a special turn for economical subjects.

MORERI, LOUIS. See ENCYCLOPÆDIA, vol. viii. p. 194.

MORETO, AGUSTIN (1618-1669), Spanish dramatist and playwright, was born at Madrid in 1618. Of his personal and even of his literary history little is known. He studied at Alcala between 1634 and 1639, and afterwards removed to Toledo, where he entered the household of the cardinal-archbishop and took holy orders. Ultimately he withdrew altogether from the world, and died a member of an ascetic religious brotherhood in 1669.

Moreto in his younger years was a prolific writer for the stage, and almost rivalled Calderon in popularity. Three volumes of his plays were printed between 1654 and 1681, and many dramas besides are attributed in whole or in part to him. He employed all the dramatic forms then in vogue. Of his religious plays, *Los mas Dichosos Hermanos* (The Most Fortunate Brothers), embodying the legend of the seven sleepers, may be mentioned as the least bombastic and absurd. Others are *El Rosario Perseguido*, turning on the persecutions connected with the introduction of the rosary into Spain, and *Maria Egypciaca*, a curious representation of the extraordinary legend of St Mary of Egypt. His heroic drama, *El Valiente Justiciero* (The Brave Justiciary), a story of the times of Pedro the Cruel, is one of considerable power. His "comedias de figuron," or "character comedies," as they are called (compare vol. vii. p. 422), include *El Lindo Don Diego* (The Handsome Don Diego) and *El Desden con el Desden* (Disdain met with Disdain), the latter partly borrowed from Lope de Vega's *Milagros del Desprecio*, and in turn imitated by Molière (in his *Princesse d'Elide*), by Carlo Gozzi (*Principessa Filosofa*), and by Schreyvogel (*Donna Diana*). The *Comedias Escogidas de Don Agustin Moreto y Cabaña* form the 39th volume of the *Biblioteca de Autores Españoles* (Madrid, 1856).

MORETTO, IL ("The Blackamoor," a term which has not been particularly accounted for), is the name currently bestowed upon ALESSANDRO BONVICINO (1498-*c.*1560), a celebrated painter of Brescia, Venetian school. He was born at Rovato in the Brescian territory in 1498, and studied first under Fioravante Ferramola of Brescia, afterwards, still youthful, with Titian in Venice. His own earlier method, specially distinguished by excellent portrait-painting, was naturally modelled on that of Titian. Afterwards he conceived a great enthusiasm for Raphael (though he does not appear to have ever gone to Rome), and his style became partially Raphaelesque. It was, however, novel in its combination of diverse elements, and highly attractive,—with fine pencilling, a rich yet not lavish use of perspective and decorative effects, and an elegant opposition of light and shade. The human figure is somewhat slender in Bonvicino's paintings, the expression earnestly religious, the flesh-tints varied, more so than was common in the Venetian school. The backgrounds are generally luminous, and the draperies well modified in red and yellow tints with little intermixture of blue. The depth of Bonvicino's talent, however, was hardly in proportion to its vigour and vivacity; and he excelled more in sedate altar-pieces than in subjects of action, and more in oil-painting than in fresco, although some fine series of his frescos remain, especially that in the villa Martinengo at Novarino, near Brescia. Among his celebrated works in the city are—in the church of S. Clemente, the Five Virgin Martyrs, and the Assumption of the Madonna (this latter may count as his masterpiece); in S. Nazaro e Celso, the Coronation of the Madonna; in S. Maria delle Grazie, St Joseph; in S. Maria de' Miracoli, St Nicholas of Bari. In the Vienna Gallery is a St Justina (once ascribed to Pordenone); in the Städel Institute, Frankfort, the Madonna enthroned between Sts Anthony and Sebastian; in the Berlin Museum, a colossal Adoration of the Shepherds, and a large votive picture (one of the master's best) of the Madonna and Child, with infant angels and other figures above the clouds, and below, amid a rich landscape, two priests; in the London National Gallery, St Bernardin and other saints, and two impressive portraits. Il Moretto is stated to have been a man of childlike personal piety, preparing himself by prayer and fasting for any great act of sacred art, such as the painting of the Virgin-mother. His dated works extend from 1524 to 1554, and he was the master of the pre-eminent portrait-painter Moroni. His death took place towards 1560.

MORGAGNI, GIOVANNI BATTISTA (1682-1771), the founder of pathological anatomy, was born 25th February 1682 at Forli, an ancient and important town on the Æmilian road southwards from Bologna.[1] His parents were in comfortable circumstances, but not of the nobility; it appears from his letters to Lancisi that Morgagni was ambitious of gaining admission into that rank, and it may be inferred that he succeeded from the fact that he is described on a memorial tablet at Padua as "nobilis Forolensis." At school he was conspicuous for his talents, and he was especially noted for his readiness in classical epigram. At the age of sixteen he went to Bologna to

enjoyed much repute in its day; Haller speaks of it as "an immortal work, which may in itself serve for a pathological library." Morgagni, in the preface to his own work, discusses the defects and merits of the *Sepulchretum*; it was largely a compilation of other men's cases, well and ill authenticated; it was prolix, often inaccurate and misleading from ignorance of the normal anatomy, and it was wanting in what would now be called objective impartiality,—a quality which was introduced as decisively into morbid anatomy by Morgagni as it had been introduced two centuries earlier into normal human anatomy by Vesalius. Morgagni has narrated the circumstances under which the *De Sedibus* took origin. Having finished his edition of Valsalva in 1740, he was taking a holiday in the country, spending much of his time in the company of a young friend who was curious in many branches of knowledge. The conversation turned upon the *Sepulchretum* of Bonet, and it was suggested to Morgagni by his dilettante friend that he should put on record his own observations. It was agreed that letters on the anatomy of diseased organs and parts should be written for the perusal of this favoured youth (whose name does not transpire); and they were continued from time to time until they numbered seventy. Those seventy letters constitute the *De Sedibus et Causis Morborum*, which was given to the world as a systematic treatise in 2 vols. folio, Venice, 1761, twenty years after the task of epistolary instruction was begun. The letters are arranged in five books, treating of the morbid conditions of the body *a capite ad calcem*. The five books are dedicated respectively to Trew, Bromfield, Senac, Schreiber, and Meckel, as representing the several learned societies of which Morgagni was a foreign member. The five books together contain, according to an enumeration by the present writer, the records of some 640 dissections. Some of these are given at great length, and with a precision of statement and exhaustiveness of detail hardly surpassed in the so-called "protocols" of the German pathological institutes of the present time; others, again, are fragments brought in to elucidate some question that had arisen. The symptoms during the course of the malady and other antecedent circumstances are always prefixed with more or less fulness, and discussed from the point of view of the conditions found after death. Subjects in all ranks of life, including several cardinals, figure in this remarkable gallery of the dead. Many of the cases are taken from Morgagni's early experiences at Bologna, and from the records of his teachers Valsalva and Albertini not elsewhere published. Those six hundred or more cases are selected and arranged with method and purpose, and they are often (and somewhat casually) made the occasion of a long excursus on general pathology and therapeutics. The range of Morgagni's scholarship, as evidenced by his references to early and contemporary literature, strikes one with astonishment. It has been contended that he was himself not free from prolixity, the besetting sin of the learned; and certainly the form and arrangement of his treatise are such as to make it difficult to use in the present day, notwithstanding that it is well indexed in the original edition, in that of Tissot (3 vols. 4to, Yverdun, 1779), and in more recent editions. It differs from modern treatises in so far as the symptoms determine the order and manner of presenting the anatomical facts. Although Morgagni was the first to understand and to demonstrate the absolute necessity of basing diagnosis, prognosis, and treatment on an exact and comprehensive knowledge of anatomical conditions, he made no attempt (like that of the Vienna school sixty years later) to exalt pathological anatomy into a science disconnected from clinical medicine and remote from practical needs. His orderliness of anatomical method (implying his skill with the scalpel), his precision, his exhaustiveness, and his freedom from bias are his essentially modern or scientific qualities; his scholarship and high consideration for classical and foreign work, his sense of practical ends (or his common sense), and the breadth of his intellectual horizon prove him to have lived before medical science had become largely technical or mechanical. It is clear that Morgagni's immense personal influence during his lifetime did not alone make his book famous; at a distance of two hundred years from his birth, and more than one hundred from his death, the opinion is unanimous that his treatise was the commencement of the era of steady or cumulative progress in pathology and in practical medicine. Symptoms from that time ceased to be made up into more or less conventional groups, each of which was a disease; on the other hand, they began to be viewed as "the cry of the suffering organs," and it now became possible to develop Sydenham's grand conception of a natural history of disease in a catholic or scientific spirit. Laennec's application of the stethoscope to detect the sounds given out in diseased states of the heart and lungs, and Bright's application of the test-tube and re-agents to reach the structural and functional conditions of the kidney through the state of the urine, were the direct results of Morgagni's endeavour to lay bare the seats and causes of disease by anatomy; and those two means of diagnosis are the daily and hourly resource of every modern practitioner. In more general terms, Morgagni's work substituted localization for generalization and precision for vagueness.

A biography of Morgagni by Mosca was published at Naples in 1768. His life may also be read in Fabroni's *Vitæ illustr. Italor.*, and a convenient abridgment of Fabroni's memoir will be found prefixed to Tissot's edition of the *De Sedibus*, &c. A collected edition of his works was published at Venice in five vols. folio in 1765. (C. C.)

MORGAN, SYDNEY OWENSON, LADY (1777?-1859), novelist and miscellaneous describer and critic, was one of the most vivid and hotly-discussed literary personages of her generation. She was the daughter of an Irish actor, but it was one of her whims to keep the year of her birth a secret; "once upon a time" on Christmas day was her answer to inquiries. She began her literary career with a precocious volume of poems. Her second venture, *St Clair* (1804), a novel of ill-judged marriage, ill-starred love, and impassioned nature-worship, in which the influence of Goethe and Rousseau was apparent, at once attracted attention. Another novel, *The Novice of St Dominick* (1806), was also praised for its qualities of copious imagination and description, though the critics were inclined to nibble at the writer's grammar. But the book which made her reputation and brought her name into warm controversy was *The Wild Irish Girl*, also published in 1806. In this she appeared as the ardent champion of her native country, a politician rather than a novelist, extolling the beauty of Irish scenery, the richness of the natural wealth of Ireland, the noble traditions of its early history, and sketching types of the various classes with direct reference to the misgovernment to which she traced their evil features. She followed this up with *Patriotic Sketches* and *Metrical Fragments* in 1807, fitting some Irish melodies with words ("Kate Kearney" among the number) in the same year in which Moore began a similar task. Miss Owenson's politics and the favour shown her by the Whig aristocracy probably prompted the savage attack made upon her next novel, *Ida, a Woman of Athens*, in the first number of the *Quarterly* (1809). From first to last her style was open to the reproach of being made up too much of quotations, and her grammar was not always correct; but exuberant humour, keen wit, and fertility in the invention of striking and romantic incidents carry any unbiassed reader easily over all minor faults of composition. Her great ambition was to draw vivid pictures of the mingled "mirth and misery, ferocity and fun," of the Irish under English rule, and she succeeded. Her novels suffer as stories from this political purpose; she drags in too many character-sketches, and, though they are always drawn with vivacity and sharp penetration, they are drawn with too much bias of romantic enthusiasm on the one side and satirical spite on the other. In 1812 she was married to Sir T. C. Morgan, but books still continued to flow from her facile pen. In 1814 she produced her best novel, *O'Donnel*, a decided advance on previous work. She published an elaborate study of *France* under the Bourbon restoration in 1817. This was attacked with outrageous fury in the *Quarterly*, the authoress being accused of Jacobinism, falsehood, licentiousness, and impiety. She took her revenge indirectly in the novel of *Florence Macarthy* (1818), in which a *Quarterly* reviewer, Con Crawley, is insulted with supreme feminine ingenuity. *Italy*, a companion work to her *France*, was published in 1821; Lord Byron bears testimony to the justness of its pictures of life. The results of Italian historical studies were given in her *Life and Times of Salvator Rosa* (1824). Then she turned again to Irish manners and politics with a matter-of-fact book on *Absenteeism* (1825), and a highly stirring and romantic novel, *The O'Briens and the O'Flahertys* (1827). *The Book of the Boudoir* (1829) consisted of miscellaneous reflexions and reminiscences. Under the ministry of Lord Grey Lady Morgan obtained a pension of £300. During the last thirty years of her long life she broke no new ground, but to the last she was an entertaining writer, and sent some sprightly verses to the *Athenæum*

enjoyed much repute in its day; Haller speaks of it as "an immortal work, which may in itself serve for a pathological library." Morgagni, in the preface to his own work, discusses the defects and merits of the *Sepulchretum*; it was largely a compilation of other men's cases, well and ill authenticated; it was prolix, often inaccurate and misleading from ignorance of the normal anatomy, and it was wanting in what would now be called objective impartiality,—a quality which was introduced as decisively into morbid anatomy by Morgagni as it had been introduced two centuries earlier into normal human anatomy by Vesalius. From first to last her style was open to the reproach of being made up too much of quotations, and her grammar was not always correct; but exuberant humour, keen wit, and fertility in the invention of striking and romantic incidents carry any unbiassed reader easily over all minor faults of composition. Her great ambition was to draw vivid pictures of the mingled "mirth and misery, ferocity and fun," of the Irish under English rule, and she succeeded. Her novels suffer as stories from this political purpose; she drags in too many character-sketches, and, though they are always drawn with vivacity and sharp penetration, they are drawn with too much bias of romantic enthusiasm on the one side and satirical spite on the other. In 1812 she was married to Sir T. C. Morgan, but books still continued to flow from her facile pen. In 1814 she produced her best novel, *O'Donnel*, a decided advance on previous work. She published an elaborate study of *France* under the Bourbon restoration in 1817. This was attacked with outrageous fury in the *Quarterly*, the authoress being accused of Jacobinism, falsehood, licentiousness, and impiety. She took her revenge indirectly in the novel of *Florence Macarthy* (1818), in which a *Quarterly* reviewer, Con Crawley, is insulted with supreme feminine ingenuity. *Italy*, a companion work to her *France*, was published in 1821; Lord Byron bears testimony to the justness of its pictures of life. The results of Italian historical studies were given in her *Life and Times of Salvator Rosa* (1824). Then she turned again to Irish manners and politics with a matter-of-fact book on *Absenteeism* (1825), and a highly stirring and romantic novel, *The O'Briens and the O'Flahertys* (1827). *The Book of the Boudoir* (1829) consisted of miscellaneous reflexions and reminiscences. Under the ministry of Lord Grey Lady Morgan obtained a pension of £300. During the last thirty years of her long life she broke no new ground, but to the last she was an entertaining writer, and sent some sprightly verses to the *Athenæum*

Déclaration (1654), directed against faults in the administration of the Oratory and reflecting on the general (Father Bourgoing), was strictly suppressed. So, too, his great work on penance gave equal offence to the Jesuits and to Port-Royal, and even after his death (1659) the polemical vehemence of his *Exercitationes Biblicæ*, and the exaggeration of his assertion "apud neotericos Hæreticos verba Scripturarum non esse integra, non superficiem, non folia, nedum sensum, medullam et radicem rationis" long led Protestants to treat his valuable contributions to the history of the Hebrew text as a mere utterance of Popish prejudice.

Morinus was a voluminous and prolix writer on ecclesiastical antiquities. His principal works in this field are *Commentarius historicus de disciplina in administratione sacramenti pœnitentiæ XIII primis seculis in Eccl. Occid. et hucusque in Orient. observata* (1651), and *Comm. de sacris Ecclesiæ ordinationibus secundum antiquos et recentiores Latinos, Græcos, Syros et Babylonios* (1655). The second of these works expresses those irenical views on the subject of ordination which recommended Morinus to Urban VIII. The literary correspondence of Morinus appeared in 1682 under the title of *Antiquitates Ecclesiæ Orientalis* (edited by R. Simon).

The chief fame of Morinus, however, now rests on his Biblical and critical labours. By his *editio princeps* of the Samaritan Pentateuch and Targum, in the Paris Polyglott, he gave the first impulse in Europe to the study of this dialect, which he acquired without a teacher (framing a grammar for himself) by the study of MSS. then newly brought to Europe. Not unnaturally he formed a very exaggerated view of the value of the Samaritan tradition of the text, exalting it above the tradition of the Jews (*Exercitationes in utramque Samaritanorum Pentateuchum*, 1631). A similar tone of exaggerated depreciation of the Hebrew text, coloured, as has been remarked above, by polemical bias against Protestantism, mars his greatest work, the posthumous *Exercitationes biblicæ de Hebræici Græcique textus sinceritate* (1660), in which, following in the footsteps of Cappellus, but with incomparably greater learning, he brings irrefragable arguments against the then current theory of the absolute integrity of the Hebrew text of the Old Testament, and the antiquity of the vowel points. The second part of this work is still valued as a copious storehouse of materials for the history of the Hebrew text collected by the most self-denying labour—*meis ingratiis*, as he said himself.

MORLAIX, the chief town of an arrondissement in the department of Finistère, France, lies 350 miles west of Paris on the railway from Paris to Brest, and at the confluence of two small streams, 7 miles distant from the sea. Its port has 13 feet of water at ordinary and 23 feet at spring tides. The entrance of the roadstead is defended by the Château du Taureau, which stands on a rock in the sea, and was built in 1542 to protect the town from the English. Morlaix still contains a considerable number of curious wooden houses of the 15th, 16th, and 17th centuries; but the most striking piece of architecture in the town is the gigantic two-storied viaduct of the railway from Paris to Brest, 934 feet long and 207 feet above the quays. The old church of the Dominicans is now occupied by the town library. The hospital has beds for 500 patients, and can accommodate 300 female lunatics besides. A tobacco-factory, employing 400 men and 700 women, is the principal industrial establishment; and there are also extensive paper-mills, a considerable flax-mill, canvas-factories, foundries, and saw-mills. A considerable trade is carried on in grain, yarn, canvas, leather, tallow, wax, and horses; and a large quantity of butter, cattle, and vegetables is exported from Roscoff, a village in the neighbourhood, which is also known for its sea-bathing and its zoological station. The population of Morlaix was 15,183 in 1876.

Judging by the numerous coins found on the spot, the site of Morlaix was probably occupied in the time of the Romans. The counts of Leon held the lordship in the 12th century, but the dukes of Brittany disputed possession with them, and in 1187 Henry II. of England, guardian of Arthur of Brittany, made himself master of the town after a siege of several weeks. During the War of the Hundred Years Morlaix was again captured and recaptured by the French and the English, and pillaged by the latter in 1522. Queen Mary of Scotland, on her way to be married to the Dauphin, made solemn entry into Morlaix in 1548. And finally, the town having joined the League, the castle was taken by storm in the name of Henry IV. in 1594.

MORLAND, George (1763-1804), animal and subject painter, was born in London on the 26th of June 1763. He came of a race of artists. His father, a painter, mezzotint-engraver, and picture-dealer, gave him a careful art-training, and at an exceptionally early age he produced works of wonderful promise. At sixteen he exhibited sketches at the Royal Academy, and even before this his productions found ready purchasers, and some of them had been engraved. But already the taste for dissipation, which was stronger in Morland than even his love for art, had begun to manifest itself, and at seventeen he escaped from the over-strict discipline of his father's house, and began a career of reckless prodigality which has hardly a parallel in art-biography, gathering round him an *entourage* of the most abandoned associates, and supporting himself by the sale of the pictures—rustic subjects and scenes from low life—which he threw off with unexampled rapidity. About 1786 there appeared to be some prospect of amendment. He went to reside at Kensal Green, came under the influence of better companions, and married a beautiful and virtuous girl, a sister of James Ward the animal-painter and William Ward the engraver. The subjects which Morland painted during this period reflect the change in his way of life. The Idle and Industrious Mechanic, and Letitia or Seduction, moralities in the style of Hogarth, were engraved and became exceedingly popular. But soon the force of old habit asserted itself, the desire for freedom and lawlessness returned to the artist with redoubled violence, and he again drifted into a career of riot and intemperance. The means of dissipation were not wanting; the dealers were eager for his productions; indeed, so greatly were they esteemed that skilled copyists were employed to make many transcripts from the pictures on which he was at work, which were sold as originals to an unsuspecting public. The finest of Morland's subjects date from 1790 to 1792. In 1791 was painted the Inside of a Stable, now in the National Gallery, probably the artist's masterpiece. In spite of his popularity and his industry his affairs became inextricably embarrassed. For a time he eluded the bailiffs with singular dexterity, but in November 1799 he was arrested. Obtaining the Rules of the Bench, he took a house within bounds, and continued to practise both his art and his debauchery. He was released under the Insolvent Act of 1802, but his health was ruined and he was speedily stricken with palsy. Partially recovering, he continued to paint, but before long he was again arrested for debt, and died in a sponging-house in Eyre Street, Coldbath Fields, on the 29th of October 1804. His wife survived him only some three days, and they were buried in one grave.

The most characteristic works of Morland are those which deal with rustic and homely life. They show much direct and instinctive feeling for nature, and admirable executive skill, but they have no elevation of subject, no great beauty of colour or truth of atmosphere. They suffer from the haste in which the artist habitually worked. Many of them have been admirably mezzotinted by J. R. Smith and his pupils, William Ward and John Young. Particulars of Morland's life will be found in the biographies by J. Hassell (1804), G. Dawe (1807), and Blagton (1806), and in *Memoirs of a Picture*, by W. Collins, 1805.

MORMONS, or The Church of Jesus Christ of Latter-Day Saints, are a religious sect founded by Joseph Smith at Manchester, New York, in 1830, and for the last thirty-six years settled in Salt Lake City, Territory of Utah, United States. Smith was born 23d December 1805 at Sharon, Windsor county, Vermont, from which place ten years later his parents, a poor, ignorant, thriftless, and not too honest couple, removed to New York, where they settled on a small farm near Palmyra, Wayne county (then Ontario). Four years later, in 1809, they removed to Manchester, some 6 miles off; and it was at the latter place when fifteen years old that Joseph began to have

Déclaration (1654), directed against faults in the administration of the Oratory and reflecting on the general (Father Bourgoing), was strictly suppressed. So, too, his great work on penance gave equal offence to the Jesuits and to Port-Royal, and even after his death (1659) the polemical vehemence of his *Exercitationes Biblicæ*, and the exaggeration of his assertion "apud neotericos Hæreticos verba Scripturarum non esse integra, non superficiem, non folia, nedum sensum, medullam et radicem rationis" long led Protestants to treat his valuable contributions to the history of the Hebrew text as a mere utterance of Popish prejudice.

MORMONS, or The Church of Jesus Christ of Latter-Day Saints, are a religious sect founded by Joseph Smith at Manchester, New York, in 1830, and for the last thirty-six years settled in Salt Lake City, Territory of Utah, United States. Smith was born 23d December 1805 at Sharon, Windsor county, Vermont, from which place ten years later his parents, a poor, ignorant, thriftless, and not too honest couple, removed to New York, where they settled on a small farm near Palmyra, Wayne county (then Ontario). Four years later, in 1809, they removed to Manchester, some 6 miles off; and it was at the latter place when fifteen years old that Joseph began to have

June 1572 he returned to France, and had begun to enter upon a diplomatic career (his earliest extant "mémoire," laid by Coligny before Charles IX., had reference to the duty of France to support the Low Countries in their struggle for independence) when the St Bartholomew massacre, from which he escaped with difficulty, compelled him to take refuge across the Channel. There he rendered valuable services to William of Orange, and also to the duke of Alençon-Anjou, as a semi-official political agent. Returning to France at the instance of La Noue towards the end of 1573, he took part with various success in numerous military enterprises, and was made prisoner at Dormans in 1575 (10th October), but not having been recognized he got off for a small ransom. Shortly afterwards he married Charlotte Arbaleste at Sedan, and at her request wrote as a bridal present the *Discours de la Vie et de la Mort* (1576), which has been so often reprinted and translated. In 1577 Henry of Navarre made him a member of his council and sent him on a diplomatic mission to England, and during this visit, which lasted more than a year, he found time among his other pressing occupations to prepare for the press his *Traité de l'Église où l'on traite des principales questions qui ont été mues sur ce point en nostre temps* (1578), which at once became popular. From July 1578 till his return to France in 1582 he was chiefly in the Low Countries, engaged in public business, and during this interval he wrote and published a considerable work in apologetical theology (*Traité de la vérité de la religion chrétienne contre les Athées, Épicuriens, Payens, Juifs, etc.*, 1581). With the death of the duke of Anjou in 1584, by which Henry of Navarre was brought within sight of the throne of France, the period of Mornay's greatest political activity began; his importance in the Huguenot counsels was further increased in 1588 by the death of the prince of Condé, to whose influence he practically succeeded. In April 1589 he was rewarded for the reconciliation of the two Henries with the governorship of Saumur, and he took active part in many of the military operations that followed the assassination of Henry III. in the following August. He was present at the siege of Dieppe, fought by the side of Henry IV. at Ivry, and was one of the besiegers of Rouen in 1591-92, until sent on a mission to the court of Elizabeth. A crisis in his political career was marked by Henry's abjuration of Protestantism in July 1593, which gradually led to Mornay's withdrawal from the court. In this year it was that he founded the Protestant academy or university of Saumur, which had a distinguished history until its suppression by Louis XIV. in 1683. In 1598 he published a work on which he had long been engaged, entitled *De l'institution, usage, et doctrine du saint sacrement de l'Eucharistie en l'Église ancienne*. It having reached his ears that Cardinal Du Perron had alleged that of the (thousands of) citations in this controversial work he could point out five hundred that were falsified or misunderstood, he challenged his assailant to a public discussion. This was at last arranged for by the good offices of the king, and took place at Fontainebleau on 4th May 1600. Only nine passages were discussed, but in each case the decision, one is not surprised in the circumstances to learn, went against the Protestant. Mornay, from whom every indication of the particular passages to be impugned had been persistently withheld, was forced by supervening illness to withdraw. Only once again did he appear at court, in 1607. He continued, however, to give his party the benefit of his counsel and active support to the end of his long and busy life. His last work, entitled *Mystère d'iniquité, c'est à dire, l'histoire de la Papauté*, appeared in 1611. In 1618 he was chosen a deputy to represent the French Protestants at the synod of Dort. Prohibited by Louis XIII. from personally attending, he nevertheless contributed materially to the deliberations of that assembly by written communications. In 1621 he was deprived of his governorship; and his death took place at La Forêt-sur-Sèvre on 11th November 1623.

Two volumes of *Mémoires*, from 1572 to 1589, appeared at La Forêt in 1624, and a continuation, in two volumes, at Amsterdam in 1652; a more complete edition (*Mémoires, correspondances, et vie*) in twelve volumes, 8vo, was published at Paris in 1624-25. The greater number of his works were translated into English during his lifetime.

MORNY, Charles Auguste Louis Joseph, Duc de (1811-1865), was the natural son of Hortense Beauharnais, queen of Holland, and of the comte de Flahaut, a leading dandy of the period, and was thus brother to Napoleon III. The secret of his birth (23d October 1811) was carefully kept; he was acknowledged as son by the comte de Morny for a consideration, and was brought up by his paternal grandmother, Madame de Souza, a writer of society novels, and a woman of great wit and high breeding. As a boy of nineteen he was declared after the revolution of 1830 a hero of July, and was entered at the staff college. In 1832 he was gazetted sub-lieutenant, and served in Algeria as aide-de-camp to General Oudinot; he was present at Mascara and Constantine, and was made a chevalier of the Legion of Honour. In 1838 he returned to Paris, and began his career as dandy and speculator. In the first capacity he set the fashions both of dress and manners to the young men of Paris, and conceived the idea of the modern society journal, and in the second established a manufactory of beetroot sugar at Clermont-Ferrand. This last idea brought about his election for the department of the Puy-de-Dôme. In the chamber he voted consistently with the ministers. The republic of 1848 marked the crisis in his fortunes, and by 1851 all his speculations had failed, and all his property was sold. In desperation he determined to play a part in politics, and was the heart and soul of the *coup d'état* of December 1851. The success of the *coup d'état* was certain, owing to the fear of the extreme republicans entertained by the great majority of the nation, and all that was needed was a head for intrigue and an utter absence of scruples to shed innocent blood. Morny and St Arnaud fulfilled these requisites. Morny was on the day of the *coup d'état* made minister of the interior, but he had no taste for the drudgery of administration, and in January 1852 found an excuse for resigning on the question of the property of the Orleanist princes. The empire established, he was again able to begin speculating, and used both the money of the state and his influence with his brother for the success of his schemes. He had been in 1852 re-elected deputy for Clermont-Ferrand, and was in 1854 elected president of the corps legislatif, an office which he held for the rest of his life. This office in every way suited him; he had large pay, and resided in a magnificent official residence, where he produced little plays to admiring audiences. The work was not hard, being chiefly to maintain the Government majority in a good humour by sumptuous entertainments, and to win over the Liberals by the same tactics. He still speculated in railways, pictures, mines, and even in a new watering-place, Deauville, and, being absolutely unscrupulous and venal, amassed an immense fortune in spite of the utmost extravagance. In 1856 he was special ambassador at the coronation of Czar Alexander II., when he spent immense sums, and married a wealthy Russian, Princess Troubetzkoy. In 1862 he was created a duke, and in 1865, after continuing to the last his career of dissipation, died of sheer anæmia from the measures he took to keep himself fit for yet further excesses.

Of the duc de Morny little good can be said either as a statesman or a man. He looked upon everything from a purely selfish point

June 1572 he returned to France, and had begun to enter upon a diplomatic career (his earliest extant "mémoire," laid by Coligny before Charles IX., had reference to the duty of France to support the Low Countries in their struggle for independence) when the St Bartholomew massacre, from which he escaped with difficulty, compelled him to take refuge across the Channel. In 1832 he was gazetted sub-lieutenant, and served in Algeria as aide-de-camp to General Oudinot; he was present at Mascara and Constantine, and was made a chevalier of the Legion of Honour. In 1838 he returned to Paris, and began his career as dandy and speculator. In the first capacity he set the fashions both of dress and manners to the young men of Paris, and conceived the idea of the modern society journal, and in the second established a manufactory of beetroot sugar at Clermont-Ferrand. This last idea brought about his election for the department of the Puy-de-Dôme. In the chamber he voted consistently with the ministers. The republic of 1848 marked the crisis in his fortunes, and by 1851 all his speculations had failed, and all his property was sold. In desperation he determined to play a part in politics, and was the heart and soul of the *coup d'état* of December 1851. The success of the *coup d'état* was certain, owing to the fear of the extreme republicans entertained by the great majority of the nation, and all that was needed was a head for intrigue and an utter absence of scruples to shed innocent blood. Morny and St Arnaud fulfilled these requisites. Morny was on the day of the *coup d'état* made minister of the interior, but he had no taste for the drudgery of administration, and in January 1852 found an excuse for resigning on the question of the property of the Orleanist princes. The empire established, he was again able to begin speculating, and used both the money of the state and his influence with his brother for the success of his schemes. He had been in 1852 re-elected deputy for Clermont-Ferrand, and was in 1854 elected president of the corps legislatif, an office which he held for the rest of his life. This office in every way suited him; he had large pay, and resided in a magnificent official residence, where he produced little plays to admiring audiences. The work was not hard, being chiefly to maintain the Government majority in a good humour by sumptuous entertainments, and to win over the Liberals by the same tactics. He still speculated in railways, pictures, mines, and even in a new watering-place, Deauville, and, being absolutely unscrupulous and venal, amassed an immense fortune in spite of the utmost extravagance. In 1856 he was special ambassador at the coronation of Czar Alexander II., when he spent immense sums, and married a wealthy Russian, Princess Troubetzkoy. In 1862 he was created a duke, and in 1865, after continuing to the last his career of dissipation, died of sheer anæmia from the measures he took to keep himself fit for yet further excesses.

Of the duc de Morny little good can be said either as a statesman or a man. He looked upon everything from a purely selfish point

are few and for the most part feebly marked. Southward from Cape Spartel the shore sinks rapidly till it is within a few feet of the sea-level. In the low cliff which it forms about 4½ miles from the lighthouse there is a great quarry, which from remote antiquity has yielded the hand-mills used in the Tangiers district. A stretch of low marshy ground along the Tahaddart—the estuary of the Wádi Kebír (W. Muharhar) and W. al-Kharrúb—agrees with Scylax's Gulf of Cotes (Tissot). Three or four miles farther south lie the ruins of the town of Nebrosh, built by Moors from Andalusia; and 4 or 5 miles more bring us to Azilá or Arzilla, the ancient Colonia Julia Constantia Zilis or Zēles. Since its bombardment by the Austrians in 1829 it has been a wretched little place, with a mixed Moorish and Jewish population of about 1200.[1] For the next 16 miles, between Azilá and Larash or EL-ARAISH (*q.v.*) the coast has a tolerably bold background of hills, Jebel Sarsar near Fez forming an important landmark for the latter town, which, with its Phœnician, Roman, and mediæval remains, is historically one of the most interesting places in Morocco. A line of reddish cliffs about 300 feet high runs south for about 10 miles from the W. Aulkos, at whose mouth the town is built; then the coast sinks till it reaches Múlá Bú Selham, an eminence 220 feet high. Between Múlá Bú Selham (often wrongly called Old Mamura or Marmore) and a similar height crowned by the tomb of Sidi 'Abd Allah Jelílí lies the outlet of the Blue Lake (Marja Zarḳá), 10 or 12 miles long. Farther south, and separated from the sea by an unbroken line of rounded hills (230-260 feet), is the much more extensive lagoon of Ras al-Dura, which in the dry season becomes a series of marshy meres, but in the rainy season fills up and discharges into the Sebú. Eastward it is connected with the Marjat al-Gharb, fed by the W. Meda. On the south side of the outlet of the Sebú lies Ma'múra, probably founded by 'Abd al-Mumen, and originally named Mahdíya, after the Almohade Mahdí. Twenty miles farther is the mouth of the Bú Raḳraḳ, with its cluster of interesting towns: Sallee (Sálát) on the north side, long famous for its piracies and still one of the most fanatical places in the empire, and on the south side New Sallee (Rabát) with its conspicuous tower of Hasan, and Shella (Sella of Leo Africanus) with its interesting ruins. Onward for 100 miles to Point Azammur and the mouth of the Umm Rabí' river a line of hills skirts the sea; the shore is for the most part low, and, with the exception of capes at Fadála (a small village) and Dár al-Baidá or Casa Blanca, it runs in a straight line west-south-west. Casa Blanca, the ancient Anfá, once a flourishing port, was ruined by the Portuguese (1468) in revenge for its piracies. It is now a place of 4000 inhabitants, and has a thriving export trade in maize, beans, and wool, and a European colony of about 100 persons. Azammur (that is, in Berber, "The Olives," viz., of the Sheikh Bú Shuaib), with 1000 inhabitants dependent on the shebbel fisheries in the river, stands on an eminence about 1½ miles from the sea on the south side of the Umm Rabí'. The bay of Mazagan (Mázíghan), a few miles to the south, curves westward with a boldness of sweep unusual on this coast. The town of Mazagan was founded by the Portuguese in 1506, and held by them till 1769.[2] About 8 miles to the south and less than a mile inland lie the extensive ruins of Tit, a town which proved a thorn in the side of the people of Mazagan till they sallied forth and destroyed it. At Cape Blanc (so called from its white cliffs) the coast, which bulged out at Cape Mazagan, again bends east to resume much the same general direction for 55 miles to Cape Cantin. On this stretch the only point of interest is Walidíya, formerly Al-Ghait; the excellent harbour praised by Edrisi is formed by an extensive lagoon, and M. Tissot thinks that by a little dredging the place would again become the safest shipping station on the whole Morocco seaboard.[3] Beyond Cape Cantin (300 feet high) the coast becomes bolder and more irregular, especially after the mouth of the Tensift is passed. About 18 miles farther lies Saffi (Asfi), "by far the most picturesque spot on the west coast," with the high walls and square towers of its Portuguese fortifications shown to advantage by the ruggedness of the site. South of MOGADOR (*q.v.*), and onwards beyond the limits of Morocco, the coast, becoming ever more and more inaccessible and dangerous in winter, is emphatically known as the Iron Coast. From Cape Sim or Ossim (Ras Tagriwalt), 10 miles south of Mogador, the direction is due south to Cape Gir (Igir Ufrani), the termination of Jebel Ida u Tanan (Rabbi Mardochée), the last spur of the Atlas proper. Rounding this headland we reach Agadir (Agadír 'n Igir), the Santa Cruz Major or Santa Cruz de Berberia of the Spaniards, formerly known as the Gate of the Soudan.[4] It is a little town with white battlements three-quarters of a mile in circumference, on a steep eminence 600 feet high. In the 15th century it was seized by the Portuguese, and Don Manuel caused it to be fortified; but in 1536 it was captured by Muley (Maulái) Ahmed al-Hasan. Its merchants were removed to Mogador in 1773. At the mouth of the Sús Leo places three little towns called Messa (Mássa), with a mosque popularly reputed the scene of Jonah's restoration to *terra firma*. The port of this name,[5] regularly visited by the Genoese traders in the 16th century, who exported skins, gum, wax, gold, and indigo, is no doubt at the mouth of the W. Mássa, 20 miles farther south.[6] Ifni, situated in 29° 23' N. lat., and Sidi Worzek, the Cape Non[7] of the Portuguese, are the only points calling for notice till the better known Cape Nun is reached, which lies 5 or 6 miles north of the W. Der'a. With the Der'a the Sahara may be said to begin.

On most maps the interior of Morocco is represented as extremely mountainous; but, while it is traversed from east to west by more than one strongly-defined range, the greater part of the surface is really occupied by undulating steppe-like tracts diversified by low hills. The backbone of the country is the Great Atlas (Daran of the Berbers).[8] At its western extremity the range averages from 4000 to 5000 feet in height; after a slight falling off for a few miles it rises till it attains an elevation of 10,000 feet; beyond the pass (about 60 miles from the sea) which leads from Morocco to Tárúdant the summits seem to be between 11,000 and 11,500 feet; about 40 miles farther east there is a second pass at an altitude of about 7000 feet; and beyond that the main ridge continues 30 miles at a height of about 12,000 feet, with a few peaks reaching to 13,000 or 13,500 feet. Snow lies on some of the summits as late

[1] The absurd story that about the 9th century it was an English possession has its root in the visits of the Normans to this quarter. The modern town sprang from a fortress built to protect the coast against them (Dozy, *Recherches*, 3d ed., ii. 264 *sq.*).

[2] The Portuguese settlers, who had to leave it when Don José decided on surrendering this last stronghold of his country in Morocco, were afterwards sent to Brazil, where they founded Villa Nova de Mazagan.

[3] *Bull. de la Soc. de Géogr.*, Paris, 1875.

[4] This must not be confounded with Santa Cruz de Mar Pequeña, a post established in 1476 somewhere on this coast by Herrera, lord of the Canary Islands, and in modern times the subject of much geographical disputation. After obtaining permission to reoccupy the site the Spanish Government was unable to identify it.

8 Pliny says the natives called the Atlas "Dyrin."

east Devonian rocks stretch for hundreds of miles into the Sahara. The plain around the city of Morocco has a sheet-like covering of tufaceous crust rising over hill and valley and following all the undulations of the ground, the result probably of the intense heat of the sun rapidly drawing up water charged with soluble carbonate of lime from the calcareous strata, and drying it layer by layer on the surface till an accumulation several feet thick has been produced (Maw). This crust is extensively burned for lime, and it forms a natural strong roof for the matamores or underground cellars which the Moors excavate in the soft strata beneath. An enormous deposit of boulders occurs in the lateral valleys and along the escarpment of the Atlas, and the opinion that these are the products of remote glacial action is supported by the existence of true moraines in the upper part of the glens. All along the west coast there are indications of an elevation of the land in the shape of raised beaches, at Tangiers 40, at the south of Cape Spartel 50, at Mogador 60 or 70 feet high; but a number of other facts seem to show that at present a process of subsidence is in progress.[1]

That mineral deposits of great value exist in Morocco there is little doubt. At Jebel Hadíd or the Iron Mountain, the heights to the north of Mogador, old scoriæ are found. In the Bení Madan hills near Tetuan are mines, closed, it is said, by the sultan 'Abd al-Rahmán; but whether they furnished copper or lead authorities differ. On the road to Kenatsa, Rohlfs saw lead and antimony worked by the Bení Sithe. Antimony especially seems to be abundant to the south of the Atlas; Rohlfs found it in a very pure state near Tesna, and Dr Allen (whose account was not published when this article was written) informed the writer that he saw splendid veins of it north of the Der'a. That gold mines existed in Sús was long suspected; Gatell proved it. Rock-salt occurs in the mountains north of Fez, in the valley of the W. Martil, and probably in Jebel Zarhún. In several places, as in the route from Saffi to Morocco, are brine lakes, from which the salt is collected and exported as far as Central Africa.

The general aspect of the lowlands of Morocco varies so much according to the season of the year that, while one stranger finds it arid and sunburnt and monotonous, another is delighted with the richness of its vegetation and the bright variety of its colours. In some of the Atlas valleys there is a wealth of timber, enormous conifers, 10 to 12 feet in girth of stem, oaks, &c.,[2] but the greater part of the country has been cleared of every vestige of woodland, and consequently depends for its appearance on herbage, brushwood, and the lesser fruit-trees. Cultivation is confined to such comparatively narrow limits that the natural flora has full scope for its development. Cowan, writing more immediately of the country between Morocco and Mogador, speaks of "drifts of asphodel, white lilies, blue convolvuli, white broom flowers, thyme and lavender, borage, marigold, purple thistles, colossal daisies and poppies;" and Captain Trotter tells how for miles the undulating plateau of Kasr Ferá'ún was literally covered with wild flowers, whose varied colours, and the partiality with which each species confined itself to certain ground, gave to the landscape a brilliant and most unique appearance. Dark-blue, yellow, and red —iris, marigold, and poppy—occurred in patches an acre in size; farther on whole hills and valleys were of a delicate blue tint from convolvulus and borage. At times the traveller's tent is pitched on a carpet of mignonette, at times on a carpet of purple bugloss. In the country of the Bení Hasan squills are so abundant that the fibres of the bulbs are used instead of hair in making tent-cloth; and in the north of Ksar al-Kebír the moors are covered for miles with a beautiful white heather. From such gorgeous combinations of colour one can well imagine that the Moors drew the inspiration of their chromatic art; but the season of floral splendour is brief, and under the hot African sun everything soon sinks into the monotony of straw.

The botany of Morocco has been explored by Balansa (1867), Hooker, Ball, and Maw (1871), Rein and Fritsch (1873), Ibrahim Ammeribt (a Berber collector, 1873-6), the Rabbi Mardochée Abi Serur (1872-3); and the results have been systematically arranged in Cosson's *Compendium Floræ Atlanticæ: ou Flore des États barbaresques* (Paris, 1881, &c.). From the presence of a large proportion of plants of central and northern Europe (none of the northern plants, however, being of alpine or arctic type) and the absence of southern types characteristic of the sub-tropical zone Ball concludes that "the mountain flora of Morocco is a southern extension of the European temperate flora, with little or no admixture of extraneous elements, but so long isolated from the neighbouring regions that a considerable number of new specific types have been developed."[3] Of the individual plants none are more remarkable than the *'arár* and the *argan*. The former (*Callitris quadrivalvis, Thuja articulata* of Shaw) is a cypress-like tree that grows on the Atlas both in Morocco and Algeria. It furnishes gum sandarach; and its beautiful and enduring timber has been identified with the *alerce* with which the Cordova cathedral (mosque) was roofed, and with the citron-wood of the ancient Romans. The argan (*Argania Sideroxylon*) is confined even in Morocco to a tract of country extending only about 150 miles along the coast, from the river Tensift almost to the river Sús, and about 30 miles in breadth; and it is found nowhere else in the world. A gnarled trunk and wide-spreading contorted thorny branches give it a striking appearance. Large specimens have a height of from 20 to 30 feet, and a girth of 25 or 26 feet. The fruit, which ripens between May and August, is an olive-looking nut, greedily eaten by camels, mules, goats, sheep, and horned cattle (but not by horses) for the sake of the fleshy pericarp, and crushed by the natives to extract the oil from the kernel. Though "its strong and fulsome savour" renders it nauseous to the European palate, this oil is largely used in the cookery of southern Morocco. The prickly pear forms one of the features of the landscape from the coast up to the slopes of the mountains. The cork tree, common in the time of Addison, has lost ground enormously, though it probably forms the staple of the Ma'mú. forest, which extends for some 20 miles between the Bú Rakrak and the Sebú. Though not so widespread as in Algeria or some districts of southern Europe, the palmetto is often locally very abundant. Citrons, lemons, limes (sweet and sour), shaddocks, mulberries, walnuts, and chestnuts are common in many parts. Tetuan is famous for oranges, Meknes for quinces, Morocco for pomegranates, Fez for figs, Táfílelt and Akka for dates, Sús for almonds, Dukalla for melons, Tagodast, Edantenan, and Rabát for grapes, and Tárúdant for olives (Cowan). The grape is extensively cultivated; the Jews manufacture crude but palatable wines. Sugar, once grown in Sús, to supply the demands of the whole of Morocco, has disappeared. Both hemp and tobacco are cultivated under the restrictions of an imperial monopoly,—the former (prime quality) being largely used as hashish, the latter, though never smoked, as snuff. Barley is the most usual cereal; but excellent crops of wheat, maize, millet, rye, beans, pease, chick-peas, and canary seed are also obtained. Potatoes are coming into favour in certain districts.

It is still true, as in the time of Addison, that the Moors "seldom reap more than will bring the year about," and the failure of a single harvest causes inevitable dearth. Captain Colvile calculates that not more than a hundredth part of the available land is cultivated at all; and the cultivated portion possessed by each tribe is divided into three parts, one only of which is sown each year. With a plough of the most primitive description the Moorish peasant scarcely scratches the surface of the soil; and his harrow is a few branches of trees weighted with heavy stones. The corn is cut close to the ear with short curved knives, and the straw left standing. Underground granaries or matamores (*maṭmúra*) are constructed, sometimes capable of holding 2000 quarters; they preserve their contents in good condition for many years.

There is abundant space in the country for wild animals, even of the larger kind; but the absence of woodland keeps them in check. Besides the lion, which exists only in very limited numbers, and, according to local proverbs, with diminished courage, the spotted leopard, the hyæna, jackal, lynx, fox, and wild boar are the most important. The *audad* or wild sheep is found in the more inaccessible parts of the Atlas. Rabbits swarm in the country to the north of the Bú Rakrak, and since 1870 they have crossed this, which used to be their southern limit. A kind of ground-squirrel, the *sibsib*, occurs in the southern provinces. Monkeys of the same species as those of Gibraltar frequent the neighbourhood of Jebel Músá or Apes' Hill. The list of the ordinary wild birds includes blackbirds, goldfinches, linnets, greenfinches, robins, wagtails, skylarks, and crested larks, as well as turtle-doves, nightingales, and jays. The house-sparrow is not found; between Morocco and Mogador its place is taken by a beautiful bird (*Emberiza striolata*), locally called *ṭabíb*, or "the doctor" (Leared). The stranger is struck by the immense variety and number of hawks, and still more by the familiar terms on which they build their nests in the walls and rocks along with blue rock-pigeons and starlings. All through the country the red-legged partridge is the main resource of the sportsman, though he may also bag other varieties of partridge, bustards, and ducks and other water-fowl. Along the coasts there is no lack of gulls, whimbrel, oyster-catchers, &c. Every town has its colony of storks. Lizards, chameleons, tortoises, and frogs are familiar objects; it is from Morocco that the small tortoises hawked about the streets of London are usually obtained. The profusion of insect-life is one of the plagues of the country in the eyes of the European; and even the Moor, who has got reconciled to his mosquitoes and fleas, considers the locust one of his deadliest enemies.

The camel is the great beast of burden in Morocco, though asses and mules are also employed. The horse, never reduced to such base uses, is usually a sturdy little animal, but far below the ancient reputation of the Barbary steed. Roughly broken when young, his mouth is soon spoiled by barbarous bits, and his feet by square shoes. The finest animals are said to be bred in Shiadma

[1] See Mourlon in *Bull. de l'Acad. Roy. de Belgique*, vol. xxx., 1870; Coquand, *Bull. de la Soc. Géol. de France*, vol. iv.; and especially Maw's paper appended to Hooker and Ball's *Morocco*.

[2] Rohlfs says larches, but there is strong reason to doubt this.

[3] Compare Drude, "Floristische Erforschung Nord-Afrika's" in *Petermann's Mittheilungen*, 1882.

east Devonian rocks stretch for hundreds of miles into the Sahara. The plain around the city of Morocco has a sheet-like covering of tufaceous crust rising over hill and valley and following all the undulations of the ground, the result probably of the intense heat of the sun rapidly drawing up water charged with soluble carbonate of lime from the calcareous strata, and drying it layer by layer on the surface till an accumulation several feet thick has been produced (Maw). This crust is extensively burned for lime, and it forms a natural strong roof for the matamores or underground cellars which the Moors excavate in the soft strata beneath. An enormous deposit of boulders occurs in the lateral valleys and along the escarpment of the Atlas, and the opinion that these are the products of remote glacial action is supported by the existence of true moraines in the upper part of the glens. All along the west coast there are indications of an elevation of the land in the shape of raised beaches, at Tangiers 40, at the south of Cape Spartel 50, at Mogador 60 or 70 feet high; but a number of other facts seem to show that at present a process of subsidence is in progress.[1]

That mineral deposits of great value exist in Morocco there is little doubt. At Jebel Hadíd or the Iron Mountain, the heights to the north of Mogador, old scoriæ are found. In the Bení Madan hills near Tetuan are mines, closed, it is said, by the sultan 'Abd al-Rahmán; but whether they furnished copper or lead authorities differ. On the road to Kenatsa, Rohlfs saw lead and antimony worked by the Bení Sithe. Antimony especially seems to be abundant to the south of the Atlas; Rohlfs found it in a very pure state near Tesna, and Dr Allen (whose account was not published when this article was written) informed the writer that he saw splendid veins of it north of the Der'a. That gold mines existed in Sús was long suspected; Gatell proved it. Rock-salt occurs in the mountains north of Fez, in the valley of the W. Martil, and probably in Jebel Zarhún. In several places, as in the route from Saffi to Morocco, are brine lakes, from which the salt is collected and exported as far as Central Africa.

The general aspect of the lowlands of Morocco varies so much according to the season of the year that, while one stranger finds it arid and sunburnt and monotonous, another is delighted with the richness of its vegetation and the bright variety of its colours. In some of the Atlas valleys there is a wealth of timber, enormous conifers, 10 to 12 feet in girth of stem, oaks, &c.,[2] but the greater part of the country has been cleared of every vestige of woodland, and consequently depends for its appearance on herbage, brushwood, and the lesser fruit-trees. Cultivation is confined to such comparatively narrow limits that the natural flora has full scope for its development. Cowan, writing more immediately of the country between Morocco and Mogador, speaks of "drifts of asphodel, white lilies, blue convolvuli, white broom flowers, thyme and lavender, borage, marigold, purple thistles, colossal daisies and poppies;" and Captain Trotter tells how for miles the undulating plateau of Kasr Ferá'ún was literally covered with wild flowers, whose varied colours, and the partiality with which each species confined itself to certain ground, gave to the landscape a brilliant and most unique appearance. Dark-blue, yellow, and red —iris, marigold, and poppy—occurred in patches an acre in size; farther on whole hills and valleys were of a delicate blue tint from convolvulus and borage. At times the traveller's tent is pitched on a carpet of mignonette, at times on a carpet of purple bugloss. In the country of the Bení Hasan squills are so abundant that the fibres of the bulbs are used instead of hair in making tent-cloth; and in the north of Ksar al-Kebír the moors are covered for miles with a beautiful white heather. From such gorgeous combinations of colour one can well imagine that the Moors drew the inspiration of their chromatic art; but the season of floral splendour is brief, and under the hot African sun everything soon sinks into the monotony of straw.

The botany of Morocco has been explored by Balansa (1867), Hooker, Ball, and Maw (1871), Rein and Fritsch (1873), Ibrahim Ammeribt (a Berber collector, 1873-6), the Rabbi Mardochée Abi Serur (1872-3); and the results have been systematically arranged in Cosson's *Compendium Floræ Atlanticæ: ou Flore des États barbaresques* (Paris, 1881, &c.). From the presence of a large proportion of plants of central and northern Europe (none of the northern plants, however, being of alpine or arctic type) and the absence of southern types characteristic of the sub-tropical zone Ball concludes that "the mountain flora of Morocco is a southern extension of the European temperate flora, with little or no admixture of extraneous elements, but so long isolated from the neighbouring regions that a considerable number of new specific types have been developed."[3] Of the individual plants none are more remarkable than the 'arár and the argan. The former (*Callitris quadrivalvis*, *Thuja articulata* of Shaw) is a cypress-like tree that grows on the Atlas both in Morocco and Algeria. It furnishes gum sandarach; and its beautiful and enduring timber has been identified with the *alerce* with which the Cordova cathedral (mosque) was roofed, and with the citron-wood of the ancient Romans. The argan (*Argania Sideroxylon*) is confined even in Morocco to a tract of country extending only about 150 miles along the coast, from the river Tensift almost to the river Sús, and about 30 miles in breadth; and it is found nowhere else in the world. A gnarled trunk and wide-spreading contorted thorny branches give it a striking appearance. Large specimens have a height of from 20 to 30 feet, and a girth of 25 or 26 feet. The fruit, which ripens between May and August, is an olive-looking nut, greedily eaten by camels, mules, goats, sheep, and horned cattle (but not by horses) for the sake of the fleshy pericarp, and crushed by the natives to extract the oil from the kernel. Though "its strong and fulsome savour" renders it nauseous to the European palate, this oil is largely used in the cookery of southern Morocco. The prickly pear forms one of the features of the landscape from the coast up to the slopes of the mountains. The cork tree, common in the time of Addison, has lost ground enormously, though it probably forms the staple of the Ma'mú forest, which extends for some 20 miles between the Bú Rakrak and the Sebú. Though not so widespread as in Algeria or some districts of southern Europe, the palmetto is often locally very abundant. Citrons, lemons, limes (sweet and sour), shaddocks, mulberries, walnuts, and chestnuts are common in many parts. Tetuan is famous for oranges, Meknes for quinces, Morocco for pomegranates, Fez for figs, Táfilelt and Akka for dates, Sús for almonds, Dukalla for melons, Tagodast, Edantenan, and Rabát for grapes, and Tárúdant for olives (Cowan). The grape is extensively cultivated; the Jews manufacture crude but palatable wines. Sugar, once grown in Sús, to supply the demands of the whole of Morocco, has disappeared. Both hemp and tobacco are cultivated under the restrictions of an imperial monopoly,—the former (of prime quality) being largely used as hashish, the latter, though never smoked, as snuff. Barley is the most usual cereal; but excellent crops of wheat, maize, millet, rye, beans, pease, chick-peas, and canary seed are also obtained. Potatoes are coming into favour in certain districts.

It is still true, as in the time of Addison, that the Moors "seldom reap more than will bring the year about," and the failure of a single harvest causes inevitable dearth. Captain Colvile calculates that not more than a hundredth part of the available land is cultivated at all; and the cultivated portion possessed by each tribe is divided into three parts, one only of which is sown each year. With a plough of the most primitive description the Moorish peasant scarcely scratches the surface of the soil; and his harrow is a few branches of trees weighted with heavy stones. The corn is cut close to the ear with short curved knives, and the straw left standing. Underground granaries or matamores (*maṭmúra*) are constructed, sometimes capable of holding 2000 quarters; they preserve their contents in good condition for many years.

There is abundant space in the country for wild animals, even of the larger kind; but the absence of woodland keeps them in check. Besides the lion, which exists only in very limited numbers, and, according to local proverbs, with diminished courage, the spotted leopard, the hyæna, jackal, lynx, fox, and wild boar are the most important. The *audad* or wild sheep is found in the more inaccessible parts of the Atlas. Rabbits swarm in the country to the north of the Bú Rakrak, and since 1870 they have crossed this, which used to be their southern limit. A kind of ground-squirrel, the *sibsib*, occurs in the southern provinces. Monkeys of the same species as those of Gibraltar frequent the neighbourhood of Jebel Músá or Apes' Hill. The list of the ordinary wild birds includes blackbirds, goldfinches, linnets, greenfinches, robins, wagtails, skylarks, and crested larks, as well as turtle-doves, nightingales, and jays. The house-sparrow is not found; between Morocco and Mogador its place is taken by a beautiful bird (*Emberiza striolata*), locally called *ṭabíb*, or "the doctor" (Leared). The stranger is struck by the immense variety and number of hawks, and still more by the familiar terms on which they build their nests in the walls and rocks along with blue rock-pigeons and starlings. All through the country the red-legged partridge is the main resource of the sportsman, though he may also bag other varieties of partridge, bustards, and ducks and other water-fowl. Along the coasts there is no lack of gulls, whimbrel, oyster-catchers, &c. Every town has its colony of storks. Lizards, chameleons, tortoises, and frogs are familiar objects; it is from Morocco that the small tortoises hawked about the streets of London are usually obtained. The profusion of insect-life is one of the plagues of the country in the eyes of the European; and even the Moor, who has got reconciled to his mosquitoes and fleas, considers the locust one of his deadliest enemies.

The camel is the great beast of burden in Morocco, though asses and mules are also employed. The horse, never reduced to such base uses, is usually a sturdy little animal, but far below the ancient reputation of the Barbary steed. Roughly broken when young, his mouth is soon spoiled by barbarous bits, and his feet by square shoes. The finest animals are said to be bred in Shiadma

[1] See Mourlon in *Bull. de l'Acad. Roy. de Belgique*, vol. xxx., 1870; Coquand, *Bull. de la Soc. Géol. de France*, vol. iv.; and especially Maw's paper appended to Hooker and Ball's *Morocco*.

[2] Rohlfs says larches, but there is strong reason to doubt this.

[3] Compare Drude, "Floristische Erforschung Nord-Afrika's" in *Petermann's Mittheilungen*, 1882.

al-Hodna were autonomous under a number of indigenous or foreign princes. The chief of these principalities were that of the Idrísites at Fez (*supra*, p. 581), the kingdom of Tahart, and that of Nákúr. In the first years of the 10th century the Fátimite caliphs, at the head of the powerful Berber tribe of Kotáma, overthrew the Aghlabites, thus putting an end for ever to Arab rule in North Africa, and rapidly extended their empire to the Atlantic. When the Fátimites established themselves in Egypt, the Zírid dynasty reigned as their vassals in the west, and maintained themselves with varying fortunes till the rise of the great empire of the Almoravides (*q.v.*), who yielded in turn to the Almohades (*q.v.*). The latter dynasty was extinguished by the princes of the Beni-Merín, whose chief, Ya'kúb b. 'Abd al-Hakk, captured Morocco in 1269 A.D. The subsequent history of Morocco and Fez under the Merinids and their successors presents little interest, being as full of internecine wars, contested successions, fratricides, general bloodshed, and barbarities as it is empty of all indications of an advance in civilization. As regards the relations of the country to European nations, four periods may be distinguished—(1) a period lasting down to the close of the 14th century, when the Moorish potentates were still the most prominent representatives of aggressive Mohammedanism; (2) a period during which the Portuguese and Spaniards, having expelled their invaders, made vigorous reprisals and obtained possession of many towns on the coast of Morocco; (3) a period in which these nations, disheartened by the disastrous defeat in the Battle of the Three Kings (1579), allowed the Moors to recover much of the ground they had lost, and to become, by their piracies and defiance of international law, an object if not of terror yet of apprehension and irritation; and (4) a period in which the prestige of this afterglow of greatness has gradually died out.

The following are the more noteworthy events in the Moorish annals since the beginning of the 15th century.

1415. Ceuta captured by the Portuguese. 1436. First expedition against Tangiers by Don Duarte; capture of Don Fernando, who died in exile in 1459 (it was proposed to ransom him by cession of Ceuta, but the pope objected). 1459. Capture of Alcazar Seguir. 1471. Capture of Tangiers. 1510-1540. Rise of the dynasty of the Sherífs. 1577. Edmond Hogan sent by Queen Elizabeth of England to Muley 'Abd al-Melek (see Report in Hakluyt). 1578. Defeat of King Sebastian (see Leared, *Visit to Court of Morocco*, appendix). 1585. Founding of the Company of Barbary Merchants (earls of Warwick, Leicester, &c.) in London; Elizabeth's second ambassador Henry Roberts well received. 1610. The Moors from Spain settle partly at Rabát, &c., and prove troublesome. 1649. Muley Zidan sends to King Charles I. requesting him to attack Sallee by sea. About this time Ali Sherif of Yanbo, near Medina, is recognized as ruler of Táfilelt, and gradually of the rest of the empire except the city of Morocco; with him commences the dynasty of the Alides; on his death his sons, Mohammed and Arshid, dispute the succession. 1662. Tangiers (Portuguese since 1471) becomes an English possession as part of the dowry of Catherine of Braganza. 1664-1672. Reign of Arshid, a warlike, active, and cruel prince, who was the first to take the title of sultan. 1672-1727. Reign of Ishmael, who in ability and ferocity completely outdid his brother Arshid, and supported his throne by an enormous army of slaves from the Súdán. 1678. Great plague; ambassadors sent to Louis XIV. to ask the hand of Mademoiselle Blois, the king's natural daughter. 1682. The sultan sends two lions to the king of England. 1684. Sir Cloudesley Shovel defends British interests on the coast; withdrawal of the English from Tangiers. 1687. Capture of Larash from the Spaniards. 1694. Siege of Ceuta. 1725. Thomas Betton, who had been a slave in Morocco, left £13,000, the half of his fortune, for the ransom of British captives in that country. 1727-1730. Disputed succession. 1757-1789. Reign of Mohammed. 1778. Locusts. 1780. Great famine; Agadir opened to the Dutch. 1794-1822. Reign of Soliman; abolition of Christian slavery in Morocco; suppression of piracy. 1822-1859. Reign of Abd er Rahman; rupture with Spain on account of the decapitation of Consul Darmon for the wounding of a Moor. 1844. Defeat of forces sent to assist 'Abd al-Kader in Algiers; bombardment of Tangiers and Mogador by the prince de Joinville; rout of the Moorish forces in the battle of Isly; and peace of Tangiers. 1845. Naval demonstration at Tangiers and ratification of treaty; surrender to Spain of disputed territory at Ceuta. 1853. Establishment of a customs line and regular military posts along the Algerian frontier. 1856. English commercial treaty by which no duty shall exceed 10 per cent. of the value of the wares. 1859-1873. Reign of Mohammed; Spanish invasion. 1860. Decisive battle between General O'Donnell and the Moors near Tetuan (March). By the treaty of Tetuan Morocco was to pay 20,000,000 piastres to Spain, to surrender territory at Santa Cruz de Mar Pequeña for a commercial establishment, and to allow the Spanish missionaries to have a house at Fez like that which they had at Tangiers. Money not being obtainable to pay the indemnity, the Spaniards obtained control of the customs for a term of years. 1864. Decree permitting Europeans to trade in any part of the empire. 1873. Accession of Hasan. 1880. English embassy for improvement of commercial relations; conference at Madrid to define the rights of European representatives in regard to the protection afforded by them to subjects of the sultan; number of *protégés* limited to three. 1882. Expedition to subdue Sid Hosein of Iligh. 1883. Protest of the English Government against the slave trade in Morocco.

Lists of works in regard to Morocco will be found in Renou, *Descript. géogr. de l'emp. de Maroc*, Paris, 1846, forming part of *L'explor. scient. de l'Algérie*; in *Bol. de la Soc. geogr. de Madrid*, 1877, 1878; and in *Rivista Contemporanea*, Madrid, 1881. Besides Renou's *Description*—a masterly criticism of all previous geographical material—the following may be mentioned:—Ibn Khaldún, *Hist. des Berbères* (tr. by Baron de Slane); Leo Africanus, *Descript. Africæ*; Diego Torres, *Origen y sucesso de los Xarifes . . . de Marruecos*, &c., 1585; Marmol, *Descr. de l'Afrique*, 1667; Faria y Sousa, *Africa Portuguesa*, Lisbon, 1681; Addison, *Account of West Barbary*, 1671 (Pinkerton's Coll., xv.); Chenier, *Rech. hist. sur les Maures*, 1787; Jackson, *Account of the Emp. of Morocco*, 1809, and *Timbuctoo and Housa*, 1820; Drummond Hay, *Western Barbary*, 1844; John Davidson, *Notes taken during Travels in Africa*, 1839; De Aguirra, *Expedicion al Rif*, 1858; Mrs. E. Murray, *Sixteen Years in Morocco, Spain, &c.*, 1859; Richardson, *Trav. in Morocco*, 1860; Maltzan, *Drei Jahren im Nordwesten von Afrika*, 18[illegible] (4 vols.); Rohlfs, *Reise durch Marokko*, Bremen, 1868; Fritsch in "Mittheil. d. Vereins für Erdk.," Halle, 1878; Leared, *Morocco and the Moors*, 1875, and *Visit to the Court of Morocco*, 1879; De Amici's *Marocco*, Milan, 1878—a very graphic sketch, which has been deservedly translated into English, French, German, &c.; Tissot, *Rech. sur la géogr. comparée de la Maurétanie Tingitane*, 1877; Castellanos, *Descr. hist. de Marruecos*, Santiago, 1878; Hooker and Ball, *Morocco and the Great Atlas*, 1878; Gatell, *Viajes por Marruecos*, 1879; Payton, *Moss from a Rolling Stone*, 1879; Llana y Rodrigañez, *El imp. de Marruecos*, 1880; Watson, *A Visit to Wazan*, 1880; Trotter, *Mission to the Court of Marocco*, 1881; Cowan and Johnstone, *Moorish Lotus Leaves*, 1882.

Morocco, or Marocco (Marrákush), one of the quasi capitals of the sultanate (Fez and Meknes being the other two), lies in a spacious plain about 15 miles from the northern underfalls of the Atlas, and 90 miles east-south-east of Ṣafi, at a height variously estimated as 163[illegible] feet (Hooker and Ball), 1410 (Beaumier), and 150[illegible] (Leared). Ranking during the early centuries of its existence as one of the greatest and most flourishing cities of Islam, Morocco has long been in a state of grievous decay and were it not for the exceptional beauty of its situation the luxuriant groves and gardens by which it is encompassed and interspersed, and the magnificent outlook which it enjoys towards the mountains, it would be altogether a very miserable place. The wall, 25 or 30 feet high, and relieved by square towers at intervals of 360 feet, is so dilapidated that foot-passengers, and in places even horsemen, can find their way in and out through the breaches. Open spaces of great extent are numerous enough within the walls, but for the most part they are defaced by mounds of rubbish and putrid refuse. With the exception of the tower of the Kutubía Mosque and a certain archway which was brought in pieces from Spain, there is not, it is asserted, a single stone building in the city; and even bricks (though the local manufacture is of excellent quality) are sparingly employed. *Tábiya*, or pounded clay, is the almost universal material, and the houses are consequently seldom raised more than two stories in height. The palace of the sultan covers an extensive area, and has its parks and gardens enclosed by walls similar to those of the city proper, but is architecturally quite insignificant. In the whole of Morocco the tower of the Kutubía alone is a worthy memorial of the constructive genius of the early Moors; both it and the similar tower of Hasan at Rabát are after the type of the Giralda at Seville, and, if tradition may be trusted, all three were designed by the same architect Jábir. The mosque to which the tower belongs is a large brick building erected by 'Abd al-Mumen; the interior is adorned with marble pillars, and the whole of the crypt is occupied by a vast cistern excavated by Manṣúr. Other mosques of some note are those of Ibn Yúsuf, Al-Manṣúr, and Al-Mo'izz; the chapel of Sidi Bel Abbas, in the extreme north of the city, possesses property to the value of £200,000, and serves as a great almshouse and asylum. As in most other towns throughout Morocco, there is a special Jews' quarter walled off from the rest. The general population is of a very mixed and turbulent kind; crimes of violence are extremely common, and there are countless varieties of the professional thief. Almost the only manufacture extensively prosecuted is that of Morocco leather, mainly red and yellow, about 1500 men being employed as tanners and shoemakers. The city was founded in 1062 by Yúsuf b

al-Hodna were autonomous under a number of indigenous or foreign princes. The chief of these principalities were that of the Idrísites at Fez (*supra*, p. 581), the kingdom of Tahart, and that of Nákúr. In the first years of the 10th century the Fátimite caliphs, at the head of the powerful Berber tribe of Kotáma, overthrew the Aghlabites, thus putting an end for ever to Arab rule in North Africa, and rapidly extended their empire to the Atlantic. When the Fátimites established themselves in Egypt, the Zírid dynasty reigned as their vassals in the west, and maintained themselves with varying fortunes till the rise of the great empire of the ALMORAVIDES (*q.v.*), who yielded in turn to the ALMOHADES (*q.v.*). The latter dynasty was extinguished by the princes of the Beni-Merín, whose chief, Ya'kúb b. 'Abd al-Hakk, captured Morocco in 1269 A.D. The subsequent history of Morocco and Fez under the Merinids and their successors presents little interest, being as full of internecine wars, contested successions, fratricides, general bloodshed, and barbarities as it is empty of all indications of an advance in civilization. MOROCCO, or MAROCCO (Marrákush), one of the quasi capitals of the sultanate (Fez and Meknes being the other two), lies in a spacious plain about 15 miles from the northern underfalls of the Atlas, and 90 miles east-south-east of Ṣaffi, at a height variously estimated as 163- feet (Hooker and Ball), 1410 (Beaumier), and 150- (Leared). Ranking during the early centuries of its existence as one of the greatest and most flourishing cities of Islam, Morocco has long been in a state of grievous decay and were it not for the exceptional beauty of its situation the luxuriant groves and gardens by which it is encompassed and interspersed, and the magnificent outlook which it enjoys towards the mountains, it would be altogether a very miserable place. The wall, 25 or 30 feet high, and relieved by square towers at intervals of 360 feet, is so dilapidated that foot-passengers, and in places even horsemen, can find their way in and out through the breaches. Open spaces of great extent are numerous enough within the walls, but for the most part they are defaced by mounds of rubbish and putrid refuse. With the exception of the tower of the Kutubía Mosque and a certain archway which was brought in pieces from Spain, there is not, it is asserted, a single stone building in the city; and even bricks (though the local manufacture is of excellent quality) are sparingly employed. *Tábiya*, or pounded clay, is the almost universal material, and the houses are consequently seldom raised more than two stories in height. The palace of the sultan covers an extensive area, and has its park and gardens enclosed by walls similar to those of the city proper, but is architecturally quite insignificant. In the whole of Morocco the tower of the Kutubía alone is a worthy memorial of the constructive genius of the early Moors; both it and the similar tower of Hasan at Rabát are after the type of the Giralda at Seville, and, if tradition may be trusted, all three were designed by the same architect Jábir. The mosque to which the tower belongs is a large brick building erected by 'Abd al-Mumen; the interior is adorned with marble pillars, and the whole of the crypt is occupied by a vast cistern excavated by Manṣúr. Other mosques of some note are those of Ibn Yúsuf, Al-Manṣúr, and Al-Mo'izz; the chapel of Sidi Bel Abbas, in the extreme north of the city, possesses property to the value of £200,000, and serves as a great almshouse and asylum. As in most other towns throughout Morocco, there is a special Jews' quarter walled off from the rest. The general population is of a very mixed and turbulent kind; crimes of violence are extremely common, and there are countless varieties of the professional thief. Almost the only manufacture extensively prosecuted is that of Morocco leather, mainly red and yellow, about 1500 men being employed as tanners and shoemakers. The city was founded in 1062 by Yúsuf b

Francisci Carmaniolæ, in the Corner-Duodo collection. The life of Andrea has been written by Luigi Lollin, bishop of Belluno (1623), by Niccolo Crasso (1621), and by Antonio Palazzoli (1620).

The most distinguished member of the house of Morosini was Francesco, the captain-general of the republic against the Turks and conqueror of the Morea. He was born in 1618. In 1666 he was in command during an unfortunate campaign in Candia. In 1687 he conquered Patras, and so opened the Morea to the Venetian arms. In the following year he was elected doge. After his return to Venice the republic suffered severely in Candia, and though now an old man Francesco took the field again in 1693, but died the next year at Nauplia, seventy-six years of age. A more detailed account of his exploits will be found in the article VENICE.

Authorities.—Barbaro, *Genealogie delle Famiglie Patrizie Venete*, MS., clas. vii. cod. dcccxxvii., in the Marcian Library, Venice; Cappellari, *Campidoglio Veneto*, MS., clas. vii. cod. xvii., in the same library; Romanin, *Storia documentata di Venezia*; Freschot, *La Nobiltà Veneta*; Cicogna, *Iscrizione Veneziane*.

MORPETH, a municipal and parliamentary borough of Northumberland, England, is situated in a fine valley on the Wansbeck, and on the North-Eastern Railway, 50 miles south of Berwick and 16 north of Newcastle. The Wansbeck, which is crossed by a stone and two wooden bridges, winds round the town on the west, south, and east, and a small rivulet, the Cottingburn, bounds it on the north. Morpeth is irregularly built, but possesses a number of good shops. The parish church of the Blessed Virgin, a plain building of the 14th century, is situated on Kirk Hill, a short distance from the town. Among the other public buildings are the Edward VI.'s grammar school, reopened in 1857 after a Chancery suit lasting 150 years; the tow hall, erected in 1870 to supersede a building of 1714 Vanbrugh; and the county-hall and former gaol, in baronial style, built in 1814. Nothing remains of the o castle except the gateway. Morpeth had at one time one the largest cattle-markets in England. The industries the town include tanning, brewing, malting, iron and bra founding, and the manufacture of flannels, agricultr implements, and bricks and tiles. The population of municipal borough (231 acres) in 1871 was 4517, and 1881 it was 4556. The population of the parliamenta borough (17,085 acres) in the same years was 30,239 a 33,459.

Morpeth (*Morepath*, *i.e.*, the path over the moor) had attain some size before the Norman Conquest, when it was granted William de Merlay. From the De Merlays it passed through Greystocks and Dacres to the Howards, earls of Carlisle. So after the Conquest it obtained the privilege of a market, in 1552 arms were granted to it by Edward VI. It is a boron by prescription, and was incorporated by Charles II. By Municipal Act of 1835 the government was placed in a mayor a burgesses, but there is a local board of health distinct from corporation, having control over an area slightly larger than of the municipal borough. From 1553 the borough sent members to parliament, but since 1832 only one member has be returned, and in 1868 the area of the borough was increased.

MORPHEUS is a personification, apparently invent by Ovid (*Metam.*, xi. 635), of the power that calls shapes before the fancy of a dreamer. The name (f μορφή) expresses this function; Ovid translates it *artif simulatorque figuræ.* Morpheus is naturally represent as the son of Sleep (Somnus).

MORPHOLOGY

THE term Morphology (μορφή, *form*), introduced by Goethe to denote the study of the unity of type in organic form (for which the Linnæan term METAMORPHOSIS (*q.v.*) had formerly been employed), now usually covers the entire science of organic form, and will be employed in this more comprehensive sense in the present article.

§ 1. *Historical Outline.*—If we disregard such vague likenesses as those expressed in the popular classifications of plants by size into herbs, shrubs, and trees, or of terrestrial animals by habit into beasts and creeping things, the history of morphology commences with Aristotle. Founder of comparative anatomy and taxonomy, he established eight great divisions (to which are appended certain minor groups)—*Viviparous Quadrupeds*, *Birds*, *Oviparous Quadrupeds and Apoda*, *Fishes*, *Malakia*, *Malacostraca*, *Entoma*, and *Ostracodermata*—distinguishing the first four groups as *Enaima* ("with blood") from the remaining four as *Anaima* ("bloodless"). In these two divisions we recognize the Vertebrata and Invertebrata of Lamarck, while the eight groups are identical with the Mammals, Birds, Reptiles, Fishes, the Cephalopods, Crustaceans, other Articulates, and Testaceans of recent zoology. Far, too, from committing the mistake often attributed to him of reckoning Bats as Birds, or Cetaceans as Fishes, he discerned the true affinities of both, and erected the latter into a special γένος beside the Viviparous Quadrupeds, far more on account of their absence of limbs than of their aquatic habit. Not only is his method inductive, and, as in modern systems, his groups natural, *i.e.*, founded on the aggregate of known characters, but he foreshadows such generalizations as those of the correlation of organs, and of the progress of development from a general to a special form, long afterwards established by Cuvier and Von Baer respectively. In the correspondence he suggests between the scales of Fishes and the feathers of Birds, in that hinted at between the fins of Fishes and the lim of Quadrupeds, the idea of homology too is nascent; from the compilation of his disciple Nicolaus of Dama who regards leaves as imperfectly-developed fruits, he see almost to have anticipated the idea of the metamorpho of plants. In short, we find a knowledge of struct facts and a comparative freedom from the errors in by physiological resemblance, of which his successors as Theophrastus and Pliny, generally mere classifiers habit, show little trace, and which the moderns have slowly regained. Little indeed can be recorded until t 13th century, when the reappearance of Aristotle's wo gave a new impulse to the study of organic nature. the works of this period that of Albertus Magnus is the most important; but they are all no more than vivals of Aristotle, marking the reappearance of scienti method and the reawakening of interest in and sympath with nature. Meanwhile leech and apothecary, alche and witch, were accumulating considerable knowledge plants, which, after the invention of printing, bec collected and extended in the descriptive and well-illu trated folios of Gesner and his successors, Fuchs, L and others, as well as by the establishment of bo gardens and scientific academies, while, as Sachs exp it, "in the sharpest contrast to the naive empiricism of t German fathers of botany came their Italian contemp Cæsalpinus, as the thinker of the vegetable world." Bo made systematic efforts,—the Germans vaguely seeking t natural affinities in mere similarities of habit, the Ita with no inconsiderable success striving towards an in lectual basis of classification. Monographs on groups plants and animals frequently appeared, those of Belon Birds and Rondelet on Fishes being among the earliest; in the former of these (1555) we find a comparison of

Francisci Carmaniolæ, in the Corner-Duodo collection. The life of Andrea has been written by Luigi Lollin, bishop of Belluno (1623), by Niccolo Crasso (1621), and by Antonio Palazzoli (1620).

MORPHOLOGY

THE term Morphology (*μορφή, form*), introduced by Goethe to denote the study of the unity of type in organic form (for which the Linnæan term METAMORPHOSIS (*q.v.*) had formerly been employed), now usually covers the entire science of organic form, and will be employed in this more comprehensive sense in the present article.

§ 1. *Historical Outline.*—If we disregard such vague likenesses as those expressed in the popular classifications of plants by size into herbs, shrubs, and trees, or of terrestrial animals by habit into beasts and creeping things, the history of morphology commences with Aristotle. Founder of comparative anatomy and taxonomy, he established eight great divisions (to which are appended certain minor groups)—*Viviparous Quadrupeds, Birds; Oviparous Quadrupeds and Apoda, Fishes, Malakia, Malacostraca, Entoma*, and *Ostracodermata*—distinguishing the first four groups as *Enaima* ("with blood") from the remaining four as *Anaima* ("bloodless"). In these two divisions we recognize the Vertebrata and Invertebrata of Lamarck, while the eight groups are identical with the Mammals, Birds, Reptiles, Fishes, the Cephalopods, Crustaceans, other Articulates, and Testaceans of recent zoology. Far, too, from committing the mistake often attributed to him of reckoning Bats as Birds, or Cetaceans as Fishes, he discerned the true affinities of both, and erected the latter into a special γένος beside the Viviparous Quadrupeds, far more on account of their absence of limbs than of their aquatic habit. Not only is his method inductive, and, as in modern systems, his groups natural, *i.e.*, founded on the aggregate of known characters, but he foreshadows such generalizations as those of the correlation of organs, and of the progress of development from a general to a special form, long afterwards established by Cuvier and Von Baer respectively. In the correspondence he suggests between the scales of Fishes and the feathers of Birds, in that hinted at between the fins of Fishes and the lim of Quadrupeds, the idea of homology too is nascent; from the compilation of his disciple Nicolaus of Dama who regards leaves as imperfectly-developed fruits, he se almost to have anticipated the idea of the metamorpho of plants. In short, we find a knowledge of struct facts and a comparative freedom from the errors in by physiological resemblance, of which his successors s as Theophrastus and Pliny, generally mere classifiers habit, show little trace, and which the moderns have slowly regained. Little indeed can be recorded until t 13th century, when the reappearance of Aristotle's wo gave a new impulse to the study of organic nature. the works of this period that of Albertus Magnus is the most important; but they are all no more than vivals of Aristotle, marking the reappearance of scienti method and the reawakening of interest in and sympath with nature. Meanwhile leech and apothecary, alch and witch, were accumulating considerable knowledge plants, which, after the invention of printing, bee collected and extended in the descriptive and well-illu trated folios of Gesner and his successors, Fuchs, Lo and others, as well as by the establishment of bot gardens and scientific academies, while, as Sachs exp it, "in the sharpest contrast to the naive empiricism of t German fathers of botany came their Italian contemp Cæsalpinus, as the thinker of the vegetable world." bo made systematic efforts,—the Germans vaguely seeking natural affinities in mere similarities of habit, the Ita with no inconsiderable success striving towards an in lectual basis of classification. Monographs on groups plants and animals frequently appeared, those of Belon Birds and Rondelet on Fishes being among the earliest; in the former of these (1555) we find a comparison of

plants, as well as of at least the higher animals, have been studied with much and ever-increasing accuracy of detail. (See ANATOMY, HISTOLOGY, EMBRYOLOGY.) Both vegetable and animal tissues have been simply classified both according to their adult forms and according to the embryonic layers from which they respectively arise. This scrutiny of plant and animal structure over and above the special generalizations of the botanist and the zoologist has afforded much result to general histology. The improvement of technical methods has of late years largely aided the progress of discovery. A return from the study of the cell-aggregate to that of the cell has commenced, and the question of cell-structure may be said to be again paramount in histology. The process of transverse division has of late been much elucidated, and, although its complex details cannot here be entered upon, the result has been to establish a minute and thorough correspondence in cases so widely dissimilar as pollen-grains from a flower-bud, the epidermis of a tadpole, or the cells of a tumour—a result which obviously enhances the morphological completeness of the cell theory. Minor modes of cell-multiplication also are not without their morphological interest. Gemmation, familiar in the yeast plant, occurs in other low and simple organisms, and may probably be identified with the formation of polar vesicles in ova as a modification of transverse division. Schleiden had supposed all new cells to originate within pre-existing cells, and this process, known as free-cell-formation, may really be observed in various plant and animal tissues. The protoplasm groups itself round new nuclei, the new cells being in fact formed much as Schwann had in his turn supposed; but these nuclei have repeatedly been shown to arise from segmentation of the original nucleus, and thus this process too seems a mere modification of the general one of transverse division. Conjugation, too—that coalescence of two similar cells which may be observed in many Algæ, Fungi, and Protozoa—is to be considered as the undifferentiated form of that fertilization which occurs in higher animals and plants, the two apparently similar masses having become respectively differentiated into ovum and spermatozoon, or into egg-cell and antherozoid. An indefinite number of amœboid cells sometimes flow together into a single mass,—a phenomenon regarded by some as multiple-conjugation, or perhaps more probably as an almost mechanical coalescence of exhausted cells, from which conjugation proper and finally fertilization may indeed have originated. The amœboid cells of higher animals similarly unite when drawn, and this formation of *plasmodia*, as these are termed, seems to be a deep-seated property of the amœboid cell. Similarly, too, the process of rejuvenescence which occurs in many of the lowest plants and animals, such as Protococcus and Amœba, where the protoplasm passes from a resting and encysted to a naked and mobile stage, has many analogues not only among the Protista but even in the tissues of higher animals, while the phases which the lowest organisms more or less exhibit—the encysted, the ciliated, the amœboid, and the plasmodial—may be regarded as the fundamental forms of a "life-cycle," fully represented indeed only in such extremely low organisms as Protomyxa and Myxomycetes, yet nowhere completely suppressed. The very highest plants and animals may thus be considered as aggregates of more or less differentiated and variously arranged encysted, amœboid, and ciliated cells, while their development and subsequent changes, their variations normal and pathological, in reality exhibit phases more or less distinct of the ancestral life-cycle.

The examination of the precise modes of cell-division, particularly in the hands of botanists (see BIOLOGY, and summary in Sachs's *Vorlesungen über Pflanzen Physiologie*, 1883), are also constantly throwing the most interesting light upon the structure of the adult organism. Thus then, in our own day as in those of Bichat or Schwann, the labours of the histologist, when inspired by higher aims than that of the mere multiplication of descriptive detail, are of supreme morphological importance, and result in the demonstration of a unity of organic structure deeper even than any which we owe to Linnæus or Cuvier, Goethe or Geoffroy.

§ 4. *Individuality.*—Probably no subject in the whole range of biology has been more extensively discussed than that of the nature of organic individuality. The history of the controversy is of interest, since besides leading up to solid results it serves, perhaps better than any other case, to illustrate the slow emergence of the natural sciences from the influence of scholastic thought. Starting from the obvious unity and indivisibleness of Man and other higher animals, and adopting some definition such as that of Mirbel (exceptionally unmetaphysical, however), "Tout être organisé, complet dans ses parties, distinct et séparé des autres êtres, est un individu," it was attempted times without number to discover the same conception elsewhere in nature, or rather to impose it upon all other beings, plants and animals alike. The results of different inquirers were of course utterly discrepant. It seemed easy and natural to identify a tree or herb corresponding to the individual animal, yet difficulties at once arose. Many apparently distinct plants may arise from a common root, or a single plant may be decomposed into branches, twigs, shoots, buds, or even leaves, all often capable of separate existence. These, again, are decomposable into tissues and cells, the cells into nucleus, &c., and ultimately into protoplasmic molecules, these finally into atoms,—the inquiry thus passing outside organic nature altogether and meeting the old dispute as to the ultimate divisibility of matter. In short, as Haeckel remarks, scarcely any part of the plant can be named which has not been taken by some one for the individual. It is necessary, therefore, briefly to notice some of the principal works on the subject, and these may conveniently be taken in descending order.

While Cassini practically agreed with Mirbel in attempting to regard separate plants as individuals, the widest interpretation of the individual is that of Gallesio (1816), who proposed to regard as an individual the entire product of a single seed, alike whether this developed into a uni-axial plant extended continuously like a Banyan, or multiplied asexually by natural or artificial means like the Weeping-willow or the Canadian Pondweed, of each of which, on this view, there is only a single individual in Britain, happily discontinuous.

At once the oldest and most frequently maintained view is that which regards the bud or shoot consisting of a single axis with appendages as the plant-individual, of which the tree represents a colony, like a branched hydroid Polyp. This conception, often attributed to Aristotle, but apparently without foundation, appears distinctly in the writings of Hippocrates and Theophrastus,—the latter saying, "The bud grows on the tree like a plant in the ground." The aphorism of Linnæus, "Gemmæ totidem herbæ," is well known; and in this view C. F. Wolff and Humboldt concurred, while Erasmus Darwin supported it by an appeal to the facts of anatomy and development. The most influential advocate of the bud theory during the first half of the present century was, however, Du Petit-Thouars, who, although starting much as usual with a "principe unique d'existence," supported his theory on extensive though largely incorrect observations on stem structure and growth. For him the tree is a colony of *phytons*, each being a bud with its axillant leaf and fraction of the stem and root. Passing over numerous minor authors, we come to the central work of Alex. Braun (1853), in which, as Sachs has clearly pointed out, the illegitimate combination of Naturphilosophie with inductive morphology reaches its extreme. He reviews, however, all preceding theories, admits the difficulty of fixing upon any as final, since the plant, physiologically considered, is rather a *dividuum* than an *individuum*, and proposes as a compromise, or indeed as a partial cutting of the knot, the adoption of the shoot as the morphological individual, comparable to an animal, especially because, unlike the cell, leaf, &c., it includes all the representative characters of the species. Darwin and Spencer on the whole also accept the bud or shoot as at any rate the most definite individual.

The theory of metamorphosis naturally led Goethe, Oken, and others to regard the leaf as the individual, while Johannes Muller, Steenstrup, and others adopted the same view on various physiological grounds. Gaudichaud elaborated a theory intermediate between this view and that of Du Petit-Thouars, according to which the plant was built up of individuals, each consisting of a leaf with its subjacent internode of stem, which was regarded as the leaf-base, and this was supported by Edward Forbes and others, while the nominally converse view—that of the leaf as a mere outward expansion of the stem-segment—was proposed by Hochstetter.

Though sundry attempts at identifying various tissues, such as the fibro-vascular bundles, as the constituent individuals may be passed over, those associated with the cell theory are of great importance. Schwann decided in favour of the cell and regarded the plant as a cell-community, in which the separate elements were like the bees of a swarm,—a view virtually concurred in in all essential respects by Schleiden, Virchow, and other founders of the cell theory. Yet, although the structure and functions of the plant are ultimately and exclusively cellular, it is impossible to ignore the fact that, save in the very lowest organisms, these are subordinated and differentiated into larger aggregates, and form virtually but the bricks of a building, and hence the later theories outlined above. Of attempts to find the individual in the nucleus or the protoplasm granules it is of course unnecessary to speak further.

So far the theories of absolute individuality. The conception of relative individuality is well traced by Fisch upwards from the more or less vague suggestions in the writings of Goethe, Roeper, and the elder De Candolle to its clear expression in Alphonse de Candolle and Schleiden, both of whom take the cell, the shoot, and the multi-axial plant as forming three successive and subordinated categories. Nägeli too recognized not only the necessity of establishing such a series (cell, organ, bud, leafy axis, multi-axial plant) but the distinction between morphological and physiological individualities afterwards enunciated by Haeckel.

Passing over the difficulties which arise even among the Protozoa (see FORAMINIFERA), we find that a similar controversy (fully chronicled in Haeckel's *Kalkschwämme*) has raged over the individuality of Sponges. While the older observers were content to regard each sponge-mass as an individual, a view in which Lieberkühn

plants, as well as of at least the higher animals, have been studied with much and ever-increasing accuracy of detail. (See ANATOMY, HISTOLOGY, EMBRYOLOGY.) Both vegetable and animal tissues have been simply classified both according to their adult forms and according to the embryonic layers from which they respectively arise. This scrutiny of plant and animal structure over and above the special generalizations of the botanist and the zoologist has afforded much result to general histology. The improvement of technical methods has of late years largely aided the progress of discovery. A return from the study of the cell-aggregate to that of the cell has commenced, and the question of cell-structure may be said to be again paramount in histology. The process of transverse division has of late been much elucidated, and, although its complex details cannot here be entered upon, the result has been to establish a minute and thorough correspondence in cases so widely dissimilar as pollen-grains from a flower-bud, the epidermis of a tadpole, or the cells of a tumour—a result which obviously enhances the morphological completeness of the cell theory. Minor modes of cell-multiplication also are not without their morphological interest. Gemmation, familiar in the yeast plant, occurs in other low and simple organisms, and may probably be identified with the formation of polar vesicles in ova as a modification of transverse division. Schleiden had supposed all new cells to originate within pre-existing cells, and this process, known as free-cell-formation, may really be observed in various plant and animal tissues. The protoplasm groups itself round new nuclei, the new cells being in fact formed much as Schwann had in his turn supposed; but these nuclei have repeatedly been shown to arise from segmentation of the original nucleus, and thus this process too seems a mere modification of the general one of transverse division. Conjugation, too—that coalescence of two similar cells which may be observed in many Algæ, Fungi, and Protozoa—is to be considered as the undifferentiated form of that fertilization which occurs in higher animals and plants, the two apparently similar masses having become respectively differentiated into ovum and spermatozoon, or into egg-cell and antherozoid. An indefinite number of amœboid cells sometimes flow together into a single mass,—a phenomenon regarded by some as multiple-conjugation, or perhaps more probably as an almost mechanical coalescence of exhausted cells, from which conjugation proper and finally fertilization may indeed have originated. The amœboid cells of higher animals similarly unite when drawn, and this formation of *plasmodia*, as these are termed, seems to be a deep-seated property of the amœboid cell. Similarly, too, the process of rejuvenescence which occurs in many of the lowest plants and animals, such as Protococcus and Amœba, where the protoplasm passes from a resting and encysted to a naked and mobile stage, has many analogues not only among the Protista but even in the tissues of higher animals, while the phases which the lowest organisms more or less exhibit—the encysted, the ciliated, the amœboid, and the plasmodial—may be regarded as the fundamental forms of a "life-cycle," fully represented indeed only in such extremely low organisms as Protomyxa and Myxomycetes, yet nowhere completely suppressed. The very highest plants and animals may thus be considered as aggregates of more or less differentiated and variously arranged encysted, amœboid, and ciliated cells, while their development and subsequent changes, their variations normal and pathological, in reality exhibit phases more or less distinct of the ancestral life-cycle.

The examination of the precise modes of cell-division, particularly in the hands of botanists (see BIOLOGY, and summary in Sachs's *Vorlesungen über Pflanzen Physiologie*, 1883), are also constantly throwing the most interesting light upon the structure of the adult organism. Thus then, in our own day as in those of Bichat or Schwann, the labours of the histologist, when inspired by higher aims than that of the mere multiplication of descriptive detail, are of supreme morphological importance, and result in the demonstration of a unity of organic structure deeper even than any which we owe to Linnæus or Cuvier, Goethe or Geoffroy.

§ 4. *Individuality.*—Probably no subject in the whole range of biology has been more extensively discussed than that of the nature of organic individuality. The history of the controversy is of interest, since besides leading up to solid results it serves, perhaps better than any other case, to illustrate the slow emergence of the natural sciences from the influence of scholastic thought. Starting from the obvious unity and indivisibleness of Man and other higher animals, and adopting some definition such as that of Mirbel (exceptionally unmetaphysical, however), "Tout être organisé, complet dans ses parties, distinct et séparé des autres êtres, est un individu," it was attempted times without number to discover the same conception elsewhere in nature, or rather to impose it upon all other beings, plants and animals alike. The results of different inquirers were of course utterly discrepant. It seemed easy and natural to identify a tree or herb corresponding to the individual animal, yet difficulties at once arose. Many apparently distinct plants may arise from a common root, or a single plant may be decomposed into branches, twigs, shoots, buds, or even leaves, all often capable of separate existence. These, again, are decomposable into tissues and cells, the cells into nucleus, &c., and ultimately into protoplasmic molecules, these finally into atoms,—the inquiry thus passing outside organic nature altogether and meeting the old dispute as to the ultimate divisibility of matter. In short, as Haeckel remarks, scarcely any part of the plant can be named which has not been taken by some one for the individual. It is necessary, therefore, briefly to notice some of the principal works on the subject, and these may conveniently be taken in descending order.

While Cassini practically agreed with Mirbel in attempting to regard separate plants as individuals, the widest interpretation of the individual is that of Gallesio (1816), who proposed to regard as an individual the entire product of a single seed, alike whether this developed into a uni-axial plant extended continuously like a Banyan, or multiplied asexually by natural or artificial means like the Weeping-willow or the Canadian Pondweed, of each of which, on this view, there is only a single individual in Britain, happily discontinuous.

At once the oldest and most frequently maintained view is that which regards the bud or shoot consisting of a single axis with appendages as the plant-individual, of which the tree represents a colony, like a branched hydroid Polyp. This conception, often attributed to Aristotle, but apparently without foundation, appears distinctly in the writings of Hippocrates and Theophrastus,—the latter saying, "The bud grows on the tree like a plant in the ground." The aphorism of Linnæus, "Gemmæ totidem herbæ," is well known; and in this view C. F. Wolff and Humboldt concurred, while Erasmus Darwin supported it by an appeal to the facts of anatomy and development. The most influential advocate of the bud theory during the first half of the present century was, however, Du Petit-Thouars, who, although starting much as usual with a "principe unique d'existence," supported his theory on extensive though largely incorrect observations on stem structure and growth. For him the tree is a colony of *phytons*, each being a bud with its axillant leaf and fraction of the stem and root. Passing over numerous minor authors, we come to the central work of Alex. Braun (1853), in which, as Sachs has clearly pointed out, the illegitimate combination of Naturphilosophie with inductive morphology reaches its extreme. He reviews, however, all preceding theories, admits the difficulty of fixing upon any as final, since the plant, physiologically considered, is rather a *dividuum* than an *individuum*, and proposes as a compromise, or indeed as a partial cutting of the knot, the adoption of the shoot as the morphological individual, comparable to an animal, especially because, unlike the cell, leaf, &c., it includes all the representative characters of the species. Darwin and Spencer on the whole also accept the bud or shoot as at any rate the most definite individual.

The theory of metamorphosis naturally led Goethe, Oken, and others to regard the leaf as the individual, while Johannes Muller, Steenstrup, and others adopted the same view on various physiological grounds. Gaudichaud elaborated a theory intermediate between this view and that of Du Petit-Thouars, according to which the plant was built up of individuals, each consisting of a leaf with its subjacent internode of stem, which was regarded as the leaf-base, and this was supported by Edward Forbes and others, while the nominally converse view—that of the leaf as a mere outward expansion of the stem-segment—was proposed by Hochstetter.

Though sundry attempts at identifying various tissues, such as the fibro-vascular bundles, as the constituent individuals may be passed over, those associated with the cell theory are of great importance. Schwann decided in favour of the cell and regarded the plant as a cell-community, in which the separate elements were like the bees of a swarm,—a view virtually concurred in in all essential respects by Schleiden, Virchow, and other founders of the cell theory. Yet, although the structure and functions of the plant are ultimately and exclusively cellular, it is impossible to ignore the fact that, save in the very lowest organisms, these are subordinated and differentiated into larger aggregates, and form virtually but the bricks of a building, and hence the later theories outlined above. Of attempts to find the individual in the nucleus or the protoplasm granules it is of course unnecessary to speak further.

So far the theories of absolute individuality. The conception of relative individuality is well traced by Fisch upwards from the more or less vague suggestions in the writings of Goethe, Roeper, and the elder De Candolle to its clear expression in Alphonse de Candolle and Schleiden, both of whom take the cell, the shoot, and the multi-axial plant as forming three successive and subordinated categories. Nägeli too recognized not only the necessity of establishing such a series (cell, organ, bud, leafy axis, multi-axial plant) but the distinction between morphological and physiological individualities afterwards enunciated by Haeckel.

Passing over the difficulties which arise even among the Protozoa (see FORAMINIFERA), we find that a similar controversy (fully chronicled in Haeckel's *Kalkschwämme*) has raged over the individuality of Sponges. While the older observers were content to regard each sponge-mass as an individual, a view in which Lieberkühn

form higher aggregates which he terms *zoïdes*. Such zoïdes may be irregular, radiate, or linear aggregates, of which the two former classes especially are termed *dèmes*. The organ—Haeckel's idorgan—is excluded, since tissues and organs result from division of labour in the anatomical elements of the mérides, and so have only a secondary individuality, "carefully to be distinguished from the individuality of those parts whose direct grouping has formed the organism, and which live still, or have lived, isolated from one another." Perrier further points out that undifferentiated colonies are sessile, as Sponges and Corals, while a free state of existence is associated with the concentration and integration of the colony into an individual of a higher order.

So far the various theories of the subject; detailed criticism is impossible, but some synthesis and reconciliation must be attempted. Starting from the cell as the morphological unit, we find these forming homogeneous aggregates in some Protozoa and in the early development of the ovum. But integration into a whole, not merely aggregation into a mass, is essential to the idea of individuality; the earliest secondary unit, therefore, is the gastrula or méride. This stage is permanently represented by an unbranched Hydra or Sponge or by a Planarian. These secondary units may, however, form aggregates either irregular as in most Sponges, indefinitely branched as in the Hydroids and Actinozoa, or linear as in such Planarians as Catenula. Such aggregations, colonies, or demes, not being aggregated, do not fully reach individuality of the third order. This is attained, however, for the branched series by such forms as Siphonophores among Hydrozoa, or Renilla or Pennatula among Actinozoa; for linear aggregates again by the higher Worms, and still more fully by Arthropods and Vertebrates. Aggregates of a yet higher order may occur, though rarely. A longitudinally dividing Nais or laterally branched Syllis are obviously aggregates of these tertiary units, which, on Haeckel's view, become integrated in the Echinoderm, which would thus reach a complete individuality of the fourth order. A chain of Salpæ or a colony of Pyrosoma exhibits an approximation to the same rank, which is more nearly obtained by a radiate group of Botryllus around their central cloaca, while the entire colony of such an Ascidian would represent the individual of the fifth order in its incipient and unintegrated state,—these and the preceding intermediate forms being, of course, readily intelligible, and indeed, as Spencer has shown, inevitable on the theory of evolution.

The exclusion of tissues and organs from rank in this series is thus seen to necessarily follow. Ectoderm and endoderm cannot exist alone; they and the organs into which they differentiate arise merely, as Jäger expresses it, from that concentric lamination, or, with Perrier, from that polymorphism of the members of the colony, which is associated with organic and social existence. The idea of the antimere is omitted, as being essentially a promorphological conception (for a Medusoid or a Star-fish, though of widely distinct order of individuality, are equally so divisible); that of the metamere is convenient to denote the secondary units of a linear tertiary individual; the term persona, however, seems unlikely to survive, not only on account of its inseparable psychological connotations, but because it has been somewhat vaguely applied alike to aggregates of the second and third order; and the term colony, corm, or deme may indifferently be applied to those aggregates of primary, secondary, tertiary, or quaternary order which are not, however, integrated into a whole, and do not reach the full individuality of the next higher order. The term zooid is also objectionable as involving the idea of individualized organs, a view natural while the medusoid gonophores of a Hydrozoon were looked at as evolved of its homologue in Hydra, whereas the latter is really a degenerate form of the former. Passing to the vegetable world, here as before the cell is the unit of the first order, while aggregates representing almost every stage in the insensible evolution of a secondary unit are far more abundant than among animals. Complete unity of the second order can hardly be allowed to the thallus, which Spencer proposes to compound and integrate into tertiary aggregates—the higher plants; as in animals the embryological method is preferable, both as avoiding gratuitous hypothesis and as leading to direct results. Such a unit is clearly presented by the embryo of higher plants in which the cell-aggregate is at once differentiated into parts and integrated into a whole. Such an embryo possesses axis and appendages as when fully developed (fig. 2). The latter, however, being as organs mere lateral expansions of the concentric layers into which the plant embryo, like the animal, is differentiated, and so neither stages of evolution nor capable of separate existence, are not entitled to individual rank. The embryo, the bud, shoot, or uni-axial plant, all thus belong to the second order of individuality, like the Hydroid they resemble. Like the lower Cœlenterates, too, aggregates of such axes are formed by branching out from their low degree of integration. Such colonies can hardly be termed individuals of the third, much less of higher order, at least without somewhat abandoning that unity of treatment of plants and animals without which philosophical biology disappears. Individuality of the second order is most fully reached by the flower,—the most highly differentiated and integrated form of axes and appendages. Such a simple inflorescence as a raceme or umbel approximates to unity of the third order, to which a composite flower-head must be admitted to have attained, while a compound inflorescence is on the way to a yet higher stage.

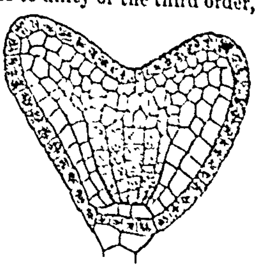

Fig. 2.—Embryo of Dicotyledon (after Sachs), showing incipient axis and appendages, as also the three concentric embryonic layers.

If, as seems probable, a nomenclature be indispensable for clear expression, it may be simply arranged in conformity with this view. Starting from the unit of the first order, the plastid or *monad*, and terming any undifferentiated aggregate a *deme*, we have a *monad-deme* integrating into a secondary unit or *dyad*, this rising through *dyad-demes* into a *triad*, this forming *triad-demes*, and these when differentiated becoming *tetrads*, the Botryllus-colony with which the evolution of compound individuality terminates being a *tetrad-deme*. The separate living form, whether monad, dyad, triad, or tetrad, requires also some distinguishing name, for which *persona* will probably ultimately be found most appropriate, since such usage is most in harmony with its inevitable physiological and psychological connotations, while the genealogical individual of Gallesio and Huxley, common also to all the categories, may be designated with Haeckel the *ovum-product* or *ovum-cycle*, the complete series of forms needed to represent the species being the *species-cycle* (though this coincides with the former save in cases where the sexes are separate, or polymorphism occurs). For such a peculiar case as *Diplozoon paradoxum*, where two separate forms of the same species coalesce, and still more for such heterogeneous individuality as that of a Lichen, where a composite unit arises from the union of two altogether distinct forms—Fungus and Alga,—yet additional categories and terms are required.[1]

§ 5. *Promorphology.*—Just as the physiologist constantly seeks to interpret the phenomena of function in terms of mechanical, physical, and chemical laws, so the morphologist is tempted to inquire whether organic as well as mineral forms are not alike reducible to simple mathematical law. And just as the crystallographer constructs an ideally perfect mathematical form from an imperfect or fragmentary crystal, so the morphologist has frequently attempted to reduce the complex-curved surfaces of organic beings to definite mathematical expression.[2] Canon Moseley (*Phil. Trans.*, 1838) succeeded in showing, by a combination of measurement and mathematical analysis, that the curved surface of any turbinated or discoid shell might be considered as generated by the revolution, about the axis of the shell, of a curve, which continually varied its dimensions according to the law of the logarithmic spiral. For Goodsir this logarithmic spiral, now carved on his tomb, seemed a fundamental expression of organic curvature and the dawn of a new epoch in natural science—that of the mathematical investigation of organic form—and his own elaborate measurements of the body, its organs, and even its component cells seemed to yield, now the triangle, and again the tetrahedron, as the fundamental form. But such supposed results, savouring more of the Naturphilosophie than of sober mathematics, could only serve to discourage further inquiry and interest in that direction. Thus we find that even the best treatises on botany and zoology abandon the subject, satisfied with merely contrasting the simple geometrical ground-forms of crystals with the highly curved and hopelessly complicated lines and surfaces of the organism.

But there are other considerations which lead up to a mathematical conception of organic form, those namely of symmetry and regularity. These, however, are usually but little developed, botanists since Schleiden contenting themselves with throwing organisms into three groups—first, absolute or regular; second, regular and radiate; third, symmetrical bilaterally or zygomorphic—the last being capable of division into two halves only in a single plane, the second in two or more planes, the first in none at all. Burmeister, and more fully Bronn, introduced the fundamental improvement of defining the mathematical forms they sought not by the surfaces but by axes and their poles; and Haeckel has developed the subject with an elaborateness of detail and nomenclature which seems unfortunately to have impeded its study and acceptance, but of which the main results may, with slight variations chiefly due to Jäger (*Lehrb. d. Zool.*, i. 283), be briefly outlined.

A. *ANAXONIA*—forms destitute of axes, and consequently wholly irregular in form, *e.g.*, Amœbæ and many Sponges.

B. *AXONIA*—forms with definite axes.

[1] See Haeckel, *Gen. Morph.* i., *Kalkschwämme* i., and *Jena. Zeitschr.* x.; also Fisch, *Aufzählung u. Kritik, &c.*, Rostock, 18[illegible]; Sachs, *Geschichte d. Bot.*; Perrier, *Les Colonies Animales*, 1882, as from these all other references can be obtained.

[2] The sciences of organic and mineral form would thus (as Haeckel points out) become thoroughly analogous, for, as promorphology develops the crystallography of organic form, so mineralogy, in the study of such phenomena as those of pseudomorphism or of mineral development, becomes parallel to morphology.

form higher aggregates which he terms *zoïdes*. Such zoides may be irregular, radiate, or linear aggregates, of which the two former classes especially are termed *dèmes*. The organ—Haeckel's idorgan—is excluded, since tissues and organs result from division of labour in the anatomical elements of the mérides, and so have only a secondary individuality, "carefully to be distinguished from the individuality of those parts whose direct grouping has formed the organism, and which live still, or have lived, isolated from one another." Perrier further points out that undifferentiated colonies are sessile, as Sponges and Corals, while a free state of existence is associated with the concentration and integration of the colony into an individual of a higher order.

So far the various theories of the subject; detailed criticism is impossible, but some synthesis and reconciliation must be attempted. Starting from the cell as the morphological unit, we find these forming homogeneous aggregates in some Protozoa and in the early development of the ovum. But integration into a whole, not merely aggregation into a mass, is essential to the idea of individuality; the earliest secondary unit, therefore, is the gastrula or méride. This stage is permanently represented by an unbranched Hydra or Sponge or by a Planarian. These secondary units may, however, form aggregates either irregular as in most Sponges, indefinitely branched as in the Hydroids and Actinozoa, or linear as in such Planarians as Catenula. Such aggregations, colonies, or demes, not being aggregated, do not fully reach individuality of the third order. This is attained, however, for the branched series by such forms as Siphonophores among Hydrozoa, or Renilla or Pennatula among Actinozoa; for linear aggregates again by the higher Worms, and still more fully by Arthropods and Vertebrates. Aggregates of a yet higher order may occur, though rarely. A longitudinally dividing Nais or laterally branched Syllis are obviously aggregates of these tertiary units, which, on Haeckel's view, become integrated in the Echinoderm, which would thus reach a complete individuality of the fourth order. A chain of Salpæ or a colony of Pyrosoma exhibits an approximation to the same rank, which is more nearly obtained by a radiate group of Botryllus around their central cloaca, while the entire colony of such an Ascidian would represent the individual of the fifth order in its incipient and unintegrated state,—these and the preceding intermediate forms being, of course, readily intelligible, and indeed, as Spencer has shown, inevitable on the theory of evolution.

The exclusion of tissues and organs from rank in this series is thus seen to necessarily follow. Ectoderm and endoderm cannot exist alone; they and the organs into which they differentiate arise merely, as Jäger expresses it, from that concentric lamination, or, with Perrier, from that polymorphism of the members of the colony, which is associated with organic and social existence. The idea of the antimere is omitted, as being essentially a promorphological conception (for a Medusoid or a Star-fish, though of widely distinct order of individuality, are equally so divisible); that of the metamere is convenient to denote the secondary units of a linear tertiary individual; the term persona, however, seems unlikely to survive, not only on account of its inseparable psychological connotations, but because it has been somewhat vaguely applied alike to aggregates of the second and third order; and the term colony, corm, or deme may indifferently be applied to those aggregates of primary, secondary, tertiary, or quaternary order which are not, however, integrated into a whole, and do not reach the full individuality of the next higher order. The term zooid is also objectionable as involving the idea of individualized organs, a view natural while the medusoid gonophores of a Hydrozoon were looked at as evolved of its homologue in Hydra, whereas the latter is really a degenerate form of the former. Passing to the vegetable world, here as before the cell is the unit of the first order, while aggregates representing almost every stage in the insensible evolution of a secondary unit are far more abundant than among animals. Complete unity of the second order can hardly be allowed to the thallus, which Spencer proposes to compound and integrate into tertiary aggregates—the higher plants; as in animals the embryological method is preferable, both as avoiding gratuitous hypothesis and as leading to direct results. Such a unit is clearly presented by the embryo of higher plants in which the cell-aggregate is at once differentiated into parts and integrated into a whole. Such an embryo possesses axis and appendages as when fully developed (fig. 2). The latter, however, being as organs mere lateral expansions of the concentric layers into which the plant embryo, like the animal, is differentiated, and so neither stages of evolution nor capable of separate existence, are not entitled to individual rank. The embryo, the bud, shoot, or uni-axial plant, all thus belong to the second order of individuality, like the Hydroid they resemble. Like the lower Cœlenterates, too, aggregates of such axes are formed by branching out from their low degree of integration. Such colonies can hardly be termed individuals of the third, much less of higher order, at least without somewhat abandoning that unity of treatment of plants and animals without which philosophical biology disappears. Individuality of the second order is most fully reached by the flower,—the most highly differentiated and integrated form of axes and appendages. Such a simple inflorescence as a raceme or umbel approximates to unity of the third order, to which a composite flower-head must be admitted to have attained, while a compound inflorescence is on the way to a yet higher stage.

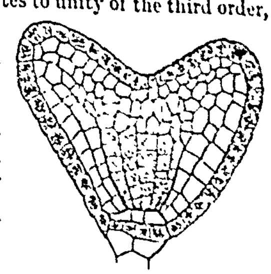

FIG. 2.—Embryo of Dicotyledon (after Sachs), showing incipient axis and appendages, as also the three concentric embryonic layers.

If, as seems probable, a nomenclature be indispensable for clear expression, it may be simply arranged in conformity with this view. Starting from the unit of the first order, the plastid or *monad*, and terming any undifferentiated aggregate a *deme*, we have a *monad-deme* integrating into a secondary unit or *dyad*, this rising through *dyad-demes* into a *triad*, this forming *triad-demes*, and these when differentiated becoming *tetrads*, the Botryllus-colony with which the evolution of compound individuality terminates being a *tetrad-deme*. The separate living form, whether monad, dyad, triad, or tetrad, requires also some distinguishing name, for which *persona* will probably ultimately be found most appropriate, since such usage is most in harmony with its inevitable physiological and psychological connotations, while the genealogical individual of Gallesio and Huxley, common also to all the categories, may be designated with Haeckel the *ovum-product* or *ovum-cycle*, the complete series of forms needed to represent the species being the *species-cycle* (though this coincides with the former save in cases where the sexes are separate, or polymorphism occurs). For such a peculiar case as *Diplozoon paradoxum*, where two separate forms of the same species coalesce, and still more for such heterogeneous individuality as that of a Lichen, where a composite unit arises from the union of two altogether distinct forms—Fungus and Alga,—yet additional categories and terms are required.[1]

§ 5. *Promorphology.*—Just as the physiologist constantly seeks to interpret the phenomena of function in terms of mechanical, physical, and chemical laws, so the morphologist is tempted to inquire whether organic as well as mineral forms are not alike reducible to simple mathematical law. And just as the crystallographer constructs an ideally perfect mathematical form from an imperfect or fragmentary crystal, so the morphologist has frequently attempted to reduce the complex-curved surfaces of organic beings to definite mathematical expression.[2] Canon Moseley (*Phil. Trans.*, 1838) succeeded in showing, by a combination of measurement and mathematical analysis, that the curved surface of any turbinated or discoid shell might be considered as generated by the revolution, about the axis of the shell, of a curve, which continually varied its dimensions according to the law of the logarithmic spiral. For Goodsir this logarithmic spiral, now carved on his tomb, seemed a fundamental expression of organic curvature and the dawn of a new epoch in natural science—that of the mathematical investigation of organic form—and his own elaborate measurements of the body, its organs, and even its component cells seemed to yield, now the triangle, and again the tetrahedron, as the fundamental form. But such supposed results, savouring more of the Naturphilosophie than of sober mathematics, could only serve to discourage further inquiry and interest in that direction. Thus we find that even the best treatises on botany and zoology abandon the subject, satisfied with merely contrasting the simple geometrical ground-forms of crystals with the highly curved and hopelessly complicated lines and surfaces of the organism.

But there are other considerations which lead up to a mathematical conception of organic form, those namely of symmetry and regularity. These, however, are usually but little developed, botanists since Schleiden contenting themselves with throwing organisms into three groups—first, absolute or regular; second, regular and radiate; third, symmetrical bilaterally or zygomorphic—the last being capable of division into two halves only in a single plane, the second in two or more planes, the first in none at all. Burmeister, and more fully Bronn, introduced the fundamental improvement of defining the mathematical forms they sought not by the surfaces but by axes and their poles; and Haeckel has developed the subject with an elaborateness of detail and nomenclature which seems unfortunately to have impeded its study and acceptance, but of which the main results may, with slight variations chiefly due to Jäger (*Lehrb. d. Zool.*, i. 283), be briefly outlined.

A. *ANAXONIA*—forms destitute of axes, and consequently wholly irregular in form, *e.g.*, Amœbæ and many Sponges.

B. *AXONIA*—forms with definite axes.

[1] See Haeckel, *Gen. Morph.* i., *Kalkschwämme* i., and *Jena. Zeitschr.* x.; also Sachs, *Geschichte d. Bot.*; Fisch, *Aufzählung u. Kritik*, &c., Rostock, 1[illegible]; Perrier, *Les Colonies Animales*, 1882, as from these all other references can be obtained.

[2] The sciences of organic and mineral form would thus (as Haeckel points out) become thoroughly analogous, for, as promorphology develops the crystallography of organic form, so mineralogy, in the study of such phenomena as those of pseudomorphism or of mineral development, becomes parallel to morphology.

as another part or organ in a different animal (*e.g.*, parachute of Draco and wings of Bird)." He further distinguishes three kinds of homology:—(1) *special*, being "that above defined, namely, the correspondence of a part or organ determined by its relative position and connexions with a part or organ in a different animal, the determination of which homology indicates that such animals are constituted on a common type," *e.g.*, basilar process of human occipital with basi-occipital of fish; (2) *general*, that "higher relation in which a part or series of parts stands to the fundamental or general type, involving a knowledge of the type on which the group in question is constituted," *e.g.*, the same human bone and centrum of the last cranial vertebra; (3) *serial* homology, "representative or repetitive relation in the segments of the same skeleton" (demonstrated when general and special homologies have been determined); thus usually the basi-occipital and basi-sphenoid are "homotypes." These terms were henceforth accepted by naturalists; but the criterion of analogy and homology became for Agassiz and other embryologists developmental as well as comparative, reference to the ideal archetype becoming less and less frequent. Passing over the discussions of Agassiz and Bronn, of which the latter is criticized and partly incorporated by Haeckel, we find the last-named (1) placing serial under general homology; (2) erecting categories of homology partially corresponding to those of individuality,—(*a*) *homotypy* (of antimeres), *hence distinct from that of Owen*, (*b*) *homodynamy* (of metameres), (*c*) *homonomy* (of parts arranged on transverse axes); (3) defining special homology in terms of identity of embryonic origin. In 1870 this latter point was more fully insisted upon by Ray Lankester, who, decomposing it into two others, proposed to supersede the term homology by *homogeny*, being the correspondence of common descent, and *homoplasy*, denoting any superinduced correspondence of position and structure in parts embryonically distinct. Thus, the fore-limb of a mammal is *homogenous* with that of a bird, but the right and left ventricles of the heart in both are only *homoplastic*, these having arisen independently since the divergence of both groups from a uni-ventriculate ancestor in relation to similarity of physiological needs. Mivart next proposed to retain homology as a generic term, with homogeny and homoplasy as two species under it, and carried the analysis into great detail, distinguishing at first twenty-five, but later fifteen, kinds of correspondence:—(1) parts similar in function only, *e.g.*, legs of Lizard and Lobster; (2) parts similar both in function and relative position, wings of Bat and Bird; (3) parts of common descent, fore-limb of Horse and Rhinoceros; (4) parts of similar embryonic origin, whatever be their racial genetic relations, *e.g.*, occipitals of Panther and Perch; (5) parts of dissimilar embryonic origin, whatever be their racial genetic relations, *e.g.*, legs of Diptera; (6, 7, 8, 9, 10) laterally, vertically, serially, antero-posteriorly, and radially homologous parts; (11) subordinate serial homologues, *e.g.*, joints of antenna; (12 and 13) secondary and tertiary subordinate serial homologues; (14 and 15) special and general homologies (in Owen's sense). In his *Kalkschwämme* Haeckel proposed to term *homophyly* the truly phylogenetic homology in opposition to *homomorphy*, to which genealogic basis is wanting; and finally Von Jhering has published a repetition of Lankester's view.

In this discussion, as in that of individuality, it is evident that we are dealing with numerous logical cross-divisions largely corresponding, no doubt, to the complex web of inter-relations presented by nature, yet remaining in need of disentanglement. Though we must set aside analogies of functional activity, the resemblances in external shape or geometric *ground-form* which correspond to these, *e.g.*, Hydrozoa and Bryozoa, Fishes and Cetaceans, mimetic organisms, are nevertheless, as our historic survey showed, the first which attract attention; and these homoplastic or homomorphic forms, as Haeckel has shown, come as fairly within the province of the promorphologist as do isomorphic crystals within that of his an-organological colleague the crystallographer. Here, too, would be considered "radial," "vertical," "lateral" homology, "homotypy of antimeres," and all questions of symmetry, for which Haeckel's nomenclature of *homaxonial, homopolic*, &c., is distinctly preferable. Entering the field of tectology or morphology in the ordinary sense, we may next consider whether two organisms compared are of the same category of individuality—are *homocategoric*; and under this serial homology, for instance, would come as a minor division, the correspondence between the units or parts of units of a linear dyad-deme or triad. From a third point of view, that of the embryologist, we trace the development of each multicellular organism (1) from the embryonic layers and systems into which the secondary unit (gastrula or plant embryo) differentiates, (2) from a unit-deme or unit of the inferior order or orders of individuality. The parts and units thus recognized by ontogenetic research, respectively or successively *homodermic, homosystemic*, and *homodemic*, may then conveniently be termed (indifferently save for considerations of priority) either "specially homologous," "homogenous," "homophylic," or "homogenetic," in the language of phylogenetic theory. These three great classes of morphological correspondence—promorphological, tectological, and embryological—may or may not coincide. But the completest homology, in which all forms of resemblance unite and from which they differentiate, is that expressed in the cell theory, or rather in that ovum theory which underlies it, and which Agassiz therefore not unjustly regarded as "the greatest discovery in the natural sciences of modern times."[1]

§ 8. *Results to Taxonomy.*—The advance and modification of classifications which follow each morphological advance have been pointed out above, and taxonomy thus never quite reaches a level with morphological knowledge. That it requires much reform at present is obvious. Although the dogma of the constancy of species is no longer maintained, its results survive, and perhaps a majority of groups have still to be remonographed in the generalizing spirit with which Haeckel has treated the calcareous Sponges, or Carpenter, Parker, and Brady the Foraminifera. The union of the Protophyta and Protozoa into the Protista (a generalization which research is constantly confirming) involves a final abandonment of the mediæval figment of three kingdoms of nature, and a revival of the Organisata of Linnæus. Physiological prejudices, too, are not completely expelled; hence, for instance, the constant attempts to separate Animalia and Vegetabilia by physiological characteristics, which would be irrelevant even if in themselves valid. A strictly morphological standard must be applied to the construction of classifications and the pruning of genealogical trees; organisms are "higher" or "lower" not according to their stage of evolution in beauty or intelligence but (as Huxley has most clearly pointed out in the essay referred to under § 6) to the degree of morphological differentiation by excess, suppression, or coalescence which they exhibit. Thus the supreme position of Man in classification must be abandoned, since the Primates are simply one of the less specialized, *i.e.*, lower orders of Mammals, and the Mammals themselves are on the whole distinctly less specialized than the Birds, or perhaps even some of the higher Reptiles. The morphological importance of the "vegetable kingdom" sinks when tested by such a standard. The Cormophytes are all nothing more than an axis with appendages, and as such may fairly be compared, not with the entire animal assemblage, but merely to that group which is homomorphic (or rather isomorphic) with them as reducible to axis and appendages too. Such a group we find in the Hydromedusæ, which we can easily model in imagination into all the specializations of the floral world, a single genus like Clava or Tubularia affording a starting-point for countless "natural orders."

§ 9. *Relation of Morphology to Physiology.*—Although the pure morphologist investigates laws of structure only, and rightly eliminates the conceptions of life, environment, and function, yet if kept permanently apart from physiological considerations his labours would be incomplete and his results inexplicable, if not indeed almost illusory. For, however deeply one penetrates through superficial and adaptive characters to an apparently permanent and fundamental morphological type, this is itself but an earlier adaptation, showing the fading traces of an earlier adaptation still. And, conversely, the most superficial of adaptive characters, if transmitted to numerous varying descendants, may attain high morphological importance. The morphological aspect of an organism is merely statical, and, like that of an eddy or a vortex-ring, becomes only truly intelligible when viewed in its dynamic aspect; and thus, though the demonstration of the structural unity of the organic world is in itself a great result, yet the desire of a deeper explanation of form as determined by function and environment is thereby rendered all the more pressing. An example may be taken from botany. Thus Airy beautifully explains the phenomena of phyllotaxis as *adaptations to bud-life*. Or again, in a common flower, say the Dead-nettle, all the details of form are indeed described by the systematist with equal minuteness (a proceeding which, except in so far as serving for specific identification, is of no further scientific value), but receive separate interpretation from the two distinct standpoints of the morphologist and physiologist. The latter, to whom form is important merely so far as explanatory of function, shows how the tough persistent calyx is protective against various dangers, how the corolla serves to lure the fertilizing bees, which find in its lip a landing stage and in each lateral process a hold-fast, while its hood at once protects the pollen against rain and determines the curvature of the stamens,—this curvature, as well as their didynamous arrangement, [illegible] position, and linearly arranged anther-lobes being all adaptati[illegible] through the medium of the bee's hairy back to meet the similarly placed stigma of another flower,—and so on. The morphologist, on the other hand, analyses the calyx into its five constituent [illegible], reduces the corolla to a regular pentamerous type, ascertains the position of the four stamens, and asserts the loss of a fifth [illegible] one, finds the ovary *to be primitively* two-celled, and thus [illegible] a schematic conception of a not archetypal but ancestral form. This ground-form itself, however, suggests a new train of considerations both morphological and physiological respecting the [illegible]

[1] For bibliography see Lankester, *Ann. Mag. Nat. Hist.*, 1870, [illegible] *Jena. Zeitschr.*, 1883.

as another part or organ in a different animal (*e.g.*, parachute of Draco and wings of Bird)." He further distinguishes three kinds of homology:—(1) *special*, being "that above defined, namely, the correspondence of a part or organ determined by its relative position and connexions with a part or organ in a different animal, the determination of which homology indicates that such animals are constituted on a common type," *e.g.*, basilar process of human occipital with basi-occipital of fish; (2) *general*, that "higher relation in which a part or series of parts stands to the fundamental or general type, involving a knowledge of the type on which the group in question is constituted," *e.g.*, the same human bone and centrum of the last cranial vertebra; (3) *serial* homology, "representative or repetitive relation in the segments of the same skeleton" (demonstrated when general and special homologies have been determined); thus usually the basi-occipital and basi-sphenoid are "homotypes." These terms were henceforth accepted by naturalists; but the criterion of analogy and homology became for Agassiz and other embryologists developmental as well as comparative, reference to the ideal archetype becoming less and less frequent. Passing over the discussions of Agassiz and Bronn, of which the latter is criticized and partly incorporated by Haeckel, we find the last-named (1) placing serial under general homology; (2) erecting categories of homology partially corresponding to those of individuality,—(*a*) *homotypy* (of antimeres), hence distinct from that of Owen, (*b*) *homodynamy* (of metameres), (*c*) *homonomy* (of parts arranged on transverse axes); (3) defining special homology in terms of identity of embryonic origin. In 1870 this latter point was more fully insisted upon by Ray Lankester, who, decomposing it into two others, proposed to supersede the term homology by *homogeny*, being the correspondence of common descent, and *homoplasy*, denoting any superinduced correspondence of position and structure in parts embryonically distinct. Thus, the fore-limb of a mammal is *homogenous* with that of a bird, but the right and left ventricles of the heart in both are only *homoplastic*, these having arisen independently since the divergence of both groups from a uni-ventriculate ancestor in relation to similarity of physiological needs. Mivart next proposed to retain homology as a generic term, with homogeny and homoplasy as two species under it, and carried the analysis into great detail, distinguishing at first twenty-five, but later fifteen, kinds of correspondence:—(1) parts similar in function only, *e.g.*, legs of Lizard and Lobster; (2) parts similar both in function and relative position, wings of Bat and Bird; (3) parts of common descent, fore-limb of Horse and Rhinoceros; (4) parts of similar embryonic origin, whatever be their racial genetic relations, *e.g.*, occipitals of Panther and Perch; (5) parts of dissimilar embryonic origin, whatever be their racial genetic relations, *e.g.*, legs of Diptera; (6, 7, 8, 9, 10) laterally, vertically, serially, antero-posteriorly, and radially homologous parts; (11) subordinate serial homologues, *e.g.*, joints of antenna; (12 and 13) secondary and tertiary subordinate serial homologues; (14 and 15) special and general homologies (in Owen's sense). In his *Kalkschwämme* Haeckel proposed to term *homophyly* the truly phylogenetic homology in opposition to *homomorphy*, to which genealogic basis is wanting; and finally Von Jhering has published a repetition of Lankester's view.

In this discussion, as in that of individuality, it is evident that we are dealing with numerous logical cross-divisions largely corresponding, no doubt, to the complex web of inter-relations presented by nature, yet remaining in need of disentanglement. Though we must set aside analogies of functional activity, the resemblances in external shape or geometric ground-form which correspond to these, *e.g.*, Hydrozoa and Bryozoa, Fishes and Cetaceans, mimetic organisms, are nevertheless, as our historic survey showed, the first which attract attention; and these homoplastic or homomorphic forms, as Haeckel has shown, come as fairly within the province of the promorphologist as do isomorphic crystals within that of his an-organological colleague the crystallographer. Here, too, would be considered "radial," "vertical," "lateral" homology, "homotypy of antimeres," and all questions of symmetry, for which Haeckel's nomenclature of *homaxonial*, *homopolic*, &c., is distinctly preferable. Entering the field of tectology or morphology in the ordinary sense, we may next consider whether two organisms compared are of the same category of individuality—are *homocategoric*; and under this serial homology, for instance, would come as a minor division, the correspondence between the units or parts of units of a linear dyad-deme or triad. From a third point of view, that of the embryologist, we trace the development of each multicellular organism (1) from the embryonic layers and systems into which the secondary unit (gastrula or plant embryo) differentiates, (2) from a unit-deme or unit of the inferior order or orders of individuality. The parts and units thus recognized by ontogenetic research, respectively or successively *homodermic*, *homosystemic*, and *homodemic*, may then conveniently be termed (indifferently save for considerations of priority) either "specially homologous," "homogenous," "homophylic," or "homogenetic," in the language of phylogenetic theory. These three great classes of morphological correspondence—promorphological, tectological, and embryological—may or may not coincide. But the completest homology, in which all forms of resemblance unite and from which they differentiate, is that expressed in the cell theory, or rather in that ovum theory which underlies it, and which Agassiz therefore not unjustly regarded as "the greatest discovery in the natural sciences of modern times."[1]

§ 8. *Results to Taxonomy.*—The advance and modification of classifications which follow each morphological advance have been pointed out above, and taxonomy thus never quite reaches a level with morphological knowledge. That it requires much reform at present is obvious. Although the dogma of the constancy of species is no longer maintained, its results survive, and perhaps a majority of groups have still to be remonographed in the generalizing spirit with which Haeckel has treated the calcareous Sponges, or Carpenter, Parker, and Brady the Foraminifera. The union of the Protophyta and Protozoa into the Protista (a generalization which research is constantly confirming) involves a final abandonment of the mediæval figment of three kingdoms of nature, and a revival of the Organisata of Linnæus. Physiological prejudices, too, are not completely expelled; hence, for instance, the constant attempts to separate Animalia and Vegetabilia by physiological characteristics, which would be irrelevant even if in themselves valid. A strictly morphological standard must be applied to the construction of classifications and the pruning of genealogical trees; organisms are "higher" or "lower" not according to their stage of evolution in beauty or intelligence but (as Huxley has most clearly pointed out in the essay referred to under § 6) to the degree of morphological differentiation by excess, suppression, or coalescence which they exhibit. Thus the supreme position of Man in classification must be abandoned, since the Primates are simply one of the less specialized, *i.e.*, lower orders of Mammals, and the Mammals themselves are on the whole distinctly less specialized than the Birds, or perhaps even some of the higher Reptiles. The morphological importance of the "vegetable kingdom" sinks when tested by such a standard. The Cormophytes are all nothing more than an axis with appendages, and as such may fairly be compared, not with the entire animal assemblage, but merely to that group which is homomorphic (or rather isomorphic) with them as reducible to axis and appendages too. Such a group we find in the Hydromedusæ, which we can easily model in imagination into all the specializations of the floral world, a single genus like Clava or Tubularia affording a starting-point for countless "natural orders."

§ 9. *Relation of Morphology to Physiology.*—Although the pure morphologist investigates laws of structure only, and rightly eliminates the conceptions of life, environment, and function, yet if kept permanently apart from physiological considerations his labours would be incomplete and his results inexplicable, if not indeed almost illusory. For, however deeply one penetrates through superficial and adaptive characters to an apparently permanent and fundamental morphological type, this is itself but an earlier adaptation, showing the fading traces of an earlier adaptation still. And, conversely, the most superficial of adaptive characters, if transmitted to numerous varying descendants, may attain high morphological importance. The morphological aspect of an organism is merely statical, and, like that of an eddy or a vortex-ring, becomes only truly intelligible when viewed in its dynamic aspect; and thus, though the demonstration of the structural unity of the organic world is in itself a great result, yet the desire of a deeper explanation of form as determined by function and environment is thereby rendered all the more pressing. An example may be taken from botany. Thus Airy beautifully explains the phenomena of phyllotaxis as adaptations to bud-life. Or again, in a common flower, say the Dead-nettle, all the details of form are indeed described by the systematist with equal minuteness (a proceeding which, except in so far as serving for specific identification, is of no further scientific value), but receive separate interpretation from the two distinct standpoints of the morphologist and physiologist. The latter, to whom form is important merely so far as explanatory of function, shows how the tough persistent calyx is protective against various dangers, how the corolla serves to lure the fertilizing bees, which find in its lip a landing stage and in each lateral process a hold-fast, while its hood at once protects the pollen against rain and determines the curvature of the stamens,—this curvature, as well as their didynamous arrangement, position, and linearly arranged anther-lobes being all adaptations through the medium of the bee's hairy back to meet the similarly placed stigma of another flower,—and so on. The morphologist, on the other hand, analyses the calyx into its five constituent sepals, reduces the corolla to a regular pentamerous type, ascertains the position of the four stamens, and asserts the loss of a fifth posterior one, finds the ovary to be primitively two-celled, and thus reaches a schematic conception of a not archetypal but ancestral form. This ground-form itself, however, suggests a new train of considerations both morphological and physiological respecting the origin of

[1] For bibliography see Lankester, *Ann. Mag. Nat. Hist.*, [illegible] *Jena. Zeitschr.*, 1883.

there in 1808, and, in addition to his official duties connected with this post, laboured with intense application at a *Chinese Grammar* and a translation of the New Testament, both of which were published in 1814. In 1817 he published *A View of China for Philological Purposes*, and his translation of the entire Bible was completed in the following year. His next enterprise was the establishment of an Anglo-Chinese college at Malacca for "the reciprocal cultivation of Chinese and European literature," which was opened in 1820. In 1821 his *Chinese Dictionary* was published by the East India Company at an expense of £15,000. Leaving China at the close of 1823 he spent two years in England, where he advocated Chinese missions before large and enthusiastic audiences, and was elected a Fellow of the Royal Society. Returning to China in 1826 he set himself to promote education and to prepare a Chinese commentary on the Bible and other Christian literature. He died at Canton on 1st August 1834. His *Memoirs*, compiled by his widow, were published in 1839 (2 vols. 8vo, London).

MORRISTOWN, a city of the United States, county seat of Morris county, New Jersey, lies on the Whippany river, 31 miles from New York by the Morris and Essex division of the Delaware, Lackawanna, and Western Railroad. It was twice the headquarters of the American army during the War of Independence, and Washington's residence, owned by the Washington Association, assisted by the State, is a half-mile to the east. On Whatnong mountain, 3 miles distant, stands the State insane asylum, usually called Morristown Asylum, a vast granite building 1243 feet long, erected in 1874-1875, and capable of accommodating 1000 patients. The population in 1880 was 5418.

MORSE, Samuel Finley Breese (1791-1872), artist and inventor, was born at the foot of Breed's Hill, Charlestown, Massachusetts, on 27th April 1791. His father was the Rev. Jedediah Morse, D.D., the author of Morse's *Geography*. At the age of fourteen Samuel Morse entered Yale College; under the instruction of Professors Day and Silliman he received the first impulse towards those electrical studies with which his name is mainly identified. In 1811 Morse, whose tastes during his early years led him more strongly towards art than towards science, became the pupil of Washington Allston, then the greatest of American artists, and accompanied his master to England, where he remained four years. His success at this period was considerable; but on his return to America in 1815 he failed to obtain commissions for historical paintings, and after working on portraits for two years at Charleston, S.C., he removed first to Washington and afterwards to Albany, finally settling in New York. In 1825 he laid the foundations of the National Academy of Design, and was elected its first president, an office which he filled until 1845. The year 1827 marks the revival of Morse's interest in electricity. It was at that time that he learned from Professor J. F. Dana of Columbia College the elementary facts of electromagnetism. As yet, however, he was devoted to his art, and in 1829 he again went to Europe to study the old masters.

The year of his return, 1832, may be said to close the period of his artistic, and to open that of his scientific life. On board the packet-ship "Sully," which sailed from Havre 1st October 1832, while discussing one day with his fellow-passengers the properties of the electromagnet, he was led to remark: "If the presence of electricity can be made visible in any part of the circuit, I see no reason why intelligence may not be transmitted by electricity." It was not a novel proposition, but the process of formulating it started in his mind a train of new and momentous ideas. The current of electricity, he knew, would pass instantaneously any distance along a wire; and if it were interrupted a spark would appear. It now occurred to him that the spark might represent a part of speech, either a letter or a number; the absence of the spark, another part; and the duration of its absence, or of the spark itself, a third, so that an alphabet might be easily formed, and words indicated. In a few days he had completed rough drafts of the necessary apparatus, which he displayed to his fellow-passengers.[1] During the twelve years that followed Morse was engaged in a painful struggle to perfect his invention and secure for it a proper presentation to the public. The refusal of the Government to commission him to paint one of the great historical pictures in the rotunda of the Capitol seemed to destroy all his old artistic ambition. In poverty he pursued his new enterprise, making his own models, moulds, and castings, denying himself the common necessaries of life and encountering embarrassments and delays of the most disheartening kind. It was not until 1836 that he completed any apparatus that would work, his original idea having been supplemented by his discovery in 1835 of the "relay," by means of which the electric current might be reinforced or renewed where it became weak through distance from its source. Finally, on 2d September 1837, the instrument was exhibited to a few friends at his room in the university building, New York, where a circuit of 1700 feet of copper wire had been set up, with such satisfactory results as to awaken the practical interest of the Messrs Vail, iron and brass workers in New Jersey, who thenceforth became associated with Morse in his undertaking. Morse's petition for a patent was dated 28th September 1837, and was soon followed by a petition to Congress for an appropriation to defray the expense of subjecting the telegraph to actual experiment over a length sufficient to establish its feasibility and demonstrate its value. The committee on commerce, to whom the petition was referred, reported favourably. Congress, however, adjourned without making the appropriation, and meanwhile Morse sailed for Europe to take out patents there. The trip was not a success. In England his application was refused, on the alleged ground that his invention had been already published; and, while he obtained a patent in France, it was subsequently appropriated by the French Government without compensation to himself. His negotiations also with Russia proved futile, and after a year's absence he returned to New York. On 23d February 1843 Congress passed the long-delayed appropriation, steps were at once taken to construct a telegraph from Baltimore to Washington, and on the 24th of May 1844 it was used for the first time. Morse's patents were already secured to him and his associates, and companies were soon formed for the erection of telegraph lines all over the United States. In the year 1847 Morse was compelled to defend his invention in the courts, and successfully vindicated his claim to be called the original inventor of the electromagnetic recording telegraph. Thenceforward Morse's life was spent in witnessing the growth of his enterprise and in gathering the honours which an appreciative public bestowed upon him. As years went by he received from the various foreign Governments their highest distinctions, while in 1858 the representatives of Austria, Belgium, France, the Netherlands, Piedmont, Russia, the Holy See, Sweden, Tuscany, and Turkey appropriated the sum of 400,000 francs in recognition of the use of his instruments in those countries. In the preparations for laying the first Atlantic cable he took an active part, though the attempt of 1857, in which he personally engaged, was not successful. He died 2d April

their rights. But if the third mortgagee gets an assignment of the first mortgage, he can *tack* his third mortgage to the first, and so postpone the second mortgagee. And if the first mortgagee himself makes an additional advance after the date of the second mortgage, but without notice of it, his whole debt will take precedence of the second mortgagee. A similar result of equitable rules is seen in the consolidation of securities. Two separate estates, mortgaged at different times and for different sums of money by the same mortgager to the same mortgagee, are regarded as consolidated, so that the whole of the land becomes security for the whole of the money, and the owner cannot redeem either mortgage without redeeming the other. So that, as Mr Justice Williams reasons, no person can safely lend money on a second mortgage, for, in addition to the risk of a third mortgagee *tacking*, there is the danger that, if the mortgager should have mortgaged another estate for more than its value, the holder of the deficient security may buy in the first mortgage, consolidate it with his own, and exclude the second mortgagee.

An *equitable* mortgage is constituted simply by the deposit of title-deeds in security for money advanced. The enactment of the Statute of Frauds that no action shall be brought on "any contract or sale of lands," &c., or any interests in or concerning them unless the agreement be in writing and signed by the party to be charged, has been cited as incompatible with the recognition of equitable mortgages, but it is argued by Lord Abinger that the Act was never meant to affect such a transaction. The deeds which are the evidence of title could not be recovered in an action at law, and, if they were claimed in equity, the court would require the claimant to do equity by repaying the money borrowed on the deposit. Any subsequent legal mortgagee, having notice of the deposit, will be postponed to the equitable mortgagee, and when the legal mortgagee has not inquired as to the title-deeds the court will impute to him such knowledge as he would have acquired if he had made inquiry.

As to mortgages of personal property see PLEDGE.

United States.—In the United States there is great diversity in the extent to which equitable principles have been formally substituted for the rules of the common law in dealing with mortgages. Washburn (*Law of Real Property*, vol. ii.) arranges the States into three "pretty well-defined classes." In the first, the mortgage deed is held to create a seizin of and an estate in the premises, with all its common law incidents, to be enforced if need be by ejectment. In the second, the mortgagee's rights are limited to such as the rules of equity prescribe, and may not be enforced by a suit at law. In the third, the mortgagee's interest is not deemed an *estate* at all, but is here only to be enforced by the sale of the premises as a means of paying the debt. In the first class come Massachusetts, Maine, Connecticut, New Hampshire, Rhode Island, Vermont, Indiana, Missouri, North Carolina, Mississippi, Minnesota; in the second, Iowa, Illinois, Pennsylvania, Kentucky, Ohio, Wisconsin, and Texas; in the third, California, Georgia, and New York, to which may be added Oregon. (E. R.)

MORTIFICATION, a term used in surgery signifying a local death. Any cause which interferes with the blood-supply of a portion of the body will, if sufficiently prolonged or sufficiently severe, give rise to mortification. In some cases the death may be preceded by inflammation; in others, as in old people with diseased vessels, the part may die in consequence simply of insufficient blood-supply without any previous inflammation. The part is said to mortify; the process is termed gangrene; the dead part is called a slough. A severe injury may end in mortification. Extreme heat as in severe burns, or extreme cold as in frost-bite, may give rise to the condition. Those parts of the body farthest from the centre of the circulation are most liable to mortification. Frost-bite, for example, may attack the toes or fingers as well as those parts which are most exposed to the cold, more particularly the point of the nose or the ears. The part affected becomes pale, bloodless, cold, and insensible. The great point to attend to is to restore the circulation gradually, using gentle friction. If the person is brought before a fire, or if any hot applications are used, then a rapid reaction may issue in a severe inflammation, which may be followed by mortification. Chilblain is a mild form of frost-bite occurring in young people with sluggish circulations, very often caused by sitting down before a strong fire with cold feet; any one suffering from cold feet or hands should take plenty of exercise, and if after a return from a sharp walk the feet remain cold the heat should be restored by rubbing with a rough towel.

MORTMAIN, STATUTES OF. The object and effect of these enactments are treated in the articles CHARITY and CORPORATION (*q.v.*). The following is a list of the Mortmain Acts:—

9 Henry III. c. 36 (Magna Charta); 7 Edward I. st. 2, c. 1 (De Religiosis); 13 Edward I. c. 32; 13 Edward I. c. 41; 18 Edward I. st. 1, c. 3; 27 Edward I. st. 2; 34 Edward I. st. 3; 18 Edward III. st. 3, c. 3; 15 Richard II. c. 5; 21 Henry VIII. c. 6, s. 5; 23 Henry VIII. c. 10; 1 and 2 Philip and Mary, c. 8, s. 51; 35 Elizabeth, c. 4; 21 James I. c. 1; 13 and 14 Charles II. c. 6, s. 10; 29 Charles II. c. 8; 7 and 8 William III. c. 37; 9 George II. c. 36; 43 George III. c. 108; 9 George IV. c. 85; and 2 and 3 William IV. c. 115.

MORTON, JAMES DOUGLAS, fourth earl of (1530-1581), regent of Scotland, second son of Sir George Douglas of Pittendriech, was born at Dalkeith in 1530. Having married Elizabeth, daughter of the third earl of Morton, he through her succeeded in 1553 to the title and estates of his father-in-law. After the return of Queen Mary in 1561 he was chosen a privy councillor, and in 1563 he became lord high chancellor. Though his sympathies were Protestant, he took no part in the combination of Protestant barons in 1565, but he headed the armed force of 150 men who took possession of Holyrood Palace to effect the assassination of Rizzio, and it was to his house that the leading conspirators adjourned while a messenger was sent to obtain Mary's signature to the "bond of security." The queen, before complying with the request, escaped to Dunbar, and on her return to Edinburgh with an escort of 2000 men Morton and the other leaders fled to England. After her marriage with Bothwell, Morton returned, and with 600 men appeared before Borthwick Castle, where the queen, in dread of a rising, had taken refuge. He was present at the remarkable conference at Carberry Hill, and he also took an active part in obtaining the consent of the queen at Lochleven to an abdication. Thereupon he was reappointed lord high chancellor, and also succeeded Bothwell as lord high admiral. On the death of the earl of Mar he became regent (October 1572). Through his persistence in recovering the crown jewels from the countess of Argyll, widow of the earl of Moray, Morton awakened the bitter animosity of Argyll and Athole, who persuaded the young king James VI. to assume the government. Morton deemed it prudent to resign, and for a time retired to Lochleven, but shortly afterwards, with the assistance of his nephew, the earl of Mar, he obtained possession of Stirling Castle, where the king was residing, and thus for a time recovered his old influence. Suddenly, however, he was accused by James Stewart, earl of Arran, of having taken part in the murder of Darnley, the father of the king, and being tried by a jury of sixteen peers, most of whom were his enemies, was condemned to death and beheaded on 2d June 1581.

MORVEAU. See GUYTON DE MORVEAU.

MOSAIC (late Greek ψήφωσις, from ψῆφος, a small stone; also μουσεῖον, *i.e.*, refined, delicate work; hence the Latin *opus musivum*) is the fitting together of many, generally small, pieces of marble, opaque glass, coloured clays, or other substances, so as to form a pattern: the

their rights. But if the third mortgagee gets an assignment of the first mortgage, he can *tack* his third mortgage to the first, and so postpone the second mortgagee. And if the first mortgagee himself makes an additional advance after the date of the second mortgage, but without notice of it, his whole debt will take precedence of the second mortgagee. A similar result of equitable rules is seen in the consolidation of securities. Two separate estates, mortgaged at different times and for different sums of money by the same mortgager to the same mortgagee, are regarded as consolidated, so that the whole of the land becomes security for the whole of the money, and the owner cannot redeem either mortgage without redeeming the other. So that, as Mr Justice Williams reasons, no person can safely lend money on a second mortgage, for, in addition to the risk of a third mortgagee *tacking*, there is the danger that, if the mortgager should have mortgaged another estate for more than its value, the holder of the deficient security may buy in the first mortgage, consolidate it with his own, and exclude the second mortgagee.

An *equitable* mortgage is constituted simply by the deposit of title-deeds in security for money advanced. The enactment of the Statute of Frauds that no action shall be brought on "any contract or sale of lands," &c., or any interests in or concerning them unless the agreement be in writing and signed by the party to be charged, has been cited as incompatible with the recognition of equitable mortgages, but it is argued by Lord Abinger that the Act was never meant to affect such a transaction. The deeds which are the evidence of title could not be recovered in an action at law, and, if they were claimed in equity, the court would require the claimant to do equity by repaying the money borrowed on the deposit. Any subsequent legal mortgagee, having notice of the deposit, will be postponed to the equitable mortgagee, and when the legal mortgagee has not inquired as to the title-deeds the court will impute to him such knowledge as he would have acquired if he had made inquiry.

As to mortgages of personal property see PLEDGE.

United States.—In the United States there is great diversity in the extent to which equitable principles have been formally substituted for the rules of the common law in dealing with mortgages. Washburn (*Law of Real Property*, vol. ii.) arranges the States into three "pretty well-defined classes." In the first, the mortgage deed is held to create a seizin of and an estate in the premises, with all its common law incidents, to be enforced if need be by ejectment. In the second, the mortgagee's rights are limited to such as the rules of equity prescribe, and may not be enforced by a suit at law. In the third, the mortgagee's interest is not deemed an *estate* at all, but is here only to be enforced by the sale of the premises as a means of paying the debt. In the first class come Massachusetts, Maine, Connecticut, New Hampshire, Rhode Island, Vermont, Indiana, Missouri, North Carolina, Mississippi, Minnesota; in the second, Iowa, Illinois, Pennsylvania, Kentucky, Ohio, Wisconsin, and Texas; in the third, California, Georgia, and New York, to which may be added Oregon. (E. R.)

MORTIFICATION, a term used in surgery signifying a local death. Any cause which interferes with the blood-supply of a portion of the body will, if sufficiently prolonged or sufficiently severe, give rise to mortification. In some cases the death may be preceded by inflammation; in others, as in old people with diseased vessels, the part may die in consequence simply of insufficient blood-supply without any previous inflammation. The part is said to mortify; the process is termed gangrene; the dead part is called a slough. A severe injury may end in mortification. Extreme heat as in severe burns, or extreme cold as in frost-bite, may give rise to the condition. Those parts of the body farthest from the centre of the circulation are most liable to mortification. Frost-bite, for example, may attack the toes or fingers as well as those parts which are most exposed to the cold, more particularly the point of the nose or the ears. The part affected becomes pale, bloodless, cold, and insensible. The great point to attend to is to restore the circulation gradually, using gentle friction. If the person is brought before a fire, or if any hot applications are used, then a rapid reaction may issue in a severe inflammation, which may be followed by mortification. Chilblain is a mild form of frost-bite occurring in young people with sluggish circulations, very often caused by sitting down before a strong fire with cold feet; any one suffering from cold feet or hands should take plenty of exercise, and if after a return from a sharp walk the feet remain cold the heat should be restored by rubbing with a rough towel.

MORTMAIN, STATUTES OF. The object and effect of these enactments are treated in the articles CHARITY and CORPORATION (*q.v.*). The following is a list of the Mortmain Acts:—

9 Henry III. c. 36 (Magna Charta); 7 Edward I. st. 2, c. 1 (De Religiosis); 13 Edward I. c. 32; 13 Edward I. c. 41; 18 Edward I. st. 1, c. 3; 27 Edward I. st. 2; 34 Edward I. st. 3; 18 Edward III. st. 3, c. 3; 15 Richard II. c. 5; 21 Henry VIII. c. 6, s. 5; 23 Henry VIII. c. 10; 1 and 2 Philip and Mary, c. 8, s. 51; 35 Elizabeth, c. 4; 21 James I. c. 1; 13 and 14 Charles II. c. 6, s. 10; 29 Charles II. c. 8; 7 and 8 William III. c. 37; 9 George II. c. 36; 43 George III. c. 108; 9 George IV. c. 85; and 2 and 3 William IV. c. 115.

MORTON, JAMES DOUGLAS, fourth earl of (1530-1581), regent of Scotland, second son of Sir George Douglas of Pittendriech, was born at Dalkeith in 1530. Having married Elizabeth, daughter of the third earl of Morton, he through her succeeded in 1553 to the title and estates of his father-in-law. After the return of Queen Mary in 1561 he was chosen a privy councillor, and in 1563 he became lord high chancellor. Though his sympathies were Protestant, he took no part in the combination of Protestant barons in 1565, but he headed the armed force of 150 men who took possession of Holyrood Palace to effect the assassination of Rizzio, and it was to his house that the leading conspirators adjourned while a messenger was sent to obtain Mary's signature to the "bond of security." The queen, before complying with the request, escaped to Dunbar, and on her return to Edinburgh with an escort of 2000 men Morton and the other leaders fled to England. After her marriage with Bothwell, Morton returned, and with 600 men appeared before Borthwick Castle, where the queen, in dread of a rising, had taken refuge. He was present at the remarkable conference at Carberry Hill, and he also took an active part in obtaining the consent of the queen at Lochleven to an abdication. Thereupon he was reappointed lord high chancellor, and also succeeded Bothwell as lord high admiral. On the death of the earl of Mar he became regent (October 1572). Through his persistence in recovering the crown jewels from the countess of Argyll, widow of the earl of Moray, Morton awakened the bitter animosity of Argyll and Athole, who persuaded the young king James VI. to assume the government. Morton deemed it prudent to resign, and for a time retired to Lochleven, but shortly afterwards, with the assistance of his nephew, the earl of Mar, he obtained possession of Stirling Castle, where the king was residing, and thus for a time recovered his old influence. Suddenly, however, he was accused by James Stewart, earl of Arran, of having taken part in the murder of Darnley, the father of the king, and being tried by a jury of sixteen peers, most of whom were his enemies, was condemned to death and beheaded on 2d June 1581.

MORVEAU. See GUYTON DE MORVEAU.

MOSAIC (late Greek ψήφωσις, from ψῆφος, a small stone; also μουσεῖον, *i.e.*, refined, delicate work; hence the Latin *opus musivum*) is the fitting together of many, generally small, pieces of marble, opaque glass, coloured clays, or other substances, so as to form a pattern; the

concrete and cement were both set, the surface of the pavement was rubbed down and polished. This kind of mosaic was largely used for floors of hypocausts; the concrete bed was then supported on large tiles resting on numbers of short pillars.

If used for upper floors very strong joists were required, and both Pliny (xxxvi. 25) and Vitruvius (vii. 1) recommend a *double* layer of boards, one crossing the other, on which the concrete and cement bedding was to be laid.

The usual Roman pavement was made of pieces of marble, averaging from a half to a quarter of an inch square, but rather irregular in shape. A few other, but quite exceptional, kinds of mosaic pavements have been found, such as that at the Isola Farnese, 9 miles from Rome, made of tile-like slabs of green glass, and a fine "sectile" pavement on the Palatine Hill, made of various-shaped pieces of glass, in black, white, and deep yellow. In some cases—*e.g.*, in the "House of the Faun" at Pompeii—glass tesseræ in small quantities have been mixed with the marble ones, for the sake of greater brilliance of colour. Pompeii is especially rich in its mosaics both on floor and walls, almost every house having at least its vestibule paved in this way.

In addition to graceful flowing patterns and geometrical designs, picture-like subjects of great elaboration frequently occur: of these the most important is the large and minutely-executed scene of the battle of Issus, found in the "House of the Faun." It is of special value as being the chief classical historical picture still existing. It is a well-designed though somewhat crowded composition, representing the moment of Alexander's victorious charge against the cavalry of Darius. The expression of the faces and the characteristic dresses of the Greeks and Persians are represented with great skill (see fig. 2). The tesseræ, as was always the case in this sort of work, are not all the same size, the smallest (only about one-tenth of an inch square) being reserved for the faces, where greatest refinement of detail was required. This was a floor-mosaic, though generally these minutely-executed works were affixed to walls.

The most skilfully-executed of all existing mosaics of this pictorial kind is that known as "Pliny's Doves," found in Hadrian's villa at Tivoli, and now in the Capitoline Museum. It may possibly be the one so highly praised by Pliny (xxxvi. 25) as the work of Sosus, for, although he describes it as being at Pergamum, yet it was a common practice with the Romans to transport these mosaics from one place to another, and this very celebrated one may well have been brought to Tivoli to adorn the emperor's villa. It is treated in a very realistic way: the light on the gold bowl, the plumage of the doves, and especially the reflexion in the water of the drinking dove, are represented with wonderful skill. It is, in fact, far too pictorial, and, like the late mosaics in St Peter's, Rome, is more remarkable for its technical skill than for any real artistic merit. This excessive realism, produced with great difficulty and cost, is a not uncommon fault of the more elaborate Roman mosaics, and was the inevitable result of the luxury and ostentation of imperial Rome, which made art the bond-slave of the wealthy, rather than the free and natural expression of a whole people, as it was among the earlier Greeks.

Another interesting mosaic from the wall of a house at Pompeii, of extremely delicate work, is a rehearsal scene in a Greek theatre, where the choregus is instructing the actors: it is specially remarkable from its being signed as the work of Dioscorides of Samos. Other figure-subjects are not uncommon, such as various representations of the victory of Theseus over the Minotaur, others of Achilles in Scyros, many hunting scenes, and the like.

Throughout England, Germany, France, Spain, Asia Minor, and Northern Africa in no way have signs of Roman occupation been left so clearly and in so conspicuous a form as by the numerous large and generally well-preserved mosaic pavements which have at various times been discovered in all these countries. In many cases, long after all traces of the walls of the buildings have disappeared, owing to their being dug up and removed for building purposes, the mosaics still remain to testify of the artistic power and mechanical skill of the Roman colonists.

Few countries are richer than England in these remains; the great pavements of York, Woodchester, Cirencester, and many other places are as elaborate in design and as skilfully executed as any that now exist even in Rome itself. In whatever country these mosaics are found, their style and method of treatment are always much the same; the materials only of which the tesseræ are made vary according to the stone or marble supplied by each country. In England, for instance, limestone or chalk often takes the place of the white marble so common in Italian and North African mosaics; while, instead of red marble, a fine sort of burnt clay or red sandstone is generally used; other makeshifts had to be resorted to, and many of the Anglo-Roman mosaics are made entirely without marble. It is perhaps partly owing to the great wealth of Northern Africa in marbles of many colours and of varying shades that the finest of all Roman mosaics have been found in Algeria and Tunis, especially those

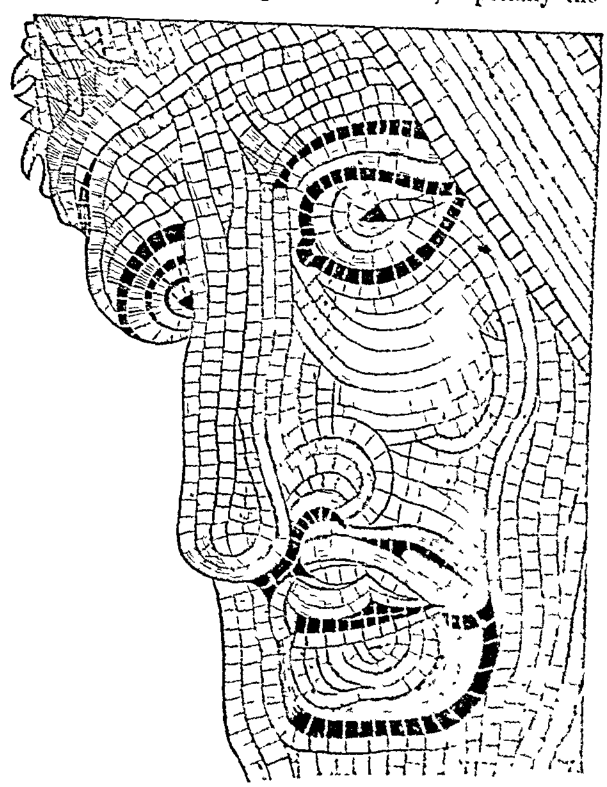

FIG. 2.—Part of a Persian's Head from the Battle of Issus, full size.

from Carthage, some of which have been brought to the British Museum. See *Archæologia*, vol. xxxviii. p. 202.

The range of colour in the marble tesseræ is very great, and is made use of with wonderful taste and skill: there are three or four different shades of red, and an equal number of yellows and greens, the last colour in all its tints being almost peculiar to this part of Africa, and one of the most pleasant and harmonious in almost any combination. Deep black, browns, and bluish-greys are also abundant. The white marble which forms the ground of nearly all the designs is often not pure white, but slightly striated with grey, giving great softness and beauty of texture to the surface, and doing away with too great monotony of tone. The Roman practice, common to all their mosaics, of not fitting the tesseræ quite closely together, but allowing the cement joints to show freely, was also of great value in giving effect to the general texture of the surface—a point quite forgotten by some later mosaic-workers, who thought that the closer their tesseræ were fitted together the better the mosaic would be. This remark does not apply to sectile mosaic, in which sufficient variety can be given by the markings and veins in each piece of marble. To return to the mosaics from Carthage, they are no less excellent in design than in the richness and beauty of their materials. Large size

concrete and cement were both set, the surface of the pavement was rubbed down and polished. This kind of mosaic was largely used for floors of hypocausts; the concrete bed was then supported on large tiles resting on numbers of short pillars.

If used for upper floors very strong joists were required, and both Pliny (xxxvi. 25) and Vitruvius (vii. 1) recommend a *double* layer of boards, one crossing the other, on which the concrete and cement bedding was to be laid.

The usual Roman pavement was made of pieces of marble, averaging from a half to a quarter of an inch square, but rather irregular in shape. This remark does not apply to sectile mosaic, in which sufficient variety can be given by the markings and veins in each piece of marble. To return to the mosaics from Carthage, they are no less excellent in design than in the richness and beauty of their materials. Large space

decoration.[1] In many cases vaulted ceilings were covered with these mosaics, as the tomb of Galla Placidia, 450 A.D., and the two baptisteries at Ravenna, 5th and 6th centuries. For exteriors, the large use of mosaic was usually confined to the west façade, as at S. Miniato, Florence, S. Maria Maggiore, Rome, and S. Mark's, Venice. In almost all cases the figures are represented on a gold ground, and gold is freely used in the dresses and ornaments—rich jewels and embroidery being represented in gold, silver, sparkling reds, blues, and other colours, so as to give the utmost splendour of effect to the figures and their drapery.

The revival of the art of painting in Italy and the

Fig. 8.—Mosaic of Theodora and attendants, from S. Vitale, Ravenna; over life-size.

introduction of fresco work in the 14th century gave the deathblow to the true art of wall-mosaics. Though at first the simple and archaic style of Cimabue and his pupils Jacopo da Turrita, Giotto, and Taddeo Gaddi was equally applicable to painting or mosaic, yet soon the development of art into greater realism and complexity required a method of expression unfettered by the necessities and canons of mosaic-work. Pietro Cavallini, a Roman artist, was one of the last who worked according to the old traditions. His mosaic of the birth of the Virgin in S. Maria in Cosmedin, Rome, executed about the middle of the 14th century, is not without merit, though his superior knowledge of form has only caused his composition to be somewhat feeble and insipid compared with the works of the earlier artists. Even in the 15th century a few good mosaics were produced at Venice and elsewhere. Since then many large pictures have been copied in glass mosaic, generally attempts to imitate oil paintings, executed with great skill and wonderful patience, but all utterly worthless as works of art, merely costly monuments of human folly and misapplied labour. The mosaics from Titian's pictures on the west end of S. Mark's at Venice, Raphael's in the Chigi Chapel in S. Maria del Popolo, and many large pictures in S. Peter's in Rome, are the most striking examples of these.

The following list, in chronological order, comprises a selection from among the most important mediæval glass wall-mosaics during the period when mosaic-working was a real art:—

5th Century.

Ravenna.	Orthodox Baptistery—vault.
	Tomb of Galla Placidia—vault, 450
	Archbishop's Chapel—vault.
Rome.	S. Paolo fuori le mura—triumphal arch
	S. Maria Maggiore—square pictures over nave columns, and triumphal arch.
Milan.	S. Ambrogio, Chapel of S. Satiro—vault.
Fundi.	Cathedral—apse.
Nola.	Cathedral—apse.

6th Century.

Ravenna.	Arian Baptistery—vault
	S. Apollinare Nuovo—apse and nave, with 9th century additions
	S. Vitale—apse and whole sanctuary, *circa* 547.
	S. Apollinare in Classe—apse and nave, 549.
Rome.	SS. Cosmas and Damian—apse
Milan.	S. Lorenzo, Chapel of S. Aquilinus—vault.
Constantinople.	S. Sophia—walls and vault, *circa* 550
Thessalonica.	Church of St George—apse, &c., and S. Sophia—dome and apse
Trebizond.	S. Sophia—apse.

7th Century

Rome.	S. Agnese fuori le mura—apse, 626.
	S. Teodoro
Jerusalem.	"Dome of the Rock"—arches of ambulatory, 688.

8th Century.

Rome.	Baptistery of S. Giovanni in Laterano
	SS. Nereus and Achilles.
Jerusalem.	Mosque of Al Aksa—on dome.
Mount Sinai.	Chapel of the Transfiguration.

9th Century

Rome.	S. Cecilia in Trastevere—apse
	S. Marco—apse
	S. Maria della Navicella—apse, and "Chapel of the Column."
	S. Prassede—triumphal arch.
	S. Pudenziana, 884.
Milan.	S. Ambrogio—apse, 832.

10th Century.

Cordova.	Mihrab (sanctuary) of Mosque.

11th Century.

Jerusalem.	"Dome of the Rock"—base of cupola, 1027.
Constantinople.	Church of S. Saviour—walls and domes.

12th Century.

Venice.	S. Mark's—narthex, apse, and walls of nave and aisles.
Capua.	Cathedral—apse.
Torcello.	Cathedral—apse.
Murano.	Cathedral—apse.
Salerno.	Cathedral—apse.
Palermo.	Capella Palatina, begun 1132—the whole walls.
	Church of La Martorana—vault
Monreale.	Cathedral—the whole walls, 1170-90.
Bethlehem.	Church of the Nativity, 1169.
Cefalu.	Cathedral—apse, 1148.
Rome.	S. Clemente—apse.
	S. Francesca Romana—apse.
	S. Maria in Trastevere—apse.

13th Century.

Florence.	Baptistery vault, begun c. 1225 by Fra Jacopo.
	S. Miniato—apse and west front.
Rome.	S. Paolo fuori le mura—apse
	S. Clemente—triumphal arch, 1297.
	S. Giovanni in Laterano—apse by Jacopo da Turrita, 1290
	S. Maria Maggiore—apse and west end by Jacopo da Turrita, 1292-1299, and Taddeo Gaddi.

[1] Unfortunately the world-wide fame of S. Mark's and the other great churches of Italy has subjected these extraordinary works to the fatal process of "restoration," and wherever any sign of decay in the cement backing (the tesseræ themselves are quite indestructible) has given the least excuse the "restorers" have destroyed whole masses of ancient work, and supplied its place with worthless modern copies. The mosaics of the S. Mark's baptistery, and of the apses at S. Miniato, at Pisa, and many other places have in this way been wantonly renewed within the last few years.

decoration.[1] In many cases vaulted ceilings were covered with these mosaics, as the tomb of Galla Placidia, 450 A.D., and the two baptisteries at Ravenna, 5th and 6th centuries. For exteriors, the large use of mosaic was usually confined to the west façade, as at S. Miniato, Florence, S. Maria Maggiore, Rome, and S. Mark's, Venice. In almost all cases the figures are represented on a gold ground, and gold is freely used in the dresses and ornaments—rich jewels and embroidery being represented in gold, silver, sparkling reds, blues, and other colours, so as to give the utmost splendour of effect to the figures and their drapery.

The revival of the art of painting in Italy and the

[1] Unfortunately the world-wide fame of S. Mark's and the other great churches of Italy has subjected these extraordinary works to the fatal process of "restoration," and wherever any sign of decay in the cement backing (the tesseræ themselves are quite indestructible) has given the least excuse the "restorers" have destroyed whole masses of ancient work, and supplied its place with worthless modern copies. The mosaics of the S. Mark's baptistery, and of the apses at S. Miniato, at Pisa, and many other places have in this way been wantonly renewed within the last few years.

Certosa near Pavia were by Borgognone, and are extremely beautiful. The stalls in Siena cathedral and in S. Pietro de' Casinensi at Perugia, the latter from Raphael's designs, are among the finest works of this sort, which are very numerous in Italy. It has also been used on a smaller scale to ornament furniture, and especially the "*Cassoni*," or large trousseau coffers, on which the most costly and elaborate decorations were often lavished. Some traditional skill in this art still lingers in Italy, especially in the city of Siena.

MOSCHELES, IGNAZ (1794-1870), one of the most refined and accomplished pianists of the present century, was born at Prague, 30th May 1794, and first studied music at the Conservatorium in that city under the direction of Dionys Weber. At the age of fourteen he made his first appearance before the public in a pianoforte concerto of his own composition with marked success. Soon after this he removed to Vienna, where he studied counterpoint under Albrechtsberger and composition under Salieri. In 1814 he prepared, with Beethoven's consent, the pianoforte arrangement of *Fidelio*, afterwards published by Messrs Artaria. In the following year he published his celebrated *Variationen über den Alexandermarsch*, a concert piece of great difficulty, which he played with so great effect that he was at once recognized as the most brilliant performer of the day. He then started on a tour, during the course of which he visited most of the great capitals of Europe, making his first appearance in London in 1822, and there securing the friendship of Muzio Clementi and John Cramer, the fathers of the English school of pianoforte playing. For a concert given by the latter he wrote his famous *Hommage à Händel*, a duet for two pianofortes, which afterwards became a lasting favourite with the public. His reception in England was sufficiently encouraging to justify his return in 1823, when he again met with a hearty welcome. During a visit to Berlin in 1824 he first became acquainted with Mendelssohn, then a boy of fifteen; and a friendship sprang up between them which was severed only by Mendelssohn's early death.

In 1826 Moscheles relinquished his wandering habits, and settled permanently in London, surrounding himself with a *clientèle* fully capable of appreciating his talents as an artist and his social worth as a firm and loyal friend. His position was henceforth a more than ordinarily enviable one. He was recognized from end to end of Europe as a *virtuoso* of the highest rank; and his popularity both as a performer and as a teacher was based on grounds which effectually secured it from the caprice of changing fashion or ephemeral patronage. He was undoubtedly for some considerable time the greatest executant of his age; but, using his brilliant touch as a means and not as an end, he consistently devoted himself to the further development of the true classical school, interpreting the works of the great masters with conscientious fidelity, and in his extempore performances, which were of quite exceptional excellence, exhibiting a fertility of invention which never failed to please the most fastidious taste.

In 1837 Moscheles conducted Beethoven's Ninth Symphony at the Philharmonic Society's concerts with extraordinary success; and on this and other occasions contributed not a little, by his skilful use of the baton, to the prosperity of the time-honoured association. During the course of his long residence in London he laboured incessantly in the cause of art, playing at innumerable concerts, both public and private, and instructing a long line of pupils, who flocked to him, in unbroken succession, until the year 1848, when, at Mendelssohn's earnest solicitation, he removed to Leipsic, to carry on a similar work at the Conservatorium then recently founded in that city. In this new sphere he worked with unabated zeal for more than twenty years, dying 10th March 1870.

Moscheles's most important compositions are his Pianoforte Concertos, Sonatas, and Studies; his *Hommage à Handel*; and his three celebrated *Allegri di Bravura*.

MOSCHUS, of Syracuse, is one of the Greek bucolic poets; he was a friend of the Alexandrian grammarian Aristarchus (about 200 B.C.). His chief work is the epitaph of Bion of Smyrna, another of the bucolic poets, who seems to have lived in Sicily. It is probable that the miscellaneous collection of poems which we possess by the three poets Theocritus, Bion, and Moschus was known to Artemidorus in 200 B.C. His poetry is the work of a well-educated man with a trained artistic eye; he models his works on those of Bion, writing epigrammatic, epic, and idyllic or elegiac verses, all except a few lines being in hexameter verse; but he treats all his subjects in a descriptive, not in a narrative or an epigrammatic style. Besides the epitaph of Bion, he wrote two little epic poems, "Europa" and "Megara," and a pretty little epigram, "Love the Runaway;" and a few short pieces of his are also preserved. They are written with much elegance, but the style is perhaps too refined and carefully wrought, and he has few of the higher qualities of a poet.

MOSCOW, a government of Central Russia, bounded by Tver on the N.W., Vladimir and Ryazan on the E., Tula and Kaluga on the S., and Smolensk on the W., and having an area of 12,858 square miles. The surface is undulating, with broad depressions occupied by the rivers, and varies in elevation from 500 to 850 feet. Moscow is situated in the centre of the so-called Moscow coal-basin, which extends into the neighbouring governments, and consists of limestones of the Upper and Lower Carboni ferous, the latter containing beds of inferior coal, w[illegible] the former contains several good quarries of marble. Th Carboniferous formation is covered with Jurassic clays sandstones, and sands, which yield a good china-clay at Gjeli, copperas, a sandstone much employed for building and a white sand used for the manufacture of glass. T whole is thickly covered with boulder-clay and alluvial sands

The government is watered by the Volga, which skirts it for few miles on its northern boundary, by the navigable Sestra, whic brings it in communication with the canals leading to St Peter: burg, by the Oka, and by the Moskva. This last takes its origi in Smolensk, and, after a course of 280 miles right across Moscow reaches the Oka at Kolomna; it is navigable from the town c Moscow. The Oka and Moskva from a remote period have bee important channels of trade, and continue to be so notwithstandin the development of railways. The Oka brings the governmen into water communication with the Volga, whose tributaries cc nearly the whole of middle and eastern Russia, and are separate by short land distances from the Northern Dwina and the Do Large quantities of grain, metals, glass ware, skins, and other cc modities are shipped up and down the Moskva, whilst the Myacl kovo stone quarries situated on its banks supply the capital wit building stone. There are several marshes, mostly in the nor

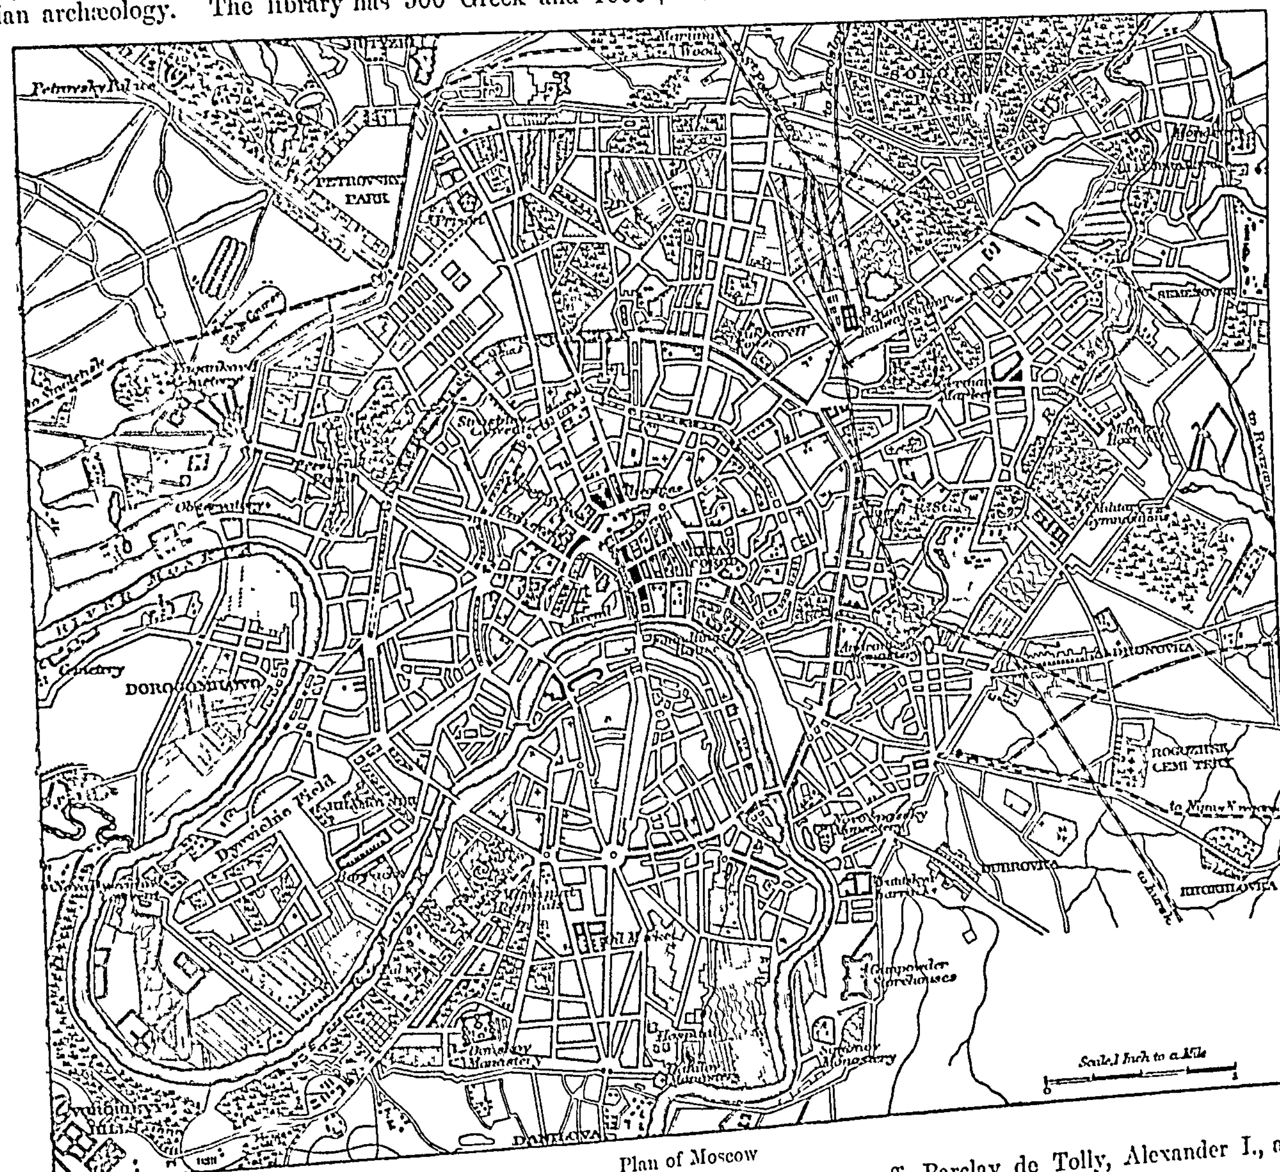
prison. Close by, the great campanile of Ivan Veliky, erected in the Lombardo-Byzantine style by Boris Godunoff in 1600, rises to the height of 271 feet (328 feet including the cross), and contains many bells, one of which weighs 1285 cwts. The view of Moscow from this campanile is really wonderful, and its gilded cupola is seen from a great distance. Close by is the well-known Tsar-Kolokol (Czar of the Bells), 60 feet in circumference round the rim, 19 feet high, and weighing 3850 cwts. It was cast in 1735, and broken during the fire of 1737 before being hung. The treasury of the patriarchs (riznitsa) contains not only such articles of value as the *sakkos* of the metropolitan Foty with 70,000 pearls, but also very remarkable monuments of Russian archæology. The library has 500 Greek and 1000 very rare Russian MSS., including a Gospel of the 8th century.

The great palace of the emperors, erected in 1849, is a fine building in white stone with a gilded cupola. It contains the *terems*, or rooms erected for the young princes in 1636 (restored in 1836-1849, their former character being maintained), a remarkable memorial of the domestic life of the czars in the 17th century. In the treasury of the czars, Granovitaya Palata and Orujeynaya Palata, now public museums, the richest stores connected with old Russian archæology are found—crowns, thrones, dresses, various articles of household furniture belonging to the czars, Russian and Mongolian arms, carriages, &c.

The four sides of the Senate Square are occupied by



Plan of Moscow

buildings of various dates, from the 15th century onwards. The senate, now the law courts, was erected by Catherine II. Facing it is the arsenal, containing full ammunition for 200,000 men.

The Temple of the Saviour, begun in 1817 on the Vorobiovy hills, in commemoration of 1812, was abandoned in 1827, and a new one was built during the years 1838-1881 on a hill on the bank of the Moskva, at a short distance from the Kremlin. Its style is Lombardo-Byzantine, with modifications suggested by the military taste of Nicholas I. Its colossal white walls are well proportioned, and its gilded cupolas are seen from a great distance. The buildings that surround it are to be cleared away, and its wide squares adorned by obelisks, and by monuments to Kutuzoff, Barclay de Tolly, Alexander I., and Nicholas I.

The Kitay-Gorod, which covers 121 acres, and has 20,000 inhabitants, is the chief commercial quarter of Moscow. It contains the Gostinoy Dvor, consisting of several stone buildings divided into 1200 shops, where all kinds of manufactured articles are sold. The "Red Square," 900 yards long, whose stone tribunal was formerly the forum, and afterwards the place of execution, separates the Gostinoy Dvor from the Kremlin. At its lower end stands the fantastic Pokrovsky cathedral (usually known as Vasili Blajennyi), which is the wonder of all strangers visiting Moscow, on account of its towers, all differing from each other, and representing, in their variety of colours, pine-

still these are insufficient for the population, and the municipal schools every year refuse admission to about 1500 boys and girls.

The scientific societies are specially distinguished for their services in the exploration of the country. The following deserve particular mention:—the society of naturalists (founded in 1805); the society of Russian history and antiquities, which has published many remarkable works; the society of amateurs of Russian literature; the physical and medical society; the mathematical society; the society for the diffusion of useful books; the very active archæological society, founded in 1864; a society of gardening and of agriculture; several technical, artistic, and musical societies; and the very active young society of the friends of natural science, which already has published many useful volumes.

Among the museums of Moscow, the museum, formerly Rumantseff's, now connected with the so-called "public museum," occupies the first rank. It contains a library of 150,000 volumes and 2300 MSS., remarkable collections of old pictures, sculptures, and prints, as well as a rich mineralogical collection, and an ethnographical collection representing very accurately the various inhabitants of Russia. The historical museum has already been mentioned. The private museum of Prince Golitzyn contains a good collection of paintings and MSS.; and great treasures of archæology are amassed in various private collections in Moscow and its suburbs.

The periodical press does not on the whole exercise great influence; twenty-five periodicals are published, besides those of scientific societies. But Moscow publishes a far larger number of books for primary instruction and of the humblest kind of literature and prints for the use of peasants than any other Russian city.

The philanthropic institutions are numerous, the first rank being occupied by the immense Foundlings' Hospital, erected in 1764. The hospitals, municipal, military, and private, are very large, but much below the standard of other capitals. The number of private philanthropic institutions is very considerable.

Though the drama was introduced into Russia at Kieff, Moscow was the place of its development. The earliest stage representations were made at Moscow in 1640, and the first comedy—a translation of Molière's *Médecin Malgré Lui*—was played in the palace before Sophie, the sister of Peter I. It was only in 1759 that a theatre was erected. A large stone theatre was erected in 1776, and rebuilt in 1856 after a fire. It is for the Moscow stage that the best Russian dramas have been written, and it was in the "small theatre" that the best Russian actors—Schepkin, Sadovsky, Shumsky, and Madame Vasilieff—exhibited the comedies of Gogol, Griboyedoff, and Ostrovsky.

Moscow, where the Great-Russian language is spoken in its greatest purity, was the birthplace of the two chief Russian poets, Pushkin and Lermontoff, as well as of Griboyedoff, Ostrovsky, and Herzen. A monument to Pushkin was erected in 1880, on the Tverskoy boulevard. Griboyedoff, in his remarkable comedy *Goré ot uma*, has given a lively picture of the higher Moscow society of the beginning of this century, which continued to hold good until within the last few years. His remark as to the unmistakable individuality of the Moscow type also maintains its truth; although the physiognomy of Moscow has much changed since his day, it still has its special features that distinguish it from every other capital. The division of classes is much more felt at Moscow than elsewhere. The tendency towards originality, the love of grandiose undertakings, a kind of brag, together with little feeling of independence, a good deal of laziness, and much cordiality, still characterize the educated classes. The merchants live quite aloof from any political or even intellectual movement, under a rude patriarchal system, well described in the dramas of Ostrovsky. A large proportion of them are nonconformists. Their sons, the well-known kupecheskiye synki, "merchants' sons," when they leave this kind of life, astonish the capital with their extravagances and absurd display of wealth. But Moscow takes its present physiognomy chiefly from its busy lower classes. The streets are full of merchants and peasants, who continue to wear the old Russian garb, go on foot in the streets, drink tea in modest restaurants, and transact large business. From being a town of the aristocracy, Moscow is coming to be more and more a town of the wealthy middle classes, who persist in keeping the low educational level of the peasants in the villages, and have but one aspiration, to become in their turn "merchants" of the type described by Ostrovsky.

Suburbs.—Moscow is surrounded by beautiful parks and picturesque suburbs. Of the former one of the most frequented is the Petrovsky Park, to the north-west. A little farther out is the Petrovskoye Razumovskoye estate, with an agricultural academy and its dependencies (botanical garden, experimental farm, &c.). Another large park and wood surround an imperial palace in the village of Ostankino. The private estates of Kuzminki, Kuskovo, and Kuntzevo are also surrounded by parks: the last has remains of a very old graveyard, supposed to belong to the pagan period. Twenty-eight miles westward from the city is the Savvin-Storojevsky monastery, situated, like so many other Russian monasteries, in a very fertile country, amidst beautiful forests: it has a pretty cathedral, a rich treasury, and library. Farther westward still is the New Jerusalem monastery erected by the patriarch Nikon.

In the south-west, on the right bank of the Moskva, which here makes a great bend to the south, are the Vorobiovy hills, which are accessible by steamer from Moscow, and afford one of the best views of the capital. In the bend of the Moskva is situated the Novo-Dyevitchiy convent, erected in 1525, and connected with many events of Russian history. It is now the burial-place of the Moscow aristocracy, and one of the richest nunneries in Russia. The village Arkhangelskoye has also a good park and a palace built by Rastrelli. Iliynskoye, formerly a private estate, was purchased by the imperial family in 1864.

In the south, on the road to Serpukhoff, is the village of Kolomenskoye, the residence of Alexis Mikhailovitch, with a church built in 1531 (a striking monument of Russian architecture, restored in 1880). Diakovo has also a church built in the 16th and 17th centuries—a pure example of the architecture of Moscow, recalling the temple of Vasili Blajennyi. One of the best sites in the neighbourhood of Moscow is occupied by the park of Tsaritzyno (11 miles from the Kursk railway station), purchased by Catherine II., with an unfinished palace and a beautiful park. The monastery Nikolo-Ugryeshskiy, 12 miles from the city, between the Kursk and Ryazan railways, also occupies a beautiful site, and is much visited by Moscow merchants, to venerate a holy picture by which Dmitry Donskoy is said to have been blessed before going to fight the Mongols.

In the north, the forest of Sokolniki, covering 4½ square miles, with its radial alleys and numerous summer residences, is the part of Moscow most frequented by the middle classes. Close by, towards the east, is situated the Preobrajenskoye suburb, the centre of the nonconformists, and farther south the village of Izmailovo, with a home for invalids and a model farm for apiculture. To the west of Sokolniki is situated the wood of Mariina, the favourite resort of the merchants and "merchants' sons," who there spend fabulous sums of money on choirs of Gipsy singers.

History.—The Russian annals first mention Moscow in 1147 as a place where Yuri Dolgoruki met with Svyatoslav of Syeversk and his allies. The site was inhabited from a very remote antiquity by the Merya and Mordvinians, whose remains are numerous in the neighbourhood, and it was well peopled by Great-Russians in the 12th century. To the end of the 13th century Moscow remained a dependency of the princes of Vladimir, and had to suffer from the raids of the Mongols, who burned and plundered it in 1237 and 1293. It is only under the rule of Daniil, son of Alexander Nevsky (1261-1302), that the prince of Moscow acquired some importance for the part he took in the wars against the Lithuanians. He annexed to his principality Kolomna, situated at the confluence of the Moskva with the Oka. His son in 1302 annexed Pereyaslavl Zalessky, and next year Mojaisk (taking thus possession of the Moskva from its head to its mouth), and so inaugurated a policy which lasted for centuries, and consisted in the annexation by purchase and other means of the neighbouring towns and villages. In 1300 the Kremlin, or fort, was enclosed by a strong wall of earth and wood, offering a protection to numerous emigrants from the Tver and Ryazan principalities who went to settle around the new city. Under John Kalita (1325-1341) the principality of Vladimir—where the princes of Kieff and the metropolitan of Russia had taken refuge after the wars that desolated south-western Russia—became united with Moscow; and in 1325 the metropolitan Peter established his seat at Moscow, giving thus a new importance and a powerful support to the young principality. In 1367 the Kremlin was enclosed by stone walls, which soon proved strong enough to resist the Lithuanians under Olgerd (1368 and 1371). The son and grandson of Kalita steadily pursued the same policy. The latter (Dmitry Donskoy) annexed the dominions of Starodub and Rostoff, and took part in the renowned battle of Kulikovo (1380), where the Russians ventured for the first time to oppose the Mongols in a great pitched battle. The church, which strongly supported the princes of Moscow, ascribed the presumed victory to him and to the holy pictures of the Moscow monasteries.

At this time Moscow occupied a wide area covered with villages. The Kremlin had three cathedrals—old, small, and dark buildings having narrow windows filled with mica-plates—which were surrounded by the plain wooden houses of the prince and his boyars.[1] To the east of the Kremlin was the *posad*, or city, also enclosed by a wall, and even then an important centre for trade. Different parts of the town belonged to different princes. In 1366 Moscow suffered from pestilence. Two years after the battle of Kulikovo it was taken and plundered (for the last time) by the khan (Toktamish) [illegible]

The gradual increase of the principality continued during the first half of the 15th century, and at the death of Vasili II. the Blind, in 1462, it included not only the whole of what is now the government of Moscow, but also large parts of the present governments of Kaluga, Tula, Vladimir, Nijni-Novgorod, Kostroma, Vyatka, Vologda, Yaroslav, and Tver. Still the princes, although assuming, like several others, the title of Great Prince, had [illegible]

[1] The name of boyars, or boïars, was given to the descendants of the [illegible] military bands of the princes, who had become counsellors at the [illegible]

still these are insufficient for the population, and the municipal schools every year refuse admission to about 1500 boys and girls.

The scientific societies are specially distinguished for their services in the exploration of the country. The following deserve particular mention:—the society of naturalists (founded in 1805); the society of Russian history and antiquities, which has published many remarkable works; the society of amateurs of Russian literature; the physical and medical society; the mathematical society; the society for the diffusion of useful books; the very active archæological society, founded in 1864; a society of gardening and of agriculture; several technical, artistic, and musical societies; and the very active young society of the friends of natural science, which already has published many useful volumes.

Among the museums of Moscow, the museum, formerly Rumantseff's, now connected with the so-called "public museum," occupies the first rank. It contains a library of 150,000 volumes and 2300 MSS., remarkable collections of old pictures, sculptures, and prints, as well as a rich mineralogical collection, and an ethnographical collection representing very accurately the various inhabitants of Russia. The historical museum has already been mentioned. The private museum of Prince Golitzyn contains a good collection of paintings and MSS.; and great treasures of archæology are amassed in various private collections in Moscow and its suburbs.

The periodical press does not on the whole exercise great influence; twenty-five periodicals are published, besides those of scientific societies. But Moscow publishes a far larger number of books for primary instruction and of the humblest kind of literature and prints for the use of peasants than any other Russian city.

The philanthropic institutions are numerous, the first rank being occupied by the immense Foundlings' Hospital, erected in 1764. The hospitals, municipal, military, and private, are very large, but much below the standard of other capitals. The number of private philanthropic institutions is very considerable.

Though the drama was introduced into Russia at Kieff, Moscow was the place of its development. The earliest stage representations were made at Moscow in 1640, and the first comedy—a translation of Molière's *Médecin Malgré Lui*—was played in the palace before Sophie, the sister of Peter I. It was only in 1759 that a theatre was erected. A large stone theatre was erected in 1776, and rebuilt in 1856 after a fire. It is for the Moscow stage that the best Russian dramas have been written, and it was in the "small theatre" that the best Russian actors—Schepkin, Sadovsky, Shumsky, and Madame Vasilieff—exhibited the comedies of Gogol, Griboyedoff, and Ostrovsky.

Moscow, where the Great-Russian language is spoken in its greatest purity, was the birthplace of the two chief Russian poets, Pushkin and Lermontoff, as well as of Griboyedoff, Ostrovsky, and Herzen. A monument to Pushkin was erected in 1880, on the Tverskoy boulevard. Griboyedoff, in his remarkable comedy *Gore ot uma*, has given a lively picture of the higher Moscow society of the beginning of this century, which continued to hold good until within the last few years. His remark as to the unmistakable individuality of the Moscow type also maintains its truth; although the physiognomy of Moscow has much changed since his day, it still has its special features that distinguish it from every other capital. The division of classes is much more felt at Moscow than elsewhere. The tendency towards originality, the love of grandiose undertakings, a kind of brag, together with little feeling of independence, a good deal of laziness, and much cordiality, still characterize the educated classes. The merchants live quite aloof from any political or even intellectual movement, under a rude patriarchal system, well described in the dramas of Ostrovsky. A large proportion of them are nonconformists. Their sons, the well-known kupecheskiye synki, "merchants' sons," when they leave this kind of life, astonish the capital with their extravagances and absurd display of wealth. But Moscow takes its present physiognomy chiefly from its busy lower classes. The streets are full of merchants and peasants, who continue to wear the old Russian garb, go on foot in the streets, drink tea in modest restaurants, and transact large business. From being a town of the aristocracy, Moscow is coming to be more and more a town of the wealthy middle classes, who persist in keeping the low educational level of the peasants in the villages, and have but one aspiration, to become in their turn "merchants" of the type described by Ostrovsky.

Suburbs.—Moscow is surrounded by beautiful parks and picturesque suburbs. Of the former one of the most frequented is the Petrovsky Park, to the north-west. A little farther out is the Petrovskoye Razumovskoye estate, with an agricultural academy and its dependencies (botanical garden, experimental farm, &c.). Another large park and wood surround an imperial palace in the village of Ostankino. The private estates of Kuzminki, Kuskovo, and Kuntzevo are also surrounded by parks; the last has remains of a very old graveyard, supposed to belong to the pagan period. Twenty-eight miles westward from the city is the Savvin-Storojevsky monastery, situated, like so many other Russian monasteries, in a very fertile country, amidst beautiful forests; it has a pretty cathedral, a rich treasury, and library. Farther westward still is the New Jerusalem monastery erected by the patriarch Nikon.

In the south-west, on the right bank of the Moskva, which here makes a great bend to the south, are the Vorobiovy hills, which are accessible by steamer from Moscow, and afford one of the best views of the capital. In the bend of the Moskva is situated the Novo-Dyevitchiy convent, erected in 1525, and connected with many events of Russian history. It is now the burial-place of the Moscow aristocracy, and one of the richest nunneries in Russia. The village Arkhangelskoye has also a good park and a palace built by Rastrelli. Iliynskoye, formerly a private estate, was purchased by the imperial family in 1864.

In the south, on the road to Serpukhoff, is the village of Kolomenskoye, the residence of Alexis Mikhailovitch, with a church built in 1531 (a striking monument of Russian architecture, restored in 1880). Diakovo has also a church built in the 16th and 17th centuries—a pure example of the architecture of Moscow, recalling the temple of Vasili Blajennyi. Still the prince, although assuming, like several others, the title of Great Prince, had simply

[1] The name of boyars, or boiars, was given to the descendants of the former military bands of the princes, who had become counsellors and landowners.

Præp. Ev., ix. 27); she named the boy Μωϋσῆς, not because she used the Hebrew verb משה to express the fact that he was drawn out of the water, but because the Egyptian word for water was μω, and υσης applies to those who have been delivered from it (*Ant.*, ii. 9, 6; comp. Philo, ed. Mangey, ii. 83; Euseb., *l.c.*, ix. 28). She took care to have him trained in all the wisdom of the Egyptians (Acts vii. 22) and in that of the Greeks, Assyrians, and Chaldæans as well (Philo, ii. 84). To his great intellectual endowments corresponded his personal beauty, of which Josephus speaks in extravagant terms (*Ant.*, ii. 9, 6-7). It was on account of this beauty that, when on one occasion, as a young man, he led an Egyptian army against Meroe, the Ethiopian princess Tharbis opened the gates of the capital to him in order to make him her husband (*Ant.*, ii. 10; comp. Numb. xii. 1).

For reasons explained in Exod. ii. 11 *sq.*, Moses left the land of Pharaoh and came to Midian to the Kenite priest Jethro (also called Hobab Ben Raguel and Raguel), whose daughter Zipporah he married, becoming by her the father of two sons, Gershom and Eliezer (Exod. ii. 21 *sq.*; xviii. 2 *sq.*). During his stay in Midian he received, at the foot of Sinai (Horeb), the divine revelation at the burning bush whereby he was called to become the liberator of Israel from Egyptian bondage. With much reluctance he at last accepted this vocation, and, already expected by his brother Aaron and the elders, returned to his people.[1] Arrived in Egypt, he associated Aaron with him as his interpreter, being himself no orator, but a man of counsel and action, and appeared before Pharaoh to demand of the king in Jehovah's name permission for the people to go with flocks and herds into the wilderness to celebrate there a festival (the spring festival of the Passover) in honour of their God. Jehovah gave emphasis to the demand by great signs and wonders,—the plagues of Egypt, which have their explanation for the most part in evils to which Egypt is periodically liable, but are treated by Israelite tradition as the weapons of Jehovah in his ever-intensifying conflict with the king and the gods of Egypt. At length, by the slaying of the first-born, the stubbornness of Pharaoh was broken, so that he consented to, and even urged, the departure of the Hebrews. By and by, however, he changed his mind, and, setting out in pursuit of the Hebrews, overtook them at the Red Sea; but Jehovah fought for them, and annihilated Pharaoh's chariots and all his host. In order to present themselves in proper festal array at the celebration for the sake of which they were going into the wilderness, the Hebrew women had borrowed dresses and ornaments from those of Egypt; the Egyptians could now only blame themselves and their hostile conduct if those articles were not returned.[2]

By the miracle wrought at the Red Sea Moses was pointed out to the Hebrews as the man of God, to whom accordingly they now committed the task of caring for their outward life as well as their spiritual guidance. He led them first to Sinai, where the law was revealed and the worship in connexion with the ark of the covenant instituted. When he had communed face to face with the Godhead for forty days on the holy mountain, the skin of his face shone so that he had to wear a veil (hence the horns, properly rays, on his forehead). Driven from Sinai in consequence of their worship of the golden calf, the Israelites removed to Kadesh with the view of entering Palestine. But this plan was defeated by their unbelief and faintheartedness, and, as a punishment, they were compelled to sojourn forty years in the wilderness of Kadesh (Paran, Sin). It was here and now that the people went to school with Moses; here, at the sanctuary of the camp, he declared law and judgment; and here, according to the view of the oldest tradition, the foundations of the Torah were laid (Exod. xviii.). The region of Kadesh was also the scene of almost all the miracles and other circumstances we read about Moses. Here he showed himself to be at once the father and mother of the people, their judge, priest, and seer. It was not till towards the very close of his life that he led the Israelites from Kadesh into northern Moab, which he wrested from the Amorite king, Sihon of Heshbon. Here he died on Mount Pisgah or Nebo, after taking leave of the people in the great legislative address of Deuteronomy. According to Deuteronomy xxxiv. 6, he "was buried in a valley in the land of Moab, . . . but no man knoweth of his sepulchre unto this day."[3] As his successor in the leadership, Moses had named Joshua ben Nun, but the real heirs to his position and influence were the priests at the sanctuary of the ark of the covenant. Of his personal character the Bible tells us nothing (for ענו in Numb. xii. 3 means only "heavily burdened"); but later Judaism is all the more at liberty on this account to expatiate upon it (see especially Josephus, *Ant.*, iv. 8, 49).

Such in brief *résumé* are the accounts of Moses given in the Bible[4] and the Midrash. In addition to these we have also the statements of Hellenistic writers, preserved chiefly in the *Contra Apionem* of Josephus. These are all of an Egyptian complexion, and probably embody no ancient and independent tradition, but, in all that relates to the Hebrews, where they do not rest upon pure conjecture, merely go back upon obscure rumours of Jewish origin and dress them up after the manner of the Midrash—only in a contrary sense, with hatred and not with love—and then seek to fit them as well as may be into the Egyptian history and chronology as known from other sources. The great number of new proper names of places and persons which occur in the writings of Manetho and his like cannot be urged against this view, for the Midrash also is full of them. The very name Osarsiph, given to Moses himself, moreover, suggests a suspicion of dependence on the Asaphsuph, "mixed multitude" of Numb. xi. 4 (comp. Exod. xii. 38); what is said in these places is known to have played a great part in the rise of the idle Egyptian tales about the origin of the Jews and of their lawgiver.

For literature, see the various commentaries on the Pentateuch, and especially Dillmann on Exodus. (J. WE.)

MOSES OF CHORENE was a native of Khor'ni[5] in Tarôn, a district of the Armenian province of Turuberan. According to the only trustworthy authority—the *History of Armenia*[6] which bears his name—he was a pupil of the two fathers of Armenian literature, the patriarch or catholicos Sahak the Great and the vartabed Mesrôb. Shortly after 431 he was sent by these men to Alexandria to study the Greek language and literature, and thus prepare himself for the task of translating Greek writings into Armenian. Moses took his journey by Edessa and the sacred places of Palestine. After finishing his studies in the Egyptian capital he set sail for Greece; but the ship was driven by contrary winds to Italy, and he seized the opportunity of paying a flying visit to Rome. He then visited Athens, and towards the end of winter (440) arrived in Constantinople, whence he set out on his homeward journey. On his arrival in Armenia he found that his patrons were both dead. The *History of Armenia* speaks of its author as an old, infirm man, constantly engaged in the work of translating.[7] In the later Armenian tradition

1 On the road occurred the remarkable incident which, in the view of the narrator, led to the circumcision of infants being substituted for that of the bridegroom (Exod. iv. 24, 25; ותגע לרגליו, to mark the substitution,—compare the euphemism in Isa. vii. 20).

2 Quite contrary to the sense of the Biblical narrative, Justin (xxxvi. 2, 13) says, "Sacra Ægyptiorum furto abstulit;" and still more perverse is the gloss which Ewald, proceeding upon this expression of Justin, gives.

3 The legend of his assumption is of later growth; see the apocryphal *Assumptio Moysis* (APOCALYPTIC LITERATURE, vol. ii. p. 177), and compare Luke ix. 30, 33; Jude 9.

4 Outside of the Hexateuch, however, he is almost never mentioned.

5 Cf. Sukias Somal, *Quadro della storia letteraria di Armenia*, p. 24 *sq.*

6 iii. 61 *sq.*, 68, 65.

7 On linguistic grounds, the Mechitarists ascribe to him the translation of Eusebius's *Chronicle* and of the Pseudo-Callisthenes.

Præp. Ev., ix. 27); she named the boy Μωϋσῆς, not because she used the Hebrew verb משה to express the fact that he was drawn out of the water, but because the Egyptian word for water was μω, and υσης applies to those who have been delivered from it (*Ant.*, ii. 9, 6; comp. [2] Quite contrary to the sense of the Biblical narrative, Justin (xxxvi. 2, 13) says, "Sacra Ægyptiorum furto abstulit;" and still more perverse is the gloss which Ewald, proceeding upon this expression of Justin, gives.

[3] The legend of his assumption is of later growth; see the apocryphal *Assumptio Moysis* (APOCALYPTIC LITERATURE, vol. ii. p. 177), and compare Luke ix. 30, 33; Jude 9.

[4] Outside of the Hexateuch, however, he is almost never mentioned.

[5] Cf. Sukias Somal, *Quadro della storia letteraria di Armenia*, p. 24 *sq.*

[6] iii. 61 *sq.*, 68, 65.

[7] On linguistic grounds, the Mechitarists ascribe to him the translation of Eusebius's *Chronicle* and of the Pseudo-Callisthenes.

Geography, is of opinion that we have in it a writing of the 7th century. In this judgment we must concur; and, if the limits within which the *Geography* was composed are to be more nearly defined, we may say that, from isolated traces of Arab rule[1] (which in Armenia dates from 651), it must have been written certainly after that year, and perhaps about the year 657.[2]

Another extant work of Moses is a *Manual of Rhetoric*, in ten books, dedicated to his pupil Theodorus. It is drawn up after Greek models, in the taste of the rhetoric and sophistry of the later imperial period. The examples are taken from Hermogenes, Theon, Aphthonius, and Libanius; although the author is also acquainted with lost writings, *e.g.*, the *Peliades*, of Euripides. On account of the divergence of its style from that of the *History of Armenia*, Armenian scholars[3] have hesitated to ascribe the *Rhetoric* to Moses of Khor'ni; but, from what has been said above, this is rather to be regarded as a proof of its authenticity.

Smaller works bearing the same honoured name[4] are—the *Letter to Sahak Arderuni*; the *History of the Holy Mother of God and her Image* (in the cloister of Hogotsvanch in the district Andzevatsi of the province of Vaspurakan), which is also addressed to Sahak; and the *Panegyric on Saint Rhipsime*. Of the sacred poems attributed to him, there is only one short prayer, contained in the hymnal of Sharakan, which can really claim him as its author.

Of works passing under the name of Moses of Khor'ni, the following are regarded by the historians of Armenian literature as spurious: a *History* (distinct from the *Panegyric*) *of the wanderings of Saint Rhipsime and her companions*; *a Homily on the transfiguration of Christ*; *a Discourse on Wisdom* (*i.e.*, the science of grammar); the *Commentaries on grammar* (an exposition of Dionysius Thrax). In the case of the grammatical writings, it has been suggested that there may have been some confusion between Moses of Khor'ni and a Moses of Siunich, who lived in the 7th century. (A. v. G.)

MOSHEIM, Johann Lorenz von (*c.* 1694-1755), well known as a church historian, but also distinguished in his day as a master of eloquence, was born at Lübeck on the 9th of October. There is some uncertainty as to the year, but the probability is in favour of 1693 or 1694. He received a somewhat irregular education at the gymnasium of his native place, and afterwards entered the university of Kiel, where he took his master's degree in 1718. His first appearance in the field of literature was in a polemical tract against Toland, *Vindiciæ antiquæ Christianorum disciplinæ* (1720), which was soon followed by a volume of *Observationes sacræ* (1721). These works, along with the reputation he had acquired as a lecturer on philosophy, and also as a fervent and eloquent preacher while acting as assistant to Albrecht zum Felde, his teacher and future father-in-law, secured for him a call to a theological chair at Helmstädt, in 1723. The *Institutionum Historiæ Ecclesiasticæ libri IV.* appeared in 1726 (2 vols., 12mo), and in the same year he was appointed by the duke of Brunswick abbot of Marienthal, to which dignity and emolument the abbacy of Michaelstein was added in the following year. Mosheim was much consulted by the authorities when the new university of Göttingen was being formed; especially had he to do with the framing of the statutes of the theological faculty, and with the provisions for making the theologians independent of the ecclesiastical courts. But having signed in 1726 a promise to remain in Helmstädt he was unable to accept the call to the Georgia Augusta which was urgently pressed upon him, until the year 1747, when the duke of Brunswick at last released him from his obligation. To enhance the dignity he already possessed as a learned and brilliant theological professor at Göttingen, a new office was specially created for him, that of chancellor, which, however, proved somewhat burdensome, exciting the jealousy of the nobles whom he governed. He died at Göttingen on 9th September 1755, shortly after the completion of a new and greatly improved edition of his *Church History*.

For Mosheim's place as an ecclesiastical historian, see Church History, vol. v. p. 765. In this department of literature, in addition to the *Institutiones* must be specially mentioned his *De Rebus Christianorum ante Constantinum Magnum Commentarii* (1753), and Gibbon's just criticism: "Less profound than Petavius, less independent than Le Clerc, less ingenious than Beausobre, the historian Mosheim is full, rational, correct, and moderate." His exegetical writings, characterized by learning and good sense, include *Cogitationes in N. T. loc. select.* (1726), and expositions of 1 Cor. (1741) and the two Epistles to Timothy (1755). In his sermons (*Heilige Reden*) considerable eloquence is shown, and a mastery of style which justifies the position he held as president of the German Society. There are two English versions of the *Institutes*, that of Maclaine, published in 1764, and that of Murdock (1832), which is much more correct. The latter was revised and re-edited by Reid in 1848. An English translation of the *De Rebus Christianorum*, begun in 1813 by Vidal, was completed and edited by Murdock in 1851.

MOSQUE (*Jámi'*, or more fully *Masjid Jámi'*, the place of congregational prayer). Owing to the almost complete absence of ritual in the Moslem worship, the mosque, at least in its earlier forms, is one of the simplest of all religious buildings,—its normal arrangement being an open court (*Saḥn*) surrounded by a covered cloister (*Líwán*), in the centre of which is a cistern for the ablutions requisite before prayer (*Míḍa'a*);[5] the side of the mosque which is towards Mecca is occupied by a roofed building (*Maksúra*), or place reserved for prayer, sometimes screened off from the court, but frequently quite open towards it. In the centre of this sanctuary is a niche (*Mihráb* or *Kibla*) showing the direction of Mecca; and by the side of the niche is a lofty pulpit (*Mimbar*). In front of the pulpit is a raised platform (*Dakka*) from which certain exhortations are chanted, and near it one or more seats and lecterns combined from which chapters of the Koran are read to the people.

Minarets (*Ma'ádhin*, sing. *Ma'dhana*) were not built during the first half-century after the Flight, but now as a rule no mosque is without at least one. From the upper gallery of this the *Moedhdhin* announces to the faithful the times for prayer,—five times during the day, and twice at night. Blind men are generally selected for this office, so that they may not overlook the neighbouring houses.

Most mosques have endowed property, which is administered by a warden (*Náẓir*), who also appoints the imáms and other officials. The larger mosques have two imáms: one is called (in Arabia and Egypt) the *Khatíb*, and he preaches the sermon on Fridays (the Moslem Sabbath); the other, the *Rátib*, reads the Koran, and recites the five daily prayers, standing close to the *Mihráb*, and leading the congregation, who repeat the prayers with him, and closely follow his postures. The imáms do not form a priestly sect; they generally have other occupations, such as teaching in a school or keeping a shop, and may at any time be dismissed by the warden, in which case they lose the title of imám. Doorkeepers and attendants, to sweep the floor, trim the lamps, and perform other menial offices, are attached to each mosque, in numbers varying according to its size and endowment. Moslem women, as a rule, are expected to say their prayers at home, but in some few mosques they are admitted to one part specially screened off for them. This is the case in the mosque of Sitta Zainab in Cairo. In the Aḳsá mosque at Jerusalem there is a latticed balcony for the women, who can see without being visible to the male worshippers below.

The greatest possible splendour both of material and workmanship is often lavished on the building and its

and horse-shoe. Fig. 1 gives its plan as a good typical specimen of this normal type of mosque.

The mosque at Kairawán, Tunis, said to have been founded by 'Okba (see *supra*, p. 567), follows the normal plan, with 439 fine antique marble columns, horse-shoe arches, some pointed and others round, and flat ceiling of dark wood, once magnificently painted. Its sanctuary is ten aisles deep by seventeen wide. In the centre of the court is a marble fountain over the sacred well, said to communicate with the spring Zemzem at Mecca. Its minaret, a rather later addition, is very massive and stately; it is square, in three stories, each battlemented, the walls battering considerably. The sanctuary is domed, and the *Miḥráb* is decorated with magnificent tiles. Adjoining the sanctuary is a small room for a library.

The other great mosque of Sidi-'Okba, built soon after his death in 682, and containing his tomb, is in Algeria near Biskra; it much resembles the Kairawán mosque, but is less splendid, some of the columns being not of marble but of baked clay decorated with painting.

The great mosque of Fez, about the same date, is also very large and magnificent, with *Mimbar* and *Miḥráb* richly ornamented with minute mosaics; it has also a fine inlaid and painted wood ceiling, and some elaborately-carved doors. It still possesses a fine library. (See Amici, *Journey to Fez*, 1878.)

The great mosque of Damascus was built on the site of a Christian basilica, erected by Theodosius in 395-408. From 636, when the Arabs conquered Damascus, until 708 this basilica was used jointly both by the Christians and the Moslems. The basilica was then pulled down, and the present mosque built by the caliph Walíd. It has the normal plan, and is 508 feet by 320 feet. Its sanctuary is only three aisles deep; it has a central dome on the south or Mecca side, and on the east and west a large porch. Samhúdí records that one of the conditions of peace concluded between the Byzantine emperor and Walíd was that the emperor should furnish a certain number of workers in mosaic for the decoration of the mosques at Mecca, Medina, Jerusalem, and Damascus.

The mosque of Aḥmed Ibn Ṭúlún, in Cairo, completed in 879, has the normal plan, with the exceptional addition of an outer court, or wide passage, running round three sides of the rectangle,—probably to cut it off completely from the noise of the surrounding streets. It is built of brick, coated with delicate reliefs in stucco, once enriched with painting. The *Miḥráb* has beautiful mosaics, and the *Mimbar* is a marvel of delicate carving and inlay. The pillars and arches are of brick enriched with elaborate stucco-work. It has a very remarkable minaret on the west side, with a spiral external staircase. The architect was a Copt, an Egyptian Christian. It is perhaps the earliest important building in which the pointed arch is largely used.

The mosque Al-Azhar, "The Splendid," was built in the centre of New Cairo about 970 and, though frequently restored, has in the main been little altered. It is on the normal plan, with ranges of pointed and slightly horse-shoe arches, supported on more than 400 fine antique columns of marble and porphyry, chiefly from Roman buildings. Among its later decorations are magnificent wall-coverings of the most beautiful Persian tiles. It has a special interest in being the chief university of the Moslem world, containing some thousands of students (*mujáwirín*), for whom certain parts of the mosque (*Riwáḳ*) are screened off, according to the country from which they come. Thus special parts are reserved for natives of the various provinces of Egypt, of Morocco, Syria, Arabia, India, Turkey, &c. Each student can, if he is too poor to hire lodgings, live, eat, and sleep in the mosque. Each has a large chest in which to keep his clothes and books; these are piled against the walls to a height of seven or eight feet. The students pay no fees, but the richer ones give presents to the lecturers, who sit on the matting in various parts of the sanctuary or cloister, while the students sit round each lecturer in a circle. The usual course of study lasts for three years, though some students remain for much longer. The chief of the lecturers, called the *Sheikh al-Azhar*, receives about £100 a year, the others little or nothing, as regular pay. The Koran, sacred and secular law, logic, poetry, and arithmetic, with some medicine and geography, are the chief subjects of study.

Of mosques which are not built on the normal plan the earliest and most important are the two in the Harám al-Sheríf (High Sanctuary) at Jerusalem (see vol. xiii. p. 642).

The Kubbet al-Ṣakhra (Dome of the Rock), popularly, but wrongly, called the "Mosque of Omar," is not, strictly speaking, a mosque at all. It belongs rather to the class of "shrines,"—generally small square, circular, or octagonal buildings erected over some sacred spot or tomb. It is a very beautiful building, with high central dome, and double ambulatory round it,—the outer wall being octagonal, and the dome, with the pillars that carry it, circular in plan. It is decorated in a very sumptuous way by inlay of rich marbles and very splendid glass mosaics. The outer wall and most of the internal mosaics are later than the dome itself. Its windows of mosaic-like stained glass are very beautiful, and are almost the only Moslem example of the use of lead "cames," instead of the bits of glass being fitted into marble or stucco tracery; this, as well as the glass wall-mosaics, was probably the work of Byzantine artificers.[1]

The mosque within the same enclosure, called Al-Aḳṣá, is entirely roofed, with many aisles and columns, having no open court, quite unlike the usual arrangement of a mosque.

The finest and largest group of mosques is at Cairo. Many of them are very complicated buildings, with no resemblance to the normal plan before described. In some cases a hospital, a school, a court of justice, a monastery, or very frequently a tomb, forms part of the building, and causes considerable modifications in its plan.

The finest of these is the mosque of the sultan Hasan, built between 1356 and 1359 (fig. 2), a good specimen of a mosque built in a crowded site with a wing for a tomb. In plan it is cruciform, the central part being open to the sky; the eastern arm of the cross is the sanctuary, and farther east is the stately domed tomb of the sultan himself. All four arms of the cross are vaulted in stone with a plain waggon vault. Its magnificent entrance on the north, with an enormously high arch, decorated with stalactite reliefs in stone, is set somewhat askew to follow the line of the old street. It has two minarets, one of great height and grandeur.

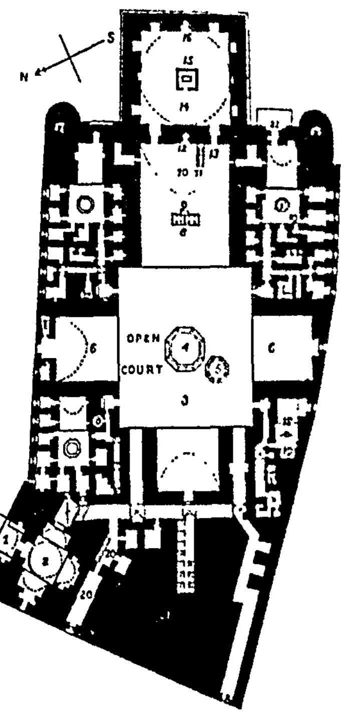

FIG. 2.—Plan of Mosque of Sultan Hasan, Cairo.

1, 2. Main entrance. 3. Court open to sky. 4, 5. Fountains. 6, 6. North and south vaulted transepts (the dotted lines show the curve of the vault). 8, 9. Dakka. 10. Sanctuary. 11. Mimbar. 12. Kibla. 13. Door to tomb. 14. Domed tomb-chamber. 15. Tomb within screen. 16. Kibla. 17, 17. Minarets. 18, 19, 20. Various entrances to mosque. 21. Small rooms connected with service of the mosque. 22. Sultan's private entrance.

The Muristán Kalaún is a combination of hospital, tomb, and mosque,—an enormous building covering a very large area. It was built by Sultan Kalaún at the beginning of the 14th century; his tomb, built 1320, which forms part of this great building, is a massive square edifice with a very grand and well-designed octagonal dome. Its wall-mosaics in pearl and precious stones are unusually magnificent. Even a bare list of the mosques of Cairo would occupy a large space; they are over four hundred in number, and are mostly remarkable for some beauty in design or richness in their ornament and material.

The mosque of Ibrahim Agha should specially be noted for the splendid Persian tiles which cover the east wall of its sanctuary; these are of the end of the 16th century, and are unrivalled in beauty both of drawing and colour. The tiles are 9 inches square, and work into large designs with very graceful sweeping curves of foliage, drawn with the greatest skill, and painted in the most brilliant yet harmonious colours—perfect masterpieces of coloured decoration. See MURAL DECORATION.

The so-called "Tombs of the Caliphs," really tomb-mosques of Egyptian sultans, are a large group of very fine buildings, less than a mile outside the walls of Cairo. The largest is that of Sultan Barkúk, with a superb dome and two stately minarets. In addition to an extensive open court, it has on each side of the sanctuary a magnificent tomb-chamber containing the bodies of the sultan himself, who died in 1399, and various members of his family.

The most beautiful and graceful of all these mosques is that which contains the tomb of Sultan Káit-Bey, who died in 1496; its dome is entirely covered externally with beautiful and delicate reliefs carved in stone. Its minaret is a masterpiece of invention and extreme grace of outline, combined with the richest and most exquisite detail; like most of the Cairo mosques, its exterior is ornamented by bands of red stone alternating with the yellow Mokattam limestone. Inside, marble inlaid pavements and mosaics on the walls, with decorations in painted stucco and wood carved and inlaid give extreme splendour to the building. Fig. 3 gives its plan as a typical example of the combined mosque and tomb, —the latter the more important. The mosque inside the walls of

[1] See De Vogüé, *Temple de Jérusalem*, 18[illegible]; Texier, *Arch. Byzant.* [illegible]

and horse-shoe. Fig. 1 gives its plan as a good typical specimen of this normal type of mosque.

The mosque at Kairawán, Tunis, said to have been founded by 'Okba (see *supra*, p. 567), follows the normal plan, with 439 fine antique marble columns, horse-shoe arches, some pointed and others round, and flat ceiling of dark wood, once magnificently painted. Its sanctuary is ten aisles deep by seventeen wide. In the centre of the court is a marble fountain over the sacred well, said to communicate with the spring Zemzem at Mecca. Its minaret, a rather later addition, is very massive and stately; it is square, in three stories, each battlemented, the walls battering considerably. The sanctuary is domed, and the *Mihráb* is decorated with magnificent tiles. Adjoining the sanctuary is a small room for a library.

The other great mosque of Sidi-'Okba, built soon after his death in 682, and containing his tomb, is in Algeria near Biskra; it much resembles the Kairawán mosque, but is less splendid, some of the columns being not of marble but of baked clay decorated with painting.

The great mosque of Fez, about the same date, is also very large and magnificent, with *Mimbar* and *Mihráb* richly ornamented with minute mosaics; it has also a fine inlaid and painted wood ceiling, and some elaborately-carved doors. It still possesses a fine library. (See Amici, *Journey to Fez*, 1878.)

The great mosque of Damascus was built on the site of a Christian basilica, erected by Theodosius in 395-408. From 636, when the Arabs conquered Damascus, until 708 this basilica was used jointly both by the Christians and the Moslems. The basilica was then pulled down, and the present mosque built by the caliph Walíd. It has the normal plan, and is 508 feet by 320 feet. Its sanctuary is only three aisles deep; it has a central dome on the south or Mecca side, and on the east and west a large porch. Samhúdí records that one of the conditions of peace concluded between the Byzantine emperor and Walíd was that the emperor should furnish a certain number of workers in mosaic for the decoration of the mosques at Mecca, Medina, Jerusalem, and Damascus.

The mosque of Ahmed Ibn Túlún, in Cairo, completed in 879, has the normal plan, with the exceptional addition of an outer court, or wide passage, running round three sides of the rectangle,—probably to cut it off completely from the noise of the surrounding streets. It is built of brick, coated with delicate reliefs in stucco, once enriched with painting. The *Mihráb* has beautiful mosaics, and the *Mimbar* is a marvel of delicate carving and inlay. The pillars and arches are of brick enriched with elaborate stucco-work. It has a very remarkable minaret on the west side, with a spiral external staircase. The architect was a Copt, an Egyptian Christian. It is perhaps the earliest important building in which the pointed arch is largely used.

The mosque Al-Azhar, "The Splendid," was built in the centre of New Cairo about 970 and, though frequently restored, has in the main been little altered. It is on the normal plan, with ranges of pointed and slightly horse-shoe arches, supported on more than 400 fine antique columns of marble and porphyry, chiefly from Roman buildings. Among its later decorations are magnificent wall-coverings of the most beautiful Persian tiles. It has a special interest in being the chief university of the Moslem world, containing some thousands of students (*mujáwirín*), for whom certain parts of the mosque (*Riwák*) are screened off, according to the country from which they come. Thus special parts are reserved for natives of the various provinces of Egypt, of Morocco, Syria, Arabia, India, Turkey, &c. Each student can, if he is too poor to hire lodgings, live, eat, and sleep in the mosque. Each has a large chest in which to keep his clothes and books; these are piled against the walls to a height of seven or eight feet. The students pay no fees, but the richer ones give presents to the lecturers, who sit on the matting in various parts of the sanctuary or cloister, while the students sit round each lecturer in a circle. The usual course of study lasts for three years, though some students remain for much longer. The chief of the lecturers, called the *Sheikh al-Azhar*, receives about £100 a year, the others little or nothing, as regular pay. The Koran, sacred and secular law, logic, poetry, and arithmetic, with some medicine and geography, are the chief subjects of study.

Of mosques which are not built on the normal plan the earliest and most important are the two in the Harám al-Sherîf (High Sanctuary) at Jerusalem (see vol. xiii. p. 642).

The Kubbet al-Sakhra (Dome of the Rock), popularly, but wrongly, called the "Mosque of Omar," is not, strictly speaking, a mosque at all. It belongs rather to the class of "shrines,"—generally small square, circular, or octagonal buildings erected over some sacred spot or tomb. It is a very beautiful building, with high central dome, and double ambulatory round it,—the outer wall being octagonal, and the dome, with the pillars that carry it, circular in plan. It is decorated in a very sumptuous way by inlay of rich marbles and very splendid glass mosaics. The outer wall and most of the internal mosaics are later than the dome itself. Its windows of mosaic-like stained glass are very beautiful, and are almost the only Moslem example of the use of lead "cames," instead of the bits of glass being fitted into marble or stucco tracery; this, as well as the glass wall-mosaics, was probably the work of Byzantine artificers.[1]

The mosque within the same enclosure, called Al-Aksá, is entirely roofed, with many aisles and columns, having no open court, quite unlike the usual arrangement of a mosque.

The finest and largest group of mosques is at Cairo. Many of them are very complicated buildings, with no resemblance to the normal plan before described. In some cases a hospital, a school, a court of justice, a monastery, or very frequently a tomb, forms part of the building, and causes considerable modifications in its plan.

The finest of these is the mosque of the sultan Hasan, built between 1356 and 1359 (fig. 2), a good specimen of a mosque built in a crowded site with a wing for a tomb. In plan it is cruciform, the central part being open to the sky; the eastern arm of the cross is the sanctuary, and farther east is the stately domed tomb of the sultan himself. All four arms of the cross are vaulted in stone with a plain waggon vault. Its magnificent entrance on the north, with an enormously high arch, decorated with stalactite reliefs in stone, is set somewhat askew to follow the line of the old street. It has two minarets, one of great height and grandeur.

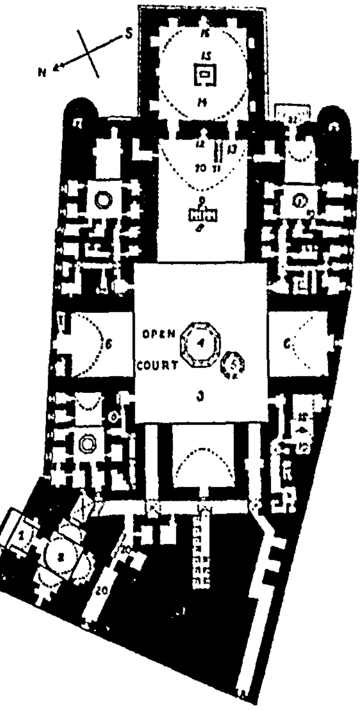

FIG. 2.—Plan of Mosque of Sultan Hasan, Cairo.

1, 2. Main entrance. 3. Court open to sky. 4, 5. Fountains. 6, 6. North and south vaulted transepts (the dotted lines show the curve of the vault). 8, 9. Dakka. 10. Sanctuary. 11. Mimbar. 12. Kibla. 13. Door to tomb. 14. Domed tomb-chamber. 15. Tomb within screen. 16. Kibla. 17, 17. Minarets. 18, 19, 20. Various entrances to mosque. 21. Small rooms connected with service of the mosque. 22. Sultan's private entrance.

The Muristán Kalaún is a combination of hospital, tomb, and mosque,—an enormous building covering a very large area. It was built by Sultan Kalaún at the beginning of the 14th century; his tomb, built 1320, which forms part of this great building, is a massive square edifice with a very grand and well-designed octagonal dome. Its wall-mosaics in pearl and precious stones are unusually magnificent. Even a bare list of the mosques of Cairo would occupy a large space; they are over four hundred in number, and are mostly remarkable for some beauty in design or richness in their ornament and material.

The mosque of Ibrahim Agha should specially be noted for the splendid Persian tiles which cover the east wall of its sanctuary; these are of the end of the 16th century, and are unrivalled in beauty both of drawing and colour. The tiles are 9 inches square, and work into large designs with very graceful sweeping curves of foliage, drawn with the greatest skill, and painted in the most brilliant yet harmonious colours—perfect masterpieces of coloured decoration. See MURAL DECORATION.

The so-called "Tombs of the Caliphs," really tomb-mosques of Egyptian sultans, are a large group of very fine buildings, less than a mile outside the walls of Cairo. The largest is that of Sultan Barkúk, with a superb dome and two stately minarets. In addition to an extensive open court, it has on each side of the sanctuary a magnificent tomb-chamber containing the bodies of the sultan himself, who died in 1399, and various members of his family.

The most beautiful and graceful of all these mosques is that which contains the tomb of Sultan Káit-Bey, who died in 1496; its dome is entirely covered externally with beautiful and delicate reliefs carved in stone. Its minaret is a masterpiece of invention and extreme grace of outline, combined with the richest and most exquisite detail; like most of the Cairo mosques, its exterior is ornamented by bands of red stone alternating with the yellow Mokattam limestone. Inside, marble inlaid pavements and mosaics on the walls, with decorations in painted stucco and wood carved and inlaid give extreme splendour to the building. Fig. 3 gives its plan as a typical example of the combined mosque and tomb, —the latter the more important. The mosque inside the walls of

high latitudes they are driven off by anointing the body with fish-oil; and in hot climates "mosquito curtains" are part of the ordinary bed-furniture. It is only the female that bites; and, as it is but a very small proportion of them that can ever taste human blood or that of any warm-blooded animal, blood would not appear to be essential to their welfare. It has been suggested that warm blood may have an influence on the ova, but it cannot be supposed that the eggs of those multitudes of individuals that never get a chance to taste blood are necessarily infertile; everything tends to prove the opposite.

Of late mosquitoes have been accused of playing a hitherto unsuspected part in the dissemination of certain entozoic diseases. According to the researches of Drs Manson and Cobbold and others, it appears certain that the insects, in sucking the blood of persons who are hosts of the entozoon known as *Filaria sanguis-hominis*, take these parasites into their own system, and it is believed that they afterwards (by their death and otherwise) contaminate drinking water with them, and thus convey the entozoa into the blood of persons previously unaffected.

Mosquitoes are aquatic in their early stages. The female deposits her eggs in boat-shaped masses on the surface of the water. The larvæ are very active, and have a peculiar jerking motion; the last segment is furnished with a respiratory apparatus, the form of which probably varies according to the species, but it is usually a long tube, the extremity of which can be exposed to the external air. The pupæ are also active (contrary to the condition in most dipterous pupæ), and are odd-looking creatures owing to the great development of the thoracic region; the respiratory apparatus is in the thorax in this state, the extremity of the body having two swimming-plates; the pupæ do not eat, but their activity is very great.

No notice of the mosquito or gnat would be complete without an explanation of the mouth-parts by which it is enabled to cause such extreme irritation. When these parts are closed one upon the other the whole looks like a long proboscis; but in reality this consists of seven distinct slender pieces separated to the base, viz.—the labium, two maxillæ, two mandibles, the lingua, and the labrum. The nomenclature of the mouth-parts varies with different authors. G. Dimmock (*Anatomy of the Mouth-parts and of the Sucking-apparatus of some Diptera*), the latest investigator of this complex apparatus, states that the labium has for function, for the most part, the protection of the fine setæ which form the true piercing organ of *Culex*. In the female of *Culex* the protective sheath is formed by the labium alone. When the mosquito has found a place which suits it for piercing—for it often tries different places on our skin before deciding on one—it plants its labellæ firmly upon the spot, and a moment later the labium is seen to be flexing backwards in its middle; the setæ, firmly grouped together, remain straight and enter the skin. When the setæ have entered to nearly their full length, the labium is bent double beneath the body of the insect. When the mosquito wishes to withdraw the setæ it probably first withdraws the two barbed maxillæ beyond the other setæ, that is, so that their barbs or papillæ will be kept out of action by the mandibles and hypopharynx; then it readily withdraws the setæ, perhaps aiding their withdrawal by the muscles

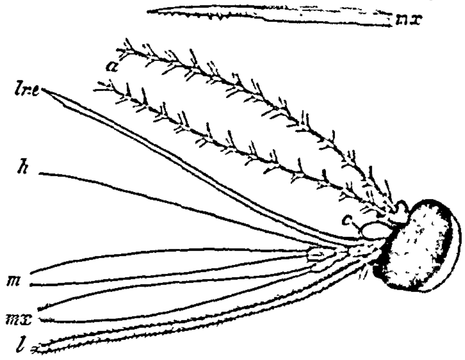

FIG. 3.—Mouth-parts, &c., of female *Culex* (after Dimmock). *a*, antennæ; *c*, clypeus; *h*, hypopharynx; *lr-e*, labrum-epipharynx; *l*, labium; *m*, mandibles; *mx*, maxillæ (with the tip of one of them enlarged).

of the labium, for during the process of extracting the setæ from the skin, while they are slowly sinking back into the groove upon the upper side of the straightening labium, the mosquito keeps the labellæ pressed firmly upon the skin. The withdrawal of blood is effected by means of a pumping apparatus at the base of the mouth-parts. As no investigator appears to have been able to detect a poison gland, it has been considered that the irritation caused by the bite of a mosquito was solely of mechanical origin; but the extreme irritation and its duration have not caused this idea to be commonly accepted. Dimmock avows his belief that there is use made of a poisonous saliva. In the male of *Culex* the mouth-parts vary considerably from those of the female,—a conspicuous point of difference being that in this sex the mandibles are absent, and the maxillæ are not barbed.

About 35 species of *Culex* (mosquito or gnat) have been described as inhabiting Europe, and about 130 from the rest of the world, but their differentiation is involved in great difficulty and uncertainty, and it is probable that the number of true species may be very much less. A species from Cuba has received the name *Culex mosquito*; but there is not one species that specially deserves the name more than another from a popular point of view, nor from a scientific point of view is there any difference between a mosquito and a gnat.

MOSQUITO COAST. See NICARAGUA.

MOSSES, or MUSCI, one of the two divisions of the botanical class *Muscineæ*, which includes also the Liverworts or *Hepaticæ*. See MUSCINEÆ.

MOSSLEY, a manufacturing town of Lancashire, England, is situated on the London and North-Western Railway and on the Huddersfield canal, near the west bank of the Tame, which here separates Lancashire from Cheshire, 3 miles north-east of Ashton-under-Lyne, and 10 east-north-east of Manchester. The houses are for the most part built of stone. To supersede the old church of St George, erected in 1757, a new building was begun in 1881. A mechanics' institute was erected in 1858. In the vicinity of the town is an eminence called Hartshead Pike, on which is a lofty circular tower surmounted by a spire rebuilt of stone in 1758. Mossley has risen into importance since the introduction of the cotton manufacture about fifty years ago. A fair is held annually. The town was placed under the Local Government Act in 1864, the district to which its provisions extend including also part of Saddleworth in Yorkshire. The total population was in 1871 10,578, and 13,372 in 1881.

MOSTAR, the chief town of Herzegovina, is built on both banks of the Narenta, about 35 miles from its mouth, and 40 miles south-west of Serajevo (Bosna Serai), the capital of Bosnia. Among the public buildings are a palace, two Greek churches, and forty mosques, in several cases with Roman or Byzantine tracery in their windows. The fine old bridge from which the town takes its name

high latitudes they are driven off by anointing the body with fish-oil; and in hot climates "mosquito curtains" are part of the ordinary bed-furniture. It is only the female that bites; and, as it is but a very small proportion of them that can ever taste human blood or that of any warm-blooded animal, blood would not appear to be essential to their welfare.
